Table D-3: Proposed Community Solid Waste Measures

Reduce Waste in half by 2020 over 2004 levels with :
Increase participation in commercial recycling/reuse programs for paper, cardboard, and plastic film
Participate in StopWaste.Org's audit and technical assistance program
Encourage businesses to participate in the County Green Business program
Increase participation in residential recycling programs
Educate residents and businesses about the benefits of Bay-Friendly Landscaping and Gardening
Increase participation in commercial and residential food waste collection program (for composting).
Consider incentives for waste reduction such as new rate structures for refuse and discards collection that credit diversion and allow for reduced rate composting/recycling services for businesses and residents.

Table D-4: Proposed Government Solid Waste Management Measures

Implement a duplex copying/printing policy in municipal office buildings
Reduce Landscape Waste in City landscapes by implementing StopWaste.Org's *Bay-Friendly Landscaping* Program. Include practices such as: • Increase on-site composting and mulching of municipal plant debris, using compost as a soil amendment, mulch for weed suppression, including the use of drip irrigation systems, a diverse plant pallet to resist pests, and reducing turf and sheared hedges.
Increase recycling and composting in municipal facilities
Adopt policies that support reduced waste (and which support other environmental priorities) including the following: • Environmental purchasing policy • 75% Diversion Goal • Construction &Demolition materials recycling ordinance • Civic Bay-Friendly/Green Building Ordinance • Residential green building resolution • Consider mandatory residential & commercial recycling/composting ordinance
Revise franchise language as franchises are renegotiated to include language that maximizes diversion (see StopWaste.Org for best practices)

Organization 1-1
Process 1-2

2 Comments on the Draft EIR 2-1

3 Response to Comments on the Draft EIR 3-1

Agencies 3-1
Organizations/Individuals 3-6
Oral Testimony 3-10

4 Revisions to the Draft EIR 4-1

Appendix A: Revisions to the Draft General Plan A-1

1 Introduction

This Program Final Environmental Impact Report (EIR) has been prepared by the City of Emeryville (City) in accordance with the California Environmental Quality Act (CEQA). The City is the lead agency responsible for ensuring that the proposed Emeryville General Plan (General Plan) complies with CEQA.

PURPOSE

The Final EIR includes the Draft EIR and this document, which includes Comments on and Responses to Comments on the Draft EIR, and minor corrections and clarifications to the Draft EIR. It is intended to disclose to City decision makers, responsible agencies, organizations, and the general public, the potential impacts of implementing the proposed General Plan. This program level analysis addresses potential impacts of activities associated with implementation of the General Plan, which are described in Chapter 2: Project Description, of the Draft EIR.

The primary purpose of the Final EIR is to revise and refine the environmental analysis in the Draft EIR, published May 15, 2009, in response to comments received during the 45-day public review period. The review period for the Draft EIR (State Clearinghouse No. 2006022008) was from May 15, 2009 to June 30, 2009. This Response Addendum, combined with the Draft EIR, constitutes the Final EIR on the project. This Final EIR amends and incorporates by reference the Draft EIR, which is available as a separately bound document from the City of Emeryville Planning Department, 1333 Park Avenue, in Emeryville.

The Draft EIR contains some impacts that are significant and unavoidable despite extensive mitigating policies, including impacts to air quality, traffic, cultural resources and noise. Other potentially significant impacts can be avoided or reduced to levels that are not significant through implementation of the policies identified in the Draft EIR.

ORGANIZATION

This document contains the following components:

- Chapter 2 lists all of the agencies and individuals that submitted either written or oral comments on the Draft EIR; reproduces all comments and provides a unique number for each EIR comment in the page margin.
- Chapter 3 provides responses to comments, numbered, and in order according to the comments in Chapter 2.
- Chapter 4 lists revisions to the Draft EIR by chapter and page, in the same order as the revisions would appear in the Draft EIR. Actual revised pages of the Draft EIR appear at the end of the section, also in the same order that they would appear in the Draft EIR.
- Appendix A lists revisions to the Draft General Plan.

PROCESS

Upon publication of the Final EIR, the Planning Commission and City Council will hold public hearings to certify the EIR and to consider adoption of the proposed General Plan. The Commission and Council will determine the adequacy of the Final EIR, and, if determined adequate, will make findings and certify the document as compliant with CEQA.

Copies of the Final EIR have been provided to agencies and other parties that commented on the Draft EIR or have requested the Final EIR. The Final EIR is also available at the City of Emeryville, Planning Department, 1333 Park Avenue, in Emeryville and the City's website at: http://ca-emeryville.civicplus.com/index.aspx?nid=385.

2 Comments on the Draft EIR

This chapter contains copies of the comment letters and oral comments received on the Draft EIR of the proposed General Plan. A total of 12 comments were received during the 45-day comment period. Additionally, oral comments were received at a Planning Commission public hearing on the Draft EIR. Each comment letter is numbered, and each individual comment is assigned a number in the page margin. Responses to each comment are provided in Chapter 3 of this document. Please note that only comments on the Draft EIR are addressed in this Final EIR. Where appropriate, the information and/or revisions suggested in these comment letters have been incorporated into the Final EIR. These revisions are included in Chapter 4 of this document.

Where comments are on the merits of the proposed General Plan rather than on the Draft EIR, this is noted in the response. Some of these comments are addressed as revisions to the proposed General Plan, as summarized in Appendix A.

EAST BAY
MUNICIPAL UTILITY DISTRICT

June 29, 2009

Deborah Diamond, Project Manager
General Plan and Zoning Update
City of Emeryville
1333 Park Avenue
Emeryville, CA 94608

Re: Draft Environment Impact Report – City of Emeryville General Plan, Emeryville

Dear Ms. Diamond:

East Bay Municipal Utility District (EBMUD) appreciates the opportunity to comment on the Draft Environmental Impact Report (EIR) for the City of Emeryville (City) General Plan. EBMUD has the following comments.

GENERAL

A1-1 The General Plan contains outdated information about the size of EBMUD's water and wastewater service area, number of customers, demand, and facility statistics and needs to be revised. Updated information and statistics can be found in the enclosed pamphlets *All About EBMUD* and *EBMUD's Annual Report 2008*. References within the Draft EIR and corresponding tables utilizing the updated information also need to be revised.

A1-2 Page 3.10-20, under Impact Statement 3.10-2, the first paragraph states "*This EIR considers whether changes in population projects in the proposed Emeryville General Plan would make a significant difference water demand currently planned for in the 2005 UWMP.*" The City should note that EBMUD uses land-use method to project its water demands because population based methods do not capture water demand from non-residential use.

WATER SERVICE

A1-3 The Draft EIR does not reference specific development projects. Any development project associated with the General Plan will be subject to the following general requirements:

Main extensions that may be required to serve any specific development projects that will provide adequate domestic water supply, fire flows, and system redundancy will be at the project sponsor's expense. Pipeline and fire hydrant relocations and replacements due to modifications of existing streets, and off-site pipeline improvements, also at the project sponsor's expense, may be required depending on EBMUD metering requirements and fire flow requirements set by the local fire department. All project sponsors should contact

EBMUD's New Business Office and request a water service estimate to determine costs and conditions of providing water service to the development. Engineering and installation of new and relocated pipeline and services requires substantial lead-time, which should be provided for in the project sponsor's development schedule.

Please note that depending on the size and/or square footage, the lead agency for future individual projects within the City's General Plan should contact EBMUD to request a Water Supply Assessment (WSA) that meets the threshold of a WSA pursuant to Section 15155 of the California Environmental Quality Act Guidelines, and Section 10910-10915 of the California Water Code. EBMUD requires project sponsors to provide future water demand data and estimates for individual project sites for analysis of the WSA. Please be aware that the WSA can take up to 90 days to complete from the day on which the request is received.

The Draft EIR indicates the presence of hazardous materials throughout the City that are of potential concern. The project sponsor should be aware that EBMUD will not inspect, install or maintain pipeline in contaminated soil or groundwater (if groundwater is present at any time during the year at the depth piping is to be installed) that must be handled as a hazardous waste or that may pose a health and safety risk to construction or maintenance personnel wearing Level D personal protective equipment. Nor will EBMUD install piping in areas where groundwater contaminant concentrations exceed specified limits for discharge to sanitary sewer systems or sewage treatment plants. Applicants for EBMUD services requiring excavation in contaminated areas must submit copies of existing information regarding soil and groundwater quality within or adjacent to the project boundary. In addition, the applicant must provide a legally sufficient, complete and specific written remedial plan establishing the methodology, planning and design of all necessary systems for the removal, treatment, and disposal of all identified contaminated soil and/or groundwater.

EBMUD will not design the installation of pipelines until such time as soil and groundwater quality data and remediation plans are received and reviewed and will not install pipelines until remediation has been carried out and documentation of the effectiveness of the remediation has been received and reviewed. If no soil or groundwater quality data exists or the information supplied by the applicant is insufficient EBMUD may require the applicant to perform sampling and analysis to characterize the soil being excavated and groundwater that may be encountered during excavation or perform such sampling and analysis itself at the applicant's expense.

WASTEWATER PLANNING

A1-4

The Draft EIR should include additional language under section 3.10, Public Services and Utilities, about the Federal Clean Water Act and the City's National Pollutant Discharge Elimination System (NPDES) permit and associated Cease and Desist Order. The General Plan and Draft EIR should be consistent with the requirements of the City's NPDES Permit and Cease and Desist Order and include a statement to that end.

A1-5

The Draft EIR should modify the discussion of Impact 3.10-3 to include wet weather flows. The Draft EIR presents projections for future dry weather flows and makes that case that the projected increases represent a small percentage of available treatment capacity at EBMUD's Main Wastewater Treatment Plant (MWWTP). EBMUD requests the following revision to the impact statement on page 3.10-22:

Impact 3.10-3 New development would not exceed wastewater treatment capacity of the EBMUD, and would not require construction of new wastewater treatment facilities~~, expansion of existing facilities or implementation of programs and policies to further reduce inflow and infiltration (I/I) of storm water into the city's wastewater collection system and private sewer laterals during wet weather events~~. (Less than Significant)

The impact statement, as written in the Draft EIR, contradicts recent regulatory changes requiring cessation of discharges from EBMUD's Wet Weather Facilities and reduction in inflow and infiltration (I/I) throughout the East Bay wastewater collection system. EBMUD's MWWTP and interceptor system are anticipated to have adequate dry weather capacity to treat the proposed wastewater flows from this project, provided that the wastewater meets the requirements of the current EBMUD Wastewater Control Ordinance. However, wet weather flows are a concern. EBMUD has historically operated three Wet Weather Facilities to provide treatment for high wet weather flows that exceed the treatment capacity of the MWWTP. On January 14, 2009, due to the Environmental Protection Agency's (EPA) and State Water Resources Control Board's re-interpretation of applicable law, the Regional Water Quality Control Board issued an order prohibiting further discharges from EBMUD's Wet Weather Facilities.

Currently, there is insufficient information to forecast how these changes will impact allowable wet weather flows in the individual collection system subbasins contributing to the EBMUD wastewater system, including the subbasins that encompass the general plan project area. As ordered by EPA, EBMUD is conducting extensive flow monitoring and hydraulic modeling to determine the level of flow reductions that will be needed in order to comply with the new zero-discharge requirement at the Wet Weather Facilities. It is reasonable to assume that a new regional wet weather flow allocation process may occur in the East Bay, but the schedule for implementation of any new flow allocations has not yet been determined.

A1-6

In the mean time, it would be prudent for the City to incorporate the following requirements for any new development into the proposed project: (1) replace or rehabilitate any existing sanitary sewer collection systems to reduce inflow and infiltration (I/I) to the maximum extent feasible, and (2) ensure any new wastewater collection systems are constructed to prevent I/I to the maximum extent feasible. Such provisions should be incorporated into the project and described in the Draft EIR under the discussion of Impact 3.10-3. Estimates of peak wet weather flows that are expected to result from the project and compare those projected flows to current peak wet weather flows should be included. The discussion to acknowledge the possible future need for additional I/I reduction in order to meet regulatory requirements should be revised accordingly.

WATER RECYCLING

A1-7 Page 3.10-3, under Recycled Water and Conservation, fourth sentence of the first paragraph, EBMUD's Non-Potable Water Policy number should be changed to 8.01.

Page 3.10-3, under Recycled Water and Conservation, the last sentence of the first paragraph should be revised to read "*Uses for recycled water include non-residential landscape irrigation, commercial and industrial process purposes, and toilet and urinal flushing in commercial buildings.*"

Page 3.10-3, under Recycled Water and Conservation, the first and second sentences in the third paragraph should be revised to read *"In 2008, the average daily recycled water use was 5.5 mgd. By 2020, EBMUD plans to recycle a total of 14 mgd in order to meet the anticipated potable water needs of its service area."*

Page 3.10-4, under Recycled Water and Conservation, the second sentence of the first paragraph should be revised to read *"This multi-phased project, commenced in 2003 with Phase 1A recently completed, will provide up to 2.2 mgd of recycled water from EBMUD's Main Wastewater Treatment Plant to customers in the aforementioned areas."*

WATER CONSERVATION

A1-8 Individual projects within the City's General Plan Update may present opportunity to incorporate water conservation measures. EBMUD would request that the City include in its conditions of approval a requirement that the project sponsor comply with Article 9-4.54 of the Municipal Code of the City of Emeryville: Landscape Design and Development Requirements. Project sponsors should be aware that Section 31 of EBMUD's Water Service Regulations requires that water service shall not be furnished for new or expanded service unless all the applicable water-efficiency measures described in the regulation are installed at the project sponsor's expense.

If you have any questions concerning this response, please contact David J. Rehnstrom, Senior Civil Engineer, Water Service Planning at (510) 287-1365.

Sincerely,

William R. Kirkpatrick
Manager of Water Distribution Planning

COMMENTS A2

Making San Francisco Bay Better

June 30, 2009

Deborah Diamond
Project Manager, General Plan and Zoning Update
Planning Division
1333 Park Ave.
Emeryville, CA 94608

Subject: City of Emeryville General Plan Update. BCDC Inquiry File No. AL.EY.6501.1.

Dear Ms. Diamond:

Thank you for the opportunity to comment on the draft environmental impact report (draft EIR) for the Emeryville General Plan update, State Clearinghouse Number 2006022008 received in our office on May 14, 2009. The Commission has not reviewed this draft EIR, so the staff comments in this letter are based on the *San Francisco Bay Plan* (Bay Plan) and the McAteer-Petris Act.

A2-1

Jurisdiction. In *Chapter 3: Settings, Impacts and Mitigation Measures*, in the Land Use and Housing, Biological Resources, and Hydrology and Flooding sections, the draft EIR describes BCDC's jurisdiction and authority. There are a few inconsistencies and minor errors in these descriptions that should be resolved. For example, on page 3.4-8, the description of the 100-foot shoreline band should say that it extends inland from mean high tide line, as opposed to "the high tide line" as currently stated here. The following paragraphs provide information about BCDC's jurisdiction and authority to discuss in the Regulatory Setting sections of the report.

The Commission has "Bay" jurisdiction over all areas of the Bay subject to tidal action which is defined by the shoreline. The shoreline is located at the mean high tide line, except in marsh areas, where the shoreline is located at five feet above mean sea level. The Commission's "Bay" jurisdiction extends to certain waterways identified in the McAteer-Petris Act consisting of all areas of the waterways that are subject to tidal action including submerged lands, tidelands, and marshlands up to five feet above mean sea level. Additionally, the Commission has "shoreline band" jurisdiction over an area 100 feet wide inland and parallel to the shoreline.

The Commission controls filling and dredging within its "Bay" jurisdiction through the permit system established by the McAteer-Petris Act. The Commission also administers permits for development within its 100-foot "shoreline band" jurisdiction. However, the Commission's authority along the shoreline is more limited; it may deny a permit application for a proposed project only if the project fails to provide maximum feasible public access to the Bay and shoreline consistent with the project, or is inconsistent with a priority use designation.

In accordance with provisions of the McAteer-Petris Act, the Commission has designated certain areas within the 100-foot "shoreline band" for specific priority uses for ports, water-related industry, water-oriented recreation, airports and wildlife refuges. The Commission is authorized to grant or deny permits for development within these priority use

areas based on appropriate Bay Plan development policies pertaining to the priority use. Along the Emeryville shoreline, the Bay Plan designates the southern and western shores of the peninsula as Waterfront Park, Beach priority use area, and the crescent as a Wildlife Refuge priority use area.

Sea Level Rise and Safety of Fills. We strongly support inclusion of measures in the General Plan update to "monitor climate change effects and implement any measures necessary to reduce any risk of flooding from sea level rise in the future" as stated on page 3.5-23. Additionally, although a 2100 scenario of sea level rise is beyond the planning horizon for the General Plan update, it would still be valuable to assess potential impacts to new construction (under the built-out Proposed General Plan) of a 55-inch sea level rise. We suggest this in part because the cost of flood protection for this new development could become extremely expensive with a higher sea level in the second half of the century, and creating this future hazard and cost may not be consistent with Proposed General Plan Key Principle #8 (page E-3).

A2-2

The draft EIR considers impacts of future sea level rise in the Hydrology and Flooding section (3.5). The descriptions of future sea level rise scenarios in the Environmental Setting and Impact Analysis sections are inconsistent with each other, and some of the information is outdated. In describing BCDC's assessment of sea level rise impacts to the Bay and its shoreline, the draft EIR should consistently reference the draft BCDC staff report, *Living with a Rising Bay: Vulnerability and Adaptation in San Francisco Bay and on the Shoreline,* released in April 2009. This BCDC report assessed sea level rise projections of 16-inches and 55-inches at mid-century and end of century, respectively. Furthermore, in addition to noting on page 3.5-6 that the BCDC maps of vulnerable areas do not account for existing shoreline protection, it should also be noted in this text that the maps do not indicate increases to storm-related flood areas (such as the 100-year flood zone).

A2-3

The draft EIR accurately references the sea level rise projections from BCDC's April 2009 report in the map in Figure 3.5-4 and the paragraph beginning on page 3.5-9 and continuing on the next page. However, the final sentence of the paragraph preceding this (on page 3.5-8) states, "Average sea levels …are projected to rise by at least another one-third of a foot and up to almost three feet by the year 2100." This statement should have a reference to allow readers to understand the source of this projection information, particularly since this sea level rise projection differs from the BCDC assessment described in the next paragraph.

A2-4

The analysis of the significance of Impact 3.5-5 on page 3.5-22 is based on an older analysis of sea level rise in San Francisco Bay. This impact analysis should be done based on the sea level rise scenarios (i.e. 16-inches and 55-inches) from the recent (April 2009) BCDC assessement report.

A2-5

In the description of the Regulatory Setting in the Hydrology and Flooding section (3.5), the draft EIR should reference existing Bay Plan safety of fills findings and policies that anticipate the need for planning associated with sea level rise. The Safety of Fills findings recognize that "Bay water levels are likely to increase in the future because of a relative rise in sea level… Relative rise in sea level is the sum of: (1) a rise in global sea level and (2) land elevation change (lifting and subsidence) around the Bay." Policy 5 states, in part, "…structures on fill or near the shoreline should be above the highest estimated tide level for the expected life of the project water level during the expected life of the project or be sufficiently protected by levees…" Additionally, Policy 6 states, "local governments and special districts with responsibilities for flood protection should assure that their requirements and criteria reflect

A2-6

future relative sea level rise and should assure that new structures and uses attracting people are not approved in flood prone areas or in areas that will become flood prone in the future, and that structures and uses that are approvable will be built at stable elevations to assure long-term protection from flood hazards." It may also be appropriate to recognize in the Regulatory Setting description that shoreline development within BCDC's jurisdiction may be subject to future permit controls related to sea level rise impacts.

A2-7

The assessment of significance in Impact 3.5-5 in the Hydrology and Flooding section is, overall, difficult for the reader to follow. The draft EIR states on pages 3.5-9 and 3.5-22 and 3.5-23 that the scenarios of sea level rise do "not suggest vulnerability" to structures or urbanized areas. However, Figure 3.5-4 entitled Areas Vulnerable to a 16-inch Sea Level Rise by Mid-Century, shows that existing structures and public access on the Emeryville peninsula are potentially subject to regular inundation under this scenario. The draft EIR does not explicitly show where new development could occur along the shoreline under the Proposed General Plan build out, so it is not possible for the reader to conclude that the Impact 3.5-5 would be less than significant (as stated on page 3.5-23). Additionally, the justification of the significance determination for Impact 3.5-5 on page 3.5-23 references Impact 3.13-7 which we were unable to find.

A2-8

Lastly, although the draft EIR assesses potential impacts to structures along the shoreline due to future projected sea level rise, it does not consider impacts to recreation and biological resources. Figure 3.5-4 suggests that under the mid-century sea level rise scenario portions of Point Emery and Shorebird Park, the Emeryville Marina, and the mudflats and wetlands in the Emeryville Crescent will be inundated. Specifically addressing these future impacts in policies may be beyond the scope and timeframe of the Proposed General Plan update. However, it would be valuable to consider the potential losses of these very important recreational resources and habitats in planning for future development in Emeryville.

A2-9

Bay Trail Alignment. Development of the proposed spur alignment for the Bay Trail (Figure 3.2-5) that runs along the Emeryville Crescent to Interstate 80 may pose regulatory challenges. There are many wildlife demands on the portion of the Crescent where the trail would be located. The upland areas are designated in the Bay Plan as a wildlife refuge priority land use area (Bay Plan Map 4) and are improved with required habitat mitigation for environmental impacts of the Interstate 80 HOV improvement project. These mitigations are required in BCDC and US Army Corps of Engineers permits. Therefore, these areas cannot be displaced by a trail, unless the City provides equal or better mitigation elsewhere and convinces the regulatory agencies that the mitigation meets or exceeds current benefits. Moreover, the trail would likely be require to provide mitigation for its impacts. If a trail were built along the Crescent, it would probably have to displace the freeway. This freeway is such a vital link in the Bay Area transportation network, carrying high volumes of traffic daily; it is unlikely that such a modification would be possible now or in near future. It may be valuable to identify these and other challenges in the draft EIR discussion of impacts due to build out of the Proposed General Plan.

Thank you for your consideration of our comments. If you have any questions regarding this letter please contact me by phone at 415 352-3654 or email sarap@bcdc.ca.gov.

Dear Deborah Diamond:

The enclosed comment (s) on your Draft EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on June 29, 2009. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project.

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (2006022008) when contacting this office.

Sincerely,

Terry Roberts

Ms. Deborah Diamond
City of Emeryville
1333 Park Avenue
Emeryville, CA 94608

Dear Ms. Diamond:

Emeryville General Plan Update – Draft Environmental Impact Report

Thank you for including the California Department of Transportation (Department) in the environmental review process for the Emeryville General Plan Update. The following comments are based on the Draft Environmental Impact Report. As lead agency, the City of Emeryville is responsible for all project mitigation, including any needed improvements to State highways. The project's fair share contribution, financing, scheduling, and implementation responsibilities as well as lead agency monitoring should be fully discussed for all proposed mitigation measures and the project's traffic mitigation fees should be specifically identified in the environmental document. Any required roadway improvements should be completed prior to issuance of project occupancy permits. An encroachment permit is required when the project involves work in the State's right of way (ROW). The Department will not issue an encroachment permit until our concerns are adequately addressed. Therefore, we strongly recommend that the lead agency ensure resolution of the Department's California Environmental Quality Act (CEQA) concerns prior to submittal of the encroachment permit application; see the end of this letter for more information regarding the encroachment permit process.

A3-1

Community Planning

The Department encourages you to locate any needed housing, jobs and neighborhood services near major mass transit nodes, and connected to these nodes with streets configured to facilitate walking and biking, as a means of promoting mass transit use and reducing regional vehicle miles traveled and traffic impacts on the state highways.

A3-2

Please consider developing and applying pedestrian, bicycling and transit performance or quality of service measures and modeling pedestrian, bicycle and transit trips that your project will generate so that impacts and mitigation measures can be quantified. In addition to urban design treatments, these measures could include Travel Demand Management (TDM) policies (for example, lower parking ratios, car-sharing programs, transit subsidies, etc.) to encourage usage of nearby public transit lines.

In addition, please analyze secondary impacts on pedestrians and bicyclists that may result from any traffic impact mitigation measures. Please describe any pedestrian and bicycle mitigation measures and safety countermeasures that would therefore be needed as a means of maintaining and improving access to transit facilities and reducing traffic impacts on state highways.

Encroachment Permit

Any work or traffic control within the State ROW requires an encroachment permit that is issued by the Department. Traffic-related mitigation measures will be incorporated into the construction plans during the encroachment permit process. See the following website link for more information: http://www.dot.ca.gov/hq/traffops/developserv/permits/

A3-3

To apply for an encroachment permit, submit a completed encroachment permit application, environmental documentation, and five (5) sets of plans which clearly indicate State ROW to the address at the top of this letterhead, marked ATTN: Michael Condie, Mail Stop #5E.

Should you have any questions regarding this letter, please call Yatman Kwan of my staff at (510) 622-1670.

Sincerely,

Lisa Carboni

Subject: Public Comment: DEIR to the General Plan

This e-mail is to serve as a written response to the Draft EIR for the new General Plan (the Plan). Please include a response in the EIR.

Response To The DEIR For The General Plan

The 'photo simulations' on pages 3.12-13 through 3.12-15 are not based on any findings of fact from the Plan. In fact, they have been manipulated by a 'cherry-picking' from the Plan to provide a rosier picture of Emeryville after implementation of the Plan. This would be 'playing politics'.

The pictures clearly show an increase in the pedestrian and bicycle activity from the 'Before' to the 'After' shots. This increase in activity is consistent with the findings of the Plan. The problem is the photos show *no increase in the automobile traffic,* demonstrably not supported by findings of the Plan.

B1-1 Any reading of the Plan clearly indicates an increase in the auto traffic, so why has this not been shown in the photos alongside the increase in the bike/ped traffic which IS shown? This is a mistake and if the final EIR doesn't correct this, it is directly provable that there is politics being played with the authors of the EIR and consequently, the credibility of the EIR will be in question.

A telephone conversation with Charlie Bryant, head of the Emeryville Planning Dept, on June 2, 2009 validated my charge of politics being played. Mr Bryant indicated that under no circumstances would the photo simulations in question be altered for inclusion into the EIR. This is counter to the function of the DEIR. Members of the public are allowed to point out mistakes in the document and if the writers of the DEIR agree, presumably the mistakes will be corrected for the EIR. According to Mr Bryant, this eventuality is not possible for purposes of this EIR. So I have to ask: Why should members of the public even respond to the DEIR if the outcome is pre-determined?

B1-2

In addition to the purposeful manipulations I have illustrated above there is the problem of the photo depictions of the street trees. The 'After' pictures show a plethora of large, beautiful, mature street trees. The problem is there are no provisions in the Plan to protect the existing street trees and our Urban Forestry Ordinance (UFO) historically has been too weak to provide protection so the depiction of such large trees would be wishful thinking at best. The UFO makes it very easy and cheap for developers to cut down our trees and this is exactly what happens to the vast majority of our street trees; they aren't able to grow to the scale depicted in the simulations. A more accurate depiction would show 'lollipop' trees continuing on into the future (barring a strengthening of the UFO). The DIER should make no assumptions about a future strengthening of our UFO.

An (D)EIR should be prepared with a basis in demonstrable finding of fact. The photo

simulations in this document have been presented in a most shoddy and unprofessional manner. These are not fact based, rather they serve to smooth the way for the Plan becoming law by obfuscating the negative aspects of the Plan. The public part of this has been subverted.

Subject: Horton St Bike Blvd: General Plan DEIR

COMMENTS B2

Please include this e-mail in the FEIR and respond

Response to the DEIR for the proposed Emeryville General Plan

The Draft Environmental Impact Report (DEIR) for the proposed General Plan (the Plan) fails to sufficiently identify an important existing transportation element. This is the Horton/Overland Bicycle Boulevard.

B2-1

A bicycle boulevard is designed as a route that places the number one priority on bikes but allows vehicular traffic as a subordinate mode. It has been recognized that bicycle boulevards become failures when vehicular traffic exceeds a certain prescribed number of "trips" thus rendering the bikes subordinate to the cars, demonstrably not a bicycle boulevard. Further it has been recognized that an excess of vehicular speed will also render a bike boulevard as a failure. The actual numerical facts I allude to here are recognized by other Bay Area municipalities such as Palo Alto and Berkeley. These cities have installed traffic calming measures to prevent failures such as I described.

To transform the Horton Street Bicycle Boulevard also into a Transit Boulevard by definition degrades this existing route from its 'bikes as number one priority' into something less as far as bicycles are concerned. Further, it is universally recognized that buses and bikes are a bad combination and to be avoided in close proximity owing to the large size of buses and their reduced capacity to visualize bicyclists as compared to automobiles. So this change represents a reduction in the existing environment for bicycle transportation and the DEIR has not adequately addressed it.

It is a further insult that the Plan is calling for massively increasing automobile traffic on Holden Street with the addition of the Transit Center and the Sherwin Williams Project. The Plan and the DEIR have made no actual provisions to protect the Bike Boulevard from increases in vehicular volume and speed. A provision might take the form of a 'diverter' to allow bikes and buses but not cars. Also a critically placed 'choker' or two could provide protection for bikes.

Both the Plan and DEIR gush with praise for bicycle travel in town but they fail to advocate for the measures that would be needed if the town is to grow as they call for. We have seen what happens when the hard decisions are not made and much flowery talk is offered: it is all sound and fury, signifying nothing. I had hoped for a more bicycle friendly document.

Subject: Addendum to the Horton St DEIR Response

COMMENTS B3

Please include this addendum to my previous e-mail regarding the Horton Street Bike Blvd into the responses to the DEIR for the General Plan.

Addendum to Response to DEIR for the General Plan

The DEIR categorically states "The proposed General Plan would not physically divide any established communities..". This is untrue.

B3-1 As I explained in the previous e-mail, the existing Horton/Overland Bicycle Boulevard would be harmed by the addition of traffic from the Sherwin Williams Project and the Transit Center without the express provision for traffic calming to reduce vehicle speed and volume to universally agreed upon maximums. More importantly though are the negative effects from the inclusion of the street as a Transit Boulevard and the fact that the defining characteristic of a bike boulevard would necessarily be diminished, vis a vis bicycles with this action.

B3-2 These two problems, brought on by the enactment of the Plan would, by definition, reduce the connectivity for bicycle transportation for those wishing to travel in a North/South direction in Emeryville and would as a result, divide an existing community at least by degree. Consequently, impact # 3.1-1 must be identified as a "significant" impact in the absence of any identified mitigation. Please remove the "beneficial" finding for this impact for inclusion into the EIR.

Subject: DEIR to General Plan: the Transit Center

COMMENTS B4

Please include this e-mail response to the DEIR in the FEIR and respond in kind.

Response to the DEIR for the General Plan

B4-1

I have noted the collective will of the General Plan Committee to craft an over ridding concept to answer ideas about building density and building heights permissible in Emeryville. This has been expressed as a vision of a "core" of tall buildings in the center with heights and densities lowering as one moves laterally. Specifically, the area between the freeway and the railroad tracks has been identified as the place to receive this high density. The rationale being this would allow for the most growth while being the least impactful to the existing neighborhoods and residents.

Looking at the Maximum Floor Area Ratios (FAR) (figure 2.3-2), one notes a glaring exception has been made to the reasoned maxim without benefit of a cogent rationality. This is the piece of land adjoining the rail road tracks immediately to the north of the Amtrack Station, a parcel owned by Wareham Development Corporation.

There has been much talk by City Hall that this should be a "Transit Center". Without delving into the obvious and venal politics of this exception, the DEIR has not examined the effects, not the least of which would be the dividing of an existing community, this exemption would cause. In addition, by making claim to community/environmental benefits from a "Transit Center", the General Plan has not qualified what a transit center is. This makes an thoughtful analysis of costs/benefits impossible. In this context, I take it as a given that a profit seeking developer would use the term "transit center" to describe a proposed development if he felt it would make more likely a favorable outcome with the decision makers. Since there are no metrics being offered, any development is/could be a "transit center".

To increase the permissible FAR up to 5.5/8.0 on this parcel of land, counter to the stated goals of the Plan, from the surrounding permissible FARs means the building scale would be inconsistent and would be further exacerbated by the fact there is no accompanying meaningful reduction in auto use. This will be a significant negative impact to an existing neighborhood/community.

The people need more transparency regarding public land use policy than is being offered up here. The General Plan is not providing it and the DEIR should make note of this since it involves environmental impact.

Special note to any readers of this letter from the general public: Note the probable use of Orwellian government-speak this letter will bring in response. There is common sense and then there is the real agenda of the well connected taking what they want.

Subject: Response to the DEIR: "Family Friendly Housing"

COMMENTS B5

please include this e-mail into the responses to the DEIR

Response to the DEIR for the General Plan

B5-1 The proposed General Plan makes reference in the Guiding Principles, to the need to create "family friendly housing" in the Diverse, Balanced and Inclusive Community section (#7). Neither the Plan nor the DEIR explains what this would be.

As a parent, I can say family friendly encompasses more than number of bedrooms in a residence. There are many more qualities that need to be in effect to rightfully call a residence "family friendly" and yet this is pretty much what makes up the criterion as far as these documents are concerned.

It is not good enough to proclaim a proposed development as "family friendly" as a way to move a proposal forward through the permit process. This must be qualified, otherwise Emeryville will not get real family friendly housing and unethical developers will be permitted to game the system to their advantage at the resident's expense.

For sake of accuracy and efficacy, the term 'family friendly housing' should not be used by the Plan or the DEIR unless and until it can be measured.

Subject: Response to DEIR: LOS vs QOS

The function of a general plan is to guide a city in developing consistent with the will of the people. Any plan should be written in a way that is understandable by the general population and not an arcane, jargon filled document for city planning officials. This being true, the call from the Emeryville General Plan to abandon the old way to measure traffic movement and adapt a new way without the benefit of an easily observable line of continuity is unnecessarily vague and will unfairly serve to allow more traffic on the streets in a clandestine fashion.

B6-1

For years, residents have been able to use the old traffic model, Level Of Service (LOS) to definitively see how traffic has increased and how ease of access has eroded as a result of development decisions by City Hall. LOS uses an A through F model everyone knows from school. They can easily track how votes for certain City Council members ultimately translates into intersections dropping from B to D for instance. In this way, the electorate is informed well. The DEIR accepts the General Plan dropping of LOS in favor a new model Quality Of Service (QOS) with no analysis. This is a mistake since the loss of information continuity will result in a degradation of critical information residents need to keep in check future negative environmental impacts.

While the information QOS tracks may be of value, residents lose a measurement that will effectively 'reset the clock' on traffic increase. After 15 years of massive development in Emeryville, this is a grave mistake. More then ever, we need to accurately keep track of how our government is serving or not serving us. This resetting can be used to sneak in much more development then would have been politically possible if the LOS were to still be in effect. As a town with a well earned reputation for being very pro-development, this eventuality is likely.

Lastly, the DEIR gives no reason as to why LOS couldn't continue uninterrupted alongside QOS. There needs to be a rationale for the wholesale trashing of this valuable accounting mechanism.

Subject: General Plan DEIR: Police Services

COMMENTS B7

Please include the previous e-mail I sent regarding LOS vs QOS into the record for the General Plan FEIR. In addition also include this e-mail.

Response to the DEIR for the General Plan

B7-1 I have concerns that a potential environmental impact involving Police services has not been identified by the DEIR. Impact #3.10-5 makes reference to Police Department citizen response time and station adequacy to meet the needs of the population increase the General Plan calls for but mistakenly assumes a state of constant Police morale.

It is common knowledge that the hard to qualify notion of morale is critical to an effective Police force but what is not hard to qualify is how low pay will lower morale universally. It should be noted that the pay for rank and file EPD sworn officers has been dropped from an historic Oakland Police Dept parity to a much lower rate. It was assumed that since Emeryville is virtually surrounded by Oakland and shares a urban culture with attendant criminality, the pay rate should be the same. The pay erosion condition has deteriorated so far that EPD pay has now dropped to below the median for the ten East Bay urban core cities used to justify EPD pay. This is a recent thing and the DEIR is moving forward from this position as the "normal" state from which to measure impacts. I maintain Police morale slips with the knowledge that they are not keeping pace with their colleague's pay rate in neighboring cities, and as morale slips so will Police services to the community. One remedy of course could be a requirement to raise pay rates for EPD personnel and call for a mechanism to keep the higher rate in pace with neighboring cities so as to not fall into a more impactful environment for the community.

The DEIR needs to assume lowering Police pay will negatively impact the community and have this be quantified in the FEIR.

Subject: General Plan

Hi Deborah,

The Planning Commission is holding a hearing this coming Thursday, June 25, 2009, to accept comments on the Draft Environmental Impact Report (DEIR) prepared for the Draft Emeryville General Plan.

The DEIR includes the Draft Emeryville General Plan's land use recommendations to the Planning Commission. Before the June 25 hearing, will city staff add a note to the proposed General Plan's land use recommendation to the Planning Commission for its consideration of the DEIR indicating that the General Plan and Zoning Update Steering Committee members are not in agreement as to whether the Northwest corner of the city should be rezoned to non-residential/mixed use or whether it should be rezoned to allow for residential/mixed use development with a concommitant height limit of 75/100 feet? (See your and my June 5, 2009 emails copied herein.)

B8-1

Shouldn't the DEIR and the EIR prepared for the proposed General Plan analyze the discussed alternative zoning that would allow residential/mixed use development with a concommitant height limit of 75/100 feet?

Do I need to raise that issue at the June 25 hearing, or will city staff's note to the proposed General Plan's land use recommendation to the Planning Commission suffice to preserve the issue for adequacy of the EIR in the event that the city adopts the alternative zoning and height limitation in the new General Plan?

Please advise.

Subject: General Plan

Hi Deborah,

At the April 15, 2009 General Plan and Zoning Update Steering Committee meeting, the committee instructed staff to add a note to the proposed General Plan's land use recommendation to the Planning Commission and City Council that the committee members are not in agreement as to whether the Northwest corner of the city should be rezoned to non-residential/mixed use or whether it should be rezoned to allow for residential/mixed use development with a concommitant height limit of 75/100 feet.

Are all the "necessaries" in place for staff to add that note to the Planning Commission and City Council without further committee action, or do I need to attend the upcoming June 9, 2009 GPZUSC meeting to press for some further committee action to accomplish that?

Please advise.

Dear Ms. Diamond,

I am Corporate Counsel for Level 3 Communications, owner and occupier of 5000 Hollis Street.

B9-1

Level 3 wishes to note that the land use designation of its property, per the proposed general plan, changed from a combination of "Park/Open Space" and “Public” at the time the draft EIR was published for circulation, to "Office/Technology" at the time the plan was finalized by the General Plan Steering Committee. Level 3 does not presume that these changes necessarily or significantly affect the Environmental Impact Report, it merely notes that the impacts, if any, of these changes might be considered by the Study's authors.

Please don’t hesitate to contact me if you have questions or need additional information.

Yours,

COMMENTS C1

SUMMARY OF PLANNING COMMISSION COMMENTS ON THE EMERYVILLE GENERAL PLAN DRAFT EIR

Planning Commission Public Hearing

June 25, 2009

Jim Martin

C1-1 1. Why are there no mitigation measures in the Draft EIR? The EIR should be revised to clarify what mitigation measures were added as a result of environmental review.

C1-2 2. The Final EIR should include a listing of all revisions to the Public Review Draft General Plan, published in January 2009.

C1-3 3. Page 3.1-19 and 3.1-20 describe 70 housing units being lost to redevelopment. Where are these units? Does this include affordable housing? How is this not a significant impact?

C1-4 4. Fehr & Peers and Nelson/Nygaard prepared a set of feasible improvements to intersections which were not referenced in the Draft EIR. Those studies should be referenced through new policies to continue studying these recommendations.

C1-5 5. Policy T-P-3 regarding Quality of Service is too long, wordy, and detailed.

C1-6 6. There are inconsistencies between the discussion of tsunamis and sea level rise on pages 5.5-8 through 3.5-9 and Figure 3.5-4 on page 3.5-10. The EIR should acknowledge flooding risks and require the City to cooperate with local and state agencies to reduce flooding impacts.

C1-7 7. Only one policy measure is listed on page 3.7-17 to mitigate Impact 3.7-1. The General Plan should expand on existing noise policies in the General Plan and include additional noise mitigation policies to reduce ambient noise and construction-generated noise, and to enable noise attenuation measures for rooftop and other mechanical equipment to mitigate impacts in Section 3.7: Noise of the General Plan.

C1-8 8. Impact 3.8-2 is concluded to be a significant and unavoidable impact. The City's existing ordinances regarding preservation and demolition should be reevaluated if we start to lose Tier 1 and 2 resources.

C1-9 9. Policies on pages. 3.11-8 through 3.11-9 of the Draft EIR should be renumbered and reordered to start with the broadest ideas and logically build on one another.

C1-10 10. Impact 3.11-3 should be edited to read: The construction or expansion of recreation facilities ~~would~~could have an adverse physical effect on the community.

C1-11 11. The proposed FAR of 0.75/1.25 in the Eastern Residential Neighborhoods seems too high compared with the FARs of existing structure. This could have the potential to disrupt neighborhood character. This does not suggest a "beneficial" impact as concluded in Impact 3.12-2 of the Draft EIR.

C1-12 12. Add a note to Figure 2.3-2: Maximum Floor Area Ratios that FAR values include parking area.

Patricia Jeffery

C1-13 13. Impact 3.1-3 should include a table that identifies how the General Plan is consistent with the existing local and regional plans and Zoning Ordinance described in this section.

C1-14 14. More discussion is need in Chapter 4: Alternatives to evaluate the three alternatives and support the conclusion of an environmentally superior alternative.

John Scheuerman

C1-15 15. Grade separation of local traffic (vehicles, bicycles, and pedestrians) from the railroad tracks at 65th Street has benefits for both circulation and noise: this linkage needs to be articulated in the relevant sections of the Draft EIR. Closing some of the at-grade crossings can reduce train noise impacts, while improving the Emery Go-Round route by allowing for a loop circulation.

C1-16 16. Why do the existing and projected railroad contours appear the same if rail traffic is expected to increase over time?

Gail Donaldson

C1-17 17. Agree with the comment regarding the FAR values for the Eastern Residential Neighborhoods.

3 Response to Comments on the Draft EIR

This chapter includes responses to each comment, and in the same order, as presented in Chapter 2. The responses are marked with the same number-letter combination as the comment to which they respond, as shown in the margin of the comment letters.

AGENCIES

A1: East Bay Municipal Utility District (EBMUD)

A1-1: A revision has been provided on page 3.10-2 of the Draft EIR to address this comment and update general information about EBMUD. See Chapter 4 of this Final EIR for revision (page 4-6). The same comment pertaining to the General Plan is noted.

A1-2: Impact 3.10-2 on page 3.10-20 of the Draft EIR and the discussions that follow project water demand based on total potential customers—both residents and workers—thereby encompassing future residential and non-residential development. These findings are shown in Table 3.10-5. The discussion recognizes that EBMUD projections are based only "in part" on population. The City acknowledges that EBMUD uses a land use method to project its water demand in order to capture demand from residential and non-residential use.

A1-3: The General Plan Draft EIR is a program-level EIR and does not include specific development projects. Individual projects will be subject to their own environmental assessment, including any necessary analysis of water supply and fire flows, and site remediation.

The City uses standard conditions of approval that are applied to projects as warranted. The City's Subdivision Ordinance requires projects to construct infrastructure improvements, including water hookups, as a condition of subdivision, parcel map, or other division of land approval. An action item in the proposed General Plan calls for the City's Public Works Department to "continue to coordinate with utilities service providers as necessary (i.e. PG&E, EBMUD)."

In terms of the commenter's concern about the presence of hazardous materials contamination, the City appreciates and concurs with EBMUD's concern for public health and safety. Emeryville is an urban area that is affected by hazardous materials and contaminants, but has shown leadership in efforts to clean up sites, allowing new uses and ensuring the healthy and safety of residents, workers, and visitors. As described on page 3.3-6 of the Draft EIR, in Alameda County, remediation of contaminated sites is generally performed under the oversight of the California Department of Toxic Substances, San Francisco Bay Regional Water Quality Control Board, Alameda County Department of Environmental Health and/or the City. At sites where contamination is suspected or known to occur, the project sponsor is required to perform a site investigation and draw up a remediation plan, if necessary. For typical development projects, site remediation is completed either before or during the construction phase of the project.

The City provides parcel-based information on contamination status; assistance with State regulatory agencies regarding investigation and preparation of clean-up documents; and grants and no/low interest loans for investigations and clean-up. As described in Chapter 7: Sustainability of the proposed General Plan, the City has cleaned up 240 acres of land with substantial soil and groundwater contamination. This was aided through the City's selection, by the Environmental Protection Agency, for a pilot program of brownfields cleanup and a $5.8 million grant for this purpose. Emeryville also received Sweden's Bangemann Challenge Award (now known as the Stockholm Challenge Award) in recognition of its international leadership in brownfields remediation. Lastly, policy CSN-P-32 has been amended to ensure that "prior to reuse, development sites and utility corridors servicing development will be remediated, according to relevant State and federal regulations."

A1-4: The Federal Clean Water Act and the National Pollutant Discharge Elimination System are described on page 3.5-11 of the Hydrology and Flooding section of the Draft EIR. Further, wastewater services are described on page 3.10-5 of Section 3.10: Public Services and Utilities of the Draft EIR. The discussion in both sections has been revised to include the Cease and Desist Order described by the commenter; see Chapter 4 for revision. Also, the "Summary of Impacts" discussion on page 3.10-8 of Section 3.10: Public Services and Utilities of the Draft EIR has also been revised; see Chapter 4 for revision. Moreover, two new policies have been added to page 4-16 of Chapter 4: Parks, Open Space, Public Facilities, and Services of the General Plan, consistent with the requirements of the NPDES system and the Order, as shown in Appendix A (page A-6).

- New Policy: The City will continue to cooperate with EBMUD, the Regional Water Quality Control Board, and other relevant agencies to adopt and implement programs and policies to further reduce inflow and infiltration (I&I) of storm water in the City's wastewater collection system and private sewer laterals during wet weather events.

- New Policy: The City will continue to require development projects to replace or upgrade as needed, sanitary sewer systems serving the development site to reduce inflow and infiltration (I&I) of stormwater in the City's wastewater collection system and private sewer laterals during wet weather events.

A1-5: Comments noted. Impact 3.10-3 on page 3.10-22 of the Draft EIR has been revised to address this comment and to be consistent with recent regulatory changes. See Chapter 4 for revision (page 4-8).

A1-6: The City appreciates EBMUD's guidance on how to address project-level wastewater management. As EBMUD is aware, Emeryville has significantly reduced I/I of storm water into its wastewater collection system over the last 20 years. As described in the response to comment A1-4, above, the City has added policies into the General Plan to implement programs to reduce inflow and infiltration.

A1-7: Revisions have been provided on page 3.10-3 and 3.10-4 of the Draft EIR to address this comment and clarify and update EBMUD's policy and projections for non-potable water use and treatment facilities. See Chapter 4 for revisions (page 4-6).

A1-8: The City appreciates EBMUD's interest in maximizing water conservation. The General Plan Draft EIR is a program-level EIR and does not evaluate specific development projects. Individual projects will be subject to City development regulations, such as Article 9-4.54 cited in EBMUD's comment, and which include water service standards and efficiency measures. The General Plan does not change developers' responsibilities to meet all applicable City regulations and requirements. Regarding EBMUD requirements, General Plan action CSN-A-3, cited on Draft EIR page 3.10-22, explicitly states that the City will "implement EBMUD water efficiency requirements for new and rehabilitation projects" without having to list all the EBMUD requirements individually therein.

A2: San Francisco Bay Conservation and Development Commission (BCDC)

A2-1: BDCD's jurisdiction and authority have been revised on pages 3.1-5, 3.4-8, and 3.5-13 of the Draft EIR to address this comment. Section 3.1: Land Use and Housing, of the Draft EIR includes a discussion of BCDC in terms of the consistency of the Bay Plan with the proposed General Plan and its permitting authority for developments. Section 3.4: Biological Resources includes BCDC due to its regulation along the shoreline, which has the potential to contain biological resources. Lastly, the Section 3.4: Hydrology and Flooding addresses BCDC's policies protection of the Bay and related waterways and its implications for flood hazards. See Chapter 4 for revisions.

A2-2: The City appreciates BCDC's interest in protecting and preparing for potential hazards due to sea level rise. The Draft EIR provides a map showing areas of the city that may be vulnerable to a 16-inch sea level rise scenario (Figure 3.5-4), which BCDC has projected at mid-century (i.e. around 2050). In addition, the discussion on page 3.5-9 acknowledges BCDC's further projection of a possible 55-inch sea level rise in 2100. The Draft EIR evaluates potential impacts of activities associated with implementation of the proposed General Plan, which as described in Chapter 2: Project Description of the Draft EIR, has a planning horizon of 2030. It is unknown how severe sea level rise and its effects will be to Emeryville, the region, and the world, and it is beyond the scope of this analysis and the capacity of the City on its own to plan for that scenario. The City wants to be responsible and proactive in addressing this potential hazard. Therefore, in response to this comment, the City has added a policy to the proposed General Plan (see Appendix A, page A-8) and subsequently to page 3.5-23 of the Draft EIR to cooperate with regulatory agencies (such as BCDC) regarding flood hazards due to a variety of impacts, including sea level rise. In this way, the City can address sea level rise and other potential flooding hazards by working together to address this regional and global threat.

A2-3: In response to this comment, the discussion regarding sea level rise on page 3.5-9 of the Draft EIR has been updated. See Chapter 4 for revision (page 4-3).

A2-4: In response to this comment, the discussion regarding sea level rise on page 3.5-8 has been updated. See Chapter 4 for revision (page 4-3).

A2-5: In response to this comment, the impact analysis for Impact 3.5-5 on page 3.5-22 has been updated. See Chapter 4 for revision (page 4-5).

A2-6: In response to this comment, the Regulatory Setting regarding BCDC safety of fills finding and policies associated with planning for sea level rise (page 3.5-13) has been updated. See Chapter 4 for revision (page 4-5).

A2-7: In response to this comment, Impact 3.5-5 has been reorganized to better describe the potential flood hazards and the General Plan policies that reduce the impact to a less than significant level. Additionally, the "Areas of Change" map has been added to Chapter 2: Project Description (page 2-14) of the Draft EIR to illustrate where new development may be expected under the proposed General Plan. This map shows where new development is likely to occur in the proposed General Plan; these areas are not located in a flood hazard area or area subject to sea level rise hazard at mid-century. See Chapter 4 for revision.

A2-8: The City appreciates BCDC's interest in protecting existing parks and open spaces from potential flood hazards. Much of the City's existing open space is located west of I-80 and therefore near or in areas with a potential for flooding due to wave action or sea level rise. The City shares this concern about its existing natural and recreation resources. Through General Plan policies the City has made a commitment to protect these amenities, including "… to encourage protection of essential habitat for special status species and support habitat protection and enhancement within Emeryville that are within the City's control." In addition, a new policy referenced in the response to comment A2-2, addresses the threat due to sea level rise, along with other potential hazards, by working with regional agencies. The threat to these wetland and park areas will continue to be evaluated as information and projections become available.

A2-9: The City appreciates BCDC's interest in protecting the Emeryville Crescent as a wildlife refuge. The City shares an interest in the protection of this valuable resource and has designated this portion of land as Conservation Area on Figure 3.11-1 which appears on page 3.11-5 of the Draft EIR. As described in the proposed General Plan, the Bay Trail route along the Emeryville Crescent was removed from local and regional plans several years ago due to concerns about its potential impacts on the fragile ecosystem of the adjacent mudflats. Since that time, a similar trail has been built along the Albany Mudflats about four miles to the north. Since the Emeryville Crescent trail would provide a critical shoreline link between East Bay cities and the Bay Bridge, the General Plan proposes that it be constructed following design studies to ensure that any impacts on the adjacent wildlife habitat are adequately mitigated. Plan policies have been revised and added, in response to this comment, to ensure that BCDC and other habitat protection measures are met:

- CSN-P-21 (revised): Provide visual, and where practical, physical, access to the Emeryville Crescent in a manner consistent with the protection of this fragile

ecological system. Improvements to the Bay Trail in the Emeryville Crescent must be consistent with habitat protection.

- New Policy: Where new trails or other improvements are proposed in the vicinity of the baylands and essential habitat for special-status species, require adequate avoidance and mitigation necessary to protect sensitive resources.

A3: Department of Transportation (Caltrans)

A3-1: Comment noted. Traffic mitigation fees are assessed at the project-level in the City of Emeryville, on the basis of the number of units and size of the development for residential and non-residential projects, respectively, pursuant to the City's Traffic Facilities Impact Program adopted September 6, 1990.

A3-2: The guiding principles of the General Plan as described in Chapter 2: Project Description of the Draft EIR prioritizes a balance of residential and employment uses that capitalize on transit nodes and enhanced pedestrian and bicycle networks. As a result, vehicle miles traveled per trip are expected to decrease under buildout of the General Plan as shown on page 3.2-28 of the Draft EIR. The General Plan includes a Quality of Service standard to measure transportation performance for all transportation modes, not just automobiles:

- T-P-3: A "Quality of Service" standard that seeks to optimize travel by all transportation modes shall be developed and used to measure transportation performance. The City does not recognize "Level of Service" (LOS) as a valid measure of overall transportation operations, and sets no maximum or minimum acceptable LOS levels, with the exception of streets that are part of the regional Congestion Management Agency network. (These streets may change, but as of 2008 include San Pablo Avenue, Frontage Road, and Powell and Adeline streets.) LOS shall not be used to measure transportation performance in environmental review documents or for any other purpose unless it is mandated by another agency over which the City has no jurisdiction (such as Caltrans, Berkeley, Oakland, and the Congestion Management Agency), and then it shall only be used for the purposes mandated by that agency.

No mitigation measures have been identified in the Draft EIR. Rather policy measures have been integrated into the General Plan, thereby creating a self-mitigating plan. As can be seen in the analysis on page 3.2-39 of the Draft EIR, automobile capacity expansions are considered infeasible for improving mobility in the project area, so all measures to increase mobility target increasing bicycle, pedestrian, and transit options, convenience, and safety. Therefore, there is no need for secondary analysis of impacts of traffic mitigation measures on bicyclist and pedestrians.

A3-3: Comment noted regarding the process for applying for encroachment permits.

ORGANIZATIONS/INDIVIDUALS

B1: Brian Donahue

B1-1: Comment noted. The visual simulations are not projections or analyses of the traffic levels expected in the future under the implementation of the General Plan. The visual simulations are intended to illustrate streetscape conditions in specific parts of the community based on the land use and urban design policies and development densities and intensities that can be expected from implementing the General Plan. As such, the simulations are included in Section 3.12: Visual Resources of the Draft EIR, not in Section 3.2: Transportation. These simulations, furthermore, are not the primary basis of the visual resources evaluation. The evaluation for this resource area is qualitative, and therefore the anticipated level of impact is based primarily on the effects of proposed General Plan policies. For urban design and streetscape, there are a multitude of such policies: Impact 3.12-2 lists 45 discrete urban design policies that the EIR preparers believe will help to achieve the streetscape depicted in the simulations, most notably UD-A-1 which commits the City to preparing Design Guidelines for various urban design elements, and UD-A-4 which requires the city to prepare a citywide streetscape plan.

B1-2: In the telephone conversation noted, Mr. Bryant indicated that the City's contract with the firm that prepared the photo simulations had been completed, and that no further revisions to the simulations were being contemplated. In a follow-up voicemail message to Mr. Donahue, Mr. Bryant clarified his previous comments, noting that all comments on the Draft EIR would be responded to in the Final EIR, and that any revisions to the Draft EIR necessary to make it accurate and legally adequate would be made in the Final EIR.

B2: Brian Donahue

B2-1: Comments noted. However, these comments represent comments on the Plan and do not concern the substance of the Draft EIR. The commenter is encouraged to review the transportation typologies described in Chapter 3: Transportation of the General Plan, which articulates safety measures and potential conflicts between modes:

- Major Transit Hub – These are transfer points where high volume transit lines intersect. These are located in the Amtrak station with access from both sides of the rail line, and at 40th Street and San Pablo Avenue.

- Bicycle Boulevard – These are through-routes for bicycles providing continuous access and connections to the local and regional bicycle route network. Through-motor vehicle traffic is discouraged. High volumes of motor vehicle traffic are also discouraged, but may be allowed in localized areas where necessary to accommodate adjacent land uses. *Local automobile, truck, and transit traffic are accommodated in the roadway, but if there are conflicts, bicycles have priority. Traffic calming techniques to slow and discourage through-automobile and truck traffic may be appropriate. Pedestrians are accommodated with ample sidewalks on both sides of the road.* (Emphasis added.)

- Transit Street - These are primary routes for AC Transit, Emery Go-Round, and other public transit providers. Signal preemption for transit vehicles, bus stops, and, where appropriate, bus lanes, are provided. Other travel modes, including automobiles, bicycles, and trucks, are accommodated in the roadway, but if there are conflicts, transit has priority. These streets accommodate moderate to high volumes of through-traffic within and beyond the city. Pedestrians are accommodated with ample sidewalks on both sides of the street, and amenities around bus stops (e.g. shelters, benches, lighting, etc).

Safety and potential conflict between bicycles and transit are addressed through the following General Plan policies:

- T-P-47: The City supports "traffic calming" and other neighborhood traffic management techniques to enhance the quality of life within existing neighborhoods and to discourage through-traffic on bicycle boulevards and local streets.

- T-P-48: The City will establish equal priority to bicycles and public transit (and discourage through-traffic by other modes) on streets in the vicinity of the Amtrak station that are designated as both Transit Streets and Bicycle Boulevards.

B3: Brian Donahue

B3-1: See response to comment B2-1, above.

B3-2: Comments noted. However, the City respectfully disagrees. The proposed General Plan is a comprehensive, program-level document that represents a careful balancing of the needs and desires of the whole community for sustainable future development. Improved connectivity is one of the paramount goals and policy strategies of the proposed General Plan. As described in the findings for Impact 3.1-1 on page 3.1-18 of the Draft EIR, land use and transportation policies identify opportunities to provide new streets, sidewalks, and circulation access for all modes of travel. Furthermore, the proposed General Plan may change the nature or character of specific streets, but a change in character or nature of a street's use does not constitute a significant adverse effect under CEQA. Rather, the environmental analysis, in this case of the physical division of established communities, is designed to look at the overall program of actions and make a determination as to whether the program as a whole is causing a significant adverse effect. The analysis in the Draft EIR concludes that the General Plan policies and land use program, taken as a whole, actually provide more linkages within Emeryville and between Emeryville and surrounding communities (Draft EIR p. 3.1-18).

B4: Brian Donahue

B4-1: Comments noted. However, these comments represent comments on the Plan and do not concern the substance of the Draft EIR. For information, Chapter 5: Urban Design of the General Plan (page 5-6) describes the high-intensity nature of the

Powell/Christie core and transit center as a focal point for transit-oriented high-density mixed-use development:

- The Powell Street/Christie Avenue core is at the center of much of the proposed growth under the General Plan and will experience considerable transformation over the next 20 years. A variety of activities, ranging from retail and entertainment, to office and residential uses will ensure the district maintains a lively, yet community-centered character. Heights will also increase substantially to fill in the Emeryville skyline—thus creating a more consistent pattern to the district's urban form and allowing views of the Bay and the hills. The transit center at the Amtrak Station and the Marketplace development are key projects to fulfill this transit-oriented mixed-use concept.

In addition, the definition of major transit hubs is provided in the response to comment B2-1, where two hubs are identified. Finally, several policies, including the following, illustrate the character of this area:

- LU-P-2: The Powell/Christie/Shellmound/I-80 interchange area will be developed into a compact but high-intensity regional transit hub. This hub will include a retail core, with stores, restaurants, and hotels; a financial and commercial center, creating a daytime work population; and a residential neighborhood, providing vitality during non-work hours.

- T-P-36: The City supports Transit-Oriented Development with reduced parking requirements, and amenities to encourage transit use and increase pedestrian comfort around the Major Transit Hubs at the Amtrak station and the 40th Street/San Pablo Avenue intersection.

B5: Brian Donahue

B5-1: Comments noted. However, these comments represent comments on the Plan and do not concern the substance of the Draft EIR. The Draft EIR does not attempt to measure or evaluate the "family-friendliness" of the proposed General Plan, nor is it required to do so under CEQA.

B6: Brian Donahue

B6-1: Comments noted. The critique of switching from LOS to QOS represents a comment on the Plan and does not concern the substance of the Draft EIR. The commenter is encouraged to review page 3-7 of the General Plan, which describes the basis for transitioning to a Quality Service metric and away from a Level of Service standard. An excerpt of this section is provided here:

- In 2002 the Florida Department of Transportation published the 2002 Quality/Level of Service Handbook. The document's methodologies incorporated extensive research into the road user's perspective of their travel experience. As a result of this research, the analytical techniques used to analyze pedestrian, bicycle, and transit modes are as rigorously developed and tested as those for automobiles. Emeryville intends to use this current state of the practice research and other valid

transportation engineering methodologies for assessing and optimizing the quality of service for all travel modes.

- Because automobile travel has been the dominant form of transportation, "Level of Service" (LOS) has traditionally been measured for vehicle drivers, with minimal regard to bicycle, pedestrian, and transit users. This bias unintentionally but inherently ignores overall mobility and conditions for non-auto road users and perpetuates a system that focuses on expanding vehicle capacity, which can reduce the quality of service for pedestrians and bicyclists.

Regarding the Draft EIR, as there are no current data about QOS, an LOS analysis is provided for information. Page 3.2-3 through 3.2-34 report results of the comparison of LOS for existing conditions, a no growth 2030 future scenario, and the proposed General Plan 2030 scenario. Furthermore, Impact 3.2-1 acknowledges that in the future the LOS on various roadway segments will be E or F. While many roadways will have failing LOS even under the No Growth scenario, some will be even less functional (for automobiles) under the proposed General Plan. This significant and unavoidable impact, which the Draft EIR acknowledges and fully discloses, is in part why the General Plan policies focus on improvements to bicycle, pedestrian, and transit mobility, and why the Plan proposes a switch to a service standard that better reflects the functionality of these other modes.

B7: Brian Donahue

B7-1: Comments noted. However, these comments represent comments on the pay rate of Emeryville Police Department and do not concern the substance of the Draft EIR, which evaluates environmental impacts and physical changes.

B8: Frederic Schrag

B8-1: Alternative 2: Neighborhood Centers as described on page 4-4 of the Draft EIR evaluates a scenario which assumes "high-rise mixed-use [development] along the freeway edge (up to 250 feet) with FARs assumed to average about 3.5." Moreover, this alternative shows a classification of High Intensity Mixed Use (which allows residential development) in the northwest corner of the city. Therefore, this alternative adequately accounts for the impacts of a residential/mixed-use development with just a 75/100 foot height limit.

B9: Ryan McManis

B9-1: Comments noted. During the public review period, the southern proposed large park location was adjusted and some land use designations altered on either side of Hollis between 53rd Streets and Park Avenue. These changes to the General Plan are documented in Appendix A. The impact of these changes were not substantial to the development buildout of the General Plan and therefore do not affect the impact analysis or conclusions.

ORAL TESTIMONY

C-1: Planning Commission Hearing on Draft EIR

C1-1: During the preparation of the Draft EIR, additional policy measures were proposed for inclusion in the General Plan based on analysis of resulting impacts. These measures could have been added to the Draft EIR in the form of mitigation measures, but in an effort to create a self-mitigating document with a clear implementation program, all policy measures have been consolidated into the Plan itself. These policies are denoted with a letter "A" (e.g. LU-P-8A) and may be found on the following pages of the Draft EIR: 3.1-23, 3.2-40, 3.2-42, and 3.2-43. Moreover, in response to comments on the Draft EIR and due to recommendations from the General Plan and Zoning Update Steering Committee and City staff, additional policy measures have been proposed for inclusion in the General Plan, and subsequently—in many cases—in the EIR. All new General Plan policies are noted in Appendix A.

C1-2: Appendix A documents all substantive changes between the Public Review Draft General Plan (January 2009) and Hearing Draft General Plan (August 2009).

C1-3: The "loss of existing due to redevelopment" value represents an accounting measure that estimates the proportion of existing development that may be redeveloped on each site in an area of change and does not represent a policy statement to replace housing units. The General Plan and Draft EIR (pages 3.1-17 through 3.1-20) have been edited in response to this comment to clarify the meaning of these values. Upon reevaluation, it has been determined that the estimate of 70 housing units was an error, and that , in fact, no housing units are anticipated to be lost through redevelopment. See Chapter 4 for Draft EIR revisions.

C1-4: In response to this comment, a policy has been added to Chapter 3: Transportation of the General Plan to continue to study and evaluate appropriate traffic and transportation improvements.

C1-5: Comments noted. However, this comment represents a comment on the Plan and does not concern the substance of the Draft EIR.

C1-6: See response to comment A2-2, which describes BCDC's modeling of two sea level rise scenarios, their applicability to the proposed General Plan, and a new policy that has been added to the Draft EIR, as a result of this comment. See Chapter 4 (page 4-5) for revision to pages 3.5-22 and 3.5-23.

C1-7: In response to this comment, policies have been added to the General Plan that will serve as additional mitigations to Impact 3.7-1. These policies have also been added to the discussion on page 3.7-17 of the Draft EIR. See Chapter 4 for Draft EIR revisions (page 4-5).

C1-8: Comments noted. As described on page 3.8-18, the City's Zoning Ordinance prohibits the movement, removing or demolition of a Tier 1 or Tier 2 architecturally significant building or structure in the Park Avenue District unless the Planning Commission first

approves such action. Article 64 of the Emeryville Municipal Code outlines the findings and conditions of approval required for removal or demolition of a significant structure in the Park Avenue District. Similarly, Article 67 requires City Council approval to demolish an "architecturally significant" building outside of the Park Avenue District. These measures are deemed sufficient for the protection of historic resources within the city, and vests the Planning Commission and City Council with absolute discretion to approve or deny demolition of historic structures.

The significant and unavoidable conclusion to Impact 3.8-2 is a result of a 1997 court decision that the demolition of any historic building is a significant and unavoidable impact and therefore may not be authorized without the preparation of an EIR (League for Protection of Oakland's Architectural and Historic Resources v. Oakland (1997) 52 Cal.App.4th 896). This EIR for the General Plan recognizes that new development may result in demolition of properties determined to be "historic" and therefore recognizes this is a significant and unavoidable impact.

C1-9: Comment noted. However, this is a comment on the Plan and does not concern the substance of the Draft EIR.

C1-10: In response to this comment, page 3.11-10 of the Draft EIR has been edited. See Chapter 4 for Draft EIR revisions (page 4-9).

C1-11: In response to this comment and related discussions at the City staff and General Plan Steering Committee levels, FAR values in the Eastern Residential Neighborhoods have been adjusted to 0.75 (base) and 1.0 (base with bonus). The intent of the FAR values in this area is to preserve the neighborhood character while including allowance for off-street parking in the FAR value. This is exemplified through General Plan goals and policies:

- LU-G-5: Preservation of residential neighborhoods—Residential use, structures, low-rise scale, and character of the Triangle, Doyle Street, and Watergate neighborhoods preserved, and the scale of other areas of stability maintained.

- LU-P-13: Building heights will step down to the east and west from the Powell/Christie core; buildings taller than 55 feet are not permitted east of Hollis Street. The height and scale of existing development (30 feet maximum) in the Doyle Street and Triangle neighborhoods will be maintained.

- UD-P-15: Infill residential development should incorporate the scale, character and identity of adjacent existing development.

The Draft EIR has been revised to reflect the new FAR values. See Chapter 4 for Draft EIR revisions.

Staff has been directed by the Planning Commission to review recent development proposals in these neighborhoods to evaluate FAR values with and without parking. As a result of this review, revised FAR values may be presented to the Planning

Commission and City Council for consideration prior to adoption of the new General Plan.

C1-12: In response to this comment, Figure 2.3-2 on page 2-11 has been updated to include a note about the inclusion of parking in the FAR value. See Chapter 4 for Draft EIR revisions (page 4-1).

C1-13: Such a table has been added to the Draft EIR; see Chapter 4 (page 4-2) for Draft EIR revisions (to page 3.1-21).

C1-14: In response to this comment, the Chapter 4: Alternatives analysis has been updated to reflect total overall development (page 4-7 of the Draft EIR) for each alternative and to expand the discussion of the environmentally superior alternative (page 4-25 and 4-26 of the Draft EIR). See Chapter 4 (page 4-9) for Draft EIR revisions.

C1-15: In response to this comment, page 3.7-26 was updated to consider the dual benefit of grade-separated railroad crossings to both improve circulation and reduce noise impacts. See Chapter 4 for Draft EIR revisions (page 4-6).

C1-16: In response to this comment, the projected noise contours, shown in Figure 3.7-3, were revised to reflect increases in freight rail traffic, particularly during night hours when noise is most disturbing to residents. See Chapter 4 for Draft EIR revisions (page 4-6).

C1-17: See response to comment C1-11.

4 Revisions to the Draft EIR

This chapter includes the revisions to the Draft EIR. These revisions have been made in response to comments or based on review by the EIR preparers. The revisions appear here in the order they appear in the Draft EIR. Text additions are noted in underline and text deletions appear in ~~strikeout~~.

The City has refined the proposed General Plan based upon agency and public comments. The changes to the Plan as described in Appendix A do not alter the conclusions presented in the Draft EIR regarding significant environmental impacts or mitigation measures and therefore do not trigger recirculation. Revisions to the Draft EIR are described in Table 4-1 and organized by chapter, page and table or figure, where applicable. Certain revised pages (including revised figures) have been appended to the end of this chapter, for clarity purposes; these pages are referenced in the table.

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
2	8	Fig. 2-3-1	Land Use Diagram figure updated as described in Appendix A.
2	11	Fig. 2-3-2	FAR figure updated as described in Appendix A.
2	12	Fig. 2-3-3	Residential Density figure updated as described in Appendix A.
2	13	Fig. 2-3-4	Building Heights figure updated as described in Appendix A.
2	14	New Fig 2.4-1	Insert new figure: Areas and Change and Stability after page 2-14. Update text as follows: In order to estimate potential buildout, the Plan makes several assumptions. A set of opportunity sites have been identified for redevelopment, as shown in Figure 2.4-1: Areas of Change and Stability. These include vacant and underutilized sites, as well as sites with proposed or approved projects.
3.1	15		~~BCDC regulates new development within the first 100 feet inland from the San Francisco Bay shoreline in order to ensure as much public access to the Bay as possible.~~ The Commission has "Bay" jurisdiction over all areas of the Bay subject to tidal action which is defined by the shoreline. The shoreline is located at the mean high tide line, except in marsh areas, where the shoreline is located at five feet above mean sea level. This jurisdiction includes substantial changes to land use, building construction or remodeling, and subdivision of property, as well as Bay fill and structures over the Bay. BCDC authored The San Francisco Bay Plan in 1969 to protect and preserve the bay through regional efforts and defines its jurisdiction and major strategies. Key initiatives that pertain to Emeryville include: developing maritime ports, water-related industries, and waterfront parks and recreation facilities; maintaining wildlife refuges in baylands; and encouraging private shoreline development. For the purposes of the updated General Plan, the BCDC's power of re-

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
			view would mainly affect any changes to land uses or structures on the Peninsula and any redevelopment of I-80's Ashby Avenue interchange. (Note: By statute Watergate and Trader Vic's are regulated only to mean high tide, not 100 feet, and the entire marina is included in BCDC jurisdiction, even beyond 100 feet inland from the mean high tide line.) The Commission controls filling and dredging within its "Bay" jurisdiction through the permit system established by the McAteer-Petris Act. The Commission also administers permits for development within its 100-foot "shoreline band" jurisdiction. However, the Commission's authority along the shoreline is more limited; it may deny a permit application for a proposed project only if the project fails to provide maximum feasible public access to the Bay and shoreline consistent with the project, or is inconsistent with a priority use designation.
3.1	17	Tab. 3.1-2	See updated table and page at the end of this chapter.
3.1	19-20		Impact 3.1-2: Changes in land uses under the proposed General Plan may result in the displacement of ~~a minimal number of~~ houses, businesses, and/or people. (Less than Significant) Generally, existing residential uses were classified in the General Plan as areas of stability, meaning that they would not undergo significant land use changes under the proposed General Plan. However, the proposed General Plan does estimate that ~~approximately 70 existing housing units~~some residential and non-residential development could be lost due to redevelopment~~, in the North Hollis district and southern portion of the San Pablo Avenue corridor~~. The "loss of existing due to redevelopment" value represents an accounting measure that estimates the proportion of existing development that may be redeveloped on each site in an area of change. It does not refer to actual units and does not represent a policy statement to replace housing units. Rather, over time, sites may redevelop as opportunities and need for rehabilitation or replacement arises.
3.1	21		See updated table and page at the end of this chapter.
3.4	8		~~BCDC jurisdiction includes the Bay and a shoreline band that extends inland 100 feet from the high tide line. BCDC permits are required for all work within either the high Bay or the shoreline band.~~ The Commission has "Bay" jurisdiction over all areas of the Bay subject to tidal action which is defined by the shoreline. The shoreline is located at the mean high tide line, except in marsh areas, where the shoreline is located at five feet above mean sea level. The Commission's "Bay" jurisdiction extends to certain waterways identified in the McAteer-Petris Act consisting of all areas of the waterways that are subject to tidal action including submerged lands, tidelands, and marshlands up to five feet above mean sea level. Additionally, the Commission has "shoreline band" jurisdiction over an area 100 feet wide inland and

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
			parallel to the shoreline.
3.5	8		~~Average sea levels have risen between one-third and two-third of a foot over the course of the 20th century and are projected to rise by at least another one-third of a foot and up to almost three feet by the year 2100.~~
3.5	9		Note that the USGS model compares the sea level rise scenario to land-surface elevation data and does not account for shoreline protection; therefore the area south of 64th Street and west of I-80 does not account for the at-grade freeway barrier. Moreover, these projections do not account for potential changes to storm-related flood areas (such as the 100-year flood zone).
3.5	11		Following first paragraph: The United States of America, on behalf of the EPA, and the State of California, on behalf of the California State Water Resources Control Board and California Regional Water Quality Control Board, San Francisco Bay Region, filed a complaint against the East Bay Municipal Utility District (EBMUD) alleging that EBMUD has discharged pollutants to San Francisco Bay in violation of the federal Clean Water Act, California Water Code and the terms of its NPDES Permits. (see United States Environmental Protection Agency, California State Water Resources Control Board, California Regional Water Quality Control Board, San Francisco Bay Region v. East Bay Municipal Utility District: United States District Court, Northern District of California, Case No. CV 09-0186 CW). On July 22, 2009, a Stipulated Order ("Order") negotiated by EBMUD with the United States and State of California was entered in the U.S. District Court as a partial judgment. EBMUD receives wastewater from Emeryville and six other Satellite agencies via EBMUD's interceptor system. The interceptor system transports wastewater to EBMUD's year round main wastewater treatment plant near the eastern anchorage of the Bay Bridge. During wet weather, inflow and infiltration (I/I) of storm water into the wastewater collection system and private sewer laterals during severe wet weather events – via misconnections, cracks and other imperfections in system pipes, joints and manholes – can lead to a 10-fold increase in the volume of wastewater that reaches EBMUD's interceptor system. Accordingly, the main wastewater treatment plant can be overwhelmed resulting in illicit discharges to the Bay. The Order requires EBMUD to undertake additional data gathering and studies over the next few years regarding wet weather flows to their system and measures to reduce such flows. These studies will likely result in an agreement between Emeryville and the six other Satellite agencies and the United States and the State of California to implement programs and improvements to further eliminate inflow and infiltrate into the wastewater system. While Emeryville has significantly reduced I/I of storm water

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
			into its wastewater collection system over the last 20 years, it shares drainage basins with Oakland which has not achieved the same results as Emeryville. As provided in Section 7 of the Order, the United States, State of California, and EBMUD have determined that (i) eliminating discharge from—rather than further treatment at—the wet weather facilities is in the optimal way to further reduce East Bay sanitary sewer systems' wet weather-related water quality impacts to San Francisco Bay; and (ii) the means of pursuing this objective is to reduce wet-weather flows in the collection systems and in private sewer laterals, which will reduce impacts to San Francisco Bay by reducing the frequency and volume of EBMUD's wet weather discharges. . Construction of new wastewater treatment systems or expansion of existing facilities is not identified as the preferred means to address this issue primarily due to the significant costs of constructing such facilities. Accordingly, the Order provides that EBMUD shall adopt a Regional Private Sewer Lateral Ordinance ("Regional Ordinance") setting standards for the performance of lateral sewer pipes that extend from privately-owned property/structures to the Satellites' wastewater collection systems. These standards are to provide for the testing of private sewer laterals; repair or replacement of defective laterals; and elimination of improper inflow connections (e.g. removal of downspout connections to a sewer line). The Regional Ordinance will also require the owner of a private sewer lateral to obtain a "Compliance Certificate" from EBMUD (or from the Satellite agency if the Satellite agency has adopted an ordinance imposing standards no less Stringent than the Regional Ordinance) prior to (a) transferring title to such property or structure, (b) obtaining any permit or other approval needed for the construction or significant modification of any structure, and (c) obtaining approval from EBMUD for an increase or decrease in size of the owner's water service. Finally, EBMUD is required to develop and fund a Private Lateral Incentive Work Program that will include, among other measures, financial incentives to accelerate the testing of private laterals, repair or replacement of defective sewer laterals, and elimination of improper inflow connections. On July 14, 2009, the City of Emeryville received a notice from the California Regional Water Quality Control Board (RWQCB), San Francisco Bay Region, of a Tentative Order for the City of Emeryville, Sanitary Sewer Collection System, NPDES Permit No. CA0038792 and Amendment of Cease & Desist Order. Consistent with the aforementioned Stipulated Order negotiated and agreed to by EBMUD, the State of California and the United States, the Tentative Order and Amendment of Cease & Desist Order issued by the RWQCB provides that the City of Emeryville "shall not cause or contribute discharges from EBMUD's Wet Weather Facilities that occur during wet weather or that are associate with wet weather." A hearing before the RWQCB regarding the Tentative Order

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
			and Amendment of Cease & Desist Order issued to the City of Emeryville is scheduled for November 18, 2009. It is anticipated that a Final Order and Amendment of Cease & Desist Order will be issued by the RWQCB shortly after the November 18, 2009, hearing. Thereafter, subject to the right of the City of Emeryville and the six other Satellite agencies to appeal the decision of the RWQCB, the City will operate its sanitary sewer collection system in a manner consistent with the Final Order and Amendment of Cease & Desist Order.
3.5	13		Insert as second paragraph under "McAteer-Petris Act/San Francisco Bay Conservation and Development Commission" The Safety of Fills findings in BCDC's Bay Plan recognize that "Bay water levels are likely to increase in the future because of a relative rise in sea level… Relative rise in sea level is the sum of: (1) a rise in global sea level and (2) land elevation change (lifting and subsidence) around the Bay." Policy 4 states, in part, "...structures on fill or near the shoreline should have adequate flood protection including consideration of future relative sea level rise..." and as a general rule, these structures "should be above wave runup level or sufficiently set back from the edge of the shore so that the structure is not subject to dynamic wave energy." Additionally, Policy 6 states, "local governments and special districts with responsibilities for flood protection should assure that their requirements and criteria reflect future relative sea level rise and should assure that new structures and uses attracting people are not approved in flood prone areas or in areas that will become flood prone in the future, and that structures and uses that are approvable will be built at stable elevations to assure long-term protection from flood hazards." Moreover, shoreline development within BCDC's jurisdiction may be subject to future permit controls related to sea level rise impacts.
3.5	22-23		See updated pages at the end of this chapter.
3.7	17		The following new policies are being added to the General Plan, and Draft EIR to help reduce the impact: • Noise impacts should be controlled at the noise source where feasible, as opposed to at receptor end. This includes measures to buffer, dampen or actively cancel noise sources. • The City shall require noise buffering, dampening, or active cancellation, on roof-top or other outdoor mechanical equipment located near residences, parks, and other noise sensitive land uses. • The City shall limit the potential noise impacts of construction activities on surrounding land uses through Noise Ordinance regulations that address allowed days and hours of construction, types of work, construction equipment, notification of neighbors, and sound attenuation devices.

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
3.7	19	Fig. 3.7-3	Future Noise Contours figure updated as described in Appendix A.
3.7	26		Following second paragraph: In addition, proposed grade-separated crossings over the railroad have the dual benefit of both improving circulation for vehicles, pedestrians, transit, and bicycles, as well as reducing noise impacts from trains.
3.10	2		The District supplies water to approximately 1.3 million customers within a ~~331~~325-square-mile service area and provides wastewater treatment to approximately 642,000 residents within an ~~88~~83-square-mile area.
3.10	3		EBMUD's Non-potable Water Policy No. ~~73~~8.01 (1996) mandates that all customers use recycled water for non-domestic purposes when such water is of adequate quality and quantity, available at reasonable cost, not detrimental to public health, and not injurious to plant life, fish, and wildlife.
3.10	3		Uses for recycled water include non-residential landscape ~~and agricultural~~ irrigation, commercial and industrial process purposes, ~~wetlands restoration and stream flow augmentation,~~ and toilet flushing and urinal flushing in commercial buildings.
3.10	3		In ~~2005~~ 2008, the average daily recycled water use was ~~6~~5.5 mgd. By 2020, EBMUD ~~hopes~~plans to recycle a total of 14 mgd ~~and uphold this goal through the year 2030~~ in order to meet the anticipated potable water needs of its service area.
3.10	4		This multi-phased project, commenced in 2003 with ~~phase one expected to be~~ Phase 1A recently completed ~~in 2009~~, will provide up to ~~2.5~~2.2 mgd of recycled water from EBMUD's Main Wastewater Treatment Plant to customers in the aforementioned areas.
3.10	5		Following second paragraph: The United States of America, on behalf of the EPA, and the State of California, on behalf of the California State Water Resources Control Board and California Regional Water Quality Control Board, San Francisco Bay Region, filed a complaint against the East Bay Municipal Utility District (EBMUD) alleging that EBMUD has discharged pollutants to San Francisco Bay in violation of the federal Clean Water Act, California Water Code and the terms of its NPDES Permits. (see United States Environmental Protection Agency, California State Water Resources Control Board, California Regional Water Quality Control Board, San Francisco Bay Region v. East Bay Municipal Utility District: United States District Court, Northern District of California, Case No. CV 09-0186 CW). On July 22, 2009, a Stipulated Order ("Order") negotiated by EBMUD with the United States and State of California was entered in the U.S. District Court as a partial judgment. EBMUD receives wastewater from Emeryville and six other Satellite agen-

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
			cies via EBMUD's interceptor system. The interceptor system transports wastewater to EBMUD's year round main wastewater treatment plant near the eastern anchorage of the Bay Bridge. During wet weather, inflow and infiltration (I/I) of storm water into the wastewater collection system and private sewer laterals during severe wet weather events – via mis-connections, cracks and other imperfections in system pipes, joints and manholes – can lead to a 10-fold increase in the volume of wastewater that reaches EBMUD's interceptor system. Accordingly, the main waste-water treatment plant can be overwhelmed resulting in illicit discharges to the Bay. The Order requires EBMUD to undertake additional data gathering and studies over the next few years regarding wet weather flows to their sys-tem and measures to reduce such flows. These studies will likely result in an agreement between Emeryville and the six other Satellite agencies and the United States and the State of California to implement programs and improvements to further eliminate inflow and infiltrate into the wastewa-ter system. While Emeryville has significantly reduced I/I of storm water into its wastewater collection system over the last 20 years, it shares drainage basins with Oakland which has not achieved the same results as Emeryville. As provided in Section 7 of the Order, the United States, State of Califor-nia, and EBMUD have determined that (i) eliminating discharge from—rather than further treatment at—the wet weather facilities is in the opti-mal way to further reduce East Bay sanitary sewer systems' wet weather-related water quality impacts to San Francisco Bay; and (ii) the means of pursuing this objective is to reduce wet-weather flows in the collection systems and in private sewer laterals, which will reduce impacts to San Francisco Bay by reducing the frequency and volume of EBMUD's wet weather discharges. . Construction of new wastewater treatment systems or expansion of existing facilities is not identified as the preferred means to address this issue primarily due to the significant costs of constructing such facilities. Accordingly, the Order provides that EBMUD shall adopt a Regional Private Sewer Lateral Ordinance ("Regional Ordinance") setting standards for the performance of lateral sewer pipes that extend from privately-owned property/structures to the Satellites' wastewater collec-tion systems. These standards are to provide for the testing of private sewer laterals; repair or replacement of defective laterals; and elimination of improper inflow connections (e.g. removal of downspout connections to a sewer line). The Regional Ordinance will also require the owner of a private sewer lateral to obtain a "Compliance Certificate" from EBMUD (or from the Satellite agency if the Satellite agency has adopted an ordi-nance imposing standards no less Stringent than the Regional Ordinance) prior to (a) transferring title to such property or structure, (b) obtaining any permit or other approval needed for the construction or significant

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
			modification of any structure, and (c) obtaining approval from EBMUD for an increase or decrease in size of the owner's water service. Finally, EBMUD is required to develop and fund a Private Lateral Incentive Work Program that will include, among other measures, financial incentives to accelerate the testing of private laterals, repair or replacement of defective sewer laterals, and elimination of improper inflow connections. On July 14, 2009, the City of Emeryville received a notice from the California Regional Water Quality Control Board (RWQCB), San Francisco Bay Region, of a Tentative Order for the City of Emeryville, Sanitary Sewer Collection System, NPDES Permit No. CA0038792 and Amendment of Cease & Desist Order. Consistent with the aforementioned Stipulated Order negotiated and agreed to by EBMUD, the State of California and the United States, the Tentative Order and Amendment of Cease & Desist Order issued by the RWQCB provides that the City of Emeryville "shall not cause or contribute discharges from EBMUD's Wet Weather Facilities that occur during wet weather or that are associate with wet weather." A hearing before the RWQCB regarding the Tentative Order and Amendment of Cease & Desist Order issued to the City of Emeryville is scheduled for November 18, 2009. It is anticipated that a Final Order and Amendment of Cease & Desist Order will be issued by the RWQCB shortly after the November 18, 2009, hearing. Thereafter, subject to the right of the City of Emeryville and the six other Satellite agencies to appeal the decision of the RWQCB, the City will operate its sanitary sewer collection system in a manner consistent with the Final Order and Amendment of Cease & Desist Order.
3.10	18		Add to end of second paragraph: Further, the City will continue to cooperate with EBMUD to adopt and implement a Regional Private Sewer Lateral Ordinance and a Private Lateral Incentive Work Program, and continue to require development to replace or upgrade, as needed, sanitary sewer systems servicing the development. These measures are designed to reduce inflow and infiltration (I&I) of stormwater into the City's wastewater collection system and private sewer laterals thereby mitigating any impact to wet weather facilities during wet weather events.
3.10	22		Impact 3.10-3: New development would not exceed wastewater treatment capacity of the EBMUD, and would not require construction of new wastewater treatment facilities. ~~Expansion of existing facilities of implementation of programs and policies to further reduce inflow and infiltration (I/) of storm water into the city's wastewater collection system and private seer laterals during wet weather events.~~ (Less than Significant)
3.10	23		The following new policies are being added to the General Plan and the Draft EIR to help reduce the impact: • The City will continue to cooperate with EBMUD, the Regional Water

Table 4-1: Revisions to the Draft EIR

Chapter/ Section	*Page*	*Table/ Figure*	*Correction*
			Quality Control Board, and other relevant agencies to adopt and implement programs and policies to further reduce inflow and infiltration (I&I) of storm water in the City's wastewater collection system and private sewer laterals during wet weather events. • The City will continue to require development projects to replace or upgrade as needed, sanitary sewer systems serving the development site to reduce inflow and infiltration (I&I) of stormwater in the City's wastewater collection system and private sewer laterals during wet weather events.
3.11	10		Impact 3.11-3: The construction or expansion of recreation facilities ~~would~~could have an adverse physical effect on the community.

The Land Use Diagram, as shown in the Chapter 2: Project Description, Figure 2.3-1, designates the proposed location, distribution, and extent of activities that may take place throughout the city. Land use classifications—shown as color/graphic patterns on the diagram—allow for a range of activities within each classification.

SUMMARY OF IMPACTS

The proposed General Plan does not physically divide any established community. Rather, by providing better connectivity both locally and regionally, the plan provides more linkages within Emeryville and between surrounding communities.

Existing neighborhoods are designated as areas of stability and the plan does not anticipate major changes in intensity and character to these areas. While construction of proposed improvements could temporarily disrupt neighborhoods and businesses, completed improvements are expected to contribute to a vital living and working environment.

Redevelopment caused by new permitted land uses or different densities may remove a very small amount of housing in the city, as a result of redevelopment activities over time. ~~in the North Hollis district and southern portion of the San Pablo Avenue corridor, but~~ The overall proposed plan will significantly increase the number of housing units in Emeryville such that any displaced residents will be able to find accommodation in the same area. To the extent that any development activity of the Redevelopment Agency results in the removal of housing, State redevelopment law requires replacement of like type of housing within the city.

Inserted on page 3.1-21, following "Proposed General Plan Actions that Reduce the Impact."

Plan	*Consistent?*	*Discussion/Modification*
City of Emeryville		
Emeryville Zoning Ordinance	No, but pending	Zoning Ordinance must be updated to be consistent with proposed General Plan land use districts, floor area ratios, height limits, and residential densities. Proposed General Plan policies and actions call for the update of the Zoning Ordinance accordingly (already underway).
North Hollis Area Urban Design Program	Yes	The General Plan contains a policy to develop North Hollis consistently with the program's guidelines, which include: infill residential uses; a balance of transportation modes; sufficient public parking; and pedestrian improvements. Proposed General Plan policies regarding land use, transportation, and urban design, are consistent.
San Pablo Avenue Urban Design Plan	Yes	Much of the plan has already been implemented. The General Plan shares the priorities from this design plan. Moreover, the General Plan contains a policy to continue to use the design plan to guide landscaping, streetscape design and development along the corridor. Proposed General Plan policies regarding urban design are consistent.
South Bayfront Design Guidelines	Yes	Much of the South Bayfront has already been developed using these guidelines. The proposed General Plan shares its priorities in terms of streets and blocks that enable pedestrian activity; building materials and detailing; public spaces that create visual interest; and improved pedestrian and bicycle connections.
Park Avenue District Plan	Yes	The proposed General Plan supports the Park Avenue District Plan through land use, urban design, and historic resources policies. The plans are consistent in terms of FAR values, an expanded street grid (i.e. the extension of Hubbard Street), the extended Greenway, and guidelines for the development of the Sherwin Williams site. As described by a proposed General Plan policy, the Park Avenue District Plan will continue to guide development in the area.
1976 Emeryville Redevelopment Plan and 1987 Shellmound Park Redevelopment Plan	Yes	The redevelopment plans provide that all development within a redevelopment project area is required to be consistent with the City's General Plan as amended over time.
Surrounding Jurisdictions		
Berkeley Waterfront Plan	Yes	This plan covers the area of Berkeley from the railroad to the Bay shoreline. Most importantly for Emeryville, it calls for the cities of Berkeley, Albany and Emeryville to establish a joint sub-regional growth management system to minimize traffic congestion in the plan area by phasing development. This strategy is suggested due to concern that capacity along I-80 is limited and excessive development in these three cities could decline levels of service on the highway. The plan was adopted in 1986, so its assumptions have changed substantially since that time. Still, the proposed General Plan includes a policy to work with the City of Berkeley on improvements to the Ashby Avenue/I-80 interchange as a way to relieve congestion. In that way, the plans are consistent.
West Berkeley Area Plan	Yes	This plan's jurisdiction covers the area north of the Emeryville city limits between the railroad and San Pablo Avenue. Adopted in 1993, the Plan and the West Berkeley district are currently undergoing evaluation for zoning changes and possible Plan amendments. In its current form, the plan seeks to maintain a mix of land uses, buildings, and people in the area to prevent it from becoming

		excessively redeveloped or gentrified. The City of Berkeley is working with stakeholder groups to identify opportunities and challenges. This coordination will need to be maintained by both cities to ensure consistency.
Oakland General Plan Land Use and Transportation Elements	Yes	The strategic map of Oakland's General Plan designates the area to the southwest of Emeryville, as well as portions of San Pablo Avenue around Emeryville, as some of the city's key areas for growth and change. The triangular area between I-580 and Peralta Street is considered a "Housing and Business Mix Area," where both uses are allowed and neither dominates. Recommended policies of interest to Emeryville include: improving the appearance of San Pablo Avenue; targeting the Golden Gate neighborhood (east of Emeryville) for blight abatement, façade and streetscape improvements, and business attraction activities; and designating the MacArthur BART station—the one nearest to Emeryville—as a transit-oriented district. All of these policies are consistent with, and in many cases supported by, land use and urban design policies in the proposed General Plan.
Redevelopment Plan for West Oakland	Yes	This plan for the Oakland Redevelopment Agency designates the area between the Emeryville city limits, Peralta Street, and I-580 for regional commercial land uses, and the area east of Peralta Street as far north as 40th Street as mixed-typology housing. Development activities that are pertinent to Emeryville include: creating a pedestrian-friendly environment along San Pablo Avenue and Adeline Street; developing mixed-use, commercial, and high-density residential developments on San Pablo Avenue between 27th and 32nd streets; and requiring on-site public art. In the Hoover/West MacArthur area (to the southeast of Emeryville), the plan impose a five year moratorium starting in 2003 on the use of redevelopment funds for the construction of new affordable rental housing, due to the existing over-concentration of low-income housing in the area. All of these policies are consistent with, and in many cases supported by, land use and urban design policies in the proposed General Plan.
Redevelopment Plan for Broadway/MacArthur/San Pablo	Yes	This plan for the Oakland Redevelopment Agency covers two areas, one of which is immediately adjacent to the City of Emeryville: the Golden Gate neighborhood, stretching from the Emeryville city limits to San Pablo Avenue between 53rd and 67th streets. The area's A five-year implementation plan for the San Pablo subarea lays out actions for streetscape and other capital improvements; and support for business development and retention in the area. In the second portion of the Redevelopment Area, near the MacArthur BART Station, a mixed-use transit village has been approved. These policies are consistent with and in many cases supported by economic development, urban design, and transportation policies defined in the proposed General Plan.
Regional		
San Francisco Bay Conservation and Development Commission (BCDC)	Yes	General Plan policies call for the coordination with regulatory agencies, including BCDC, regarding hazard mitigation and development approvals. For the purposes of the updated General Plan, would become involved for proposed changes to land uses or structures on the Peninsula, the I-80/Ashby Avenue interchange, and the Emeryville Crescent, as described in BCDC's jurisdiction outlined in the Bay Plan.
Association of Bay Area Governments (ABAG)	No, but pending	Emeryville's buildout expectations in the proposed General Plan exceed ABAG's 2007 Projections. However, the City has been in communication with ABAG during preparation of the Plan and ABAG is expected to revise its 2009 Projections to be consistent with Emeryville's anticipated growth.

Eastshore State Park General Plan	Yes.	This plan covers the state park that runs from Oakland to Richmond, which includes the waterfront in Emeryville both north and south of the Peninsula. For the sections of the State Park within Emeryville, the plan designates the shoreline south of the Peninsula as a preservation area, and the rest of the park within Emeryville as a conservation area; there are no recreational sections of the park within Emeryville. Public access to preservation areas is restricted, while conservation areas permit passive recreation. Consequently, the plan calls for: restricting access to the shoreline south of the Peninsula, perhaps with a fence (though not on the south side of Powell Street); creating a non-paved trail along the eastern section of the Peninsula in a way that connects with the existing paved section of the Bay Trail; installing a vista point and a bird blind on the Peninsula; and providing parking for up to 20 vehicles. In particular, the proposed Emeryville General Plan calls for improvements to the Bay Trail and other improvements in a manner consistent with habitat protection and providing mitigations, as necessary. An action item in the proposed General Plan calls for coordination with the East Bay Regional Parks District.

established where feasible, with removal of invasive species and additional opportunities for riparian vegetation. Following the creation of the riparian corridor, the creek would continue to flow in the below-grade pipe. Temescal Creek is largely a sub-surface drainage flowing through culverts as shown in Figure 3.5-2, therefore the construction activities associated with creation of the riparian corridor would involve excavation and clearing of paved areas in the vicinity. Short-term stormwater and potential erosion and sedimentation impacts could occur during the temporary construction phase. These short term construction-related impacts are assessed under Impacts 3.5-1 and 3.5-2. However, in the long term, the riparian corridor and vegetative stormwater treatment of the creek would provide a natural hydrology and water resource, which would be a beneficial impact.

Mitigation Measures

None required.

Impact

3.5-5 New development under the proposed General Plan could be subject to flooding. *(Less than Significant)*

New development identified in the General Plan is not subject to a significant level of flooding. As discussed in the Setting section above, the majority of Emeryville lies in Zone ~~C~~X, which signifies areas of minimal flood~~ing~~ hazard. ~~therefore, the new development (i.e., housing or other structures) under the General Plan would not lie within a 100-year flood hazard area.~~ The shoreline and marina areas are designated as Zone V and lie within the 100-year flood zone; however, these areas do not contain urban uses or structures, nor are such uses identified in the proposed General Plan.

However, in addition to FEMA designated flood zones, the city faces several environmental threats that could contribute to flooding, including dam inundation, mudflows and seiches, tsunamis, and sea level rise which must also be considered. These potential impacts are discussed below.

~~As discussed in Impact 3.5-4 above, storm drainage facilities and stormwater control measures would minimize any adverse flooding effects.~~ Although portions of Emeryville lie in the inundation area for Temescal dam, the dam is ~~overseen by DSOD~~considered to be safe and inundation due to a dam failure unlikely. The DSOD engineers and engineering geologists review and approve plans and specifications for dams for the site geology, seismic setting, site investigations, construction material evaluation, dam stability, hydrology, hydraulics, and structural review of appurtenant structures. In addition, the DSOD engineers inspect the dams on a yearly schedule to insure they are performing and being maintained in a safe manner. Due to the high maintenance and inspection standards, failure of the Temescal Dam is highly unlikely, therefore the risk from flooding to the development proposed under the General Plan is not considered high. ~~The impact would be less than significant.~~

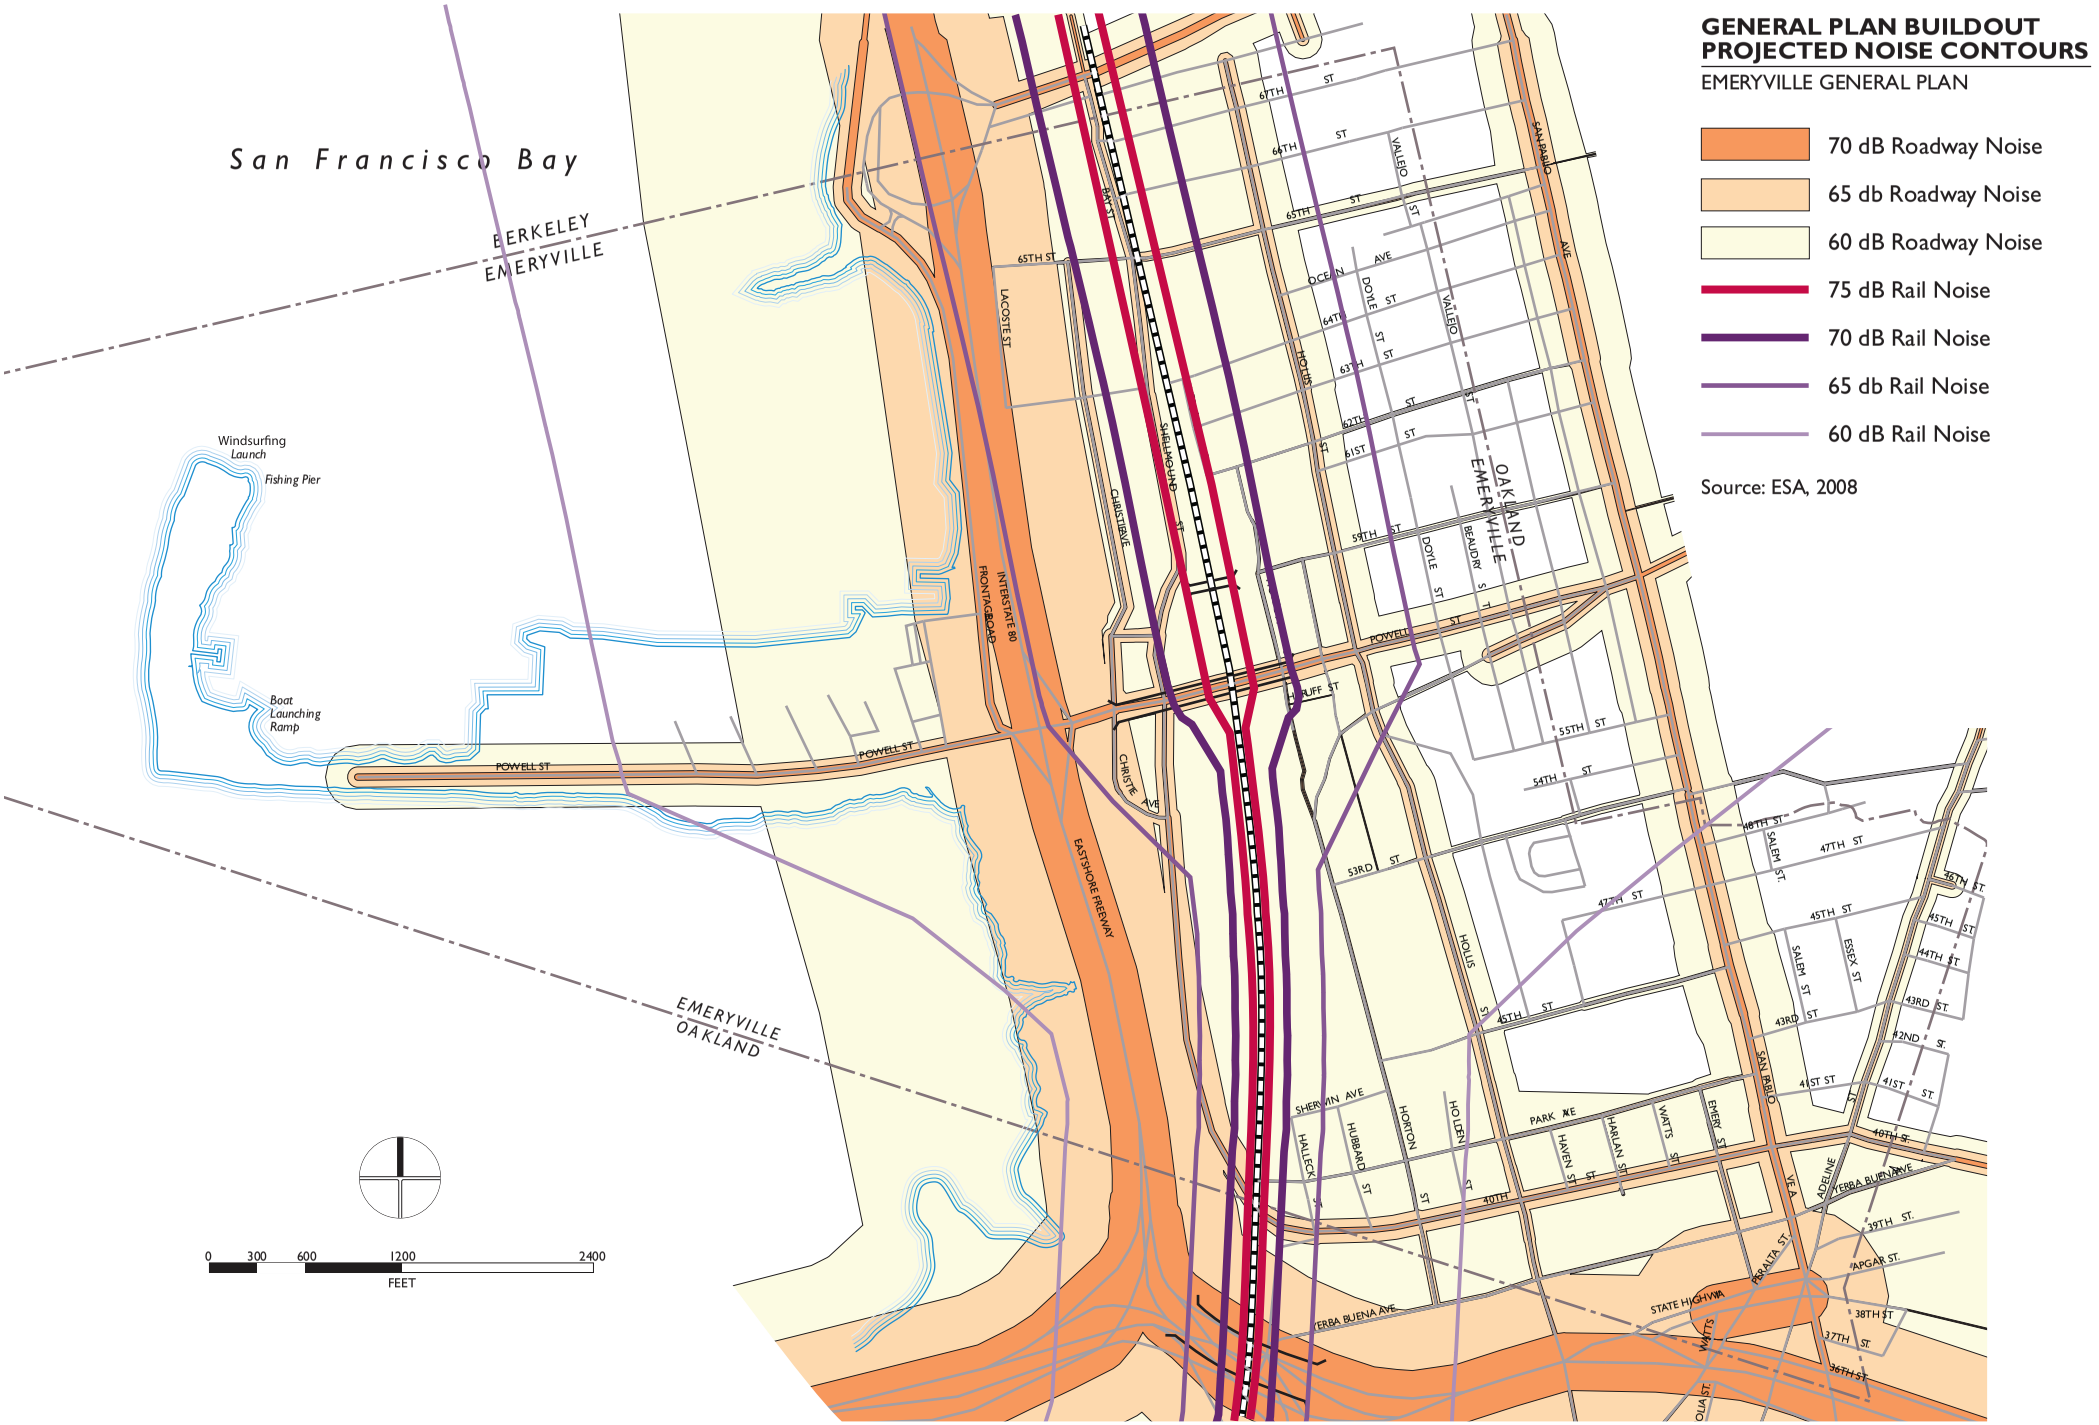
There is a low likelihood for mudflows and seiches to occur in Emeryville due to the flat topography and absence of enclosed water bodies, therefore the General Plan would not expose people or structures to a significant risk from a seiche or mudflows.

As discussed previously, the U.S. Geologic Survey estimates that a 20-foot wave at the Golden Gate Bridge (an event estimated to possibly occur once in 200 years) could potentially cause a run-up of a 10-foot wave in the Emeryville Peninsula and the shoreline area. Some of the proposed development under the General Plan would occur along the shoreline and could be subject to the risk from a tsunami, if one were to occur. The State Office of Emergency Service is currently in the process of updating tsunami hazard maps for Alameda County. The existing USGS estimates do not suggest a threat to the built environment in Emeryville, but Plan policies described below ensure that this potential hazard will continue to be evaluated as information becomes available and conditions change (e.g. the hazard is rendered more severe due to sea level rise). ~~The impact would be less than significant.~~

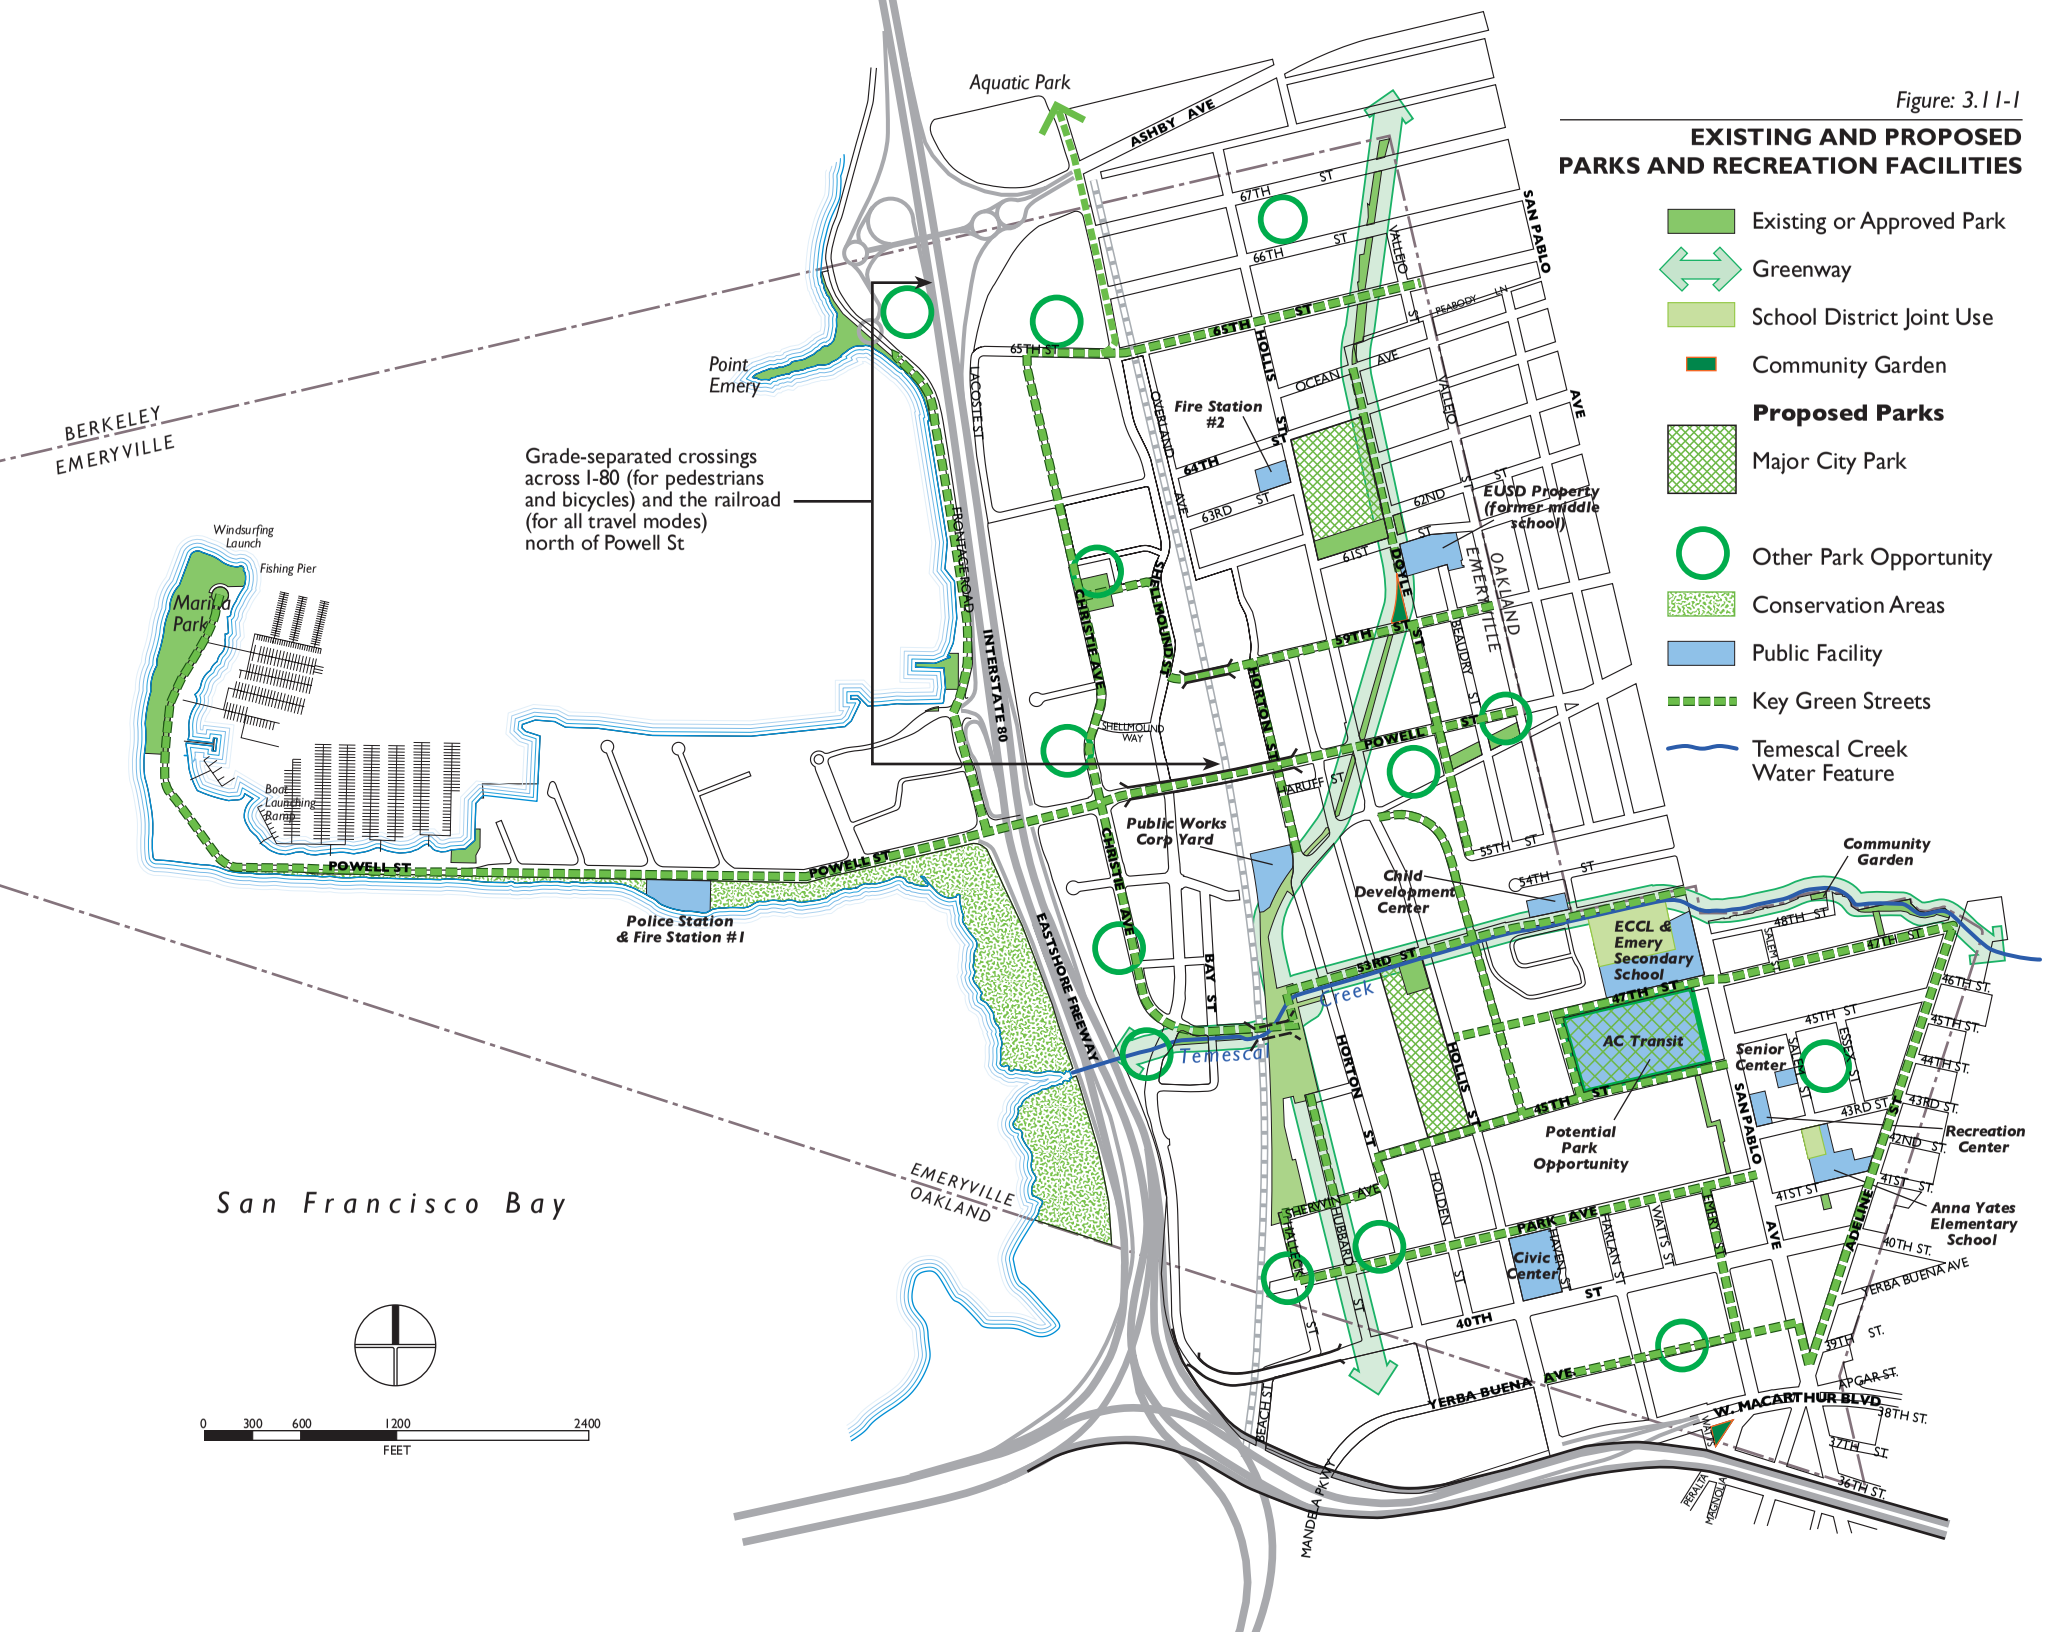
Sea level rise is a global repercussion of climate change; thus the direct influence of Emeryville's GHG emissions on Bay Area sea level rise is impossible to determine with any certainty. Nonetheless, sea level rise is likely to have widespread effects on coastal structures, infrastructure, beaches, wetlands, agricultural lands, and water supply. As discussed in Setting, ~~the San Francisco Bay Area Conservation Commission~~BCDC has modeled the impact of a ~~sea level rise of 3 feet (or approximately 1 meter) on the San Francisco Bay Area~~16-inch sea level rise projection at mid-century and 55-inch projection at end of century. ~~The model has identified areas that would be under water due to sea level rise; the areas do not include Emeryville. Therefore the development proposed under the General Plan along the shoreline in Emeryville would not be subject to the risk of flooding from sea level rise.~~ The mid-century projection shows vulnerable areas along the shoreline of the Emeryville Crescent and peninsula, but does not suggest vulnerability to structures or urbanized areas. (The BCDC/USGS model compares the sea level rise scenario to land-surface elevation data and does not account for shoreline protection; therefore the area south of 64th Street and west of I-80 does not account for the at-grade freeway barrier.) The 2100 scenario, projecting 55-inch sea level rise could have implications for Emeryville's urban area, but lies beyond the scope and planning horizon of the proposed General Plan. However, General Plan policies, along with the City's Climate Action Plan, commit the City of Emeryville ~~will~~to monitor the climate change effects and implement any measures necessary to reduce any risk of flooding from sea level rise in the future. ~~The impact would be less than significant (Also refer to Impact 3.13-7).~~

Because many of the risks from these hazards are unknown (tsunamis) and subject to change over time (sea level rise), the City has committed through General Plan policies and other City initiatives and regulations to reduce the impacts of these threats. As discussed in Impact 3.5-4 above, storm drainage facilities and stormwater control measures would minimize any adverse flooding effects.

~~Adherence to the proposed General Plan policy listed above ensures the potential impact is less than significant.~~



Proposed General Plan Policies that Reduce the Impact



New Policy:	The City will cooperate with State and federal agencies to address flooding risks due to dam inundation, tsunamis, sea level rise, or major flood events.
CSN-P-13	The City promotes construction and incorporation of cisterns, green roofs and other rainwater harvesting methods in existing, new and rehabilitation projects.
CSN-P-38	The City will continue to require development projects to implement on-site stormwater management measures through the City's development permit process.
CSN-P-39	Storm drains shall be maintained, and replaced or upgraded as needed to reduce potential flooding.
CSN-A-8	Cooperate with appropriate government agencies and public and private organizations to address seismic hazards and flooding risks due to dam inundation, tsunamis, sea level rise, or major flood events.
CSN-A-9	Implement and update emergency management operations plan, including evacuation routes, cache of supplies, training of City staff, as necessary, as the city continues to develop.

Adherence to established regulations, the Climate Action Plan and the proposed General Plan policies listed above, ensure the potential impact is less than significant.

Mitigation Measures

None required.

4.1 COMPARATIVE IMPACT ANALYSIS

LAND USE AND HOUSING

Table 4.3-1 shows land use by acreage at full buildout in each alternative. The alternatives differ in the amount of land dedicated to residential and non-residential uses, as well as the density and intensity of development.

The comparison of alternatives with respect to land use is summarized below. None of the alternatives would divide an established community or displace substantial numbers of existing housing or people. Because all development is infill in Emeryville, all developments will result in the same amount of land devoted to urban uses. None are expected to create any significant land use incompatibilities. Because there are no agricultural lands in Emeryville, no agricultural land would be converted.

- *Alternative 1: Mixed-Use City.* Alternative 1 devotes more land to employment uses such as office and retail space than the proposed General Plan. This comes at a comparative loss of residential developments, with this approach providing nearly 1,000 fewer units than in the proposed General Plan. Alternative 1 would result in a jobs/employed residents ratio of 3.1.
- *Alternative 2: Neighborhood Centers.* Alternative 2 has the largest increase in housing and population, accommodating 13 percent more housing than the proposed General Plan and resulting in the most development overall compared with the other alternatives. This comes at a comparative loss of employment, with 2,000 fewer jobs than in the proposed General Plan. This alternative would result in the most balanced jobs/employed residents ratio of 2.0.

- *No Project.* The No Project alternative would result in fewer housing units, fewer jobs, and the smallest population of all proposed alternatives. The No Project alternative would also result in the least dense development. However, jobs and housing would both increase, indicating that any jobs or homes lost to redevelopment could relocate within Emeryville. Further, the No Project alternative would not make as many changes in terms of increasing connectivity. Finally, the No Project alternative would result in the highest job/employed residents ratio, 3.3, as compared with the proposed General Plan and other alternatives.

Table 4.3-1: 2030 Buildout of Alternatives

Land Use	*Proposed General Plan*	*Alternative 1*	*Alternative 2*	*No Project*
Residential (Units)	9,800	8,900	11,700	7,505
Retail (SF)	3,083,000	3,345,000	2,833,000	3,149,000
Hotel (SF)	775,000	913,000	597,000	615,000
Office (SF)	7,255,000	8,052,000	6,812,000	6,806,000
Industrial (SF)	3,353,000	3,511,000	3,805,955	4,095,000
Parks (acres)	49	30	41	23
Total (SF)[1]	26,716,000	26,946,000	28,672,955	24,046,250

1. Total square footage excludes parks, but includes residential units (assumes 1,250 sf/unit)

Source: Dyett & Bhatia, 2008.

- *Alternative 2.* Alternative 2 would result in 1,900 more housing units and 3,300 more new residents than the proposed General Plan, but 2,000 less jobs. The estimate of 1.136 million VMT under Alternative 2 is the lowest of any alternative, including the proposed General Plan. Therefore, the demand for transportation energy is the least of any alternative. Further, due to the larger population in Alternative 2, the per capita use of transportation energy is 18 percent less than in the proposed General Plan. Electricity and natural gas use would be higher than under the No Project, but slightly less than under the General Plan, and considerably less than Alternative 1. Alternative 2 would also result in the lowest per capita GHG emissions of any alternative, due to the focus on housing, resulting in a greater jobs-to-housing ratio and the lowest overall VMT. Finally, the energy-saving and GHG reduction policies implemented under the proposed General Plan would apply to Alternative 2, reducing energy demand and GHG emissions further.
- *No Project.* The No Project alternative would result in 2,300 fewer housing units, 3,900 fewer residents, and 1,000 fewer jobs than the proposed General Plan. However, the VMT in the No Project scenario is higher than in the proposed General Plan and Alternative 2, at approximately 1.174 million. Therefore, the No Project alternative would result in the second highest overall demand for transportation energy, behind Alternative 1. The lower growth in jobs and population would result in the lowest electricity and natural gas use of any alternative. Finally, the No Project would result in the lowest GHG emissions, though when considering the smaller population, the per capita GHG emissions are actually the highest of all alternatives. The No Project alternative is the only alternative that would not include the energy-saving and GHG reduction policies implemented under the proposed General Plan. However, the Emeryville CAP includes many of these measures and would result in lower energy use and GHG emissions than shown in this analysis.

4.4 CONSIDERATION AND DISCUSSION OF THE ENVIRONMENTALLY SUPERIOR ALTERNATIVE

CEQA Guidelines (Section 15126.6(e)(2)) require the identification of an environmentally superior alternative among the alternatives analyzed. Although the environmental superiority can vary depending on the topic, or even depending on analysis criteria for the same topic, overall the proposed General Plan represents the environmentally superior alternative.

~~Because CEQA requires identification of an environmentally superior alternative,~~ The No Project Alternative, because of the lower amount of growth and the resulting lessening of adverse impacts, would be environmentally superior. The No Project scenario would result in lower population and job growth—and consequently reduced impacts—in several topic areas, such as noise, public services and utilities, and traffic. However, CEQA Guidelines mandate that if the No Project alternative is identified as the environmentally superior alternative, then another environmentally superior alternative must be identified, among the other alternatives and the Project. Even so, the No Project Alternative has several tradeoffs that make it less appealing compared with the other alternatives, namely enabling the highest jobs/employed residents ratio (3.3), thereby continuing the city's imbalance between jobs and housing; and the lowest provision of parks and aesthetic improvements.

The proposed General Plan represents the environmentally superior alternative because it minimizes impacts while achieving the goals and guiding principles developed by the General Plan Steering Committee. In particular, the proposed Project focuses development at key nodes and around transit hubs, and improves the balance of job and residential growth, lessening the strain on public facilities. Notably, it provides the most amount of parkland compared with the rest of the alternatives. Alternative 2: Neighborhood Centers shows results similar to the proposed General Plan, even reducing impacts to traffic, air quality, and energy usage. But, it has greater impacts on public facilities and services due to a larger residential population. Table 4.4-1 summarizes the relative impacts for each alternative, for all of the topics discussed in this chapter. Quantitatively, the proposed General Plan appears on par with the No Project Alternative, as shown in the "Total" column; however, qualitatively, the proposed General Plan satisfies the Plan's overarching goals. Alternative 1 and 2 both score higher (worse) in terms of their relative impacts.

Since all new development in the city will result from infill development—the redevelopment of existing sites—each alternative expects development on the same set of sites. Therefore, impacts are no different for many issue areas, including biological resources, hydrology, and geology. Likewise, there is no difference in displacement impacts due to land use changes. For the topics where significant impacts have been identified—traffic, noise, and air quality—differences between the alternatives and the proposed General Plan are negligible in a program EIR. For each of these topics, the result is still a significant and unavoidable impact.

Table 4.4-1: Comparison of Impacts				
Topic	*Proposed General Plan*	*Alternative 1*	*Alternative 2*	*No Project*
Land Use and Housing	-	-	-	-
Traffic, Circulation, and Parking	2	4	2	1
Hazardous Materials and Toxics	-	-	-	-

Appendix A: Revisions to the Draft General Plan

This Final EIR document responded to comments on the Draft EIR and, subsequently, identified relevant changes to the Plan and Draft EIR. In addition to these changes, the General Plan and Zoning Update Steering Committee and/or City staff made some additional minor changes following several meetings:

- Public Open House (February 7, 2009)
- Joint City Council/Planning Commission Study Session (February 21, 2009)
- Steering Committee Meetings (April and June 2009)

The table below describes changes made to the proposed Emeryville General Plan. Many of these changes were also discussed in Chapter 3: Response to Comments on the Draft EIR and documented in Chapter 4: Revisions to the Draft EIR. It is organized by chapter/element and only reflects substantive changes. (Typos, formatting, clarifications, and updated cross-references are not recognized in the table.) Statements in **bold**, are followed by actual General Plan text and/or edits. Page, table, figure, goal, and policy numbers refer to the numbers in the January 2009 Public Review (PR) Draft. August 2009 Hearing Draft (HD) are shown in italics and parentheses, where different.

Revisions to the Draft General Plan

Chapter- PR Page (HR Page)	*Table/ Figure*	*Correction*
Introduction		
1-3		**Deleted specific park reference from Guiding Principle #3:** ~~Two large new parks are proposed in the General Plan, as described in Chapter 4: Parks, Open Space, and Public Facilities, and Figure 4-1.~~
1-11		**Corrected redevelopment project area expiration dates:** However, the 1976 Project Area will expire in ~~2016~~2019, and the Shellmound Project Area will expire in ~~2027~~2028, both during the General Plan period.
1-12		**Expanded discussion of fiscal sustainability and balanced amidst changing economic conditions:** This multi-faceted land use approach will allow the city to be flexible and resilient as market conditions change. An analysis of projected General Fund revenues illustrates the benefit of this mix of uses.
1-16	Fig. 1-2	Updated figure to include Emery Bay Village in Eastern Residential Neighborhoods.
1-17	Fig. 1-3	Updated figure to expand boundaries of San Pablo Urban Design Guidelines.
1-18		**Corrected redevelopment project area expiration dates:** The older of the two, the 503-acre 1976 Project Area, will be operational until ~~2016~~2019, the 270-acre Shellmound Project Area until ~~2027~~2028.

Chapter- PR Page (HR Page)	*Table/ Figure*	*Correction*
1-19	Fig. 1-4	Updated figure to include redevelopment area boundaries in the Bay.
Land Use		
2-8	Tab. 2-2	**Expanded explanation of "Loss of Existing Due to Redevelopment:"** This value reflects existing underutilized properties that ~~will~~may be replaced by new uses. This is an accounting measure that estimates the proportion of existing development that may be redeveloped on each site in an area of change. Table updated to reflect rounded numbers and modification of residential units lost to zero.
2-9	Chart 2-5	Updated chart to include the 2030 projection for jobs/employed residents ratio.
2-11	Fig. 2-2	Updated Land Use Diagram figure to: • Extend Mixed Use with Residential designation along Doyle Street (north of 64th Street and south of 61st Street). • Change northwest corner of Powell Street and Frontage Road to Mixed Use with Non-Residential. • Add community gardens and Stanford, Oak Walk, and Christie parks. • Amend southern park to bound 53rd, Holden, Hollis, and 45th streets. Amend opposite parcel east of Hollis Street to Office/Technology, and the northeast and southwest corners of Holden and 45th streets asMixed Use with Residential. • Add AC Transit site at 47th Street and San Pablo Avenue as a potential park opportunity.
2-12		**Clarified what is permitted in the Industrial classification:** A range of industrial and high technology uses, including light manufacturing, repair, testing, printing, service commercial, and biotechnology uses. Live/work is appropriate east of Hollis Street. "Heavy" live/work uses (e.g. work involving manufacturing, welding, and assembly) will only be allowed, west of Hollis Street. ~~West of Hollis Street, north of 65th Street, general manufacturing uses are permitted. East of Hollis Street, new general manufacturing uses are not permitted, but~~ General manufacturing uses are permitted west of Hollis Street, north of 65th Street. East of Hollis Street, new light industrial uses are permitted, but new general manufacturing uses are not. Existing general manufacturing uses can continue as conforming uses with performance standards for noise, air quality, and truck traffic, to safeguard adjacent residential uses. Unrelated retail and commercial uses that could be more appropriately located elsewhere in the city are not permitted, except for offices, subject to appropriate standards, and in Neighborhood Retail Overlay areas (i.e., North Hollis).
2-13		Updated explanation of base and bonus FAR. See new section under the heading "Density/Intensity."

Chapter- PR Page (HR Page)	*Table/ Figure*	*Correction*
2-14	Fig. 2-3	Updated FAR figure to: • Streamline base/bonus FARs into five categories (except for already established Planned Unit Developments) • Reduce FAR in Eastern Residential Neighborhoods' FAR to 0.75/1.0, base and base with bonus. • Increase FAR between San Pablo Avenue and Adeline Street, south of 40th Street to 3.0/4.0, base and base with bonus. • Increase FAR between Peabody Lane, and Vallejo, Doyle, and 65th streets, to 1.5/2.0, base and base with bonus.
2-16	Fig. 2-4	Updated Building Heights figure to: • Streamline base/bonus building heights into five categories (except for already established Planned Unit Developments) • Increase height between San Pablo Avenue and Adeline Street, south of 40th Street to 55/75 feet, base and base with bonus. • Increase height between Peabody Lane, and Vallejo, Doyle, and 65th streets, to 55/75 feet, base and base with bonus.
2-17	Fig. 2-5	Updated to show revised southern park site (bounded by 53rd, Holden, Hollis, and 45th streets).
2-18	Fig. 2-6	Updated Residential Densities figure to: • Streamline base/bonus residential densities into five categories. • Increase density between San Pablo Avenue and Adeline Street, south of 40th Street to 50/60 units/acre, base and base with bonus. • Increase density between Peabody Lane, and Vallejo, Doyle, and 65th streets, to 85/100 units/acre, base and base with bonus. • Remove parks and non-residential sites; add new residential opportunities that result from changes to the Land Use Diagram. • Increase lowest residential density category to 20/35 units/acre, base and base with bonus, to reflect existing regulations.
2-19		**Revised bonus program criteria:** • Public Parking. <u>All or a portion of</u> publicly accessible parking <u>will be excluded from FAR calculations and may be counted towards height and density bonuses</u>. . . . • ~~Exceptional Design.~~ **Added statement to remove exceptional design as bonus criteria, but maintain for findings:** <u>Bonuses are discretionary and contingent on excellence in design.</u>
2-20		**Amended goals:** LU-G-13 Local employment opportunities—encourage establishment of businesses that will employ <u>and serve</u> Emeryville residents.

Chapter- PR Page (HR Page)	*Table/ Figure*	*Correction*
2-21		**Inserted new policy:** • Zoning performance measures will ensure health and safety compatibility for industrial uses bordering residential uses.
2-22		**Amended policy:** LU-P-18 (*LU-P-19*): The area around the Amtrak station shall be developed with <u>pedestrian and bicycle amenities, and</u> transit-supportive uses, through measures such as reduced parking requirement, incorporation of public parking in developments, and accounting for transit proximity when considering height and FAR bonuses.
Transportation		
3-6, 3-9, 3-12, 3-16	Fig. 3-1, 3-2, 3-4, 3-6	Updated figures to: • Create a bike/pedestrian path extending Christie Avenue, north of 65th Street, and connecting to 67th Street. • Add a bike/pedestrian path just west of San Pablo Avenue, between 45th and 47th streets. • Add a pedestrian priority zone to the AC Transit site at 47th Street and San Pablo Avenue and the revised southern park location.
3-15		Move entire Street System section (Section 3.6) after Section 3.2: Circulation. Add a new map and discussion to this section, designating regional retail routes.
3-17		Added truck routes figure to Section 8: Goods Movement.
3-20 (*22*) through 3-23 (*26*)		**Inserted new policies:** • *T-P-7:* The City shall continue to study and evaluate appropriate traffic and transportation improvements. • *T-P-9:* The City will work with Caltrans and the City of Berkeley to develop improvements to the Ashby Interchange. • *T-P-30:* The City will undertake a study to enhance transit mobility, including feasibility of transit-only lanes (dedicated, peak-hours only/shared with automobiles at other times, or converted from parking lanes to transit-only during peak hours), especially along congested transit streets, to provide walking access from most of the city, and connect major destinations within Emeryville and to BART. • *T-P-35:* The City will support the expansion of the Emery Go-Round to accommodate workers, residents, visitors. **Amended policy:** T-P-57 (*T-P-61*): Truck freight movement will be accommodated to and from local businesses, consistent with the typologies described in this chapter. <u>Through truck traffic is discouraged.</u>
Parks, Open Space, Public Facilities, and Services		
4-6, 4-8, 4-9		Emery Unified and Emeryville Center of Community Life discussion updated per comments from School Board and City/Schools Committee, respectively.

Chapter- PR Page (HR Page)	*Table/ Figure*	*Correction*
4-2		**Emphasize that open spaces will accommodate active and passive uses:** The General Plan proposes several different park types to accommodate the needs of present and future residents, workers, and visitors and to create a cohesive network of open spaces. The proposed strategic master plan will outline recommended programming for both active recreation and passive park use. A general framework is described here:
4-7	Fig. 4-1	Updated figure to: • Add community gardens and Christie Park • Shift "Key Green Street" on the Peninsula from the pedestrian path to Powell Street. • Amend southern park to bound 53rd, Holden, Hollis, and 45th streets. • Add AC Transit site at 47th Street and San Pablo Avenue as a potential park opportunity.
4-12		**Add discussion of Community Emergency Response Training:** The Community Emergency Response Team (CERT) Program educates people about disaster preparedness for hazards that may impact their area and trains them in basic disaster response skills, such as fire safety, light search and rescue, team organization, and disaster medical operations. Using the training learned in the classroom and during exercises, CERT members can assist others in their neighborhood or workplace following an event when professional responders are not immediately available to help. CERT members also are encouraged to support emergency response agencies by taking a more active role in emergency preparedness projects in their community.

Chapter- PR Page (HR Page)	*Table/ Figure*	*Correction*
4-15		Reordered policies P-1 through p-13. **Amended policies:** PP-P-4 (*P-P-2*): Two new large parks (five acres or larger), one each north and south of Powell Street, shall be provided. Active recreation uses will be a component of these parks. The northern park site is bounded by 61st, 64th, Hollis, and Doyle streets. There are two potential southern park sites: • One potential southern park site is shown on the PG&E site on Hollis Street, between 45th and 53rd streets. On this site, consideration shall be given as to how to incorporate the existing buildings, which are rated Tier 1 and Tier 2 in the Park Avenue District Plan, into future park uses. • The second potential southern park site is located at the AC Transit bus yard between 45th and 47th streets, adjacent to the proposed Center of Community Life. Should this site become available, the city shall explore the possibility of a public park—along or with other public uses. If a large park at this site is feasible and is considered desirable, all or part of the PG&E site may no longer be needed for a public park. PP-P-6 (*PP-P-9*): Shading of parks and green streets ~~located adjacent to~~by buildings will be minimized. PP-P-12 (*PP-P-13*): Open spaces that have deteriorated, have design features that limit access and use opportunities, and/or are in need of activity ~~and revitilization~~shall be revitalized.
4-16		**Inserted new policies:** *PP-P-24*: The City will support community involvement in disaster preparation and response through the Fire Department's Community Emergency Response Training program. *PP-P-27*: The City will continue to cooperate with EBMUD, the Regional Water Quality Control Board, and other relevant agencies to adopt and implement programs and policies to further reduce inflow and infiltration (I&I) of storm water in the City's wastewater collection system and private sewer laterals during wet weather events. *PP-P-28*: The City will continue to require development projects to replace or upgrade as needed, sanitary sewer systems serving the development site to reduce inflow and infiltration (I&I) of stormwater in the City's wastewater collection system and private sewer laterals during wet weather events.
Urban Design		
5-4	Fig. 5-1	Updated figure to: • Reflect land use and park location changes • Add a gateway at 53th and San Pablo Avenue
5-6		Expand discussion of North Bayfront and Powell/Christie core as a mixed-use transit-oriented district.
5-6 through 5-9		Amended 3D graphics to include street labels, north arrows, and correct district boundaries.

5-12, 5-14	Fig. 5-4	Updated active frontage street discussion to encompass all streets. Removed accompanying map which only specified certain streets.
5-19 (*18*)		Updated tower spacing discussion: ~~Because full-block development at lower floors will be permitted in many places in Emeryville, large floor plates are permitted for building bases.~~ To ensure generous light and views, upper floors will be stepped back, and towers will be slender and spaced apart. ~~However, in several sections of the city bulkier buildings at upper levels are allowed to accommodate employment-oriented uses.~~
5-26 (*25*) through 5-31 (*30*)		Inserted photo simulations of six intersections/areas of the city, illustrating how urban design concepts could be carried out, to improve the public realm and overall quality of life.
5-35		Updated gateway discussion to add the entry point at San Pablo Avenue and 53rd Street as a gateway and encourage additional signage at other entry points to the city, such as Hollis and 67th streets.
5-38		**Inserted new policy:** *UD-P-19:* Infill development shall provide activation at the lot frontage and minimize visible off-street parking.
5-40 (*39*)		**Amended policies:** UD-P-25 (*UD-P-26)*: Commercial uses, such as retail, restaurants, hotel lobbies, and offices, shall be required at the ground level ~~along Active Frontage Streets~~ <u>in neighborhood centers and regional retail overlay districts.</u> UD-P-26 (*UD-P-27)*: ~~Development shall be brought to the street edge, on Active Frontage Streets, locating parking in the rear.~~ <u>All ground-level street frontages should be activated. Driveways, loading zones, and curb cuts shall be provided but minimized.</u>
5-41 (*40*)		**Amended policy:** UD-P-45 *(UD-P-46)*: <u>Street trees shall be provided on City streets where feasible.</u> Street trees shall be planted in a row along the curb, between the vehicle roadway and sidewalk, unless this is physically impossible due to constraints such as underground water or sewer lines.
5-43 (*42*)		**Amended policy:** UD-P-60 *(UD-P-61)*: Above-grade parking structures should be wrapped with active uses in Pedestrian Priority Zones ~~and along Active Frontage Streets.~~
Conservation, Safety, and Noise		
6-4		**Described graywater systems:** <u>Graywater — water that comes from sinks, showers, and washing machines — may be reused on-site to flush toilets and irrigate non-edible landscape plants.</u>
6-5		**Updated special species discussion:** <u>Additional species that have the potential to occur in the city include: Coopers Hawk, Sharp-shinned Hawk, and the Peregrine Falcon.</u>
6-18 through 6-20	Fig. 6-7	Updated flood zone discussion and dam inundation map to reflect the recently released Federal Emergency Management Agency's flood zones maps. Updated sea level rise discussion and added new figure showing 16-inch potential sea level rise scenario.

6-26 (*25*)	Fig. 6-10	Updated figure to reflect changes in assumptions about future railroad use.
6-27		**Amended goal:** CSN-G-5: Preservation and protection of natural resources—Preservation and enhancement of natural habitat, and protection of biological resources, particularly around the Emeryville Crescent. **Inserted new goal:** *CSN-G-5*: Ambient noise reduction—Strive to minimize increases in ambient noise levels.
6-28		**Inserted new policy:** *CSN-P-15*: The City shall consider revising plumbing and building code requirements, as necessary, to allow for graywater and rainwater harvesting systems.
6-29		**Amended policies:** CSN-P-17 (*CSN-P-18)*: The City will ~~protect~~encourage protection of essential habitat for special status ~~wildlife~~species ~~and the seven special status plant species~~ and ~~will~~support habitat protection and enhancement ~~and open spaces~~within Emeryville that are within the City's control. CSN-P-18 (*CSN-P-19)*: The natural environment, including mature trees and landscaping, shall be protected from destruction during new construction and redevelopment. Adequate replacement shall be provided where protection is impossible. CSN-P-21 (*CSN-P-22)*: Provide visual, and where practical, physical, access to the Emeryville Crescent in a manner consistent with the protection of this fragile ecological system. Improvements to the Bay Trail in the Emeryville Crescent must be consistent with habitat protection.
6-29		**Inserted new policies:** • *CSN-P-23:* Where new trails or other improvements are proposed in the vicinity of the baylands and essential habitat for special-status species, require adequate avoidance and mitigation necessary to protect sensitive resources. • *CSN-P-24:* The City shall explore opportunities for habitat restoration and enhancement, particularly in larger parks and open space areas. • *CSN-P-31:* In order to reduce light pollution and use less energy, lighting (including on streets, recreational facilities, and in parking areas) should be designed to prevent artificial lighting from illuminating natural resources or adjacent residential neighborhoods.

6-30		**Amended policy:** CSN-P-32: Prior to reuse, ~~former commercial and industrial~~development sites and utility corridors servicing development will be ~~cleaned up~~remediated, according to relevant State and federal regulations. **Inserted new policies:** • *CSN-P-44:* The City will cooperate with State and federal agencies to address flooding risks due to dam inundation, tsunamis, sea level rise, or major flood events. • *CSN-P-49:* Noise impacts should be controlled at the noise source where feasible, as opposed to at receptor end. This includes measures to buffer, dampen or actively cancel noise sources. • *CSN-P-54:* The City will work with the California Public Utilities Commission, other pertinent agencies and stakeholders to determine the feasibility of developing a railroad quiet zone in Emeryville. • *CSN-P-55:* The City shall require noise buffering, dampening, or active cancellation, on roof-top or other outdoor mechanical equipment located near residences, parks, and other noise sensitive land uses. • *CSN-P-56:* The City shall limit the potential noise impacts of construction activities on surrounding land uses through Noise Ordinance regulations that address allowed days and hours of construction, types of work, construction equipment, notification of neighbors, and sound attenuation devices.
Sustainability		
7-22 (*24*)		Update green building and construction discussion and accompanying text box to reflect Bay-Friendly Landscaping policies.
7-30 (*33*)		ST-G-8: Environmentally-friendly and energy-efficient buildings and landscaping—Green building and Bay-Friendly Landscaping practices throughout Emeryville in new construction, redevelopment and retrofit projects.
Implementation		
8-3		Inserted the City Manager's responsibilities
8-9		Inserted the General Plan annual report to the State, as an action item.
8-16	Tab. 8-3	**Amended action item:** PP-A-12 (*PP-A-13):* Work with other public agencies, including PG&E, AC Transit, Amtrak, the Post Office and the School District and local neighborhoods on appropriate land uses for ~~school~~sites no longer needed ~~for educational purposes~~by the respective public agency. **Inserted new action items:** *PP-A-12:* Continue to operate the Community Emergency Response Team (CERT) Program. *PP-A-14:* Continue to require development projects to replace or upgrade sanitary sewer systems.

8-19	Tab. 8-5	**Amended action item:** CSN-A-8: Cooperate with appropriate government agencies and public and private organizations to address seismic hazards and flooding risks due to dam inundation, tsunamis, sea level rise, or major flood events.
8-20	Tab. 8-5	**Inserted new action item:** *CSN-A-19:* Coordinate with the Public Utilities Commission and other public agencies to develop railroad quiet zones

1 INTRODUCTION & OVERVIEW

Emeryville, one of the smallest cities in California, covers an area of 1.2 square miles. It is located between Berkeley to the north, Oakland to the south, and the San Francisco Bay to the west. At the eastern end of the San Francisco Bay Bridge, Emeryville is the gateway to the East Bay.

Emeryville was incorporated in 1896 as a city of industry and business at transportation cross-roads. After several decades of decline as major industries closed and relocated, Emeryville has remade itself into a dynamic mixed-use community, home to global leaders in film-making, biotechnology, software, and other high-tech industries; an incubator for entrepreneurs and innovation; a retail and entertainment destination, with flourishing arts, food, and culture; and a growing residential community.

This General Plan is designed to guide growth and development. The Plan focuses on enhancing livability and quality of life for the city's expanding population; fostering responsible sustainable development; increasing connectivity; and enhancing the public realm. The General Plan articulates a vision for the City focusing on broad objectives such as "quality of life" and "community character." It also sets forth actions to be undertaken by the City to achieve those goals. It is clear that such broad objectives can only be attained if they are translated into actions that are tangible and that can be implemented. At the same time, it is also recognized that this General Plan is indeed general in nature, allowing for flexibility and evolution. It can thus be anticipated that changing times, challenges, opportunities, market conditions, and fiscal realities may necessitate amendments to this General Plan. Nonetheless, amendments should be undertaken thoughtfully and without losing sight of the overall vision expressed in this document.

1.1 GUIDING PRINCIPLES

The Guiding Principles are at the heart of the General Plan. Collectively, they express a community vision for Emeryville's evolution from a center of commerce into a livable and diverse city. These Principles provide the platform for the goals, policies, and actions of the Plan. They have been crafted with input from the community, and respond to specific opportunities and challenges.

GUIDING PRINCIPLES

1. A cohesive city of distinctive districts and livable neighborhoods

Emeryville's growth is shaped—through land use, urban form, and design—to create a tapestry of distinctive districts, and neighborhoods with a full complement of uses and easy access to parks, stores, and other amenities of everyday living. Development intensities are designed to maximize accessibility to amenities, and provide transition in scale and height to lower-density neighborhoods.

2. A connected place

The General Plan fosters new connections—for automobiles, pedestrians, and bicyclists—between the western and eastern halves of the city; better connections to the Peninsula; and new and safe pedestrian and bicycle linkages to the San Francisco Bay. The Plan also seeks to provide more transportation choices. Protecting vistas of the San Francisco Bay and the East Bay Hills will visually connect the city with the surrounding region.

3. Enhanced and connected open space network and green streets

The General Plan outlines strategies for an expanded public realm, building on the strength and connectivity of the city's greenways, with a range of new parks, plazas, community commons, and recreational paths.[1] Open space is strategically located to maximize accessibility and building forms are organized to ensure that sunlight reaches streets and parks. Many more trees along streets and enhanced landscaping will provide a greener city.

4. A walkable, fine-grained city, emphasizing pedestrians

The General Plan establishes that all of Emeryville will be easily traversed on foot. A fine-grained pattern of blocks and streets is a fundamental prerequisite of a walkable and accessible city; the General Plan promotes walkability through encouragement of active uses, creation of smaller parcels/blocks and inter-connections as large sites are redeveloped, and improved sidewalks, pathways, and streetscapes. Where larger buildings may be appropriate, these shall be constructed with smaller footprints to preserve views and ensure pedestrian access. Where appropriate, in people-intensive places—such as retail, office, and residential districts—pedestrians will have priority over automobiles, and buildings shall be articulated and designed to visually engage and offer comfort to pedestrians.

5. A diversity of transportation modes and choices

The General Plan fosters and provides incentives for alternative transportation modes, including transit, car/vanpooling, bicycling, walking, and telecommuting. Residents will be able to access stores, offices, the waterfront, or regional transit networks without needing a car. Land uses capitalize on Amtrak, AC Transit, and Transbay bus lines, and proximity to BART, and are integrated with the Emery Go-Round that extends to within walking distance of most locations. Bicycle paths link housing, activity centers, and recreational amenities, and are buffered where feasible from automobiles to further safety.

1 *Greenways are linear parks with pedestrian and bicycle paths, small gathering places, and recreational facilities, either on their own right-of-way or along a street. See Chapter 4: Parks, Open Space, and Public Facilities for more detail.*

The Guiding Principles express a vision for a high-quality of life for residents, businesses, and visitors in Emeryville.

The General Plan seeks to provide a balance of regional and local amenities. Enhancing livability for the growing population is a key General Plan tenet.

6. A vibrant, urban community

Reflecting its strategic location in the heart of the Bay Area, Emeryville will continue as a vibrant community, with cultural offerings, and urban amenities. Active gathering spaces will be encouraged, and streets designed for pedestrian comfort, walking, and enjoyment. Higher intensities will support a range of amenities while furthering regional goals of promoting infill development, supporting transit, and curtailing sprawl. Emeryville will maintain its small-town ambiance through civic engagement, accessible government, and amenities and services for appropriate future residential and worker populations.

7. A diverse, balanced, and inclusive community

The General Plan embraces physical, social, and economic diversity, and strengthens the community with facilities and programs such as the Center of Community Life and a cultural center in the Park Avenue District. The Plan supports increased residential development to provide a more balanced use mix, sufficient concentration of residents/office workers, increased support for local-serving amenities, and opportunities for more workers to live in the city and enjoy shorter commutes, while recognizing that the City's employment primacy is likely to remain, given its history as an employment center. The Plan furthers a variety of housing types and emphasizes family-friendly housing, and linkages to Emeryville's school system to promote the success of its youth and to encourage new residents to actively contribute to the community.

8. A balance of regional and local amenities

Given its location, Emeryville will remain a regional destination. However, the City will balance retail uses that draw visitors from throughout the region, with stores and amenities that serve neighborhood needs, while ensuring fiscal health and a sustainable economy. The General Plan emphasizes development of pedestrian-oriented and scaled (rather than auto-oriented) districts and policies to ensure that development provides benefit for the local community, and that small, often local, businesses are viable.

9. Sustainability and innovation, with respect for the past

The Emeryville community strives to live within means that do not compromise the ability of future generations in Emeryville to enjoy a livable, healthy, and vibrant city. The Plan encourages redevelopment of contaminated land as a healthy and cost-effective way of improving the local environment, use of "green" construction techniques, and a lifestyle with low ecological impacts upon energy consumption, climate, and the natural environment. The City will interweave the future and the past, while respecting the scale, character, and use of the historical Doyle and Triangle neighborhoods and other districts.

10. An imageable and memorable city

The City will foster high-quality new construction of exceptional design while preserving and enhancing the best of existing buildings and neighborhoods. The City will foster a dramatic skyline of slender and elegant high rise buildings stepping down to low-rise buildings in the older residential neighborhoods. Enhance the experience of entering Emeryville with attractive and appropriate streetscape improvements along major regional and city arterials. Collectively, these elements serve to foster Emeryville's character as a vibrant, connected, livable community, and a rising signature city from afar and within.

1.2 PUBLIC PARTICIPATION IN PREPARING THE PLAN

The Guiding Principles and this General Plan are the product of a four-year relationship among community members and stakeholders to develop a Plan that reflects the goals and desires of the community. Public participation was structured for each phase of the planning process: issue identification, vision and goal setting, alternatives analysis, and synthesis of ideas and policies. During each phase, participants were asked for ideas and input through: public workshops and meetings; targeted outreach to youth; General Plan Steering Committee meetings; workshops with the City Council and Planning Commission; a project website; newsletters and media coverage; and a citywide survey. Interim products were disseminated through the project website and study sessions with City Council and Planning Commission.

Central to the process was the 16-member Steering Committee that shepherded the process and shaped the Plan. The Steering Committee's charge to consider input from the broader public was accomplished by a series of public workshops where residents and other stakeholders weighed in on issues and recommendations. The Planning Commission and the City Council were involved at all key stages in the process. Community members also had opportunities to comment during these public meetings. Because of the participation of hundreds of people, the General Plan comprehensively responds to the needs of the wide variety of stakeholders and the vision of urban culture articulated by the Guiding Principles.

1.3 SCOPE AND PURPOSE OF THE GENERAL PLAN

General Plan Purpose

The General Plan governs all City actions relating to Emeryville's physical development. The General Plan is mandated by and derives its authority from California Government Code Section 65300, which requires each city and county in California to adopt a General Plan, for the physical development of the county or city, and any land outside its boundaries which bears relation to its planning. The Emeryville General Plan is a document adopted by the City Council that serves several purposes:

- To outline a vision for Emeryville's long-term physical and economic development and community enhancement;
- To provide strategies and specific implementing actions that will allow this vision to be accomplished;
- To establish a basis for judging whether specific development proposals and public projects are in harmony with Plan policies and standards;
- To allow City departments, other public agencies, and private developers to design projects that will enhance the character of the community, preserve and enhance critical environmental resources, and minimize hazards; and
- To provide the basis for establishing and setting priorities for detailed plans and implementing programs, such as the Zoning Ordinance, Design Guidelines, the Capital Improvements Program, facilities plans, and redevelopment and area plans.

Community workshops for the general public (top) and targeted to youth (middle) provided opportunities for input that shaped the Plan. The General Plan and Zoning Update Steering Committee on a city tour (bottom).

State law requires that a variety of City actions be consistent with the General Plan so regular ongoing use of the Plan is essential. The Plan is both general and long-range and there will be circumstances and instances when detailed studies are necessary before Plan policies can be implemented.

General Plan Requirements

A city's general plan has been described as its constitution for development – the framework within which decisions must be made on how to grow, provide public services and facilities, and protect and enhance the environment. California's tradition of allowing local control over land use decisions means that the state's cities have considerable flexibility in preparing their general plans.

While they allow considerable flexibility, state planning laws do establish basic requirements about the issues that general plans must address. The California Government Code establishes both the content of general plans and rules for their adoption and subsequent amendment. Together, State law and judicial decisions establish three overall guidelines for general plans.

- *The General Plan Must Be Comprehensive.* This requirement has two aspects. First, the general plan must be geographically comprehensive. That is, it must apply throughout the entire incorporated area and it should include other areas that the City determines are relevant to its planning. Second, the general plan must address the full range of issues that affects the City's physical development.
- *The General Plan Must Be Internally Consistent.* This requirement means that the General Plan must fully integrate its separate parts and relate them to each other without conflict. "Horizontal" consistency applies as much to figures and diagrams as to the general plan text. It also applies to data and analysis as well as policies. All adopted portions of the general plan, whether required by State law or not, have equal legal weight. None may supersede another, so the General Plan must resolve conflicts among the provisions of each element.
- *The General Plan Must Be Long-Range.* Because anticipated development will affect the City and the people who live or work there for years to come, State law requires every general plan to take a long-term perspective. The time horizon for this general plan is approximately 20 years.

1.4 REGIONAL LOCATION AND PLANNING BOUNDARIES

Emeryville is located on the east shore of the San Francisco Bay in Alameda County, bordered by the City of Berkeley to its north and the City of Oakland to the east and south. Interstate 80/580 passes through Emeryville towards Sacramento, running north from the Bay Bridge, while Interstate 580 towards Hayward passes just to its south. Figure 1-1 illustrates the city's regional location.

The city is compact, occupying only 1.2 square miles. Emeryville is largely flat and is distinguished by a peninsula created in the 1960s that extends just over a mile into the Bay.

The planning boundaries for the new General Plan coincide with the city limits, with the exception of a small area to the south of the city that is under a Joint Planning Authority between Oakland and Emeryville. The Eastshore State Park is regulated by the State. Coordination with the surrounding communities will also be required in several areas that affect Emeryville, such as greenway connections to Mandela Parkway, bicycle routes, and Ashby Avenue interchange improvements. Also, the Tom Bates Regional Sports Complex in northwest Berkeley is administered through a Joint Powers Agreement of several cities, including Emeryville.

1.5 EMERYVILLE EVOLUTION

Early Settlement

Before the colonization of the area by Spain in 1776, the Emeryville area was the site of extensive Native American settlements. Mudflats rich with clams and rocky areas with oysters, plus fishing, hunting, and acorns from the local oak trees, provided a rich and easily exploited food source for the residents. They would dispose of their clam and oyster shells in a single place, over time creating a huge mound—the Emeryville Shellmound.

After settlement by Europeans, Emeryville became a city in its own right, largely through the efforts of businessman Joseph S. Emery. Emery came to California in 1850 looking for gold, but eventually started a stonework contracting business in San Francisco. In 1859, Emery purchased a 185-acre tract of land north of Oakland and began to develop projects in the area. A community began to develop around the Emery Tract, and the town of Emeryville was officially incorporated in 1896, taking the name of its founder. The Emeryville town hall was completed in 1903, and still stands as the center for local government today. (For an expanded understanding of Emeryville's history and historical and cultural resources, see Chapter 6.)

FIGURE 1-1

Regional Context

Industrialization

In 1871 Emery financed the construction of the San Pablo Avenue Horse Cart Railroad, which connected Oakland to Emeryville. He was also one of the primary builders of the California-Nevada Railroad, which began in Oakland, crossed the burgeoning Emery Tract, and terminated in Orinda. Emeryville soon became a city of big industrial enterprises and rail terminals. The 1870s also saw the construction of a large horse racing track on the north side of Park Avenue, which operated until 1915, and the amusement center of Shellmound Park, which stood until 1924. Successive years saw further consolidation of industry, including the paint factory of Sherwin-Williams and Shell Development, the research arm of Shell Oil Company. Residential areas remained confined to small portions at the city's eastern edge, bordering Oakland. As the city built out, bay fill was considered viable for creating new land. The Emeryville Peninsula was created in the 1960s by filling shallow water areas with demolition debris.[2]

1970s to Today: A Growing Community

In the 1970s Emeryville's landscape began to change once again as some of the city's older industries had already begun to move to the suburbs or close up shop altogether. The city's first major residential development—the 1,249-unit Watergate Apartments—was completed in 1974. In the mid 1970s Emeryville created parks and a 500-berth marina by filling in 7.8 additional acres of the San Francisco Bay to create a small boat harbor. Multi-story office buildings rose between the Eastshore Freeway and San Francisco Bay. In 1980, the 112-unit Emery Bay Village residential development was added.

With vacant warehouse and industrial space becoming available, Emeryville began to see the development of a community of artists who converted several of the buildings into live/work space. In 1984, a 583-unit housing development—the high-rise Pacific Park Plaza—was completed. Between them, Watergate, Emery Bay Village, and Pacific Park Plaza doubled the city's population to nearly 5,000 residents.

Almost all of the area to the west of the railroad tracks was developed between 1975 and 2005. Retail and office uses in large-scale redevelopment projects, such as Bay Street, IKEA, the Marketplace, and Powell Street Plaza, occupy much of this area. Development to the east of the railroad is more diverse in use, scale, and age. Here, industrial, office, and residential uses are geographically closer to one another. Two large corporate campuses—Novartis and Pixar—occupy much of the area between Park Avenue and Powell Street, along with a Pacific Gas & Electric facility. City Hall and the City's Civic Center are situated nearby, in the historic Park Avenue District, while Emery Secondary School is located East of Hollis. "Big box" retail, including the East Bay Bridge Center, fills the southern end of the city.

CHART 1-1: Historical and Projected Population and Job Trends

Source: US Census and ABAG Projections 2007.

Population and Job Trends

As large tracts of industrial land—originally built at low intensities and supporting many fewer workers per acre of land than contemporary businesses—have continued to be redeveloped, Emeryville's transformation over the past two decades has been dramatic, with substantial increases in employment and population. In one year alone (Jan. 1, 2007 to Jan. 1, 2008), the City's population grew by 6.5 percent—the second highest growth rate in the Bay Area. Chart 1-1 illustrates population and growth since 1990, and projected to 2030, according to the Association of Bay Area Governments. These projections represent a tremendous 150 percent increase in population over the 40-year period. Although employment levels in the City are higher overall, the growth rate is projected to be relatively lower: a still-impressive 93 percent between 1990 and 2030.

1.6 GENERAL PLAN BUILDOUT AND FISCAL SUSTAINABILITY

General Plan Buildout

Full development under the General Plan is referred to as "buildout." The Plan is not intended to specify or anticipate when buildout will actually occur nor does the designation of a site for a certain use necessarily mean that the site will be redeveloped with that use during the planning period. The buildout does give an indication of potential population and employment trends and allows the City to plan for growth accordingly. Table 1-1 describes population, housing unit and job projections according to analyses undertaken for this General Plan. These results project higher levels of population and employment growth compared with the regional government's projections for 2030, described above. In this case, population is projected to grow by 71 percent over the General Plan period to 16,600 residents; housing units are projected to grow to over 9,600 units—a 64 percent increase; and employment growth expected at 46 percent to approximately 30,000 jobs. Refer to Chapter 2: Land Use for a more detailed analysis of the General Plan buildout.

Fiscal Sustainability

Maintaining the fiscal health of the City is essential to ensuring that amenities envisioned in the General Plan can be implemented and sustained. As virtually all of Emeryville falls within a Redevelopment Area, the City is able to raise revenue through tax increment financing and fund major capital improvement projects. However, the 1976 Project Area will expire in 2019, and the Shellmound Project Area will expire in 2028, both during the General Plan period. In addition to redevelopment funds, the mixed-use land use pattern proposed in the Land Use Element creates a

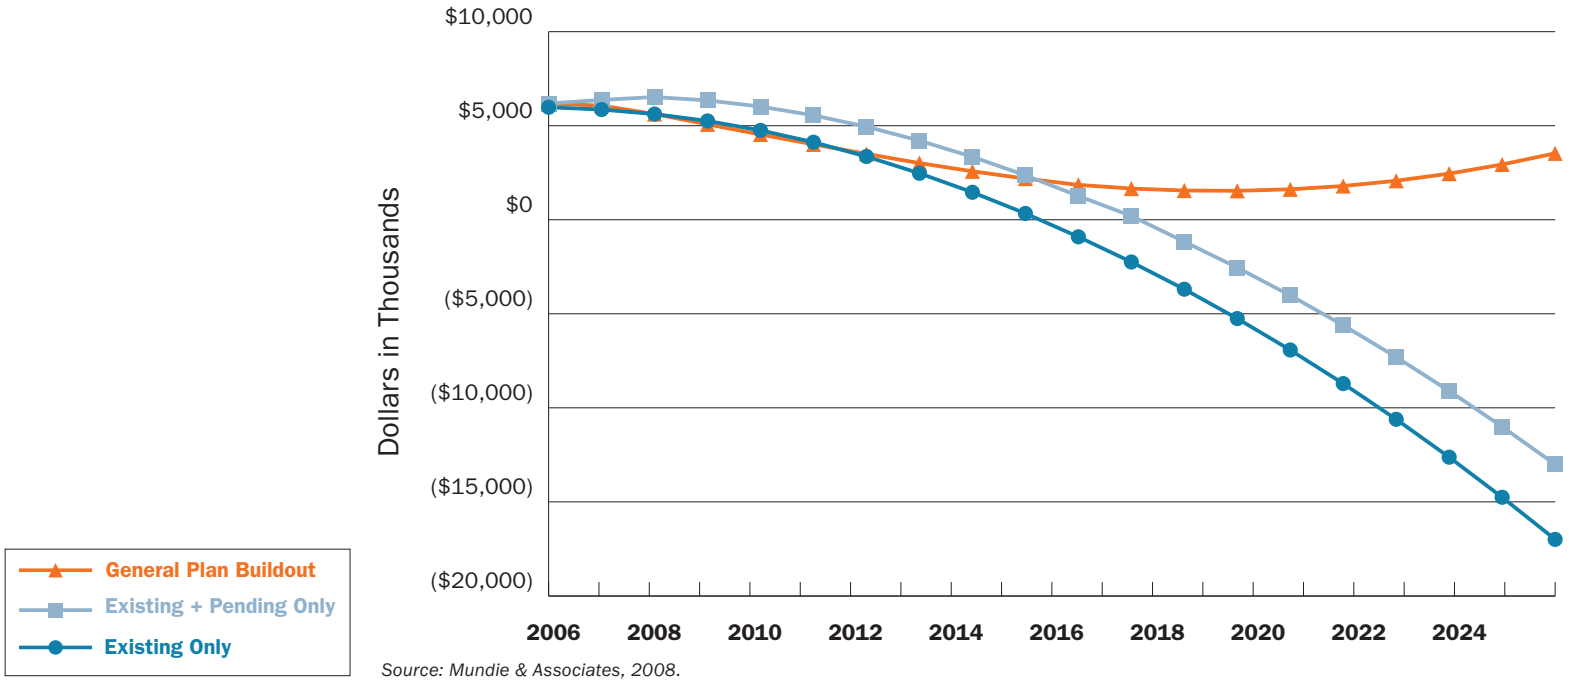
TABLE 1-1: General Plan Development Buildout Potential

	Existing (2008)	Buildout (2030)	Percent Change
Population	9,727	16,600	71%
Housing Units	5,988	9,800	64%
Jobs[1]	20,552	30,000	46%

[1] *Existing 2008 jobs calculated from annual growth rate assumed by ABAG for 2005-2010: 1.5%*

Source: Department of Finance 2008, ABAG Projections 2007, City of Emeryville, Dyett and Bhatia 2008.

The General Plan seeks to maintain the City's fiscal health as Emeryville continues to grow.



diverse revenue stream (from sales, transient-occupancy, and other taxes) that will allow for the City to fund community amenities, sustainability initiatives, and other new programming. This multi-faceted land use approach will allow the city to be flexible and resiliant as market conditions change. An analysis of projected General Fund revenues illustrates the benefit of this mix of uses.

Chart 1-2 compares the balance in the General Fund Reserves under the General Plan buildout scenario to "existing" development and "existing and pending" (which includes projects that have been approved or are under construction). The "existing" and "existing and pending" projections show a negative balance in the General Fund beginning in 2015 and 2017, respectively. On the other hand, the General Plan buildout scenario projects a continuous positive balance through the life of the Plan. This scenario represents a much better outcome for the fiscal health of the City.

While changing broader economic circumstances may result in changes to the absolute dollars shown in Chart 1-2, the relationship between these three scenarios is the most important aspect. This General Plan represents the best option regardless of economic conditions.

CHART 1-2: Balance in General Fund Reserves at Buildout

1.7 PLAN ORGANIZATION

General Plan Structure

State law mandates that general plans include seven elements: Land Use, Circulation, Open Space, Conservation, Noise, Safety and Housing. Elements for other topics of local concern may also be included. This General Plan includes two optional elements: Urban Design and Sustainability. Table 1-2 illustrates how the nine elements are arranged.

Following Chapter 7, an Implementation Program describes the implementing actions and responsible City departments that will carry out the policies in order to achieve General Plan goals. This structure is described further in the section below.

Organization of the Elements and Policy Structure

Each chapter of this General Plan includes brief background information to establish the context for the goals and policies in the chapter. This background material is not a comprehensive statement of existing conditions nor does it contain any adopted information. (Readers interested in a comprehensive understanding of issues related to a particular topic should refer to *Emeryville General Plan Update: Opportunities and Challenges Report*; *January 2006*.) This background information is followed by goals and policies. Actions are housed in the Implementation Program.

- **Goals** are the City's statements of broad direction, philosophy, or standards to be achieved.
- **Policies** are specific statements that guide decision making. They may refer to existing programs or development standards or call for establishment of new ones.
- **Actions** are implementation measures to carry out general plan policies. Each policy has at least one implementing action. Actions and the relevant City department or agency that will be implementing the actions, are described in a matrix within the Implementation Program.

Together, the goals and policies articulate a vision for Emeryville that the General Plan seeks to achieve. They also provide protection for the city's resources by establishing planning requirements, programs, standards, and criteria for project review.

Explanatory material accompanies some policies. This explanatory material provides background information or is intended to guide Plan implementation. The use of "should" or "would" indicates that a statement is advisory, not binding; details will need

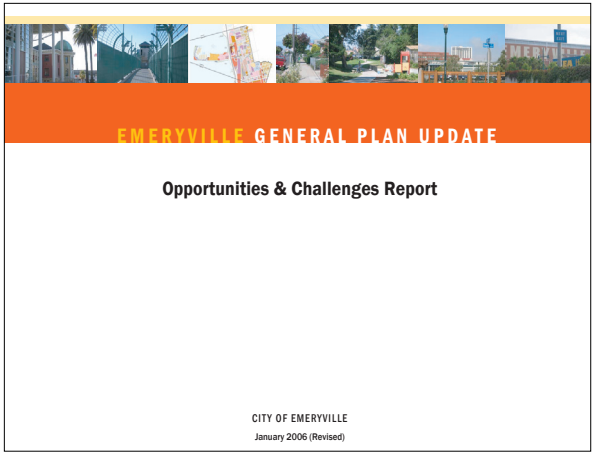

TABLE 1-2: Correspondence Between Required General Plan Elements and the Emeryville General Plan

Element	Where included in the General Plan
Land Use	Chapter 2: Land Use
Circulation	Chapter 3: Transportation
Conservation	Chapter 6: Conservation, Safety and Noise
Open Space	Chapter 6: Conservation, Safety and Noise; and Chapter 4: Parks, Open Space, and Public Facilities
Safety	Chapter 6: Conservation, Safety and Noise
Noise	Chapter 6: Conservation, Safety and Noise

Sustainability (optional)	Chapter 7: Sustainability and Chapters 2-6
Housing	Separate Document

to be resolved in Plan implementation. Where the same topic is addressed in more than one chapter, sections and policies are cross-referred.

Numbering System

Goals, policies, and actions in the General Plan are organized using a two-part numbering system. The first part refers to the element and the second represents the order in which the goal, policy, or action appear, with a letter designation to distinguish goals (G), policies (P), and actions (A). For example, the first goal in the Land Use Element is numbered LU-G-1 and the first policy is LU-P-1. Thus, each goal and policy in the Plan has a discrete number for easy reference.

Interim reports based on technical analysis and community outreach efforts helped to form the General Plan.

1.8 RELATED STUDIES

As part of the General Plan preparation, several technical studies were conducted to document environmental conditions, and analyze prospects for economic development, community character and growth, and development alternatives. In addition, summaries of community outreach activities were prepared to document findings from community workshops, stakeholder interviews and a community survey. Studies and reports prepared include:

- Report on Stakeholder Interviews; June 2005.
- Report on Community Workshop #1; June 2005.
- General Plan Update Survey Report; November 2005.
- Emeryville General Plan Update: Opportunities and Challenges Report; October 2005 (updated January 2006)
- Report on Youth Workshop; May 2006.
- Alternative Plans Workbook; October 2006;
- Report on Community Workshop #2; February 2007.
- Fiscal and Financial Impacts of Future Development Scenarios; March 2007
- Draft Plan Framework; March 2008.
- Draft Environmental Impact Report; 2009
- Final Environmental Impact Report; 2009

While these background studies and environmental documents have guided Plan preparation, they do not represent adopted City policy.

1.9 THE PLANNING PROCESS

The City's planning process includes monitoring and updating the General Plan and preparing of area plans for various parts of the city. An Annual General Plan Report will provide an overview of the status of the General Plan and its implementation programs.

Amendments to the General Plan

As the City's constitution for development, the General Plan is the heart of the planning process. It is intended to be a living document and, as such, will be subject to site-specific and comprehensive amendments over time. Amendments also may be needed from time to time to conform to State or federal law passed since adoption, and to eliminate or modify policies that may become obsolete or unrealistic due to changed conditions (such as completion of a task or project, development on a site, or adoption of an ordinance or area plan).

State law limits how frequently a city can amend its general plan. Generally, no jurisdiction can amend any mandatory element of its general plan more than four times in one year, although each amendment may include more than one change to the general plan. This restriction, however, does not apply to amendments to:

- Update optional elements (such as the Urban Design and Sustainability elements);
- Allow development of affordable housing;
- Comply with a court decision; or
- Comply with an applicable airport land use plan.

Area, Neighborhood, and Redevelopment Plans

Emeryville maintains plans for some areas within the City to tailor appropriate development standards and policies to the individual character of neighborhoods. Figure 1-2 shows the general location of the city's districts. Figures 1-3 and 1-4 show the planning areas for existing area and neighborhood plans, and redevelopment plans, respectively. Although these plans do not necessarily address all of the topics required by State law for general or specific plans, they must be consistent with the General Plan.

Area and Neighborhood Plans

North Hollis Area Urban Design Program

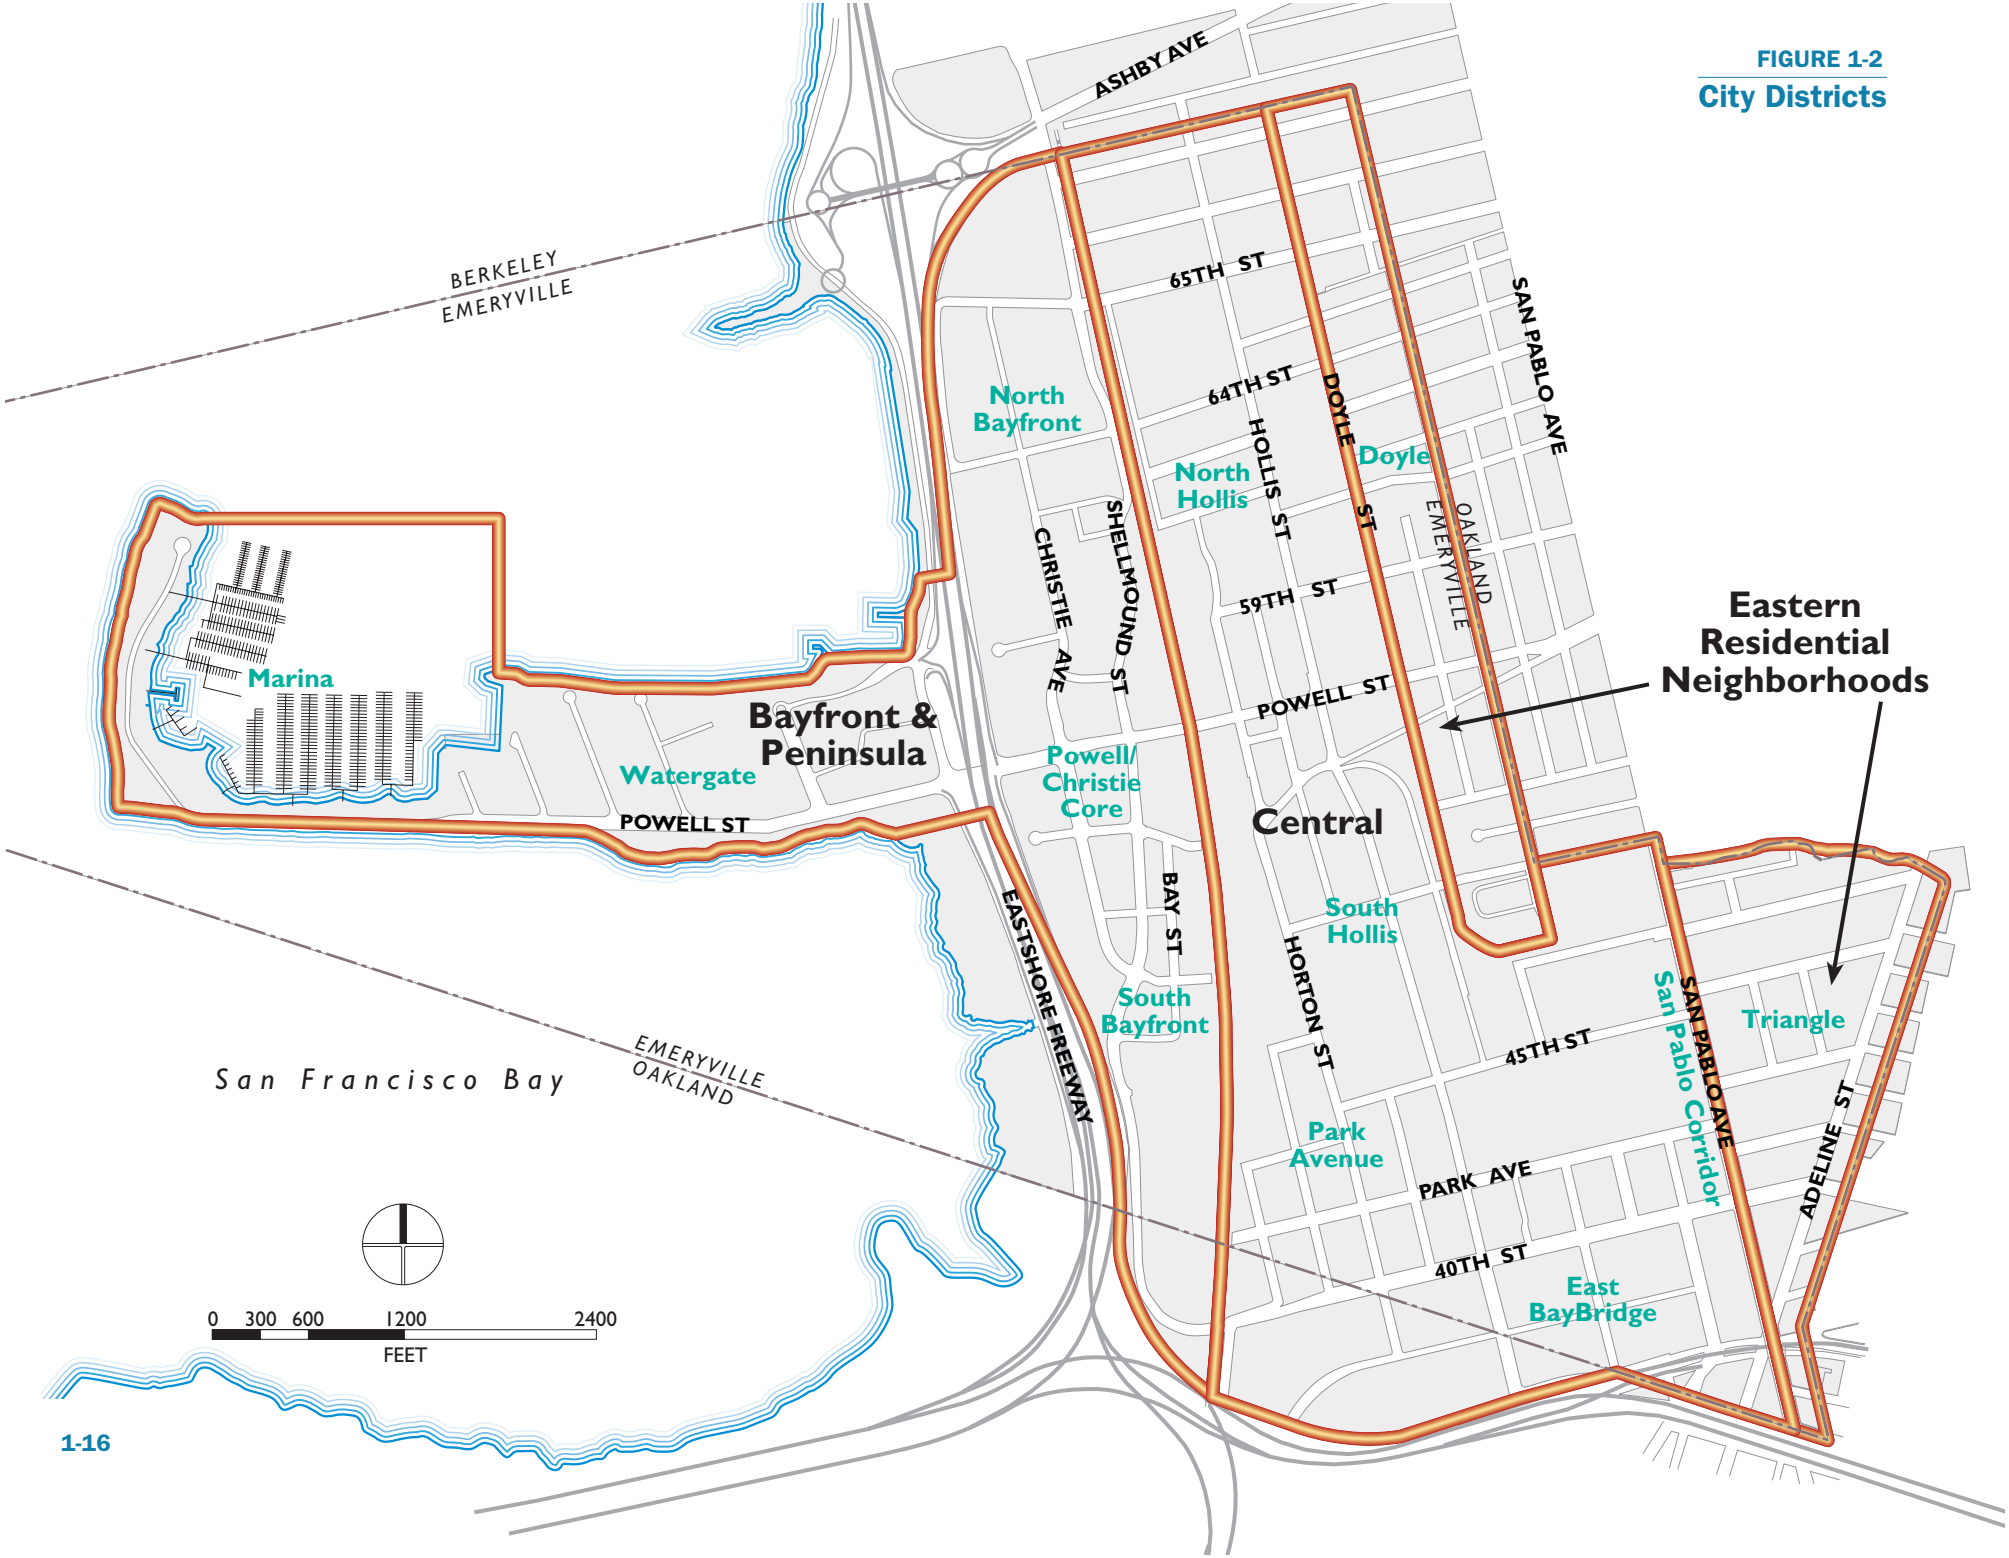
The North Hollis Area Urban Design Program was implemented through the North Hollis Overlay Zone. The plan covers the northeast corner of the city. This plan calls for infill residential uses that complement the existing neighborhood and stimulate use of the Greenway; the discouragement of through-traffic; a balance of automobile access with other transportation modes; sufficient public parking; and private development that enhances the character and pedestrian improvements of the area.

San Pablo Avenue Urban Design Plan

The San Pablo Avenue Urban Design Plan outlines a phased strategy for the development of San Pablo Avenue into an active, attractive, neighborhood retail center. The document targets land uses for three phases of catalyst projects, establishes goals for public circulation and streetscape improvements, and design guidelines for new development along and near the avenue. Much of the plan, which was written around 1990, has already been implemented.

Area plans will continue to guide development in their respective areas, such as North Hollis and the Park Avenue District.

FIGURE 1-2
City Districts



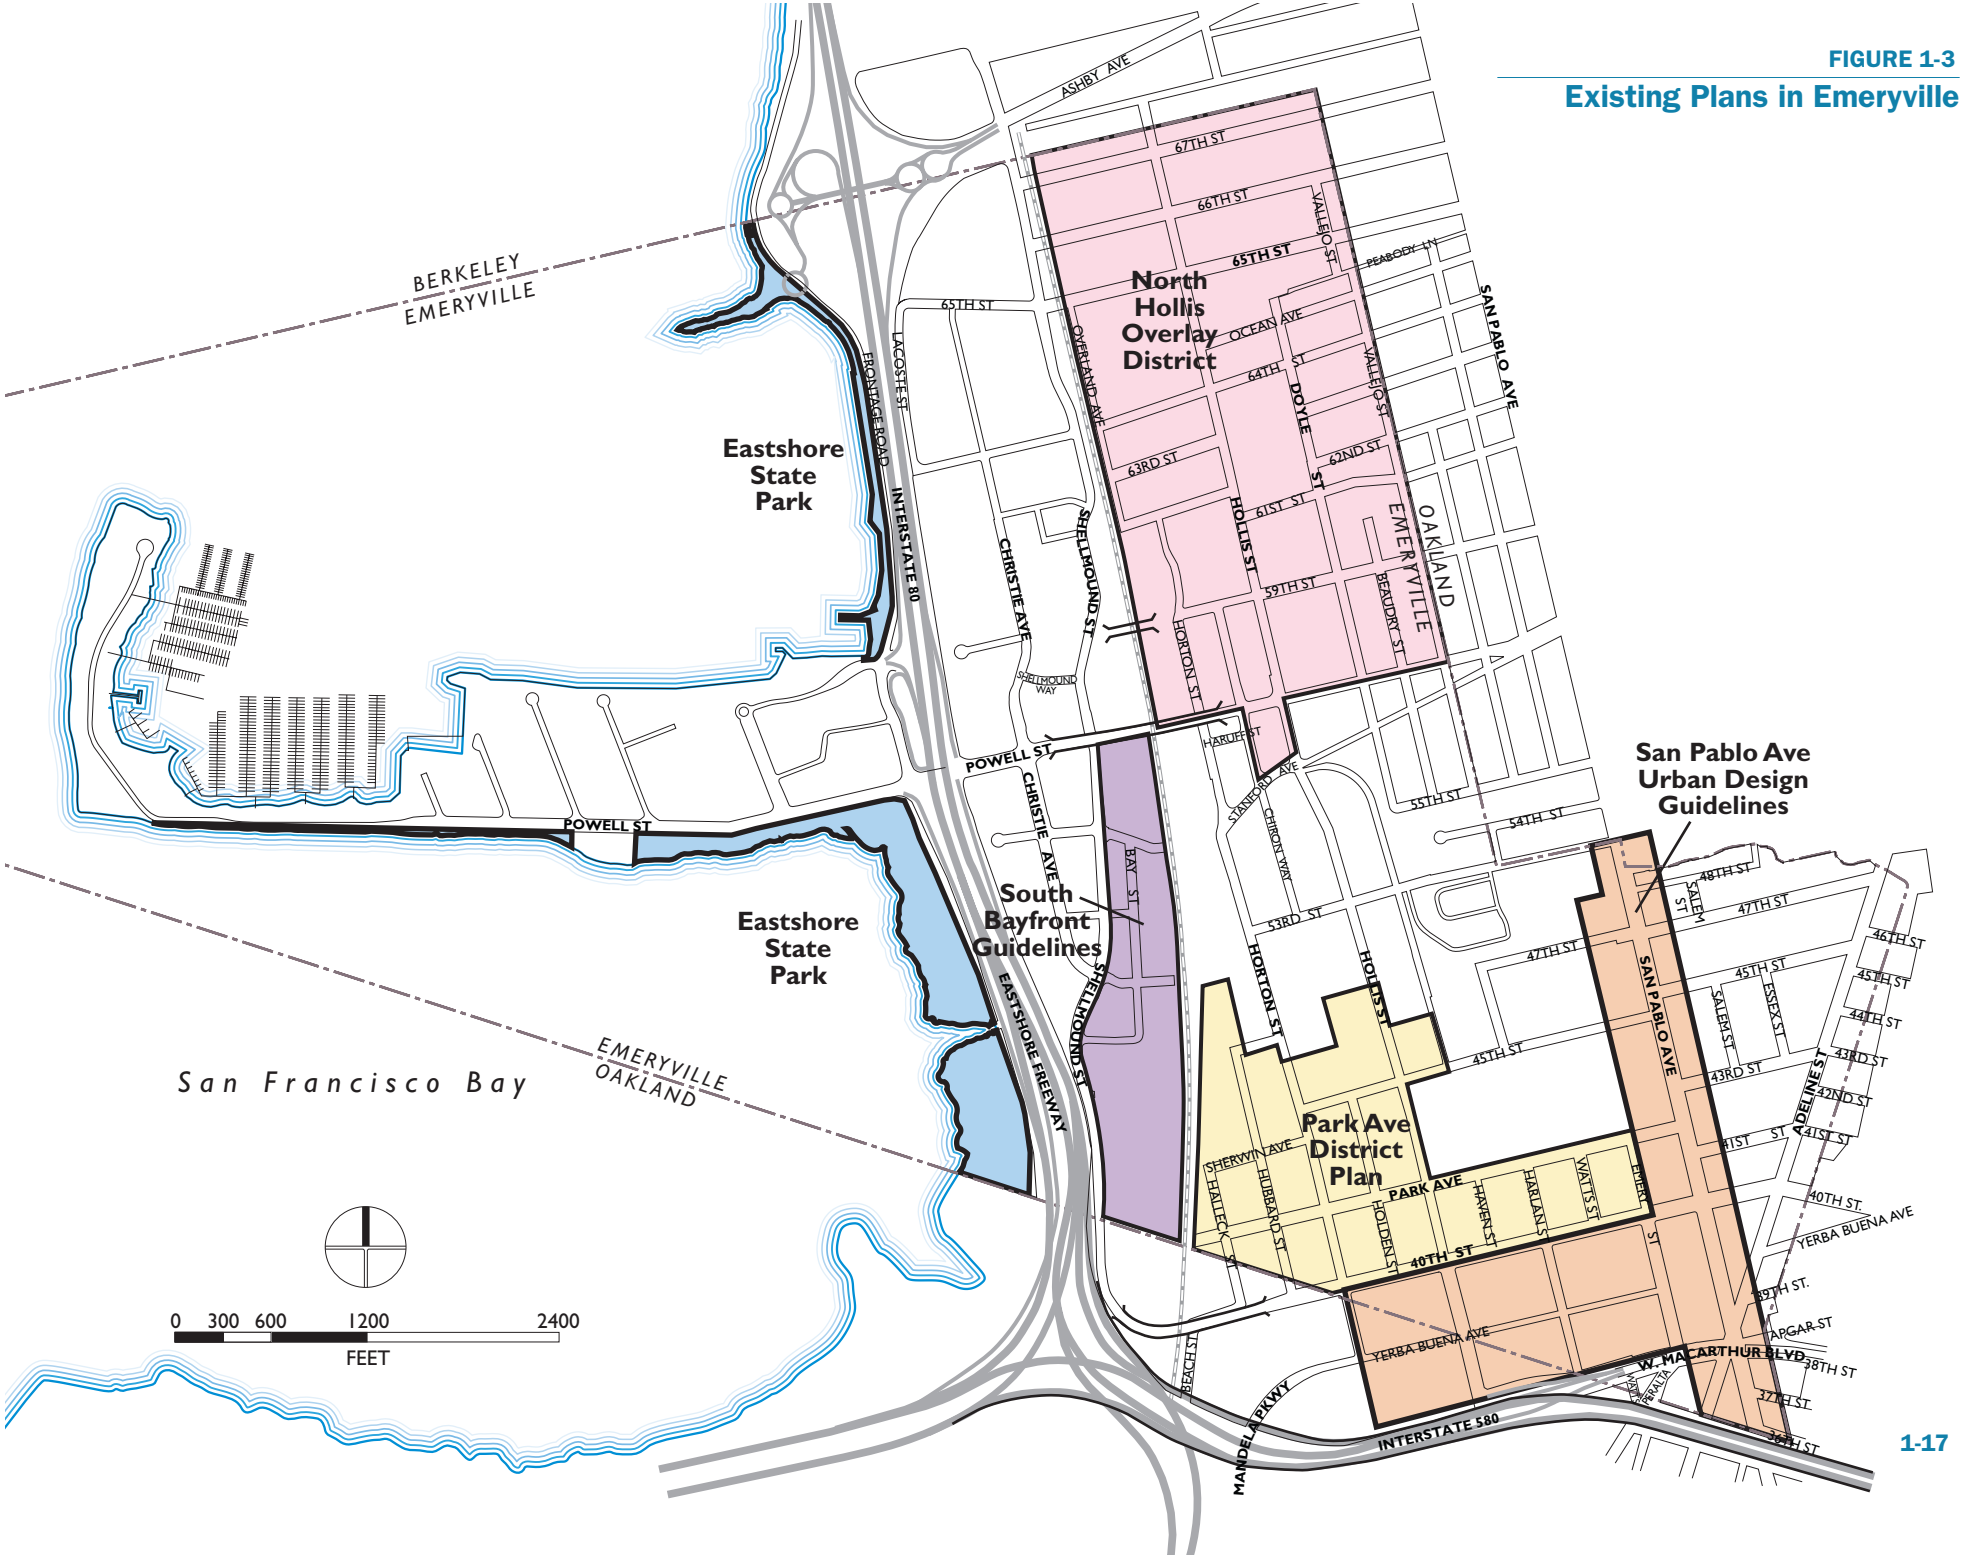


FIGURE 1-3

Existing Plans in Emeryville

Redevelopment funding has played a key role in Emeryville's retail and business development.

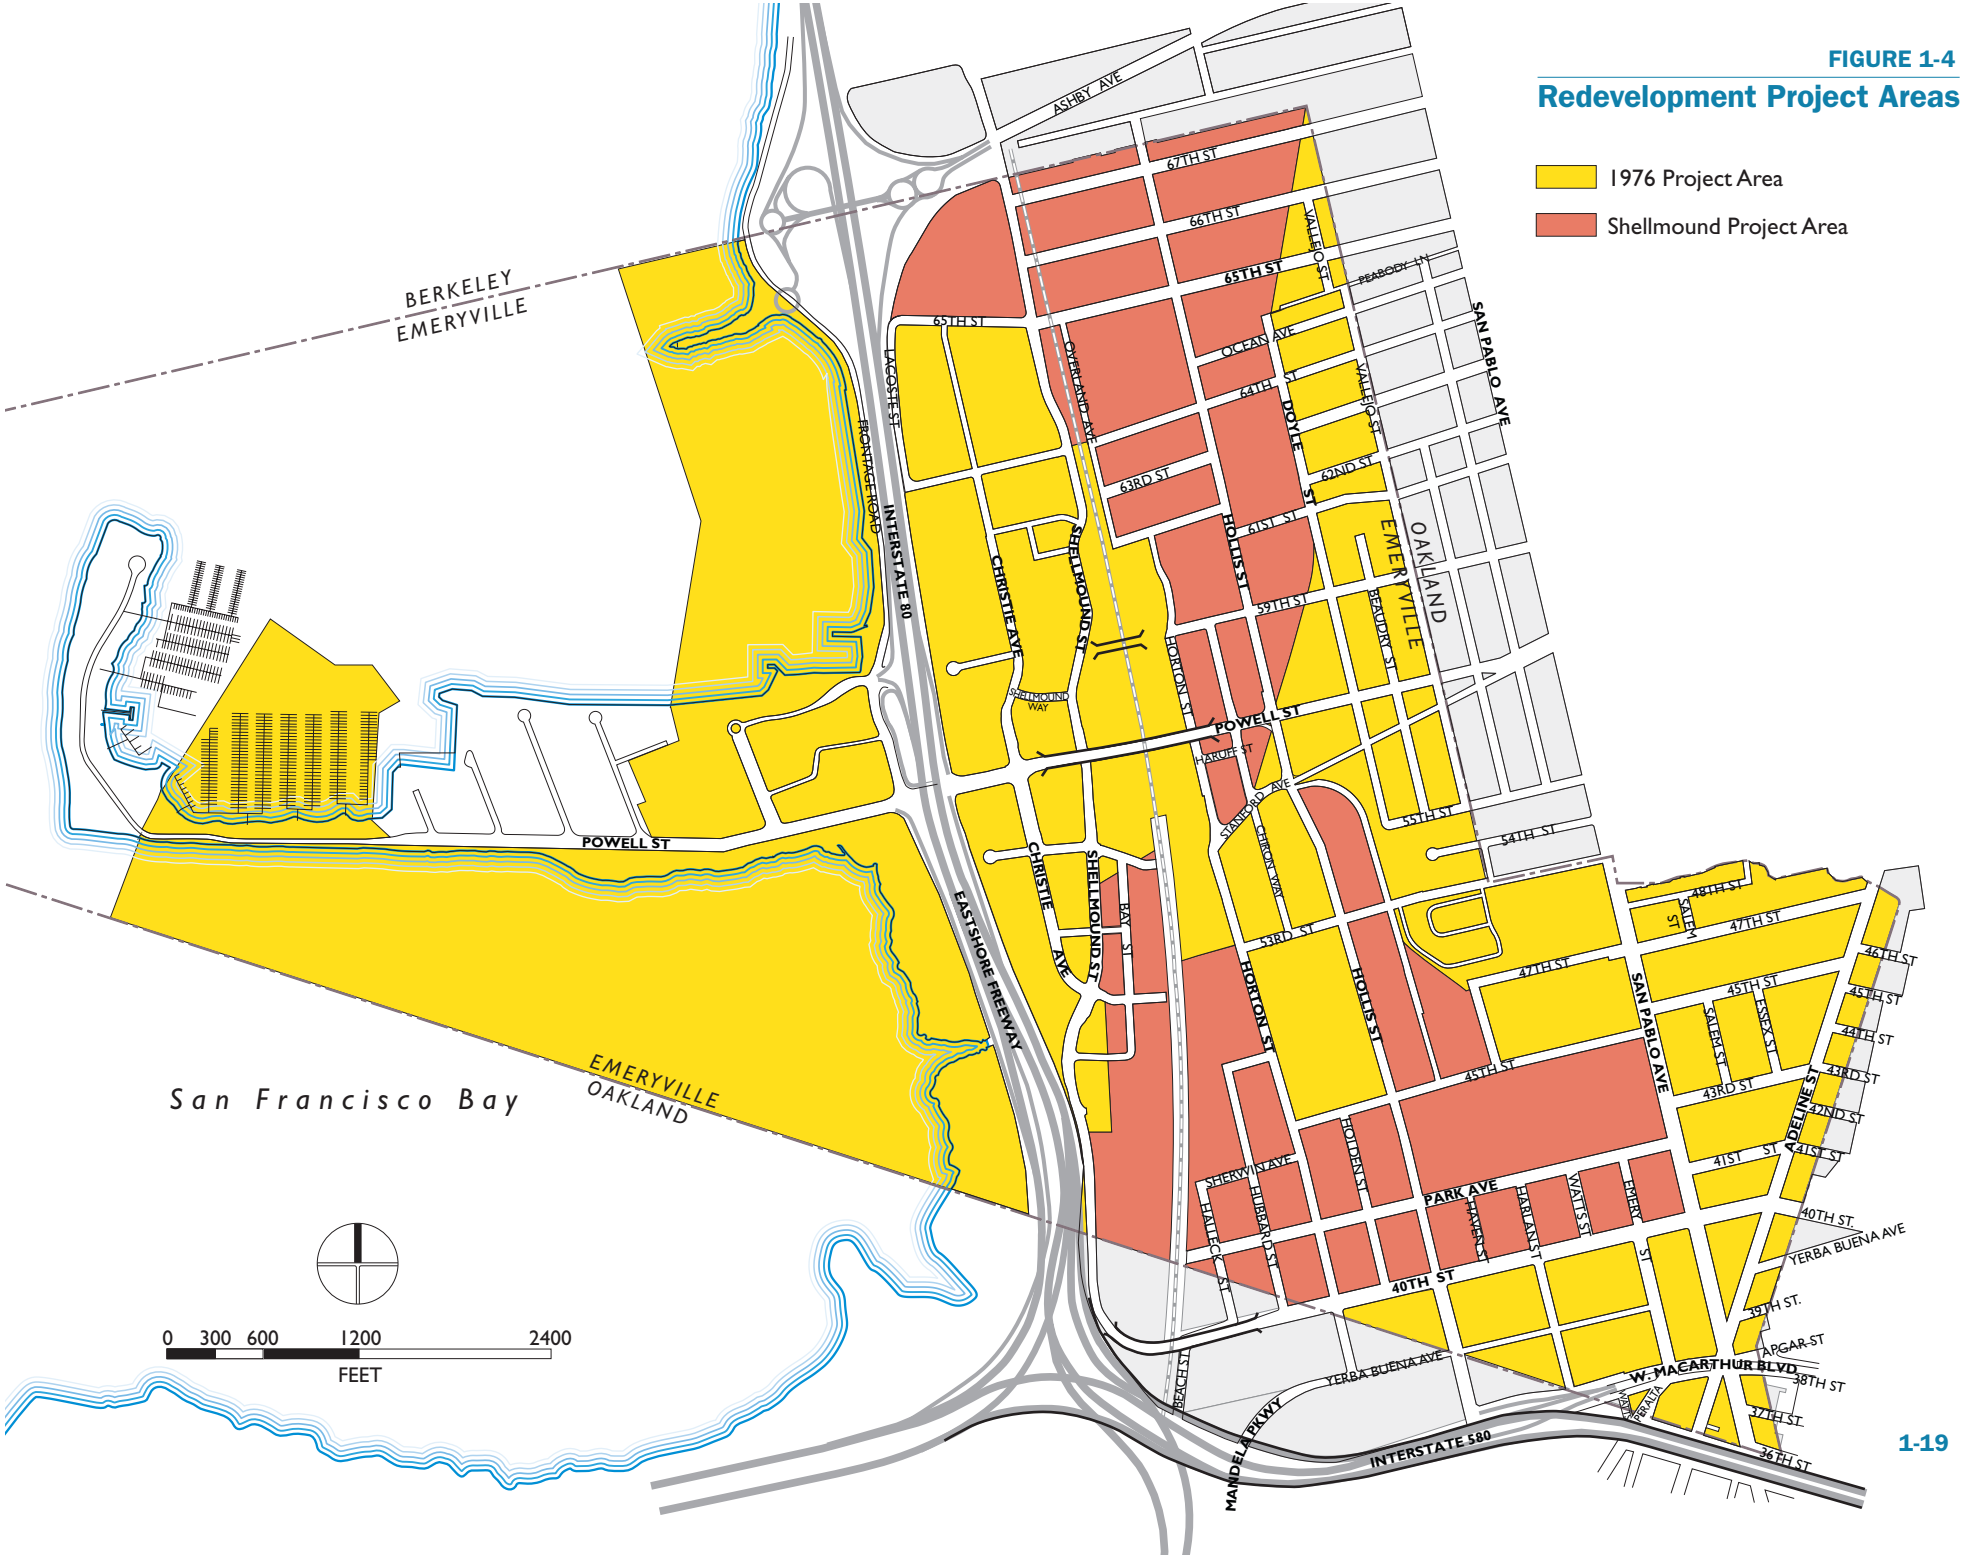
South Bayfront Design Guidelines

The South Bayfront Design Guidelines cover the South Bayfront district and the area south of Powell Street between the railroad and I-80. The plan lays out eight high-level site design principles for the development of the district and presents three development concepts which follow these guidelines. Each concept includes a set of possible land uses, building configurations, and circulation patterns. Much of the South Bayfront has already been developed according to these guidelines, which were established in 1997.

Park Avenue District Plan

The Park Avenue District Plan establishes incentives and development guidelines toward the creation of a vibrant, mixed-use neighborhood. It seeks to preserve the area's small parcels and historic buildings and encourage private development of live/work housing, small-scale businesses, pedestrian and bicycle accessibility, and 24-hour community uses. These uses will be supplemented with public investments, which may include an arts center, public parking facilities, community open space, and improved sidewalks.

Redevelopment Plans



The objectives of the Redevelopment Agency are to eliminate blight, provide for economic revitalization, preserve and improve existing residential areas, establish a more beneficial mix of land uses, and restore the public infrastructure. California redevelopment law provides tax increment financing as a source of revenue to redevelopment agencies to fund redevelopment activities. Over the past 30 years, the City's Redevelopment Agency has been responsible in large part for the City's tremendous growth in the retail and office sectors, and revenue generation that has allowed for citywide capital improvements. The City contains two redevelopment project areas, covering nearly the entire city, as shown in Figure 1-4. The older of the two, the 503-acre 1976 Project Area, will be operational until 2019, the 270-acre Shellmound Project Area until 2028. These projects areas will play an integral part in the implementing the General Plan land use policies and developing the capital improvement projects—such as streetscapes, green streets, and community public facilities—described in this Plan.

Annual General Plan Report

The California Government Code requires that an annual report be submitted to the City Council on the status of the General Plan and progress in its implementation. This report also is to be submitted to the Governor's Office of Planning and Research and the Department of Housing and Community Development. It must include an analysis of the progress in meeting the City's share of regional housing needs and local efforts to remove governmental constraints to maintenance, improvement, and development of affordable housing. In addition, mitigation monitoring and reporting requirements prescribed by the California Environmental Quality Act (CEQA) should be addressed in the Annual Report because they are closely tied to Plan implementation. Finally, the Annual Report should include a summary of all General Plan amendments adopted during the preceding year and upcoming projects and General Plan issues to be addressed in the coming year.

FIGURE 1-4

Redevelopment Project Areas

This page intentionally left blank.

2 LAND USE

How land is used underlies the experience of living, working, or visiting any urban area, making Land Use a pivotal element of any General Plan. This chapter of the General Plan provides the basis for land use decision-making; establishes the land use classification system, intensity and height standards; and outlines citywide and area-specific land use policies. An assessment of the City's revenue generation, by land use type, is also included to better understand the influence that land use has on the City's fiscal health. For more specific policies on the design of buildings and public spaces, please see Chapter 5: Urban Design.

Office (top), retail (middle) and industrial (bottom) uses account for half of the city's developable land area, while also

While Emeryville has roots as an industrial and employment center, the Plan promotes the city's evolution into a dynamic and livable mixed-use community. The Plan outlines greater integration of uses in different parts of the city and balance between employment and residential uses, with more areas designated for mixed-use development rather than single use. The Plan enhances livability and quality of life for the increasing residential population with strategically located new parks and open spaces, neighborhood and mixed-use centers, and a variety of amenities to support urban lifestyles in a walkable environment.

Because Emeryville is a built out city, new development will result from reuse of existing underutilized sites. This development pattern will result in more efficient use of land in the Bay Area's inner core, supporting more regionally sustainable land use patterns. At 25,000 jobs per square mile, Emeryville will have a relatively high employment density, but not as high as downtown San Francisco (472,000 jobs per square mile), Oakland (118,000) or Berkeley (43,000). Building intensities will be modulated to support urban design and livability goals highlighted in Chapter 5.

Achieving Emeryville's future land use vision requires continuing redevelopment with an array of uses; enhancing livability through development of neighborhood centers and parks spaced for walking access; promoting greater balance between residential and employment while furthering Emeryville's role as a premier regional commercial center; increasing local amenities; expanding arts and culture facilities; improving connections; creating more "people places", and ensuring variation in use and mix, development intensity, and height to create a tapestry of distinctive places and experiences.

2.1 CONSTANCY AND CHANGE

Emeryville's land use transformation over the past 20 years has been extensive. Formerly dominated by manufacturing and distribution, the city is now marked by ever increasing development of office, regional retail, and high-density residential land uses, as well as mixed-use developments. Almost entirely built out, with little to no vacant land, Emeryville's growth has been through redeveloping its existing land uses and rehabilitating older buildings.

Current Land Use Pattern

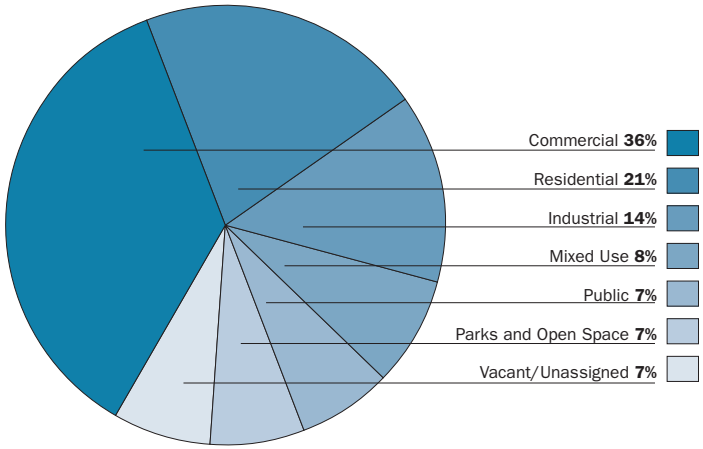
Around half of the developable land in the City—that is, excluding roads, highways, and other rights-of-way—is in Commercial (36%) or Industrial (14%) use, and just under a quarter (21%) is used for housing. (However, it should be noted that much of this commercial land area is devoted to surface parking lots.) The remainder of the city is in Public use (7%), Parks and Open Space (7%), or a mix of uses (7%). Only around 20 acres, or four percent of the land, is vacant. Specific acreages for each land use are shown in Table 2-1 and summarized in Chart 2-1.[1]

Almost all of the Bayfront and freeway edge area west of the railroad tracks has been redeveloped in the past 30 years. Much of this space is devoted to retail and office uses in large-scale developments, such as Bay Street, IKEA, the Marketplace, and Powell Street Plaza, which serve a regional clientele. Almost no industrial uses remain in this area. Residential developments in this area—Watergate Condominiums, Pacific Park Plaza, Bay Street, and Archstone/Bridge-

1 *The city's total land area is 1.2 square miles, or about 768 acres. About 20% of this, or 152.9 acres, is roads, highways, and other rights-of-way, leaving about 615.1 acres of developable land.*

The number of residential developments (far left) has increased in recent years, inspiring a greater need for public facilities and parks (middle and right).

water (formerly EmeryBay Club & Apartments)—are few in number, but large in size and high in density. In total, they comprise about 2,750 housing units—half of the housing in the city.



Development to the east of the railroad is more diverse in use, scale, and age. In the Central Emeryville area between the railroad tracks, Doyle Street (north of 53rd Street), and San Pablo Avenue (south of 53rd Street), industrial, office, and residential uses are geographically close to one another. Block, parcel and building sizes generally diminish toward the east, where pre-war structures are supplemented with new residential and commercial construction. The area north of Powell Street contains a wide variety of uses, including offices, old homes and new residential complexes, and industry. Corporate campuses and "big box" retail occupy much of the area south of Powell Street. Emeryville's public schools and much of its locally-oriented retail businesses lie along or near San Pablo Avenue, a major boulevard and state route which connects Emeryville with Oakland, Berkeley, and other East Bay cities. In the eastern residential neighborhoods, east of Doyle Street and San Pablo Avenue, the Triangle and Doyle Street neighborhoods are composed of lower density homes.

TABLE 2-1: Existing Land Use Distribution (2005)

	Acres
Commercial	222.0
Residential	126.2
Industrial	87.5
Mixed Use	48.0
Public	45.7

CHART 2-1: Existing Land Use Distribution (2005)

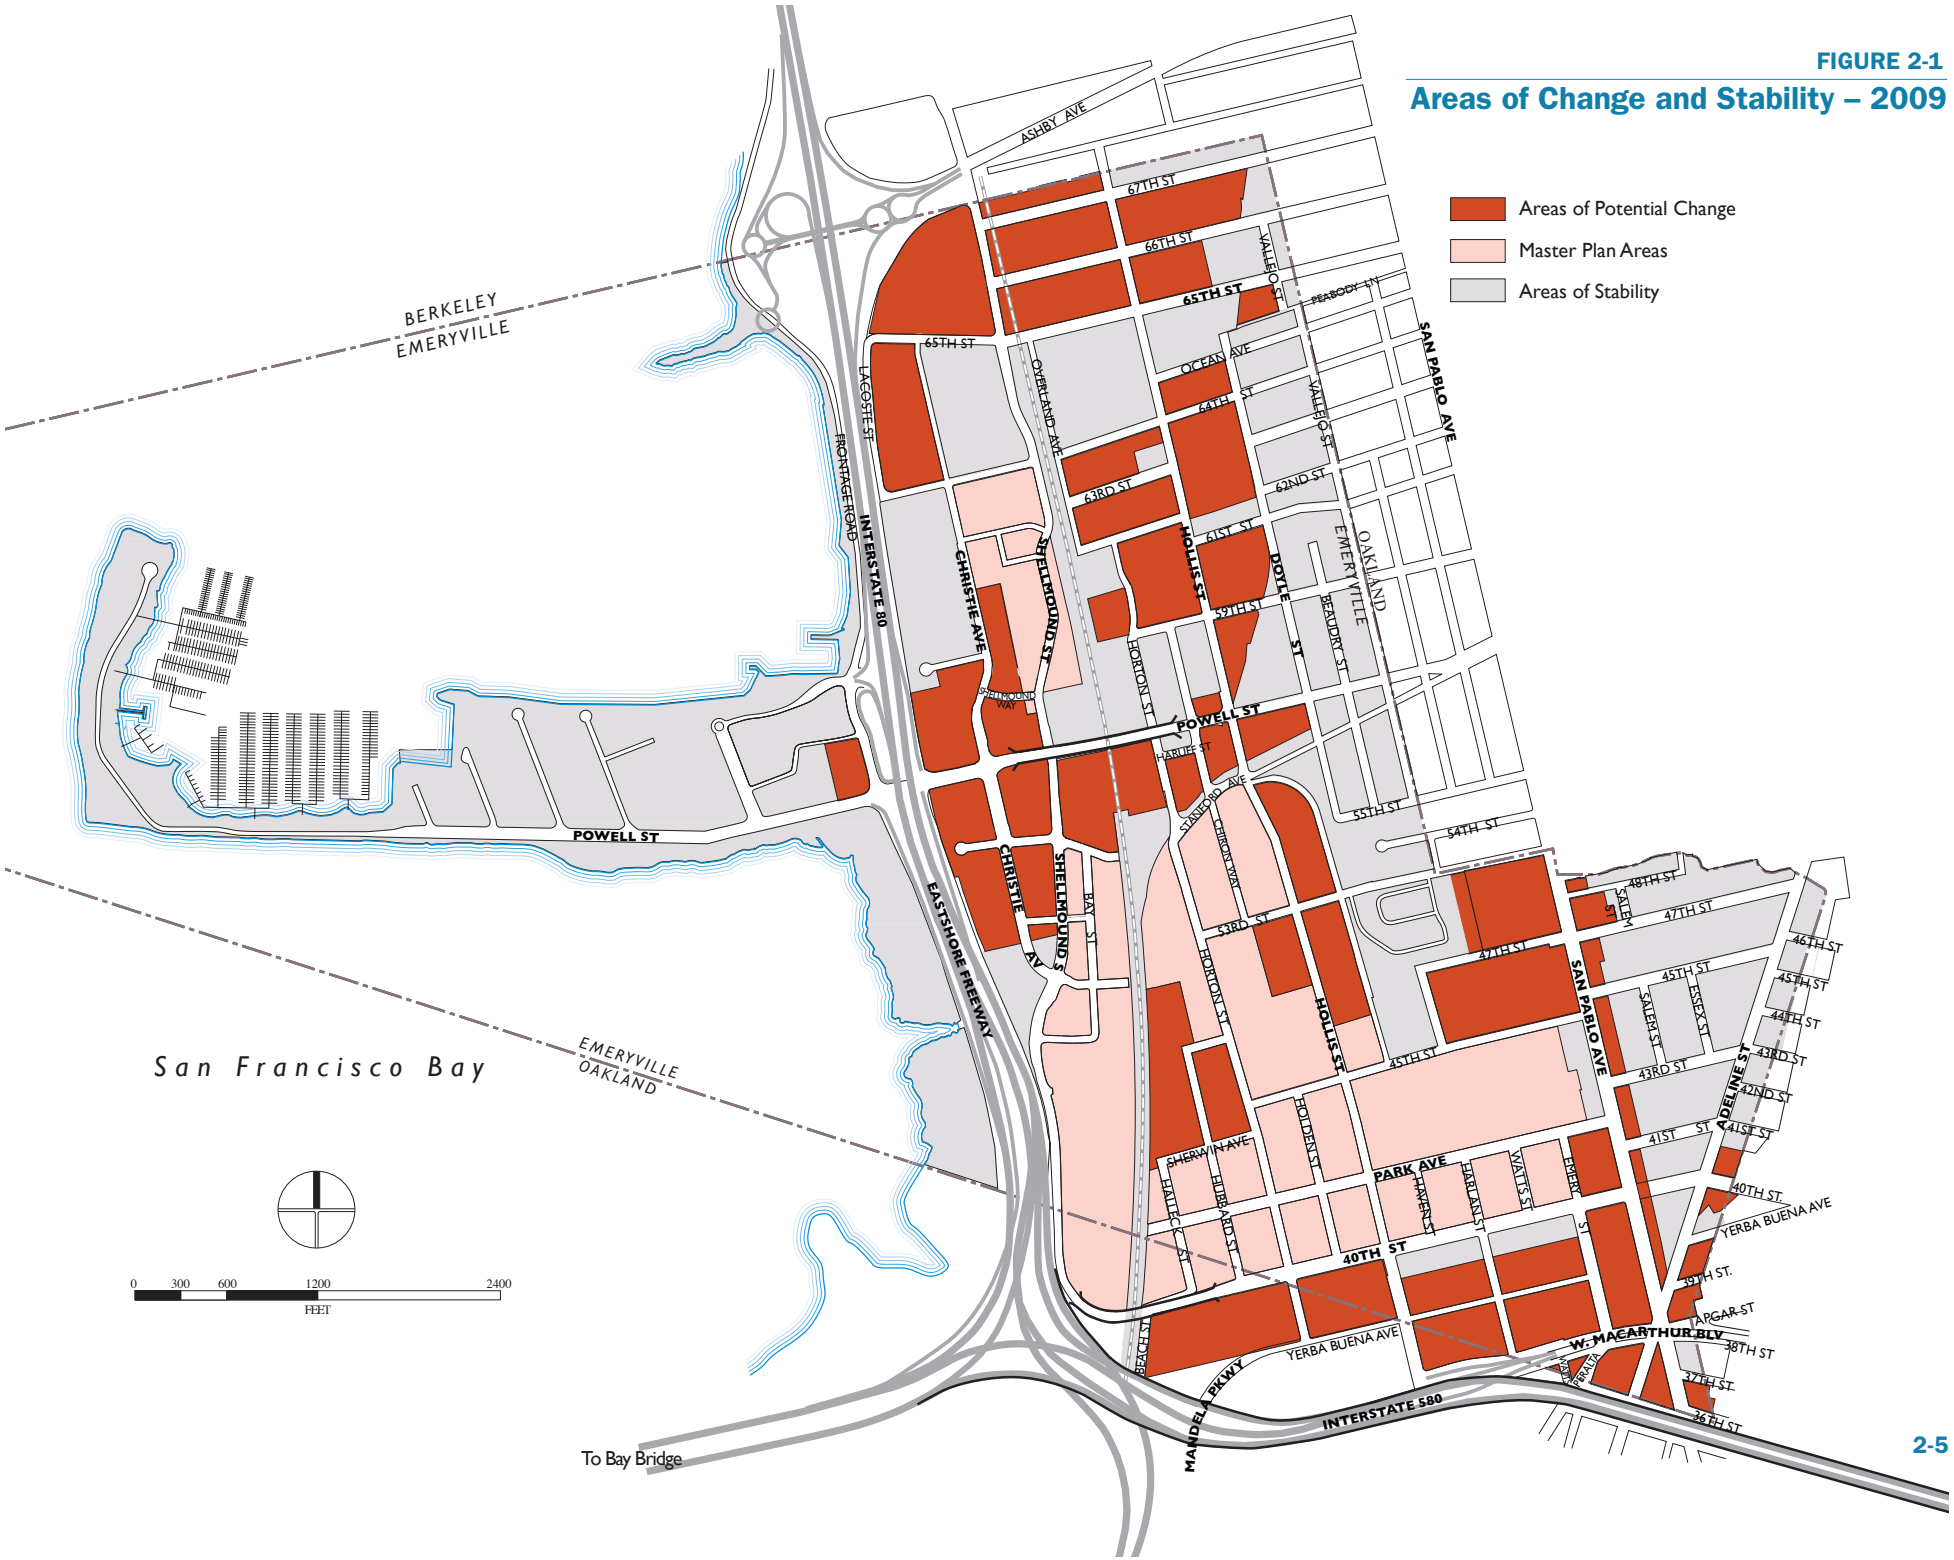
Areas of Stability and Change

To develop a strategy for land use planning, the city has been divided into areas of stability, areas of potential change, and master planned areas. These are illustrated in Figure 2-1.

Areas of stability are those parts of the city that are not anticipated to change significantly in character, land use or development intensity over the next 20 years. These include the older residential neighborhoods on the east side of town as well as the Watergate residential neighborhood on the peninsula, the Watergate office complex, Pacific Park Plaza, and more recent developments such as residential projects in the North Hollis and North Bayfront areas, the Emery Station complex and the Woodfin and Marriott hotels.

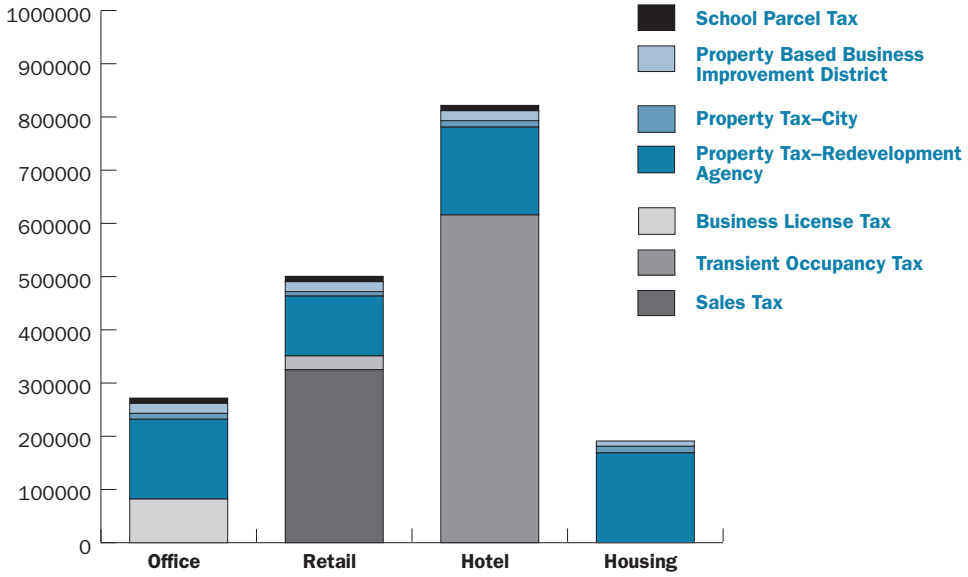
Master planned areas are areas that are likely to change over the next 20 years, but that have already been approved by the City Council either through the entitlement of Planned Unit Developments (PUD), or the adoption of an area plan that includes a vision for the future character of the area. These master planned areas include the Novartis, Pixar, the Marketplace and Bay Street PUDs, and the Park Avenue District Plan area.

Several other areas of Emeryville, because of the current land use and intensity of development, have a heightened potential for redevelopment over the next 20 years. These are areas of potential change. These include the small amount of vacant land (less than 20 acres), formerly industrial sites such as Sherwin Williams, as well as low-intensity shopping centers where there are opportunities for intensification, such as Powell Street Plaza and the East Bay Bridge Center. The community and the General Plan Update Steering Committee spent considerable time deliberating land use, intensity, and building height choices for these sites. These choices are reflected in the maps in this chapter. These maps are complemented by specific policies for each change area included at the end of the chapter.



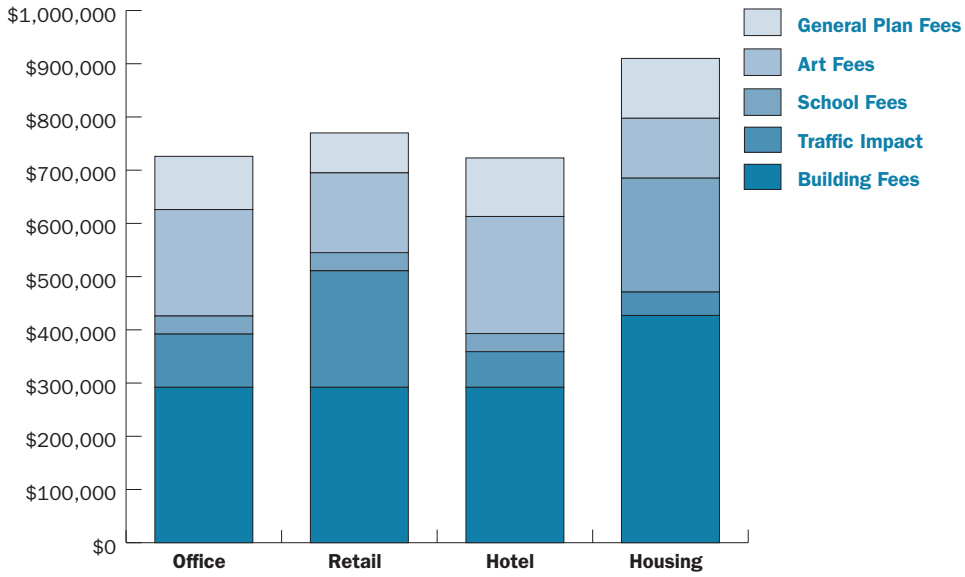
Several areas of the city have opportunities for reuse and redevelopment over the life of the General Plan, including Powell Street Plaza, the East Bay Bridge Center (bottom),

FIGURE 2-1



Areas of Change and Stability – 2009

2.2 ECONOMIC DEVELOPMENT



Different land uses have different impacts on the City's revenue generation and cost allocations. Emeryville finances its operations—both ongoing costs of delivering public services and investments in new capital facilities—by collecting revenue from residents and businesses. Charts 2-2 and 2-3 summarize the City's estimates of ongoing and one-time revenues associated with the different types of land uses in the city on a per hundred-thousand square-foot basis. While housing contributes the greatest amount of one-time revenues in total (housing contributes more than non-residential uses in the form of school impact fees, which go to the Emery Unified School District), hotel and retail uses make the greatest impact in terms of annual revenues. One-time fee revenues are used for capital improvements and facilities that are needed to respond to the impacts of new development (residents and businesses) and provide quality of life improvements. These include street modifications, traffic signals, new parks, and public art. On the other hand, annual revenues contribute to the City's General Fund.

CHART 2-2: Annual Revenues from Different Uses (Per 100,000 square feet of building space)

Source: Mundie & Associates, 2008.

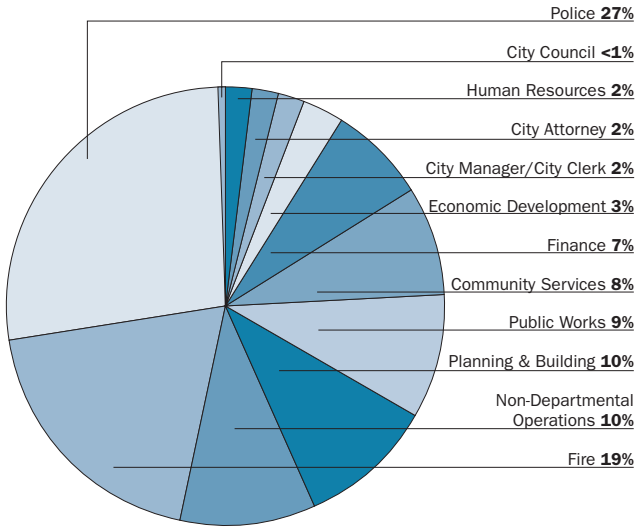
CHART 2-3: One-time Revenues from Different Uses (Per 100,000 square feet of building space)

General Fund

The City's General Fund is its primary collection bucket for ongoing and recurring revenues that are not earmarked by law for specific purposes and its primary source of funds to cover ongoing and recurring costs of operations and maintenance. For the 2006-2007 City Budget, the greatest General Fund allocation was for Police and Fire services. Labor costs (wages and benefits) tend to account for the largest share of expenditures. The purpose of General Fund spending is to improve quality of life in the city. This mission is captured in the City's budget philosophy: to provide "innovative and responsive services to the community to create and sustain a vibrant, livable city."

Redevelopment

To maximize its ability to make the capital improvements that it requires to improve the physical condition of the city, Emeryville has a Redevelopment Agency with two redevelopment project areas (see Figure 1-5). The Redevelopment Agency gains its revenue from increases in property taxes within these areas. Within the redevelopment project areas, the Redevelopment Agency has the power to make capital improvements in the "public realm;" that is, within public rights-of-way and to create some other types of incentives to attract private development.



Balance

While any new development within the redevelopment areas that enhances property values will lead to greater revenues that can be spent on public improvements, development also creates a need for services that must be provided by the General Fund. In particular, residential development has the highest need for services on a per square foot basis. Thus, Emeryville needs to ensure a balance of uses that provide revenue for continued enhancement of the community, while ensuring high quality of services to the community. In order to do so, the City will need to continue pursuing development that generates ongoing revenues, in particular hotel and retail uses. This balance is reflected in the development potential outlined in the next section.

Hotels contribute the largest revenues annually due to the transit occupancy tax (TOT). Retail, office, and residential uses also gen-

CHART 2-4: ACTUAL GENERAL FUND EXPENDITURES (2006-2007)

2.3 DEVELOPMENT POTENTIAL

Applying development policies consistent with this General Plan—using assumed average intensities for the different land use classifications to vacant land and sites with redevelopment/intensification opportunities—results in the following development potential, as described in Table 2-2. The time at which this development potential is achieved is not specified in or anticipated by the Plan; however, the transportation and other public infrastructure improvements assume that this development will occur by 2030. Designation of a site for a certain use does not necessarily mean that the site will be built or redeveloped with the designated use.

Table 2-2 shows:

A. Approved Development. This includes the various projects that have been approved or are under construction as of November 2007. This development includes 907 housing units and 1.3 million square feet of non-residential space.

B. Gross New Development. This value results from application of average assumed intensities to change areas. Approximately 2,930 housing units and 3.0 million square feet of non-residential space will be added.

C. Loss of Existing Due to Redevelopment. This value reflects existing underutilized properties that may be replaced by new uses. This is an accounting measure that estimates the proportion of existing development that may be redeveloped on each site in an area of change.

D. Net New Development. This reflects the total of the three above categories, and represents the expected development during the life of the General Plan.

E. Existing Development. This reflects existing development, as of November 2007.

F. City at 2030. Totaling net new development and existing development results in the General Plan development potential at 2030. This will result in an increase of approximately 3,800 housing units, a 70 percent increase in the existing population of 9,727 to 16,500, and 2.5 million square feet of total non-residential space, an increase of 21% over 2007 levels.

The General Plan projects the greatest potential for new development in residential (top) and office (bottom) uses. Retail development is also expected to increase somewhat, while industrial uses are expected to decline.

TABLE 2-2: General Plan Development Potential at 2030, by Land Use

	Residential (units)	Retail (SF)	Hotel (SF)	Office[1] (SF)	Industrial (SF)
A. Approved Development	907	34,461		1,313,000	
B. Gross New Development	2,930	1,075,400	324,600	1,569,700	76,200
C. Loss of Existing Due to	0	-469,000	-14,000	-510,000	-855,000
D. Net New Development (A+B+C)	3,837	640,861	310,600	2,372,700	-778,800
E. Existing Development	5,988	2,441,660	464,500	4,852,118	4,132,675
F. City at 2030 (D+E)[2]	9,800	3,083,000	775,000	7,225,000	3,354,000

Jobs: Housing Balance

The ratio of jobs to employed residents shows whether a jurisdiction has a deficit or surplus of jobs relative to population. Evaluation of data from the U.S. Census and Association of Bay Area Governments (ABAG), as illustrated in Chart 2-5, shows that Emeryville had 4.2 jobs for every employed resident in 2005; this is the highest ratio of jobs to employed residents of any city in the Bay Area with the exception of Colma, which has a population of 1,500. Emeryville's jobs/employed residents' ratio has remained constant over the past decade, balancing the spike in jobs between 1995 and 2000 with the residential spike between 2000 and 2005.

While the General Plan anticipates employment dominance to continue, Emeryville's jobs/employed residents' ratio is expected to be in greater balance by 2030. With nearly 10,000 jobs expected to be added over the life of the Plan, the City can expect a jobs/employed residents ratio of approximately 2.6. Although this still represents a much higher ratio compared with nearby cities, it does reflect a substantial improvement toward a more balanced city.

CHART 2-5: JOBS: EMPLOYED RESIDENTS' RATIO, COMPARISON OF SELECTED BAY AREA CITIES

Source: Association of Bay Area Governments, 2007 and Dyett & Bhatia (Emeryville 2030 Projected).

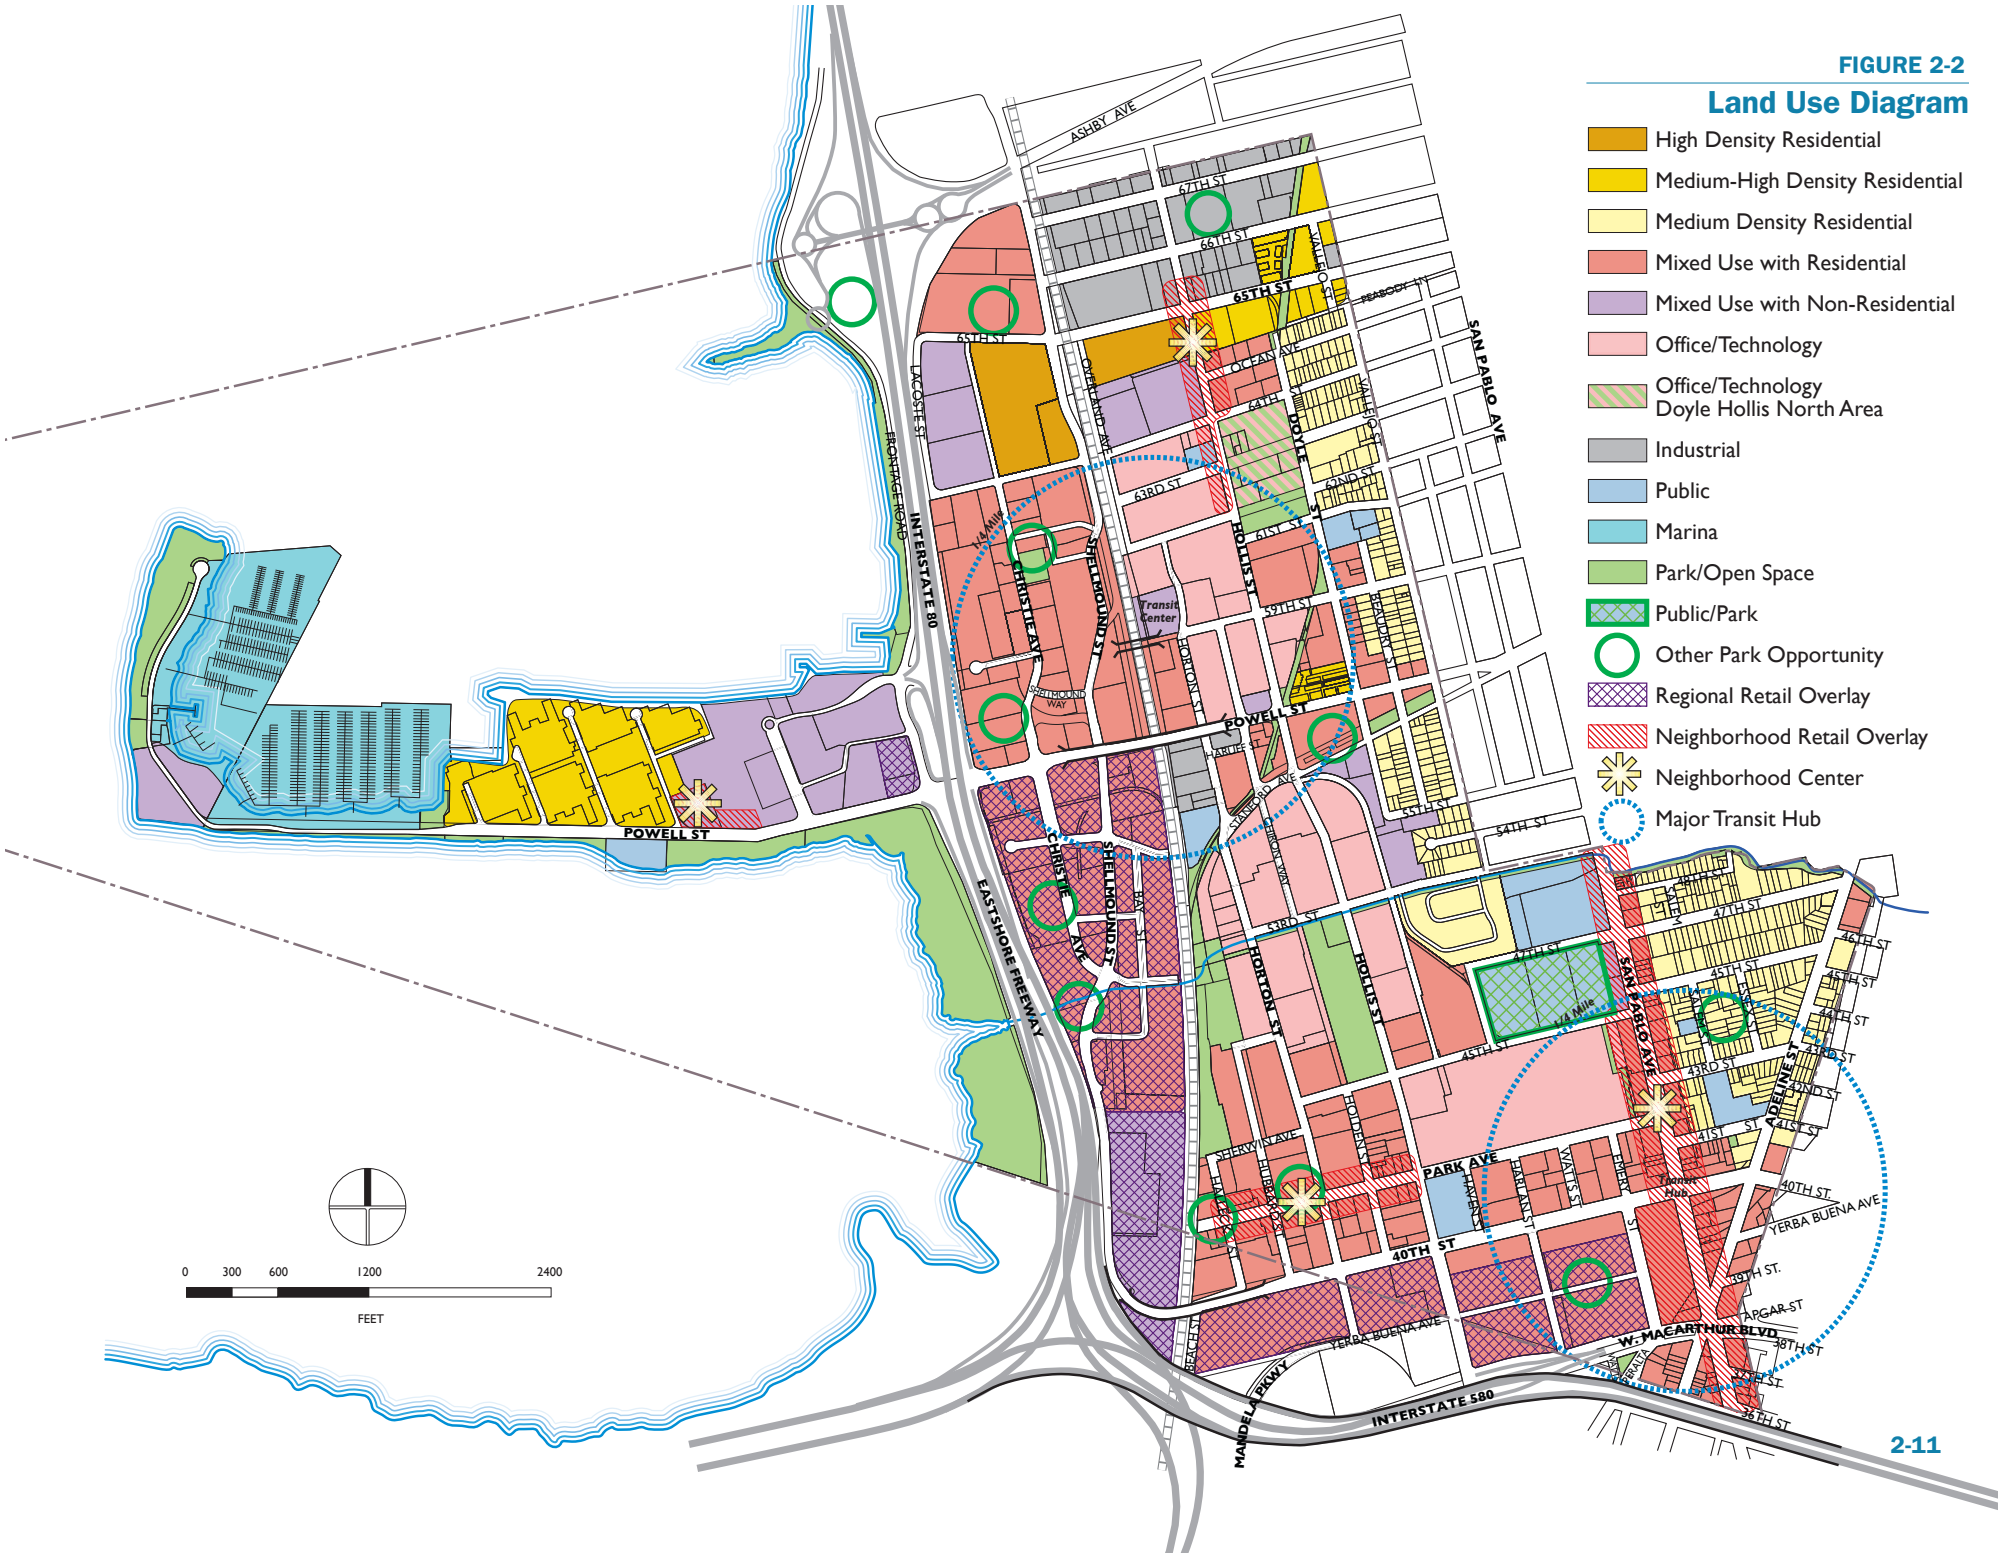
2.4 LAND USE FRAMEWORK

The land use framework is comprised of three components that work together to define activities and capacities:

- **Land Use Diagram and Classifications.** These specify land uses and mixes that are allowed in the different areas of the city. Building intensities are regulated independently of land use; however, residential uses are subject to both density standards as specified in the classifications, as well as intensity standards.
- **Building Density/Intensity.** For non-residential uses, this is expressed as Floor Area Ratio (FAR), and regulates the overall maximum building area that can be built on any site. (For explanation of how FAR is calculated, see Density/Intensity on page 2-13). For residential uses density is expressed as dwelling units per acre.
- **Building Height.** This controls maximum building height for development on any site.

These components are regulated through separate maps, allowing control of land use and urban form to reflect the unique need of each site and character of the city. Balancing building heights, FARs, and land uses will help to preserve public views, allow natural light, minimize impacts of wind and shadows, and create vibrant streetscapes and identifiable skylines.

The interrelationship of land use, building density/intensity, and building heights, shape the fundamental framework of the



Land Use Diagram

The Land Use Diagram (Figure 2-2) designates the proposed location, distribution, and extent of activities that may take place throughout the city. Land use classifications—shown as color/graphic patterns on the diagram—allow for a range of activities within each classification. The large blue circles represent 1/4-mile radii from major transit hubs (i.e. places that can be reached within a ten minute walk).

The diagram is a graphic representation of policies contained in the General Plan; it is to be used and interpreted in conjunction with the text and other figures contained in the General Plan.

FIGURE 2-2

Land Use Diagram

Land Use Classification

Land use classifications are presented below. The Zoning Ordinance provides greater detail on specific uses permitted within each classification. In addition to the direction related to the uses provided here, public uses—including government offices, police and fire stations, and public schools—are permitted in all land use classifications, except Park/Open Space. Live/work uses are permitted in all land use designations except Office/Technology, Public, Parks/Open Space, and Marina.

High Density Residential

Mid- or high-rise residential development, generally at sites with FARs greater than 2.5. Small-scale businesses, offices, retail, services, and other commercial uses are permitted on the ground floor.

The city is expected to become increasingly mixed-use—vertically and horizontally—over the life of the General Plan.

Medium High Density Residential

Residential development generally at maximum FARs ranging from 0.8 to 1.9. Incidental retail uses that serve the neighborhood are also permitted.

Medium Density Residential

Residential development at FARs less than 0.8. Single family detached and attached housing. Multifamily housing types may be a conditional use, as specified in the Zoning Ordinance. Incidental retail uses that serve the neighborhood are also permitted.

Mixed Use with Residential

One or more of a variety of residential and nonresidential uses, including but not limited to offices, retail and hotels. On larger sites, a mix of residential and non-residential uses is required; on smaller sites, a single use may be permitted.

Mixed Use with Non-Residential

One or more of a variety of nonresidential uses, including but not limited to offices, retail and hotels. On larger sites, more than one use is required; on smaller sites, a single use may be permitted.

Office/Technology

Administrative, financial, business, professional, medical and public offices, research and development, biotechnology, and media production facilities. Warehousing and distribution facilities and retail are permitted as ancillary uses only, subject to limitations established in the Zoning Ordinance.

Industrial

A range of industrial and high technology uses, including light manufacturing, repair, testing, printing, service commercial, and biotechnology uses. Three industrial areas are designated in the Land Use Diagram: (1) west of Hollis Street and north of 65th Street ("west of Hollis"), (2) east of

Hollis Street and north of 65th Street ("east of Hollis"), and (3) along Horton Street between Powell Street and Stanford Avenue ("Horton Street"). "Light" live/work is appropriate in the east of Hollis and Horton Street industrial areas. "Heavy" live/work uses (e.g. work involving manufacturing, welding, and assembly) will only be allowed in the west of Hollis area. General manufacturing uses are only permitted in the west of Hollis area. In the east of Hollis area and the Horton Street area, new light industrial uses are permitted, but new general manufacturing uses are not. Existing general manufacturing uses can continue as conforming uses, and may be expanded with a conditional use permit subject to performance standards for noise, air quality, and truck traffic, to safeguard adjacent residential uses. Unrelated retail and commercial uses that could be more appropriately located elsewhere in the city are not permitted, except for offices, subject to appropriate standards, and in Neighborhood Retail Overlay areas (i.e., North Hollis).

Public

A variety of public and quasi-public uses, including government offices; fire and police facilities; schools; community services; transit stations and ancillary facilities.

Parks/Open Space

Parks, recreation facilities, and greenways for the general community, and open space for habitat conservation (e.g. Emeryville Crescent State Marine Reserve).

Marina

Marinas, limited retail, and recreation facilities and restaurants with a waterfront orientation.

Regional Retail Overlay

This overlay is intended to reflect sites that are appropriate for retail uses that serve as a regional draw. Stores can be small in size (such as at Bay Street) or large (such as IKEA). For sites with this overlay, 100 percent of the building area can be retail, while the uses in the underlying classification are also permitted.

Neighborhood Retail Overlay

This designation is intended for four neighborhood centers. It is intended for stores, offices, services, and restaurants/cafés that serve the local community, as well as "flex space" that can be adapted for retail/restaurant use in the future, but may be used for other uses in the interim. A majority of the ground floor use, and a substantial portion of the frontage along any public street, shall be devoted to these uses. Establishments shall generally be smaller sized, lending themselves to the pedestrian-oriented nature of the centers; however larger establishments (such as supermarkets), that serve the local community and are designed appropriately with a pedestrian orientation are also permitted. Retail and eating and drinking establishments can comprise up to 100 percent of the building area.

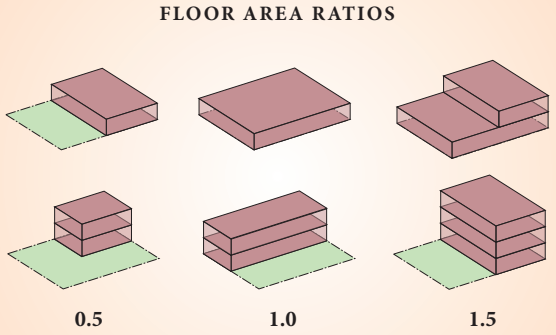
Density/Intensity

The General Plan establishes intensity standards for various parts of Emeryville. Intensity is measured as floor area ratio (FAR), obtained by dividing the gross floor area of a building by the lot area. (See text box and illustration for a detailed definition of FAR.) In general, all floor area above grade is included, including residential uses, but excluding parking. The implementing zoning regulations define in detail how gross floor area is measured.

Figure 2-3 shows maximum FAR permitted in each area. Where FAR boundaries cut across parcel lines, total FAR should be based on the average of FARs from each portion. FAR maximums may be distributed in any manner across these parcels, but height limits must be adhered to.

FLOOR AREA RATIO (FAR)

FAR expresses the ratio of building square footage to land square footage. For example, an FAR of 2.0 means that for every square foot of land, a developer may build two square feet of building. However, this example does not necessitate a two-story building that covers the entire lot. This FAR illustration describes different ways that a building can be constructed while meeting the FAR requirement. Within each set of examples, the building square footages and FAR values are equal, but the building massing and lot coverage changes. (Note that this illustration does not account for additional setback and lot coverage requirements, described in the Zoning Ordinance.)



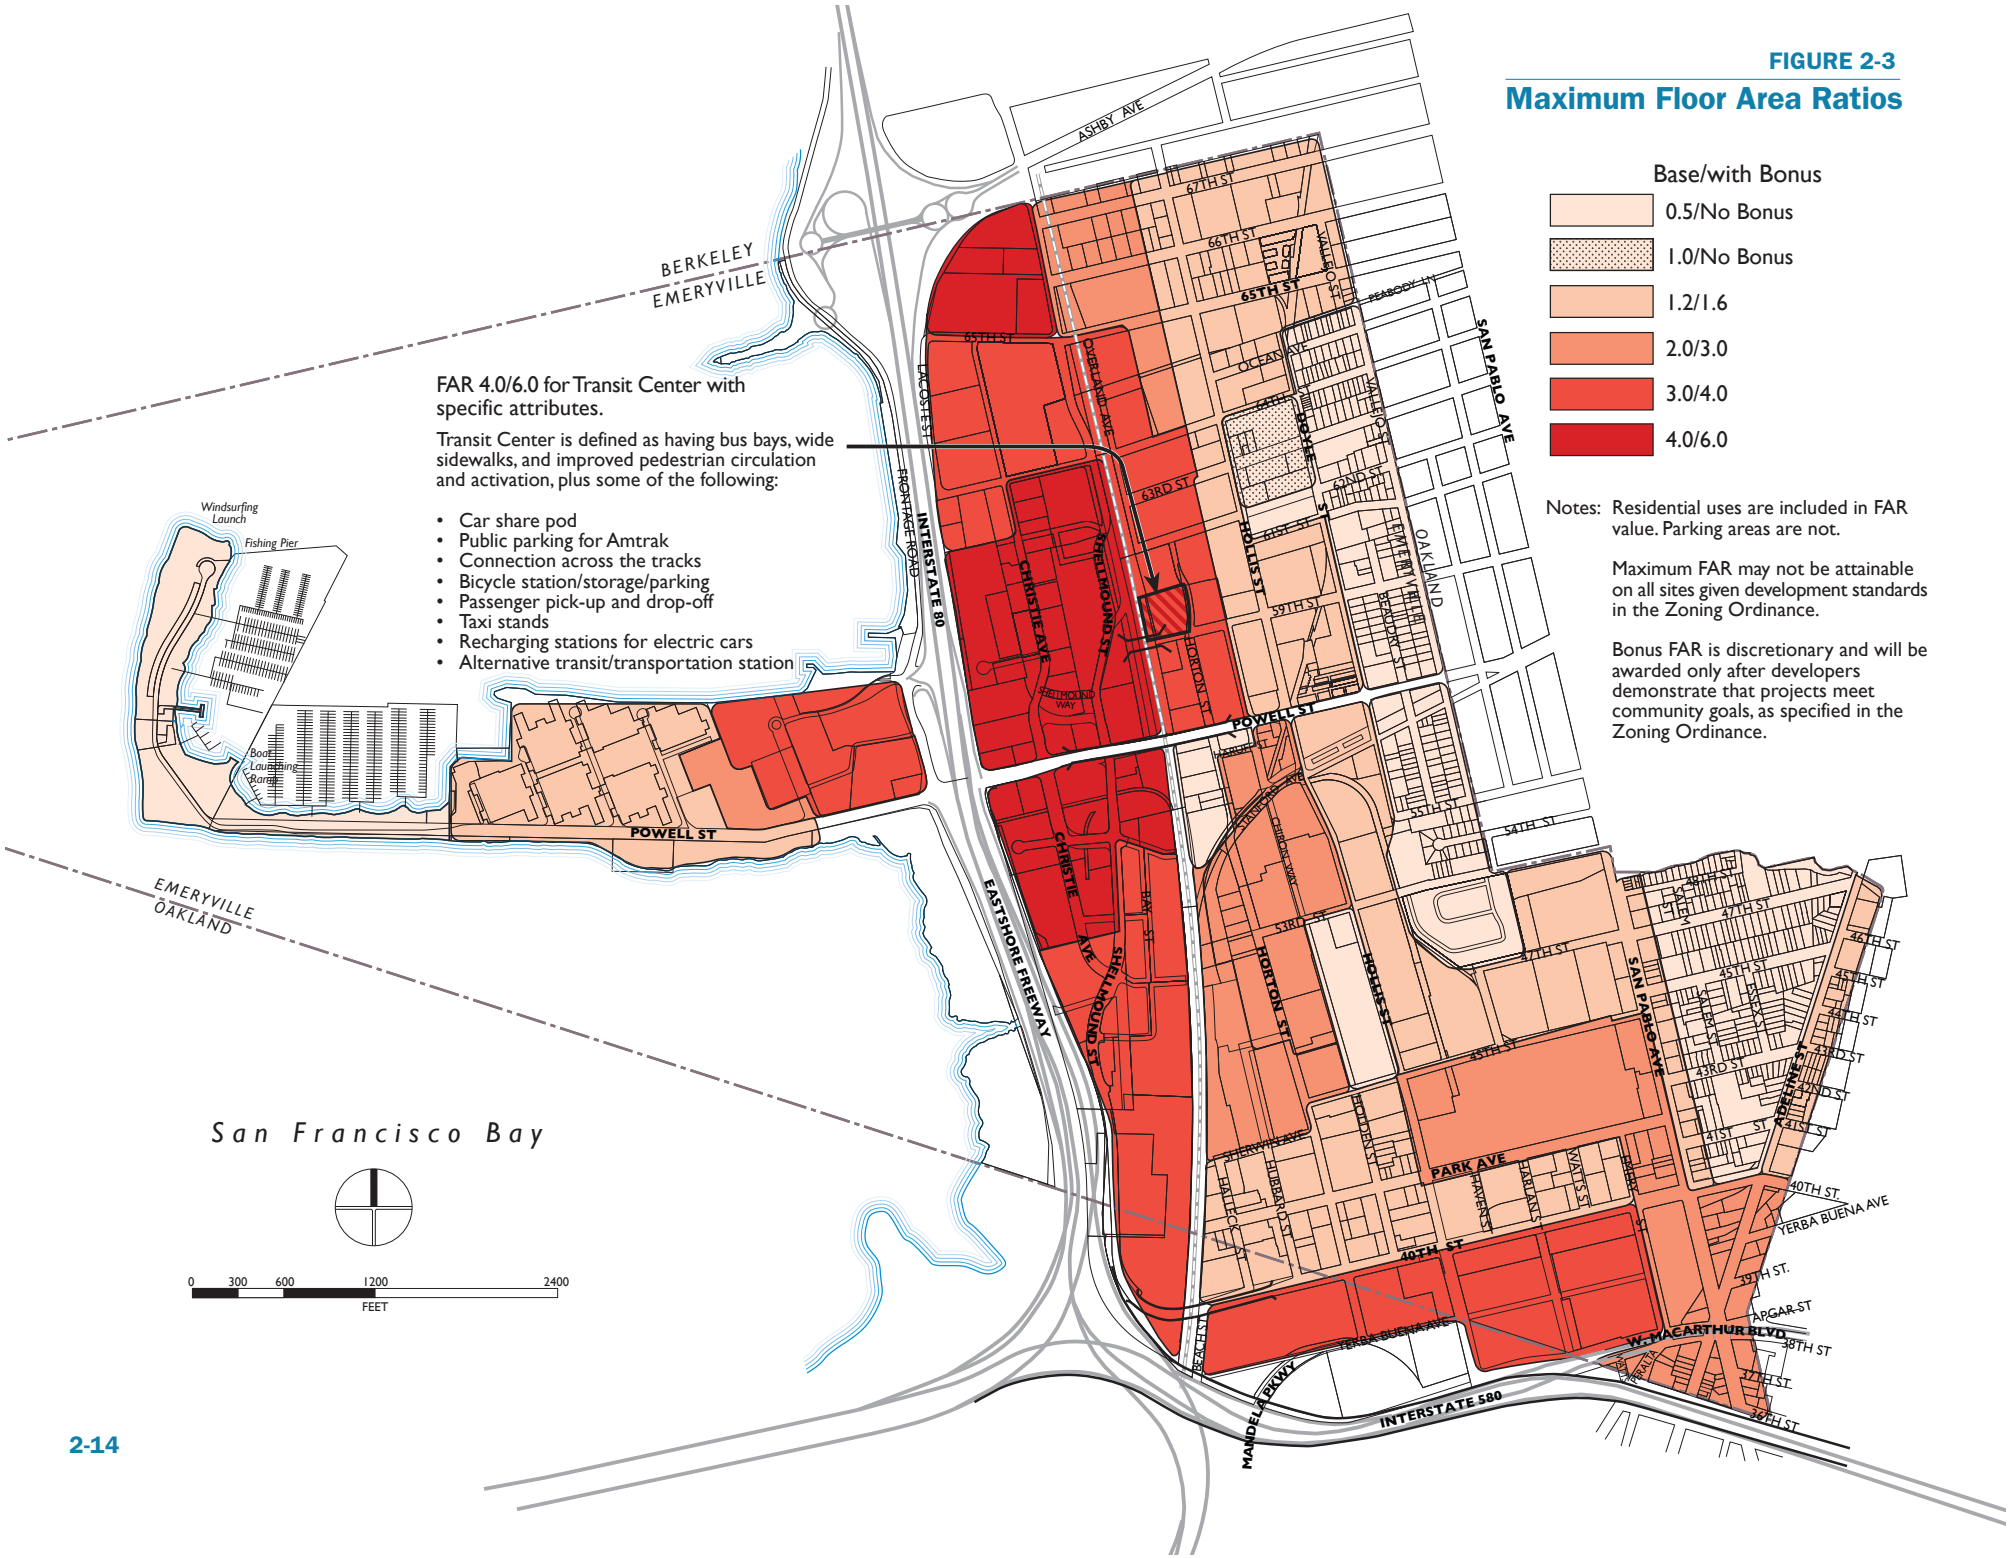


FIGURE 2-3

Maximum Floor Area Ratios

The first number describes the maximum base FAR. Proposed base development intensities in the General Plan range from 0.5 to 4.0, modulated to provide diversity, as well as high intensities in selected locations. Intensities are low in the eastern residential neighborhoods and the western end of the peninsula, gradually increasing to the highest values at the Powell Street/Christie Avenue core area.

The second number represents the maximum bonus FAR that may be awarded after developers demonstrate that projects provide certain community amenities. Bonuses are discretionary and contingent on excellence in design.

Maximum bonus FARs range from 1.6 to 6.0. (There is no bonus in the 0.5 or 1.0 FAR categories.) Maximum FARs shown on the map may not be attainable on all sites as superseding development regulations and/or site conditions may reduce development potential. The bonus program is described on page 2-19 and detailed in the Zoning Ordinance.

Building Heights

Figure 2-4 shows maximum permitted building heights—base and with bonus. Bonus height is discretionary, and will be awarded together with the bonus FAR only after developers demonstrate that projects meet specific community goals. (The bonus height provisions will be specified in the Zoning Ordinance.)

Maximum base building heights range from 30 feet to 100+ feet. Buildings heights gradually step up from the lowest in the east—reflecting the scale of the older residential neighborhoods—and the western edge of the Peninsula, to create a high-rise core in the Powell Street/Christie Avenue area. The Triangle and Doyle Street neighborhoods have a maximum height of 30 feet. These step up to 30 feet/55 feet (base/maximum) in the North Hollis and Park Avenue areas and the Watergate residential complex; these moderate heights will allow light to filter in into the streets in the North Hollis area, maintain the character and scale of the historic Park Avenue area while allowing modest increases, and maintain the scale of the Watergate residential complex, which is an area of stability.

The next step up in height (55 feet/70 feet) provides transition between the low-rise areas and the 70 feet/100 feet height limit that applies to much of Sherwin Williams, East Bay Bridge, as well majority of the sites west of the railroad. The tallest heights (100+ feet) apply to the core which extends on both sides of Powell Street, extending to Pacific Park Plaza in the north (the tallest building in the city with a height of 320 feet), as well a small portion land at the southern edge of the City at the edge of I-580 (which is elevated in the area) that is in joint Oakland/Emeryville planning jurisdiction. Several buildings have previously been approved at heights greater than these height districts would allow; these buildings are "grandfathered", and are indicated by yellow asterisks on Figure 2-4.

The three-dimensional images in Figure 2-5 illustrate how hypothetical buildings might look and feel in the cityscape under the FAR limits of Figure 2-3 and the height limits of Figure 2-4. These drawings are shown for illustrative purposes only.

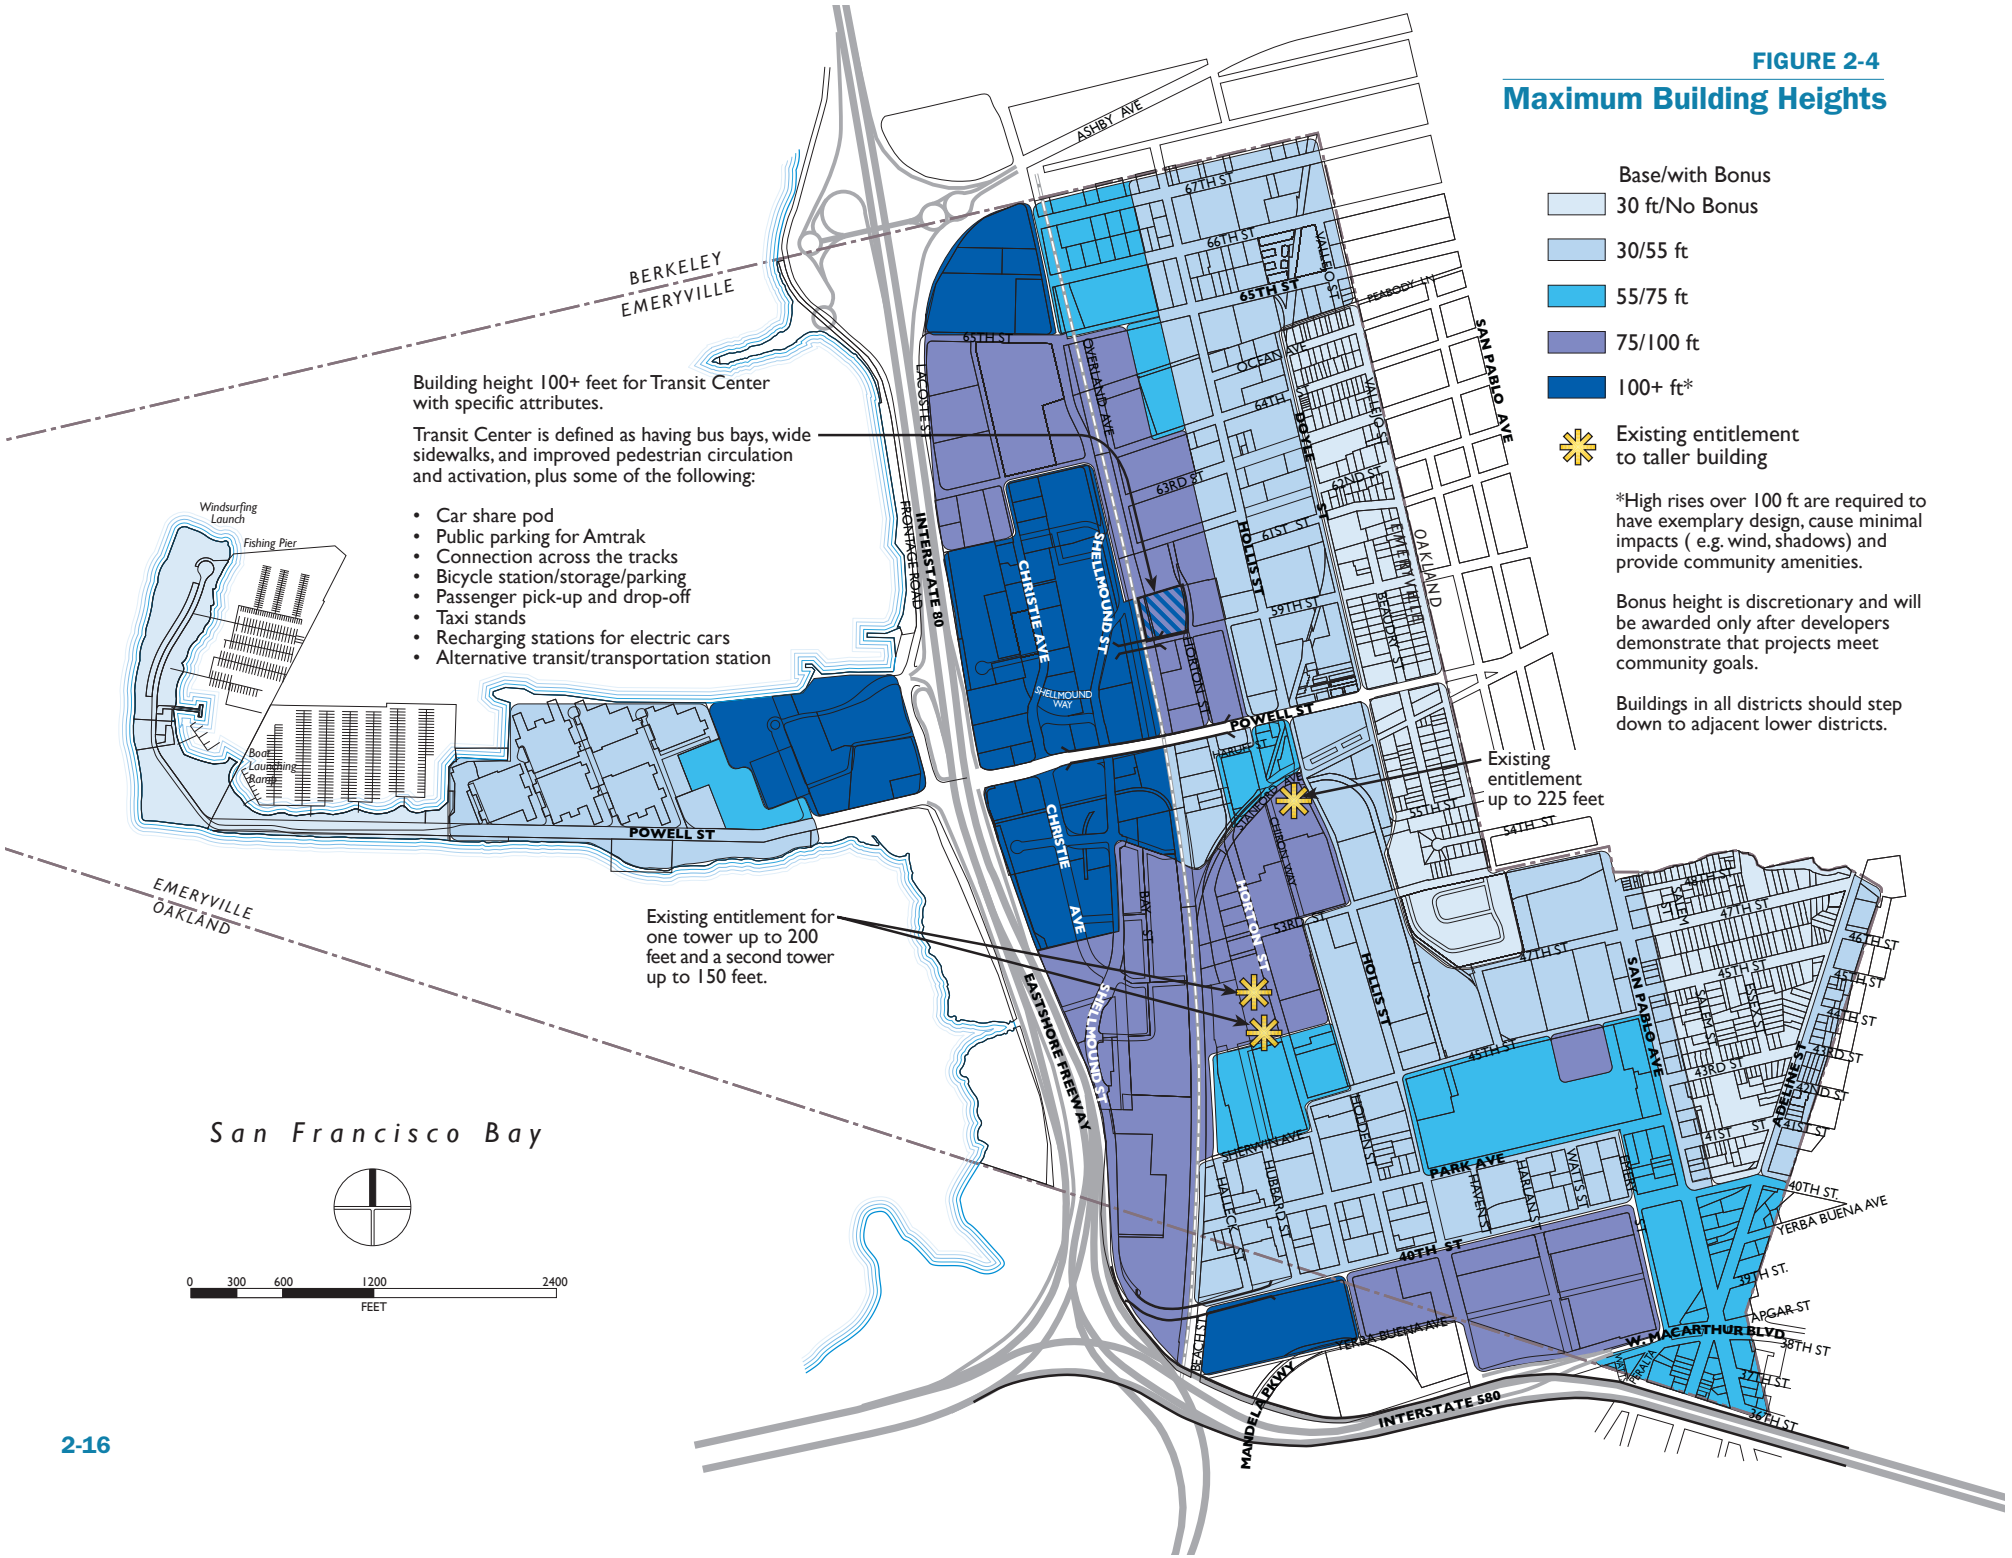
Residential Density

Figure 2-6 shows maximum permitted residential density in units per acre. As described in the FAR and heights sections, the first number refers to the base maximum density value, while the second number represents the maximum value permitted with discretionary bonus allowance. Residential densities range from 20 units per acre (base) in the eastern neighborhood to 115 units per acre (base) in the Powell/Christie core. Assuming a 1.79 persons per household ratio citywide population density

Building heights will be tallest around the Powell/Christie core. Heights step down as you move away from the core, creating visual transitions between the city's districts.

FIGURE 2-4

Maximum Building Heights



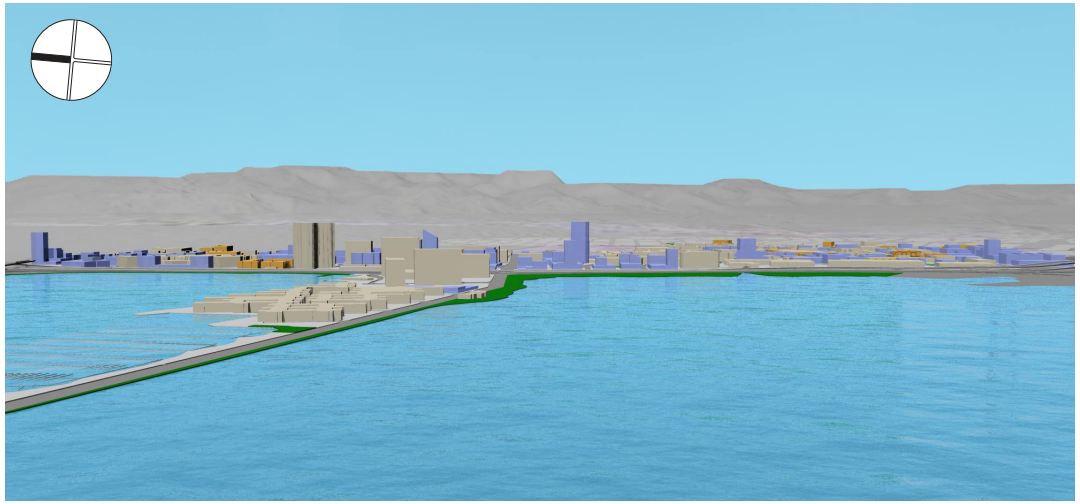


FIGURE 2-5

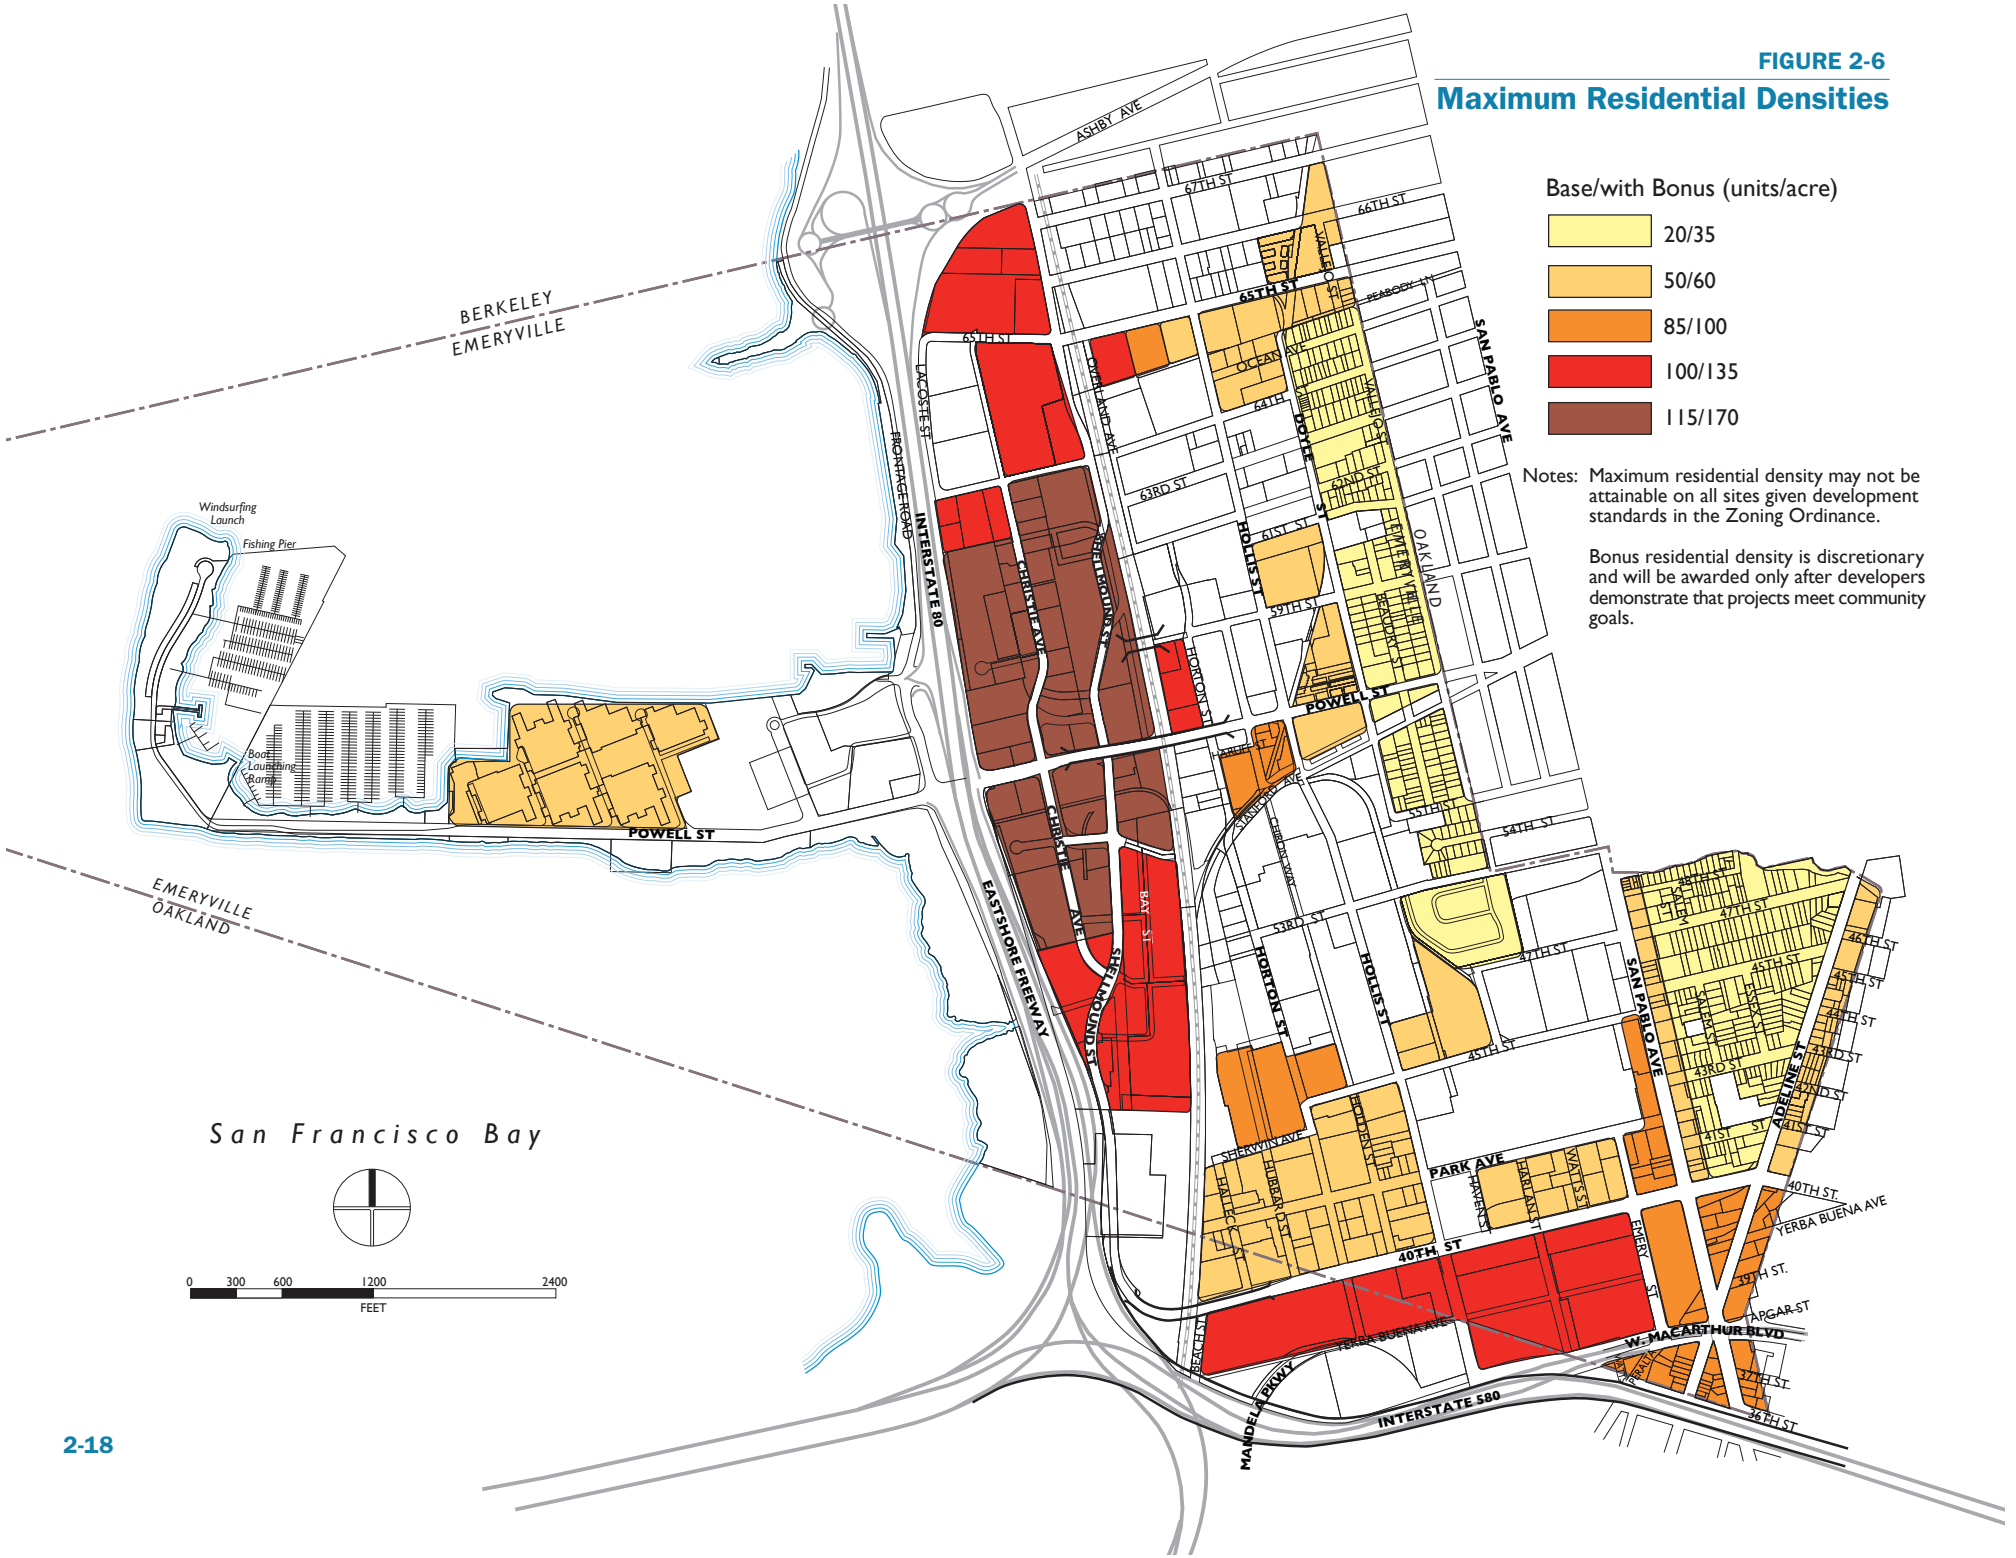
Building Height Perspectives, Hypothetical



Existing buildings
Approved or recently constructed projects
Hypothetical future projects

FIGURE 2-6

Maximum Residential Densities

is projected to range from 36 persons per acre in the eastern residential neighborhood to 206 persons per acre in portions of the Powell/Christie core. Higher residential densities may be achieved through the bonus program.

These residential densities are derived from the FARs shown in Figure 2-4, but are only mapped on those areas where the underlying land use classification of Figure 2-2 would allow residential uses. Areas that are blank in Figure 2-6 would not allow residential uses. It should be noted that policies and additional standards in the Zoning Ordinance that require mixed uses may not allow maximum residential density to be attained in the mixed-use areas.

Intensity, Height, and Density Bonus

Bonus for Community Amenities

Intensity, height, and density bonuses are permitted after developers provide certain community amenities, such as family-friendly housing, green architecture, and public open space. Bonuses are discretionary and contingent on excellence in design. (In the Medium Density Residential areas, additional FAR and greater residential density would be allowed through a conditional use permit. These are not part of the bonus system.)

The City will consider a variety of mechanisms to encourage good design; however, design will not be an eligible bonus category. The Zoning Ordinance establishes criteria on how the bonus is awarded, but the basic framework is summarized below. Note that under State density bonus law, bonuses are allowed for affordable housing. This bonus is separate from the intensity, height, and density bonuses described here.

Height and Density/Intensity Bonuses

Density/intensity bonuses are specified in the Zoning Ordinance, and are based on a point system; a development may need to provide more than one bonus feature or amenity to achieve the maximum bonus. All bonuses (with the exception of State-mandated bonuses for affordable housing) are discretionary. Available bonuses may include, but are not limited to:

- **Public Open Space.** Public parks and/or plazas beyond required park-dedication standards.
- **Family Friendly Development.** Large proportion of three bedroom or larger housing units, amenities for children such as play structures.
- **Sustainable Design.** Eco-roofs, low-impact and energy-efficient design, on-site renewable energy, LEED™ certification or equivalent at various levels.
- **Transportation Demand Management and shared parking.**
- **Public Right-of-Way Improvements.** Improvements to a public right-of-way (such as improvements to a streetscape) beyond normal improvements required along property frontage.
- **Public Parking.** All or a portion of publicly accessible parking will be excluded from FAR calculations and may be counted towards height and density bonuses.
- **Neighborhood Centers.** Retail, restaurants/cafes, art, and public uses in designated Neighborhood Centers.
- **Recycled Water (dual plumbing).**
- **Small Businesses.** Spaces for small business opportunities or mechanisms to attract and retain small businesses.

Discretionary bonuses may be awarded to developers who provide community amenities, such as public open spaces (top) and streetscape improvements (bottom), over and above existing requirements.

CITYWIDE LAND USE GOALS AND POLICIES

GOALS

LAND USE

LU-G-1 **An overall balance of uses**—Employment, residential, cultural, destination and local retail—as well as a full range of amenities and services necessary to support a vibrant community.

LU-G-2 **A mixed use city**—Mixed-use development in various parts of the city, with the range of permitted and required uses varying to meet the needs of specific districts and neighborhoods.

LU-G-3 **Community activity centers**—Centers that combine residential, retail, office, and public uses to create areas of identity and activity for residents and visitors.

LU-G-4 **A mix of housing types**—A diversity of housing types to accommodate a variety of household sizes and incomes.

LU-G-5 **Preservation of residential neighborhoods**—Residential use, structures, low-rise scale, and character of the Triangle, Doyle Street, and Watergate neighborhoods preserved, and the scale of other areas of stability maintained.

LU-G-6 **Vibrant new mixed-use centers**—Intensification of existing underutilized commercial centers with surface parking (such as Powell Street Plaza and East Bay Bridge Center) as vibrant, multi-story, walkable mixed-use destinations with structured parking and open space.

HEIGHT AND INTENSITY

LU-G-7 **A varied skyline**—with the highest intensities/heights grouped in the Powell Street/Christie Avenue area, with heights stepping down from this urban core.

LU-G-8 **Uninterrupted sunlight in key areas**—during designated periods on all major parks. Adequate sunlight on sidewalks and streets, especially in Neighborhood Centers and other key public gathering areas.

LU-G-9 **Appropriately scaled buildings**—heights and massing that do not appear monolithic.

LU-G-10 **Maximum sky exposure**—for streets and public spaces, and minimal view disruptions.

ECONOMIC DEVELOPMENT

LU-G-11 **A wide range of economic activity**—An economy that capitalizes on Emeryville's central location, strengthens the City's tax base, and ensures that Emeryville has adequate fiscal resources to fund high quality public services for its residents and businesses.

LU-G-12 **Successful businesses**—retain and foster the growth of Emeryville businesses.

LU-G-13 **Local employment opportunities**—encourage establishment of businesses that will employ and serve Emeryville residents.

POLICIES

Implementing actions supporting each policy are described in Chapter 8: Implementation Program.

LAND USE

LU-P-1 Land uses will be consistent with the Land Use Classifications in section 2.4 and the Land Use Diagram, Figure 2-2.

LU-P-2 The Powell/Christie/Shellmound/I-80 core area will be developed into a compact but high-intensity regional transit hub. This hub will include a retail core, with stores, restaurants, and hotels; a financial and commercial center, creating a daytime work population; and a residential neighborhood, providing vitality during non-work hours.

LU-P-3 The northern (north of Powell) and southern halves of the Powell/Christie core area shall be integrated and connected, and the district shall be walkable, with small blocks, pedestrian-oriented streets, and connections to surroundings.

LU-P-4 Park Avenue (west of Hollis Street), Hollis Street (between 61st and midblock between 65th and 66th streets), Powell Street/Captain Drive, and San Pablo Avenue (between 36th and 47th streets) will be developed as walkable, mixed-use neighborhood centers, with an array of amenities and services—including stores, restaurants and cafes, galleries, and office uses—to serve neighborhood needs, with community-serving uses and active building frontages that engage pedestrians at the ground level.

LU-P-5 Retail uses will be concentrated in areas with Neighborhood or Regional Retail overlays, near neighborhood centers, and in the Emeryville Marketplace.

LU-P-6 The current deficiency of park and open space will be addressed by making parkland acquisition a high priority by the City, and working with private land owners to secure these areas through development incentives, land swaps, and other mechanisms.

LU-P-7 Existing uses on sites designated for large community parks along Hollis Street shall remain as conforming uses, until such time as these sites are acquired by or dedicated to the City.

LU-P-8 Live/work uses will be permitted in all land use designations except Public, Parks/Open Space, and Marina. In the Industrial district west of Hollis Street, only "heavy" live/work—involving, for example, manufacturing, welding, or assembly—will be permitted.

LU-P-9 Zoning performance measures will ensure health and safety compatibility for industrial uses bordering residential uses.

HEIGHT AND INTENSITY

LU-P-10 Maximum building height will be defined by the Maximum Building Heights diagram, Figure 2-4.

LU-P-11 Maximum floor area ratios (FARs) and residential densities for sub-areas of the city, will be defined by Figure 2-3 and 2-6, respectively.

LU-P-12 Bulk standards will be defined in the Zoning Ordinance, with particular emphasis on zones where taller buildings are permitted.

LU-P-13 Building heights will step down to the east and west from the Powell/Christie core; buildings taller than 55 feet are not permitted east of Hollis Street. The height and scale of existing development (30 feet maximum) in the Doyle Street and Triangle neighborhoods will be maintained.

LU-P-14 Heights greater than 100 feet are only permitted for buildings that meet specific criteria, such as minimal impacts on public views, sky exposure, wind, and shadows, adequate separation from other tall buildings, and exemplary design, and/or provide public amenities, through a discretionary review and approval process.

LU-P-15 Buildings in all districts shall be required to step down to meet permitted heights in adjacent lower-rise districts.

LU-P-16 A point-based system will be established for intensity, height and density bonus, as well as review and approval process.

POLICIES FOR SPECIFIC AREAS

LU-P-17 The area around the Amtrak station shall be developed with pedestrian and bicycle amenities, and transit-supportive uses, through measures such as reduced parking requirement, incorporation of public parking in developments, and accounting for transit proximity when considering height and FAR bonuses.

LU-P-18 The reuse of the Sherwin Williams site shall include a mix of residential and nonresidential uses with ample open space, centered on an extension of the Emeryville Greenway connecting Horton Landing Park and the Park Avenue District.

LU-P-19 The relocation of the AC Transit facility will be pursued. Alternative community uses if/when the facility relocates will be studied.

LU-P-20 Along San Pablo Avenue neighborhood-oriented retail establishments—that may serve a regional clientele as well—with housing above will be promoted. Development adjacent to residential uses in the Triangle neighborhood shall be in keeping with the scale and character of the residential uses.

LU-P-21 The East Bay Bridge, Powell Street Plaza, and Marketplace shopping centers shall be intensified by consolidating parking into structures and converting surface parking lots into residential and mixed-use development—including retail, hotels, and offices; expanding the city street grid through the sites; and developing new parks and public open space. Future redevelopment of these shopping centers should include at least as much retail space as existed when this General Plan was adopted.

LU-P-22 In the short term, landscaping and façades in the East Bay Bridge Shopping Center should be upgraded.

LU-P-23 The Powell Street Plaza site shall be encouraged to redevelop as a high-intensity, high-rise, mixed-use development that complements the Powell Street entrance to the city from the freeway.

LU-P-24 The Marketplace and adjacent parcels shall be encouraged to redevelop with a mix of uses, and iconic mid to high-rise development.

LU-P-25 If new residential buildings are proposed adjacent to freeways and railroad tracks impacts of these corridors, including noise, vibration, and air pollution, should be considered during site planning. Noise, vibration, and air pollution shall be mitigated to the extent possible.

ECONOMIC DEVELOPMENT

LU-P-26 A mix of retail that draws local customers as well as patrons from the greater Bay Area shall be encouraged.

LU-P-27 A diversity of commercial uses to insulate the City's fiscal base from downturns in particular markets shall be maintained.

LU-P-28 The City will pursue retail uses that will serve the need of Emeryville residents, and encourage these uses to locate in the Neighborhood Centers.

LU-P-29 The City will encourage the development and retention of small business, start-up firms, partnership incentives, and buildings that accommodate these businesses.

LU-P-30 The City will encourage development of dynamic, leading edge industries, based in high technology, medical/bio engineering, bio technology, and media that provide good quality jobs with the potential for career advancement.

LU-P-31 The City will encourage development of existing Emeryville businesses with the objective of retaining and expanding employment opportunities and strengthening the tax base. Provide assistance

to existing businesses that may be displaced by new development to relocate in Emeryville.

LU-P-32 The City will work with existing Emeryville businesses, Chamber of Commerce, and others to address the City's economic needs and stimulate growth.

Page intentionally left blank.

3 TRANSPORTATION

The General Plan recognizes that an efficient multi-modal transportation plan, coupled with wise land use planning, is essential to improving quality of life, supporting economic vitality, and reducing greenhouse gas emissions. The Transportation Element seeks to create a well-connected transportation network that accommodates cars, public transit, walking, and biking.

3.1 BACKGROUND

Emeryville is traversed by a number of key regional transportation routes, notably the I-80 and I-580 freeways, San Pablo Avenue corridor, AC Transit bus lines, Amtrak and freight rail lines and the San Francisco Bay Trail. The San Francisco Bay Area Rapid Transit (BART) system has several stations a short distance from Emeryville, including the West Oakland Station, with frequent service to San Francisco and the MacArthur Station, a hub for the East Bay, easily accessed by free bus service provided by the Emery Go-Round shuttle. Oakland International Airport is located 10 miles to the southeast, and San Francisco International Airport is 15 miles to the southwest. However, the infrastructure that allows for such flexibility also creates some constraints, as freeway and rail lines produce congestion and internal barriers to east-west circulation.

Removing barriers to pedestrian and bicycle connectivity will help to create a street and transportation network that is accessible for all modes and for all users.

Recent Trends

A confluence of demographic, economic, and environmental trends are converging toward the necessity of creating a multi-modal transportation network in Emeryville. An aging population, increasing fuel costs, and concerns about climate change, highlight the benefits and necessity of alternative modes of transportation. Moreover, during the General Plan update process, community members expressed a desire for Emeryville to be more pedestrian and bicycle friendly.

The surge in commercial development in the past 10 years is testament to Emeryville's central location in the Bay Area and proximity to regional transportation facilities. The city has seen increased ridership regionally on the Amtrak Capitol Corridor—serving over 160,000 passengers in July 2008, a 30 percent increase in ridership over the previous year—and locally on the Emery Go-Round which has served over one million passengers annually. However, like many places, the City has accommodated motor vehicles at the expense of pedestrian and bicycle movement. While transit use among residents of Emeryville increased during the 1990s, Emeryville's circulation network is still not conducive to pedestrian and bicycle travel. In response, the General Plan creates a more balanced approach to circulation and transportation mode choice.

Commute Patterns

Emeryville residents tend to commute less by driving alone and more by telecommuting, walking, biking, carpooling, riding transit, or bicycling compared with the Bay Area as a whole. However, the city's population swells during the day by the substantial number of non-residents who work in Emeryville and tend to come by car. In 2000, there were about 1,000 residents who both lived and worked in Emeryville, about 3,000 residents who commuted to jobs outside the city ("Out-commuters"), and about 17,000 workers who lived elsewhere and commuted to jobs in Emeryville ("In-commuters").

As shown in Table 3-1, about 60 percent of workers commuting out of Emeryville drove alone, while 77 percent of commuters employed in Emeryville drove alone to work. Only 37 percent of those who both lived and worked in Emeryville drove alone. The Bay Area average is 68 percent, so Emeryville's residents tend to drive to work less than the regional average, while those who commute to Emeryville from elsewhere drive somewhat more than the regional average.

The rate of walking and biking to work was substantially higher for those who both live and work in Emeryville than the Bay Area average (31% in Emeryville, versus 4% in the Bay Area). This is influenced by Emeryville's small size and flat terrain, which make walking and bicycling relatively easy for those who live close to their workplace. In addition, the city has a high rate of workers who work at home or telecommute: 25 percent in Emeryville, compared with just four percent in the region as a whole. The rate of transit use for out-commuters (40%) is double that of in-commuters (20%). This is influenced by the substantial proportion of residents that are employed in San Francisco, Berkeley or Oakland (the top destinations), which can be easily accessed by public transportation from Emeryville.

The journey to work is only one aspect of travel patterns. People also travel for shopping, school, personal business, recreation, and other reasons. Shopping trips are especially important in Emeryville because of the large number of retail stores. However, similar detailed data is not available for these other trip purposes. While they do not constitute the whole picture, journey to work patterns are important to understand because they make up the bulk of the traffic during the busiest time of day, the "p.m. peak hour" (rush hour), which largely determines the types of transportation improvements that are typically proposed.

TABLE 3-1: Journey to Work by Mode of Travel

	Emeryville Residents		In-Commuters	Bay Area Average
COMMUTE MODE	WORK IN EMERYVILLE	OUT-COMMUTERS		
Work at Home	25%	n/a	n/a	4%
Drive Alone	37%	60%	77%	68%
Transit/Carpool/Other	6%	40%	20%	24%
Walk	28%	0.1%	2%	3%
Bicycle	4%	0.7%	1%	1%

Source: 2000 U.S. Census provides "Journey to Work"

The General Plan seeks to enhance the city's multi-modal transportation system.

3.2 CIRCULATION SYSTEM

Typology

To ensure a balanced, multi-modal transportation network, the General Plan organizes streets and other transportation facilities according to "typologies" which consider the context and prioritize travel modes for each street. This ensures that the standards consider a facility's relation to surrounding land uses, appropriate travel speeds, and the need to accommodate multiple travel modes.

The following typology definitions apply to the streets and other facilities that make up the city's circulation plan, as shown in Figures 3-1 through 3-6:

- **Transit Street** – These are primary routes for AC Transit, Emery Go-Round, and other public transit providers. Signal preemption for transit vehicles, bus stops, and, where appropriate, bus lanes, are provided. Other travel modes, including automobiles, bicycles, and trucks, are accommodated in the roadway, but if there are conflicts, transit has priority. These streets accommodate moderate to high volumes of through-traffic within and beyond the city. Pedestrians are accommodated with ample sidewalks on both sides of the street, and amenities around bus stops (e.g. shelters, benches, lighting, etc).
- **Bicycle Boulevard** – These are through-routes for bicycles providing continuous access and connections to the local and regional bicycle route network. Through-motor vehicle traffic is discouraged. High volumes of motor vehicle traffic are also discouraged, but may be allowed in localized areas where necessary to accommodate adjacent land uses. Local automobile, truck, and transit traffic are accommodated in the roadway, but if there are conflicts, bicycles have priority. Traffic calming techniques to slow and discourage through-automobile and truck traffic may be appropriate. Pedestrians are accommodated with ample sidewalks on both sides of the road.
- **Connector Street** – Automobiles, bicycles, and trucks are accommodated equally in the roadway. Transit use, if any, is incidental. These streets accommodate moderate to high volumes of through-traffic within and beyond the city. Pedestrians are accommodated with ample sidewalks on both sides of the street.
- **Local Street** – Automobiles, bicycles, and trucks are accommodated equally in the roadway. Transit use, if any, is incidental. These streets accommodate low volumes of local traffic and primarily provide access to property. Through-traffic is discouraged. Traffic calming techniques to slow and discourage through-automobile and truck traffic may be appropriate. Pedestrians are accommodated with ample sidewalks on both sides of the street.
- **Auto Dominant Highway** – These are freeways and approach roads (e.g. Ashby Avenue and West MacArthur Boulevard underpass) that serve high volumes of high speed regional motor vehicle traffic including automobiles and trucks. Transbay and express transit buses are also accommodated. Bicycles and pedestrians are prohibited.
- **Intercity Rail** – This is the mainline Union Pacific/Amtrak railroad line serving long distance and local freight and passenger traffic. The Capitol Corridor line is the third busiest route in the U.S. Other passenger routes include cross country trains (California Zephyr and Coast Starlight), San Joaquin, and future "East Bay Express". If a new Transbay tube is built, it should connect to this

Emeryville contains a range of street types, from auto-dominated highways and connector and transit streets (top) to local streets (bottom) which are more amenable for pedestrians and bicyclists.

line to provide direct rail access between San Francisco and Sacramento with a stop in Emeryville. If any new inner-city BART lines are proposed, one should follow this alignment with a station at Powell Street and entrances from Bay Street, Marketplace, Novartis, and the Emery Station complex.

- **Major Transit Hub** – These are transfer points where high volume transit lines intersect. These are located in the Amtrak station with access from both sides of the rail line, and at 40th Street and San Pablo Avenue.
- **Bicycle Path** – Class I Bicycle path as defined by Caltrans standards accommodates both bicycles and pedestrians. Motor vehicle traffic is prohibited.
- **Bike Route** – Class II (bike lanes) or Class III (signed route) bike facilities as defined by Caltrans standards, are overlaid on transit, connector, and local streets. While bicycle use is always accommodated on these streets, it is encouraged along designated bike routes, which provide continuous access and connections to the local and regional bicycle route network.
- **Pedestrian Path** – These are exclusive walkways for pedestrians. Bicycles and motor vehicles are prohibited.
- **Pedestrian Priority Zones** – These are zones on which high volumes of pedestrian traffic are encouraged along the sidewalk. This includes zones around neighborhood centers, regional retail areas, and around school and other public facilities. Sidewalks should be wide with ample pedestrian amenities. Building frontages should provide high level of pedestrian interest. Pedestrian crossings should have a high priority at intersections. In some locations, well-protected mid-block crosswalks may be appropriate.

TRANSPORTATION FACILITIES MATRIX

Facility	Transit	Bicycles	Pedestrians	Autos

FIGURE 3-1

Circulation

Multi-Modal Emphasis

The Transportation Element is intended to ensure the accommodation of multiple travel modes on the circulation system and to ensure mobility for all community members. This will require a rethinking of past policies that emphasized automobile circulation and prioritized motor vehicle improvements.

Because automobile travel has been the dominant form of transportation, "Level of Service" (LOS) has traditionally been measured for vehicle drivers, with minimal regard to bicycle, pedestrian, and transit users. This bias unintentionally but inherently ignores overall mobility and conditions for non-auto road users and perpetuates a system that focuses on expanding vehicle capacity, which can reduce the quality of service for pedestrians and bicyclists.

Measurement Standards

This General Plan departs from conventional thinking by doing away with the traditional Level of Service methodology and replacing it with an alternative "Quality of Service" (QOS) standard that optimizes travel by all modes of transportation, not just vehicle travel. This will permit greater development flexibility to take advantage of land use density and diversity which have been shown to increase transit ridership, biking, and walking, while decreasing the need for automobile travel. This can reduce air pollution, energy consumption, and greenhouse gas emissions, while improving the overall travel experience for Emeryville's citizens.

In 2002 the Florida Department of Transportation published the 2002 Quality/Level of Service Handbook. The document's methodologies incorporated extensive research into the road user's perspective of their travel experience. As a result of this research, the analytical techniques used to analyze pedestrian, bicycle, and transit modes are as rigorously developed and tested as those for automobiles. Emeryville intends to use this current state of the practice research and other valid transportation engineering methodologies for assessing and optimizing the quality of service for all travel modes.

Many transit trips begin or end as walking or biking trips. Therefore pedestrian and bicycle amenities such as ample sidewalks, bike parking and shelter, should be provided at these interfaces.

LEVEL OF SERVICE (LOS)

Historically roadway and intersection operations were described from the vehicle driver perspective using the term "Level of Service" (LOS). Level of Service represents a qualitative description of the traffic operations experienced by the driver at the intersection. It ranges from LOS "A", with no congestion and little delay, to LOS "F", with excessive congestion and delays. LOS uses quantifiable traffic measures such as average speed and intersection delay to determine driver satisfaction. LOS ratings are derived from the peak 15 minutes during the commute hours of the day.

COMPLETE STREETS

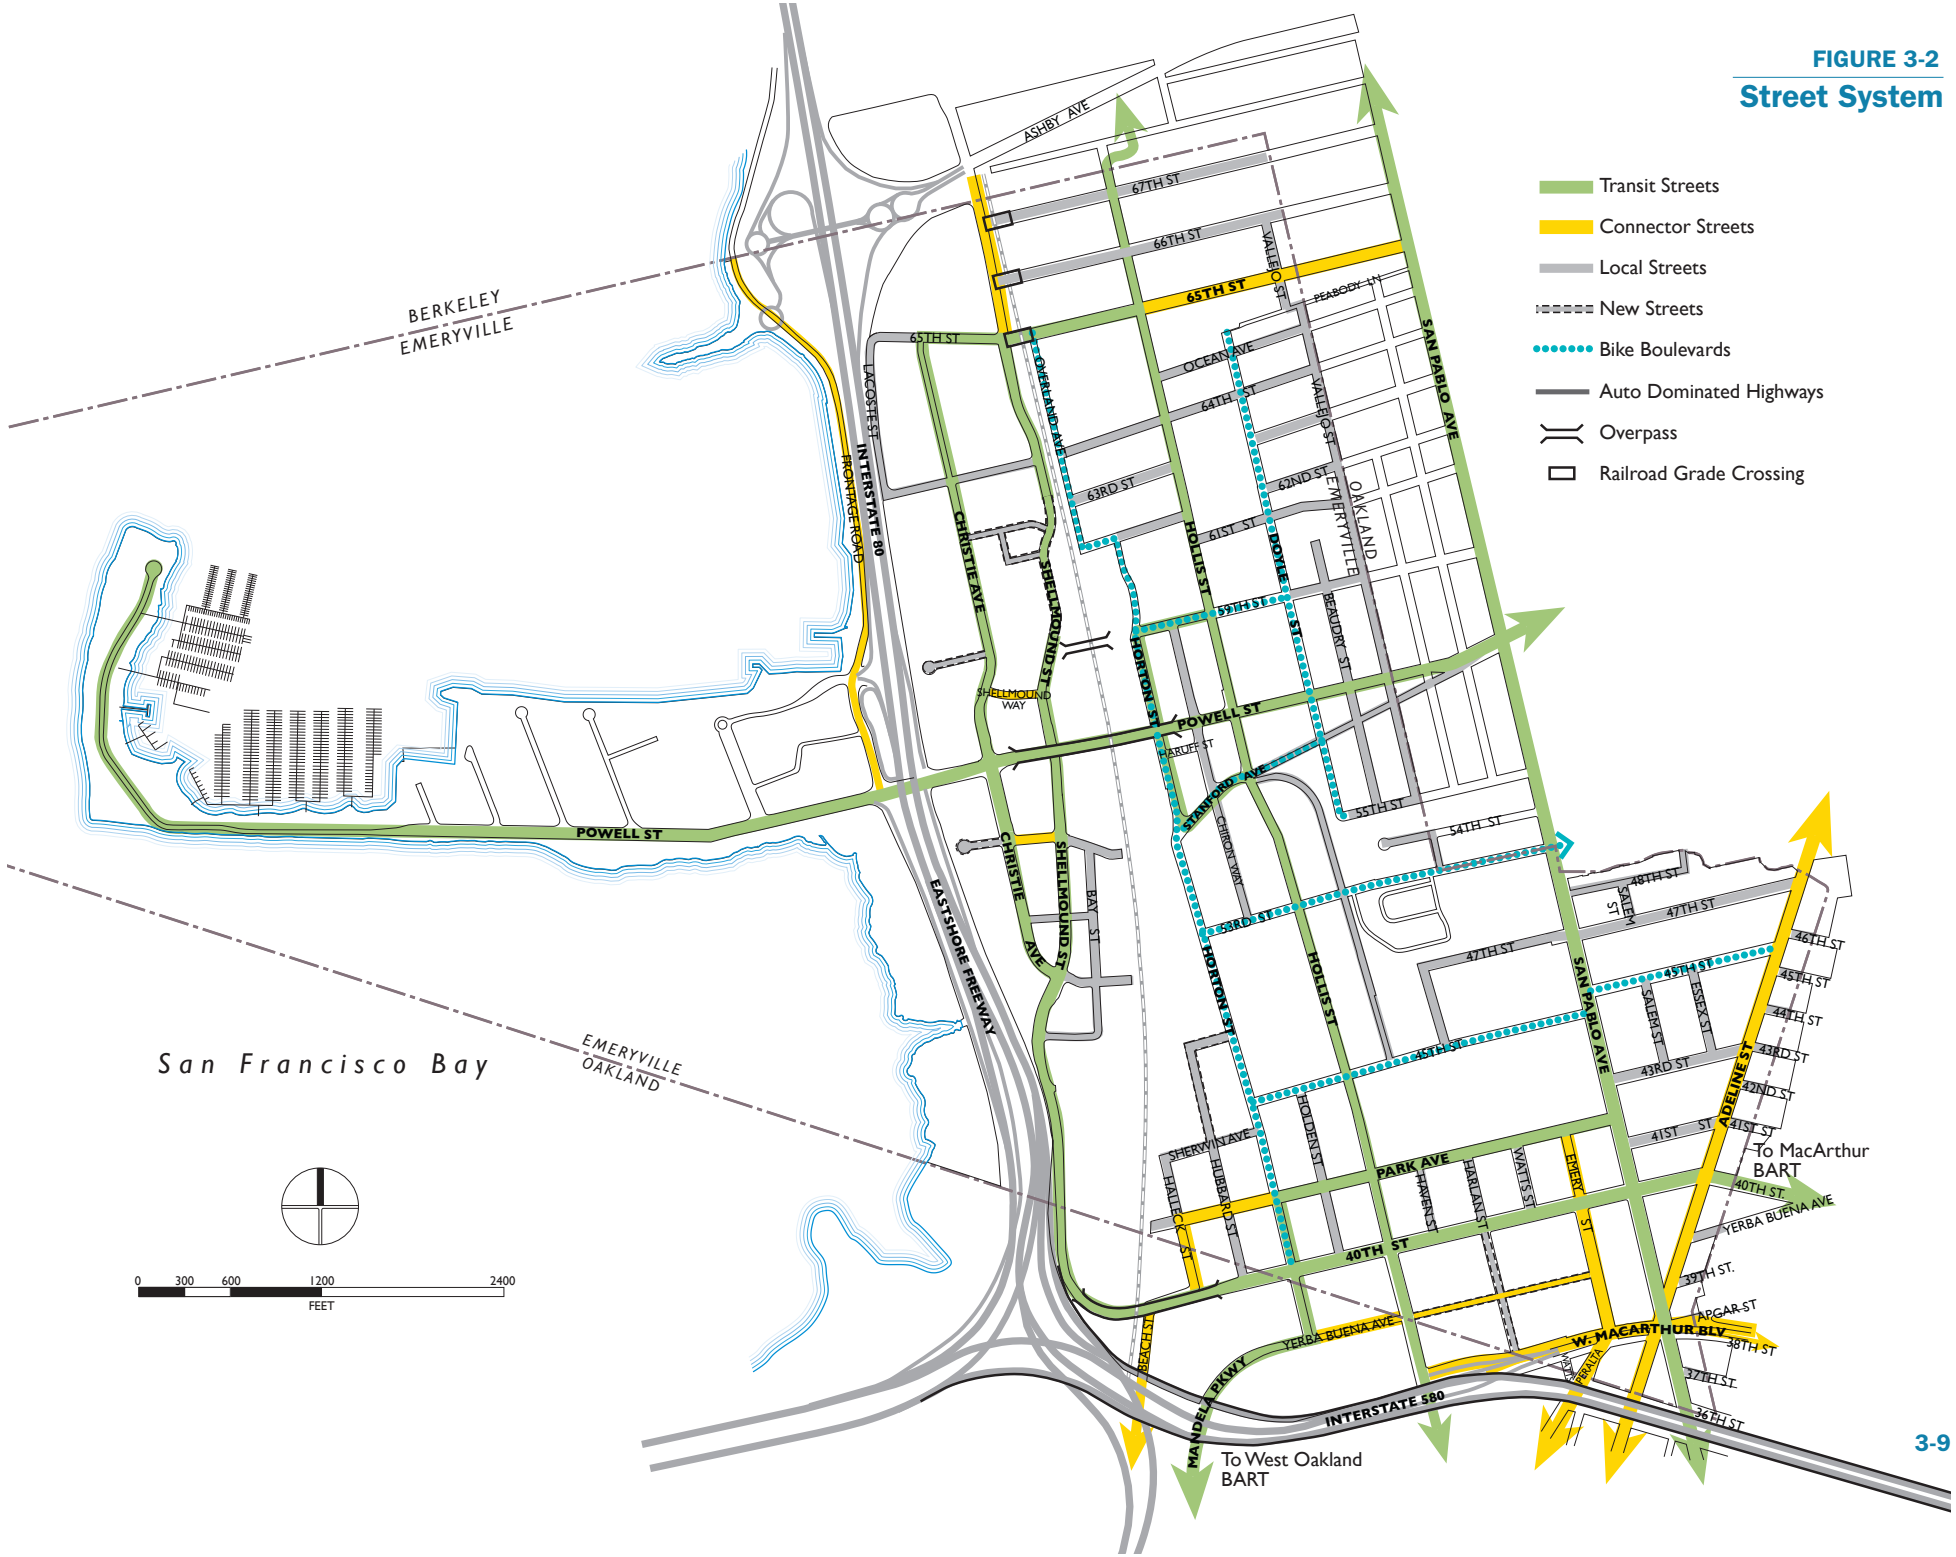
To further the goal of optimizing travel by all modes, this General Plan incorporates the concept of "Complete Streets." Complete Streets are designed and operated to enable safe, attractive and comfortable access and travel for all users. Pedestrians, bicyclists, motorists and public transit users of all ages and abilities are able to safely and comfortably move along and across a complete street. Complete Streets also create a sense of place and improve social interaction, while generally improving the values of adjacent property. The Governor signed into law the California Complete Streets Act of 2008 (AB 1358) in September 2008, requiring that General Plans develop a plan for a multi-modal transportation system. This Transportation Element outlines the City's policy for Complete Streets.

3.3 STREET SYSTEM

Framework

The backbone of Emeryville's circulation plan is the street system. It provides the basic transportation infrastructure of the city, including routes for public transit, bicyclists, pedestrians, and motor vehicles, as well as access to public and private property. The streets are also the major component of the "public realm," creating a sense of place where social interaction occurs. A balanced approach to accommodating multi-modal transportation on the street network is essential, especially in light of the city's strong retail sector, employment base, and growing residential neighborhoods.

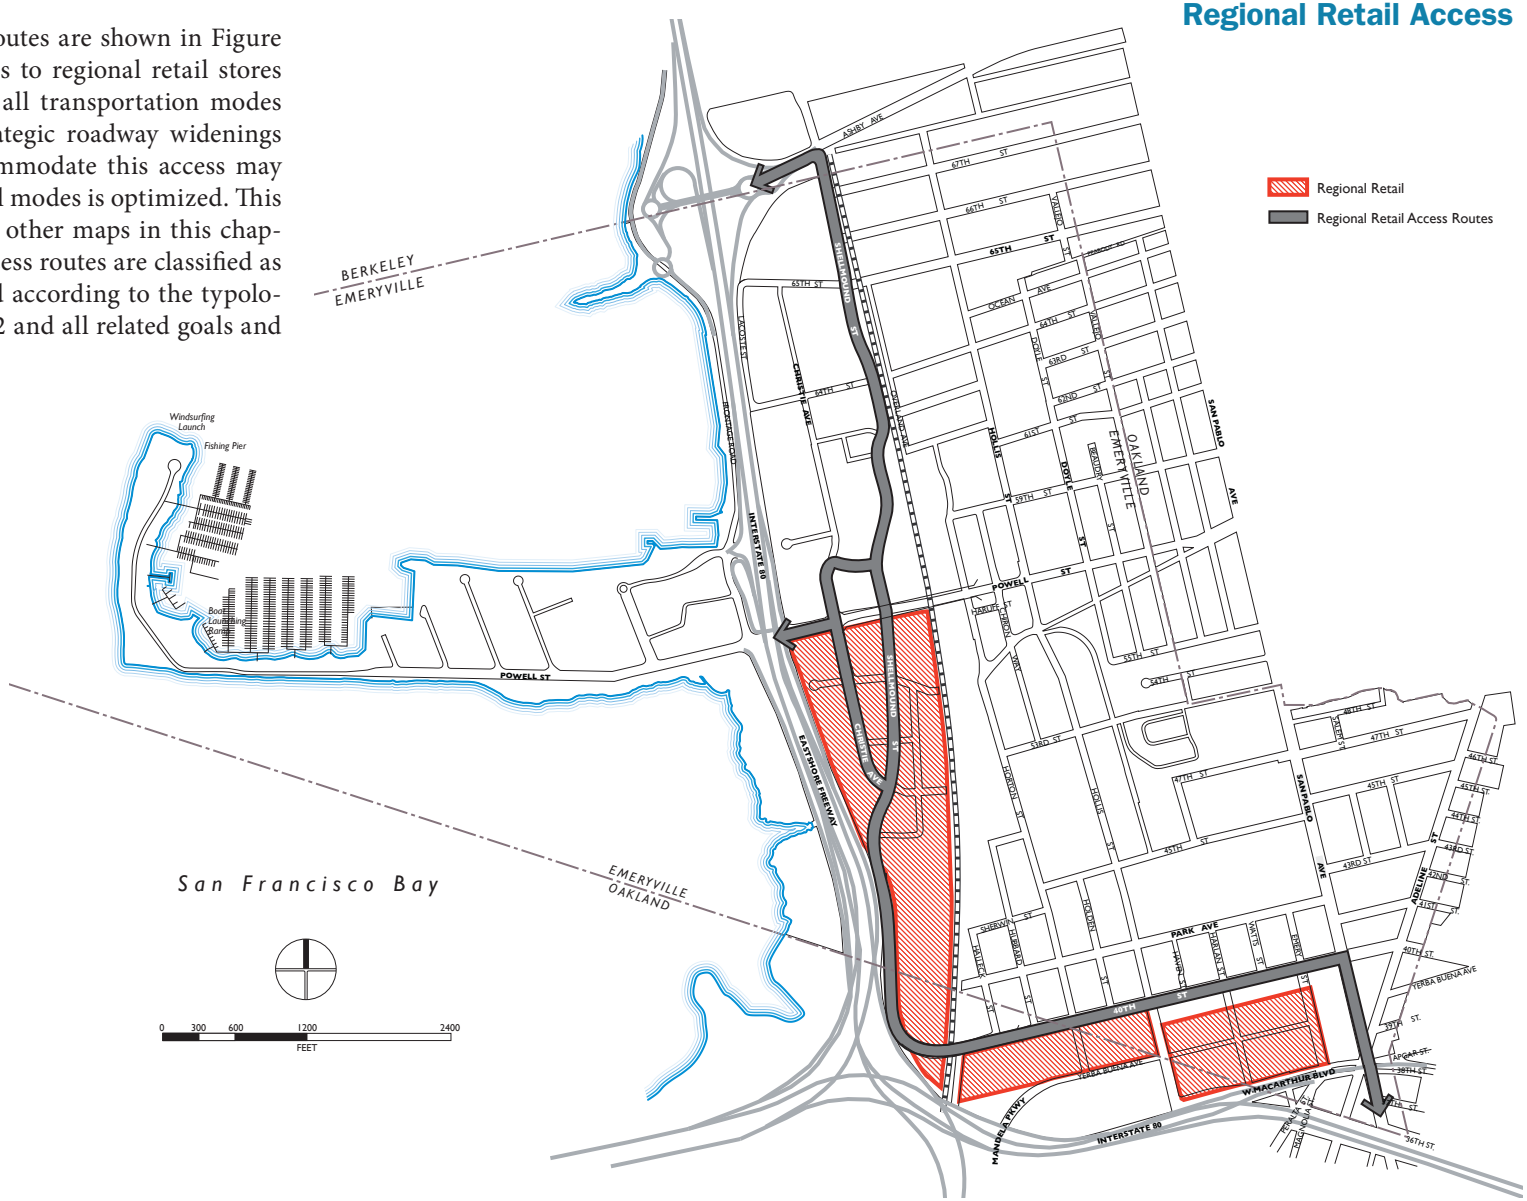
An expanded street grid will create new connections for vehicular and non-vehicular travel.



Recent transportation planning efforts have emphasized the need to maintain and enhance motor vehicle access to these regional retail destinations. At the same time, it is important to enhance travel by other modes, including public transit, bicycling, and walking, both along these regional corridors and throughout the city. The street system is set forth in Figure 3-2 and consists of the following:

- Transit streets, which carry large volumes of through-traffic, and on which public transit vehicles have priority.
- Connector streets, which carry large volumes of through-traffic, and on which all travel modes have equal priority, and where transit use, if any, is incidental.
- Bicycle Boulevards, where bicycles have priority, and on which through-traffic by other modes is discouraged.
- Local streets, which carry low volumes of local traffic, provide access to property, on which all travel modes have equal priority, and where transit use, if any, is incidental.
- Auto-dominated highways, which carry very large volumes of high speed regional traffic and on which bicycles and pedestrians are prohibited. These include the freeways and major approach roads.
- An expanded street grid throughout the city, including the North and South Bayfront areas, Sherwin Williams site, and East Bay Bridge Shopping Center.
- Regional retail access routes, which identify primary routes to regional retail stores, for all transportation modes, including automobiles.

FIGURE 3-2



Street System

Regional Retail Access

The regional retail access routes are shown in Figure 3-3. On these streets, access to regional retail stores will be accommodated for all transportation modes including automobiles. Strategic roadway widenings and other changes to accommodate this access may be considered, if travel by all modes is optimized. This map is supplemental to the other maps in this chapter. These regional retail access routes are classified as indicated on Figure 3-2 and according to the typologies discussed in Section 3.2 and all related goals and policies.

FIGURE 3-3
Regional Retail Access

3.4 WALKING

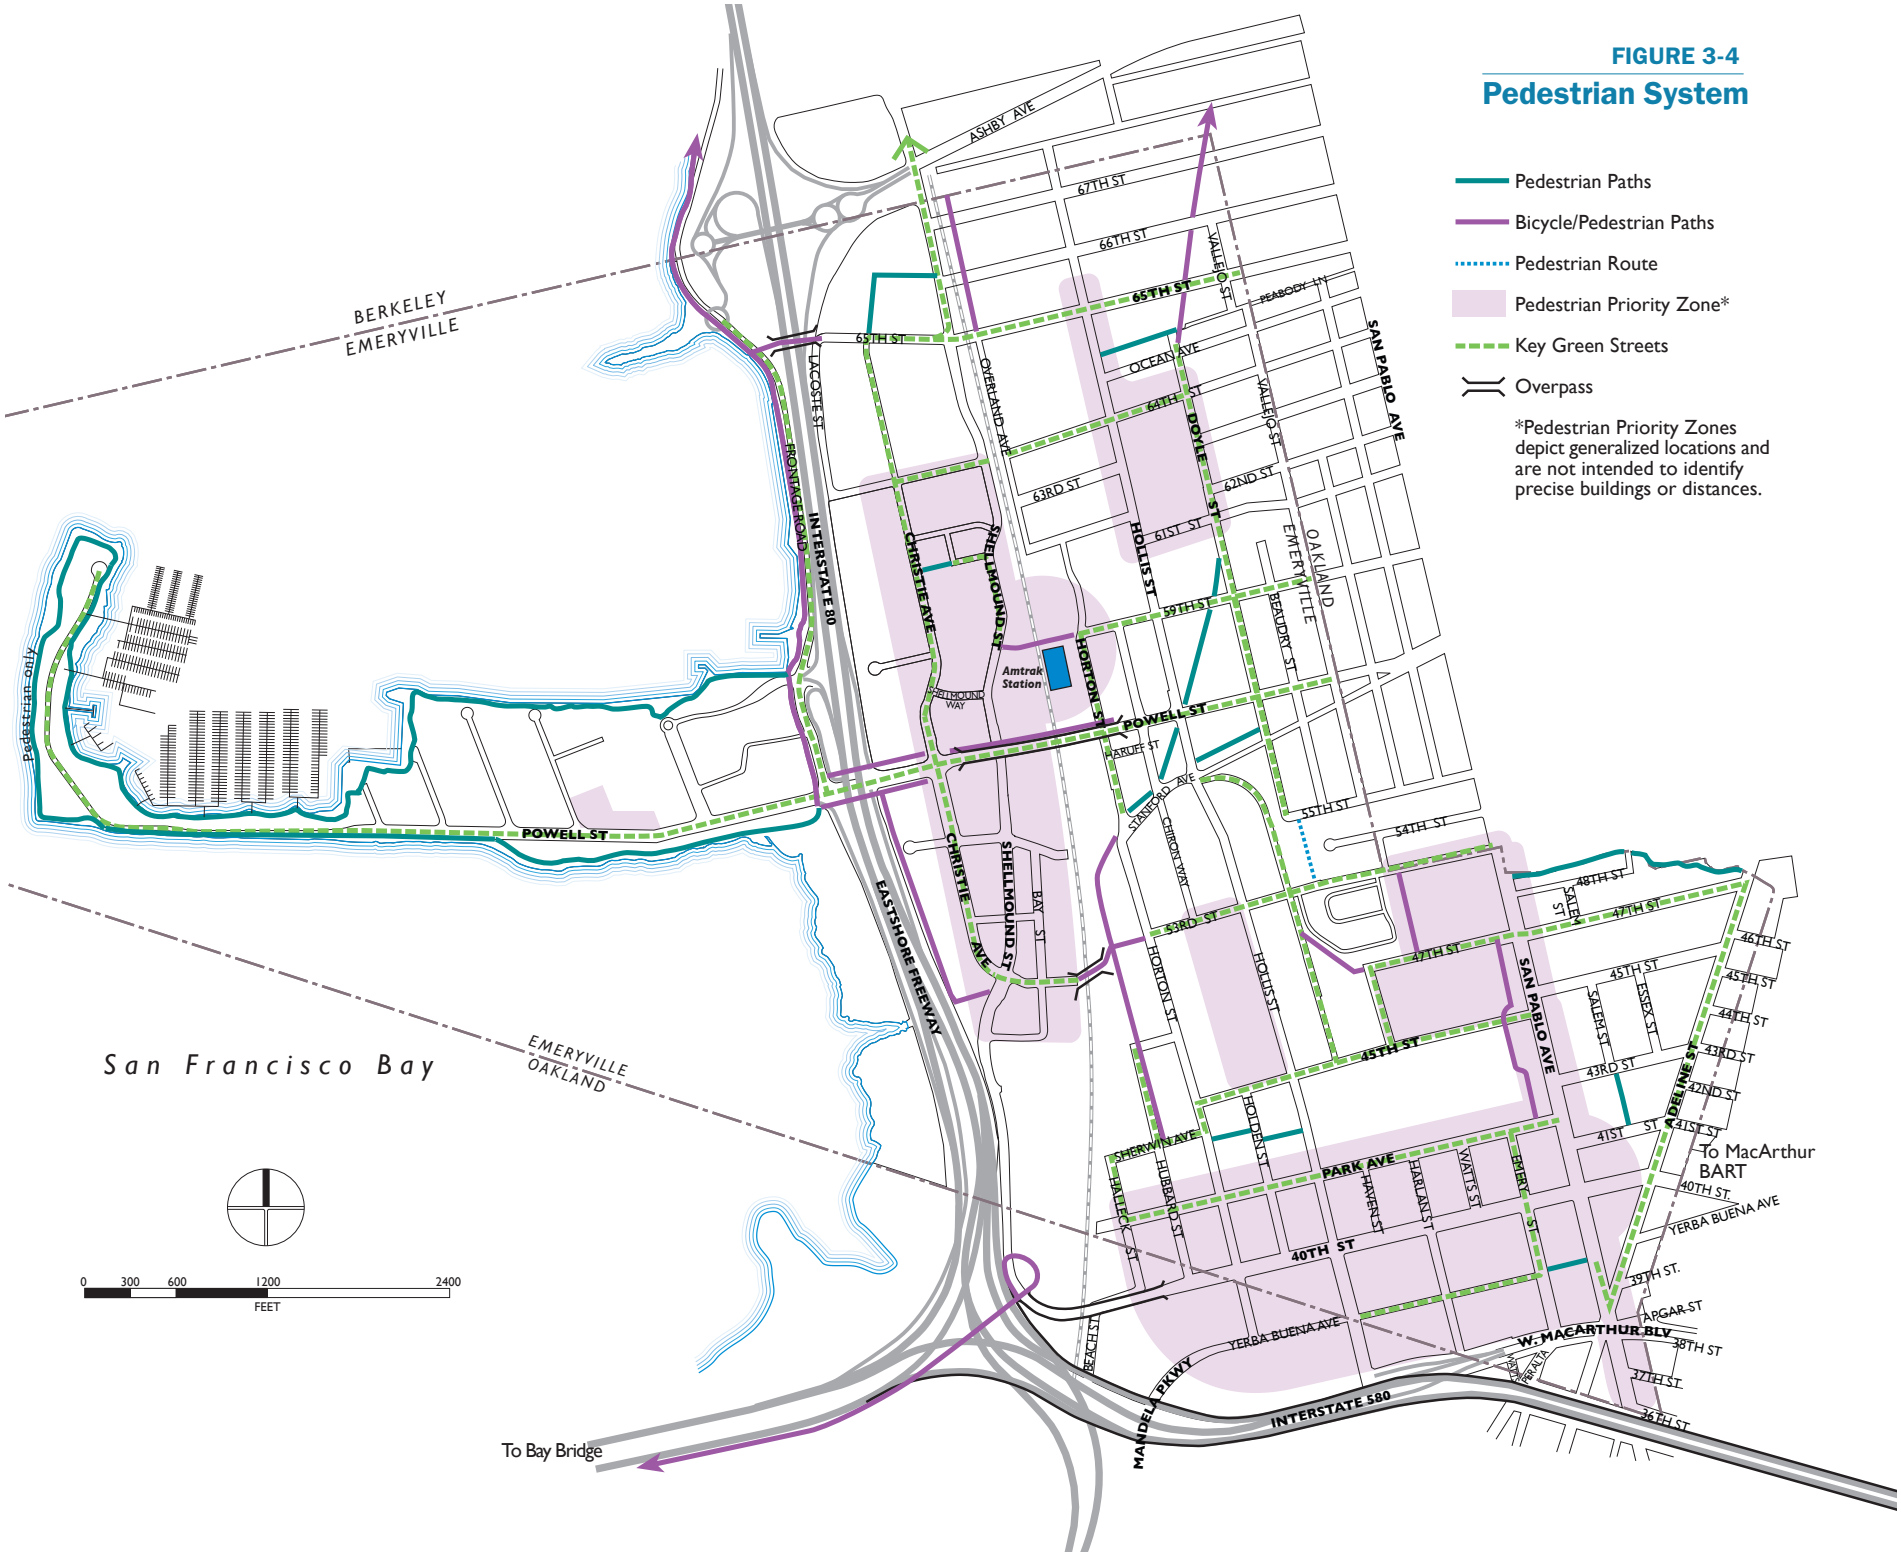
Walking is part of every trip, whether it is from the parking lot to a building or from home to a bus stop, work, or store. The walking environment is an important element of the public realm and a fundamental component of land use planning, design standards, and guidelines.

Emeryville's pedestrian network consists of sidewalks and street crossings with some off-road paths and trails. There are still a few locations in Emeryville with no sidewalks, where pedestrians must share the street with motor vehicles and bicyclists. In the industrial and commercial areas, large blocks, railroad and freeway corridors act as barriers to pedestrian travel. These barriers to pedestrian movement limit the viability of walking as a form of transportation.

Recognizing the importance of walking trips to promote health, provide transportation choice, and reduce vehicle congestion, a pedestrian circulation system has been developed and is set forth in Figure 3-4. It consists of the following:

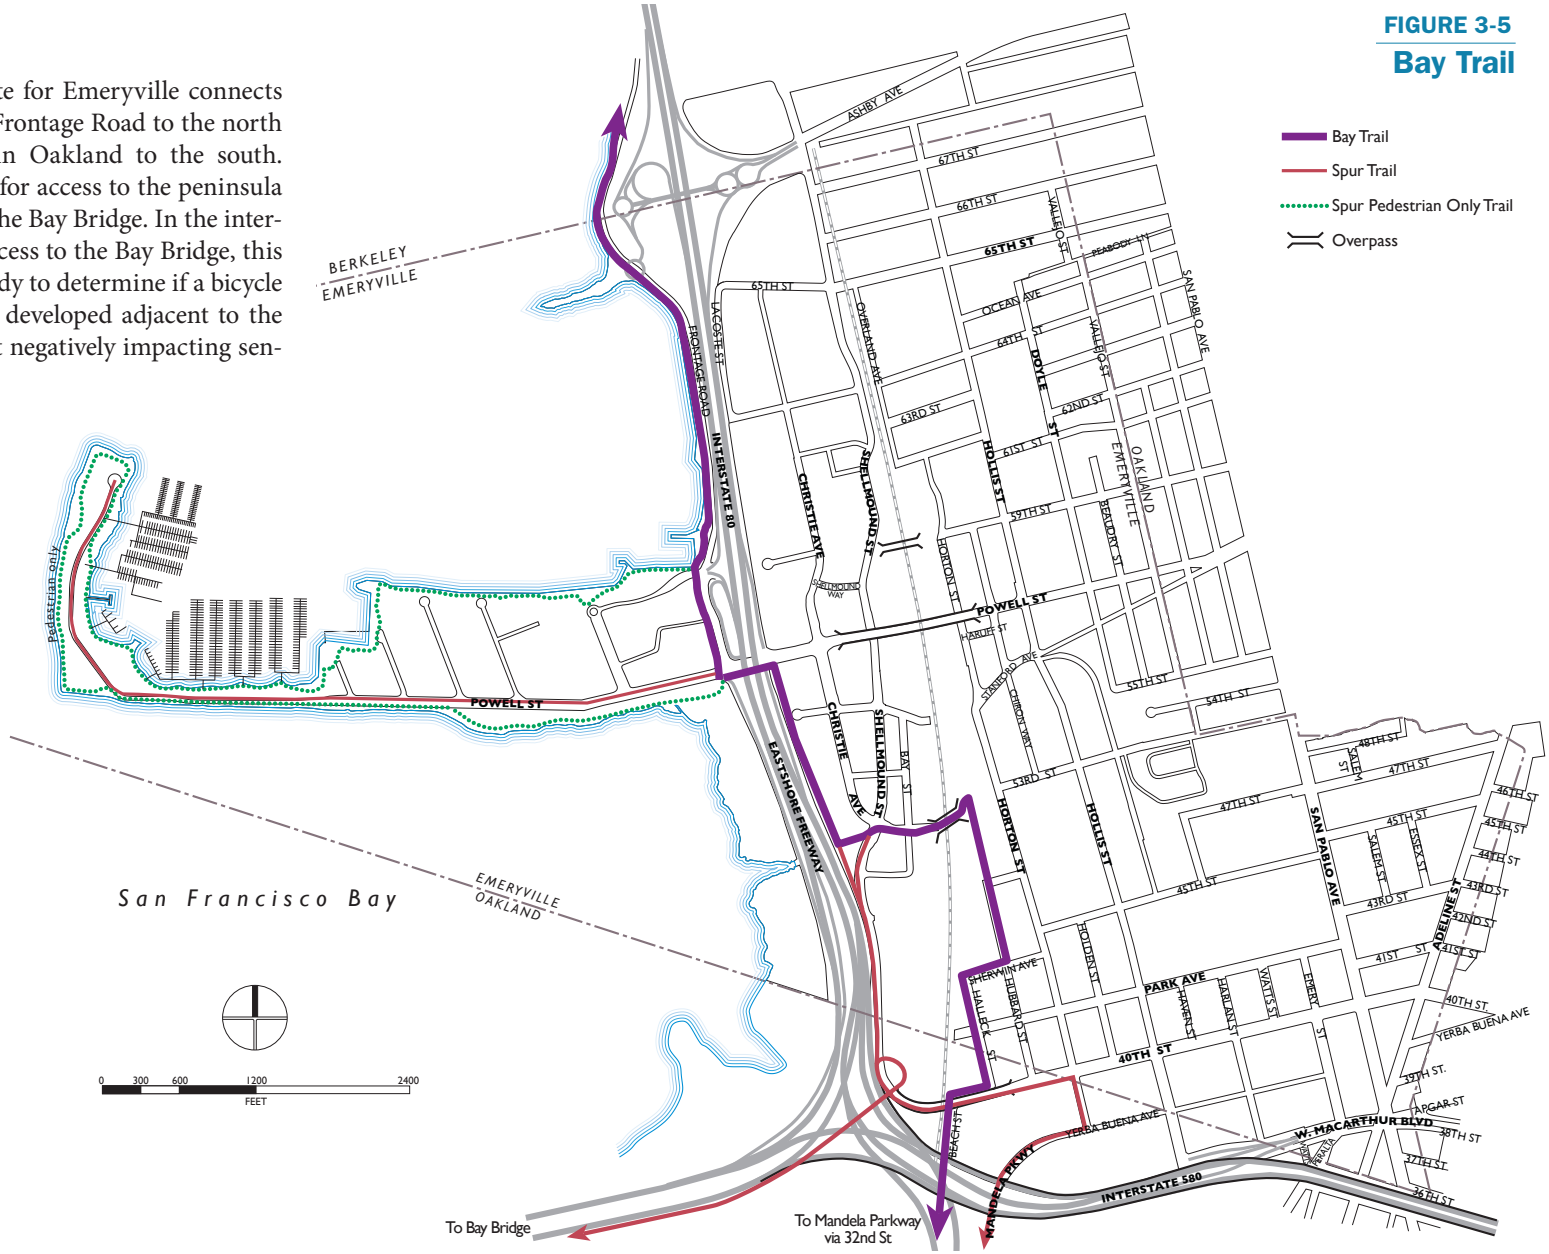
- Off-road pedestrian paths and routes, either exclusively for pedestrians or shared with bicyclists.
- Pedestrian priority zones along city streets.
- "Key Pedestrian Streets" connecting parks and open spaces, as identified in the Open Space Element.
- New and existing overpasses and underpasses across the railroad and freeway.
- The Bay Trail: a regional pedestrian and bicycle route that will eventually encircle San Francisco Bay and cross it at various places. The City of Emeryville's preferred Bay Trail alignment is set forth in Figure 3-5.

A Bicycle and Pedestrian Plan was prepared in 1998 and has been updated to reflect changes since that time. It contains a greater level of detail about pedestrian and bicycle facilities, and their implementation, than is appropriate in the General Plan. The Bicycle and Pedestrian Plan will need to be updated to be consistent with this General Plan.



Walking can feel unsafe along narrow sidewalks when surrounded by wide streets, surface lots, and parking entrances (left). Creating a network of streets with pedestrian-oriented features (right) can improve the connectivity of the pedestrian realm and encourage walking trips.

FIGURE 3-4



Pedestrian System

Regional Bay Trail

The preferred Bay Trail route for Emeryville connects with Berkeley's route along Frontage Road to the north and to Mandela Parkway in Oakland to the south. There are several spur trails for access to the peninsula and to cross I-580 to access the Bay Bridge. In the interest of providing shoreline access to the Bay Bridge, this Plan calls for a feasibility study to determine if a bicycle and pedestrian path can be developed adjacent to the Emeryville Crescent without negatively impacting sensitive habitat.

FIGURE 3-5
Bay Trail

3.5 BICYCLING

Emeryville's size and flat topography make it an ideal city for bicycling. Bicycles are a convenient means of transportation for short trips within the city. However, Emeryville has several barriers to safe and convenient bicycling. While most streets have low traffic volumes during most times of the day, 40th Street, Shellmound Street, San Pablo Avenue and portions of Christie Avenue and Powell Street have a large number of vehicle trips. These corridors serve regional retail destinations which are auto-oriented, and also serve vehicle traffic traveling through Emeryville.

Construction of a comprehensive citywide bicycle network and support facilities, such as bicycle parking at employment, retail, and other destinations, could greatly increase the mode share of bicycling as a form of transportation. The bicycle circulation system is set forth in Figure 3-6 and consists of the following:

- Off-road bicycle paths (Class I) which are shared with pedestrians.
- On-road bicycle routes, including bike lanes (Class II) and signed bike routes without lanes (Class III). (The General Plan does not distinguish between Class II and Class III. This level of detail is included in the City's Bicycle and Pedestrian Plan.)
- Bicycle Boulevards, a street classification on which bicycles have priority, and which may or may not have bike lanes, depending on the circumstances.
- New and existing grade-separated crossings of the railroad and freeway.
- The Bay Trail.

Constructing a citywide bike network, that includes support facilities such as bike parking, can encourage biking as an alternative transportation mode and a fun safe recreation activity.

3.6 PUBLIC TRANSIT

A coordinated set of policies regarding the City's public transit network seek to reduce greenhouse gas emissions (by attracting trips that would otherwise be taken by private automobile), and improve the viability of linking walking and bicycle trips with transit.

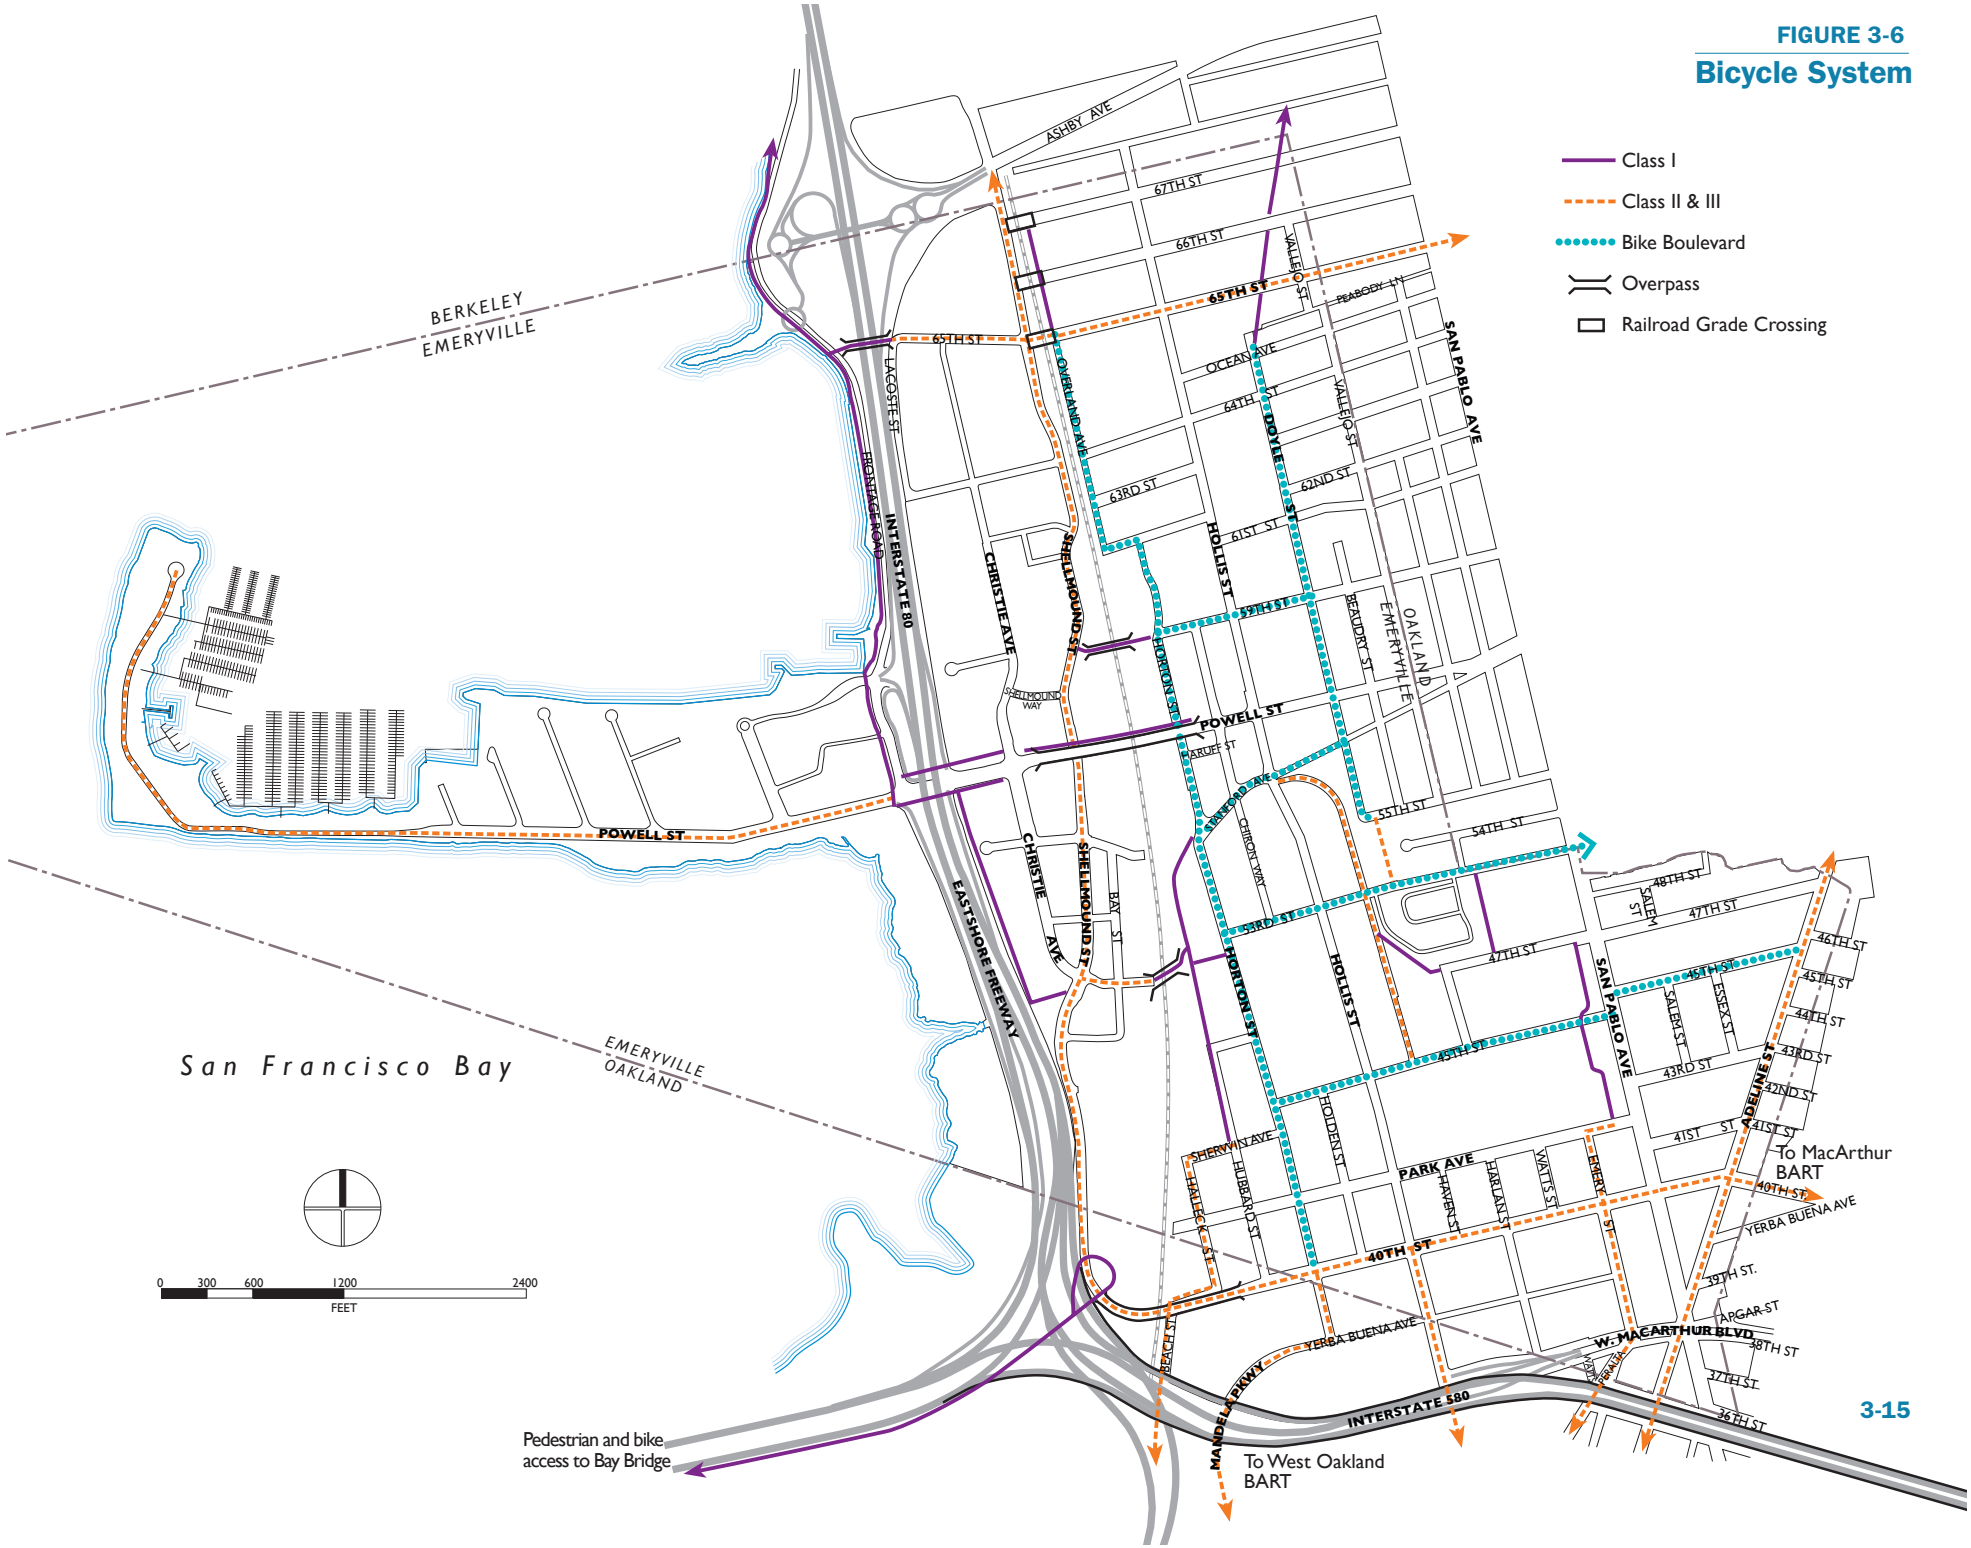
Local Transit System

Given Emeryville's central location in the East Bay, several public transit options serve the city, including the free Emery Go-Round shuttle to the MacArthur BART station, the 72 Rapid Bus on San Pablo Avenue, several other AC Transit bus routes, and numerous commuter trains at the Amtrak station. Moreover, with increases in ridership in recent years, particularly on BART and the Amtrak Capitol Corridor line, there is opportunity for improvements in service. For example, AC Transit transbay bus service to San Francisco is not designed to serve Emeryville, although several buses pass through the city. In addition, Amtrak operates frequent buses between Emeryville and San Francisco, but non-train passengers are not allowed to ride those buses. Although the Emery Go-Round does an excellent job of carrying commuters between Emeryville businesses and BART, it is not designed to meet the needs of Emeryville's residents or to provide service to other destinations. Transit service between the east and west sides of town is particularly lacking. In the long term, barriers to bus transit will be similar to those for automobiles. While roadway improvements will have some benefit to bus transit within Emeryville, additional measures may be necessary to maintain and improve reliability.

The transit system illustrated in Figure 3-7 designates most of Emeryville's major streets as "Transit Streets." Along these streets, techniques such as signal preemp-

FIGURE 3-6

Bicycle System



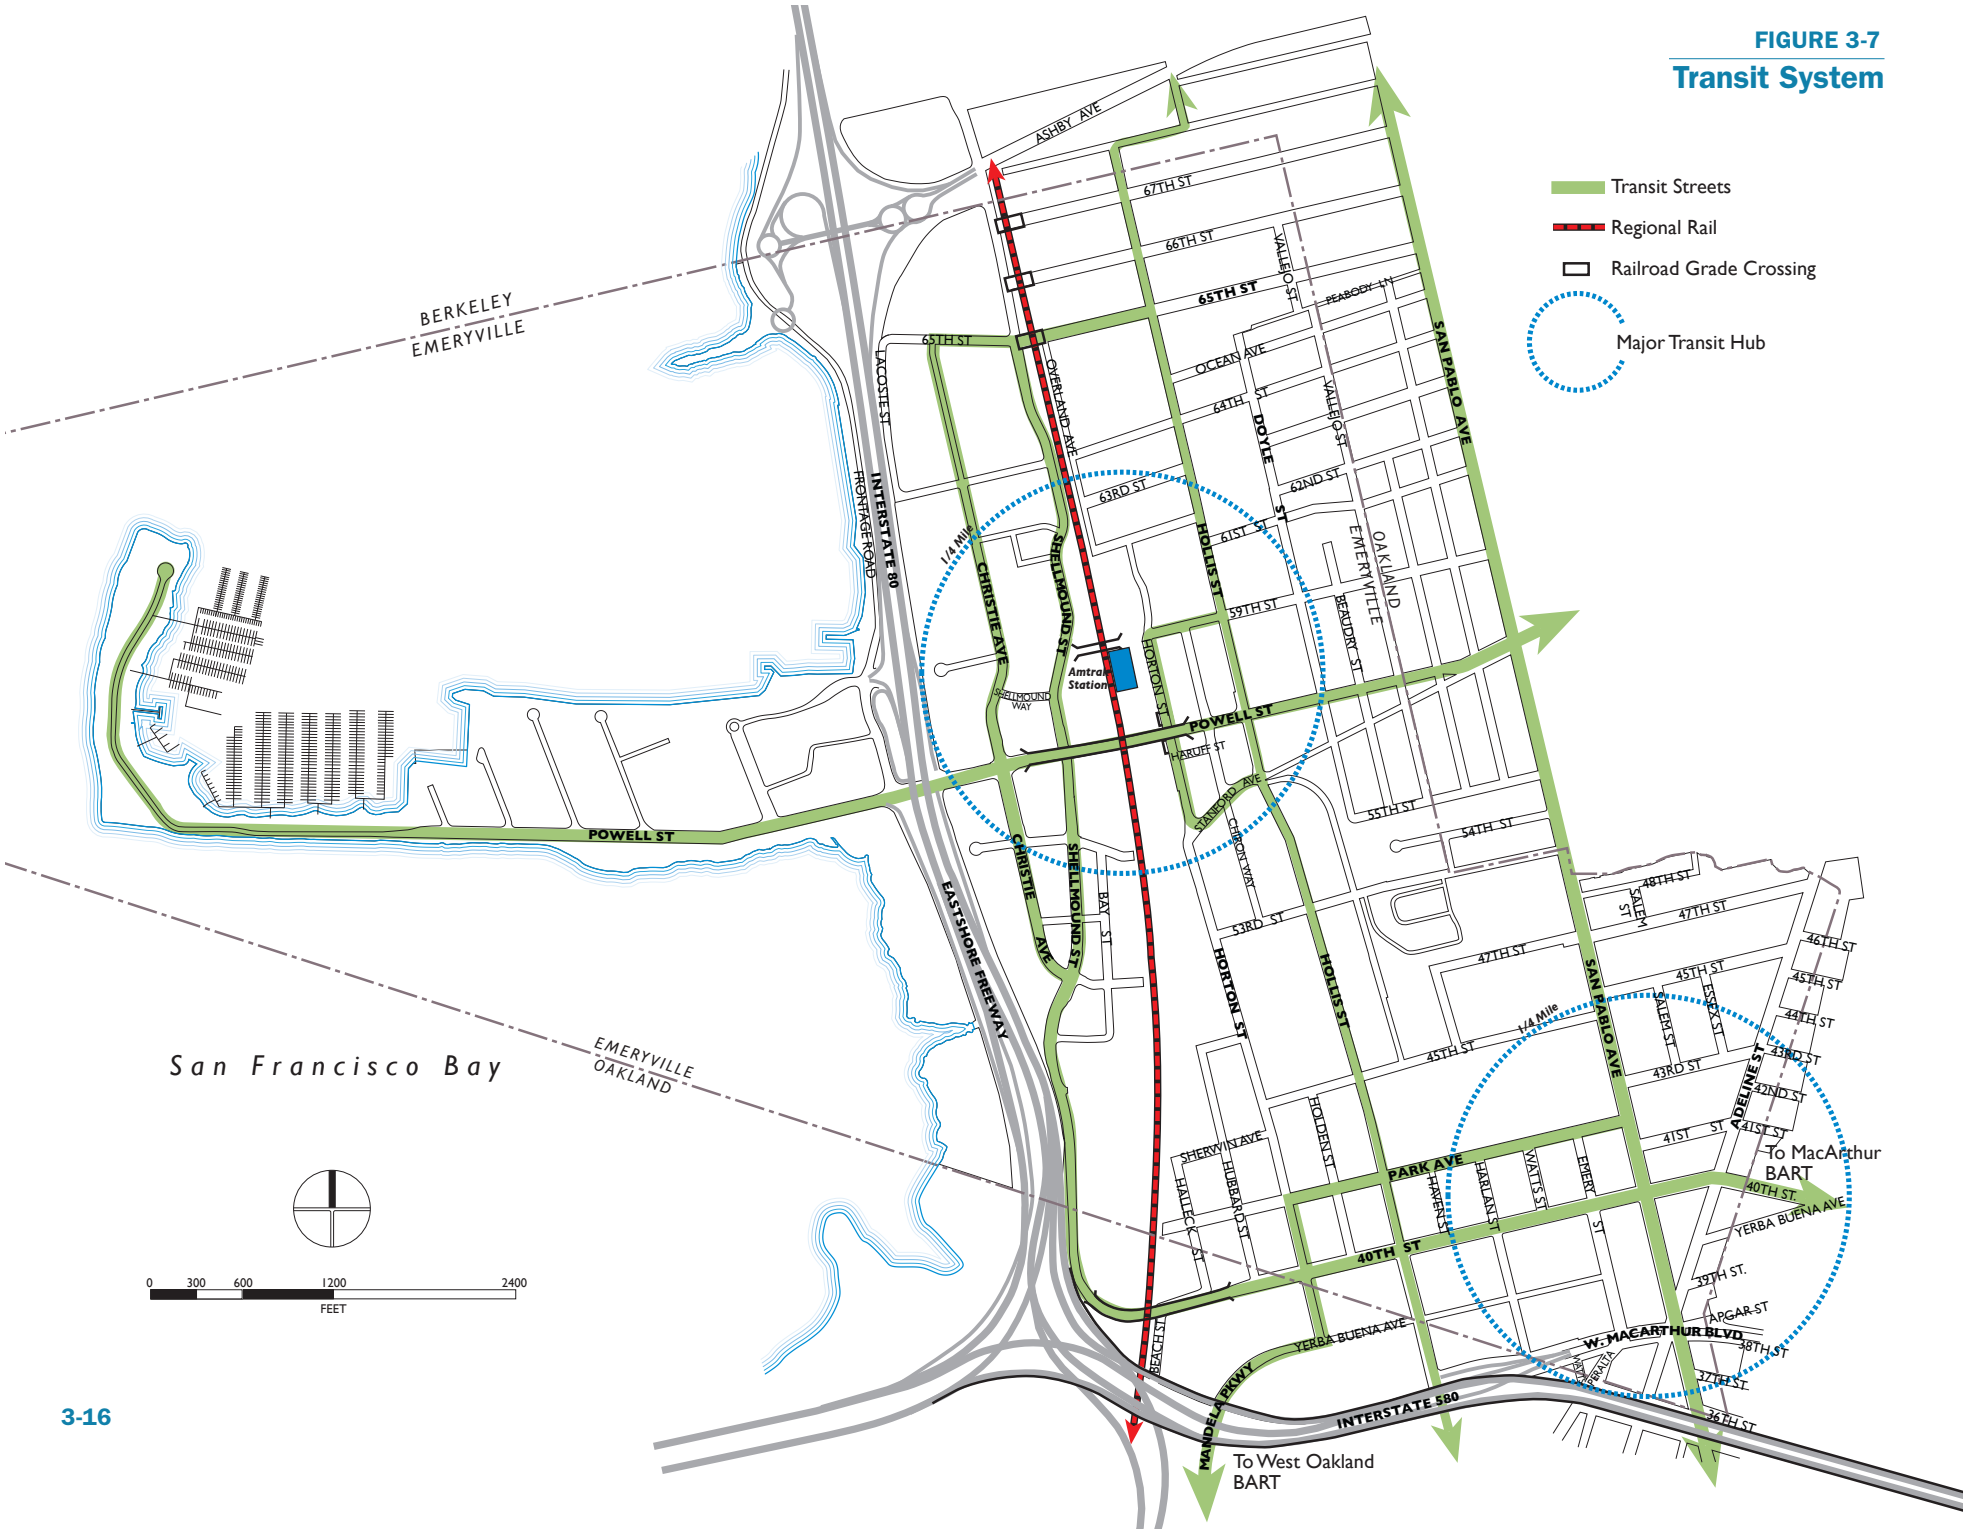


FIGURE 3-7

Transit System

tion, exclusive bus lanes, and "queue jump lanes" (lanes at intersections that allow buses to bypass traffic) will be used to give transit priority. Equally important, these streets will provide attractive, safe, and comfortable bus stops accessed by ample sidewalks with pedestrian amenities to encourage transit use. "Major Transit Hubs" are identified at the Amtrak station and the San Pablo Avenue/40th Street intersection. These are locations where a number of major transit routes intersect, and where high density "transit-oriented development" and enhanced amenities to promote transit ridership are appropriate. Other measures such as parking pricing (see Section 3-7) could increase the financial attractiveness of transit. Expanded service and increased frequency would also make transit more attractive.

Regional Rail

Figure 3-7 also identifies the regional rail line that runs north and south through the center of Emeryville. This historic rail corridor has served Emeryville for well over 100 years, and is the route for regional and transcontinental passenger and freight traffic. In September 2007, the Metropolitan Transportation Commission (MTC) adopted the 50-year Regional Rail Plan. Among other things, it proposes a new transbay tube between San Francisco and Oakland that would include both BART and conventional passenger rail tracks. This would allow the creation of new BART lines in the East Bay, as well as the direct connection of Caltrain, the Capital Corridor, and other commuter trains between San Francisco and the East Bay (although there are technical issues to be worked out with the type of rail equipment used in the tube). It would also allow future high-speed rail trains from Los Angeles to San Francisco to continue on to the East Bay.

While it is probably outside the time frame of this General Plan, a new transbay tube would provide an opportunity to develop a BART station in Emeryville at Powell Street, serving Bay Street, the Marketplace, Novartis, Emery Station, and surrounding hotels, shops, offices, and residents. It would also provide the opportunity for a direct commuter rail link between Sacramento and San Francisco via Emeryville.

In the more immediate future, the Regional Rail Plan identifies a need to expand the Union Pacific mainline to four tracks between Oakland and Martinez (through Emeryville), two serving passenger rail and two serving the increased freight traffic anticipated from the Port of Oakland. In conjunction with this, the Plan proposes "East Bay Express" train service between Pinole and Hayward. While this will allow for increased passenger rail service to Emeryville, the additional trains, especially freight, will bring noise, air pollution, and traffic disruption that will need to be mitigated. Fortunately, no additional rail right-of-way will be required.

Streetcars and Personal Rapid Transit

Streetcars and "Personal Rapid Transit" (PRT) have also been identified as a potential longer term enhancement to public transit service in Emeryville. Streetcars would operate both on city streets and on exclusive rights-of-way, similar to the systems recently developed in Portland, Oregon and many other cities, and would have stops at convenient locations throughout the city. PRT would consist of small vehicles operating above the streets with bypass tracks at each station, and would provide frequent and rapid point-to-point service between any two pairs of stations on demand. Such a system, built by the U.S. Department of Transportation, has been operating successfully since 1975 at the University of West Virginia in Morgantown. Another is under construction at London's Heathrow Airport.

Within the city, Emeryville is served by several public transit modes and agencies, including Amtrak regional rail (top) and the local Emery Go-Round (bottom).

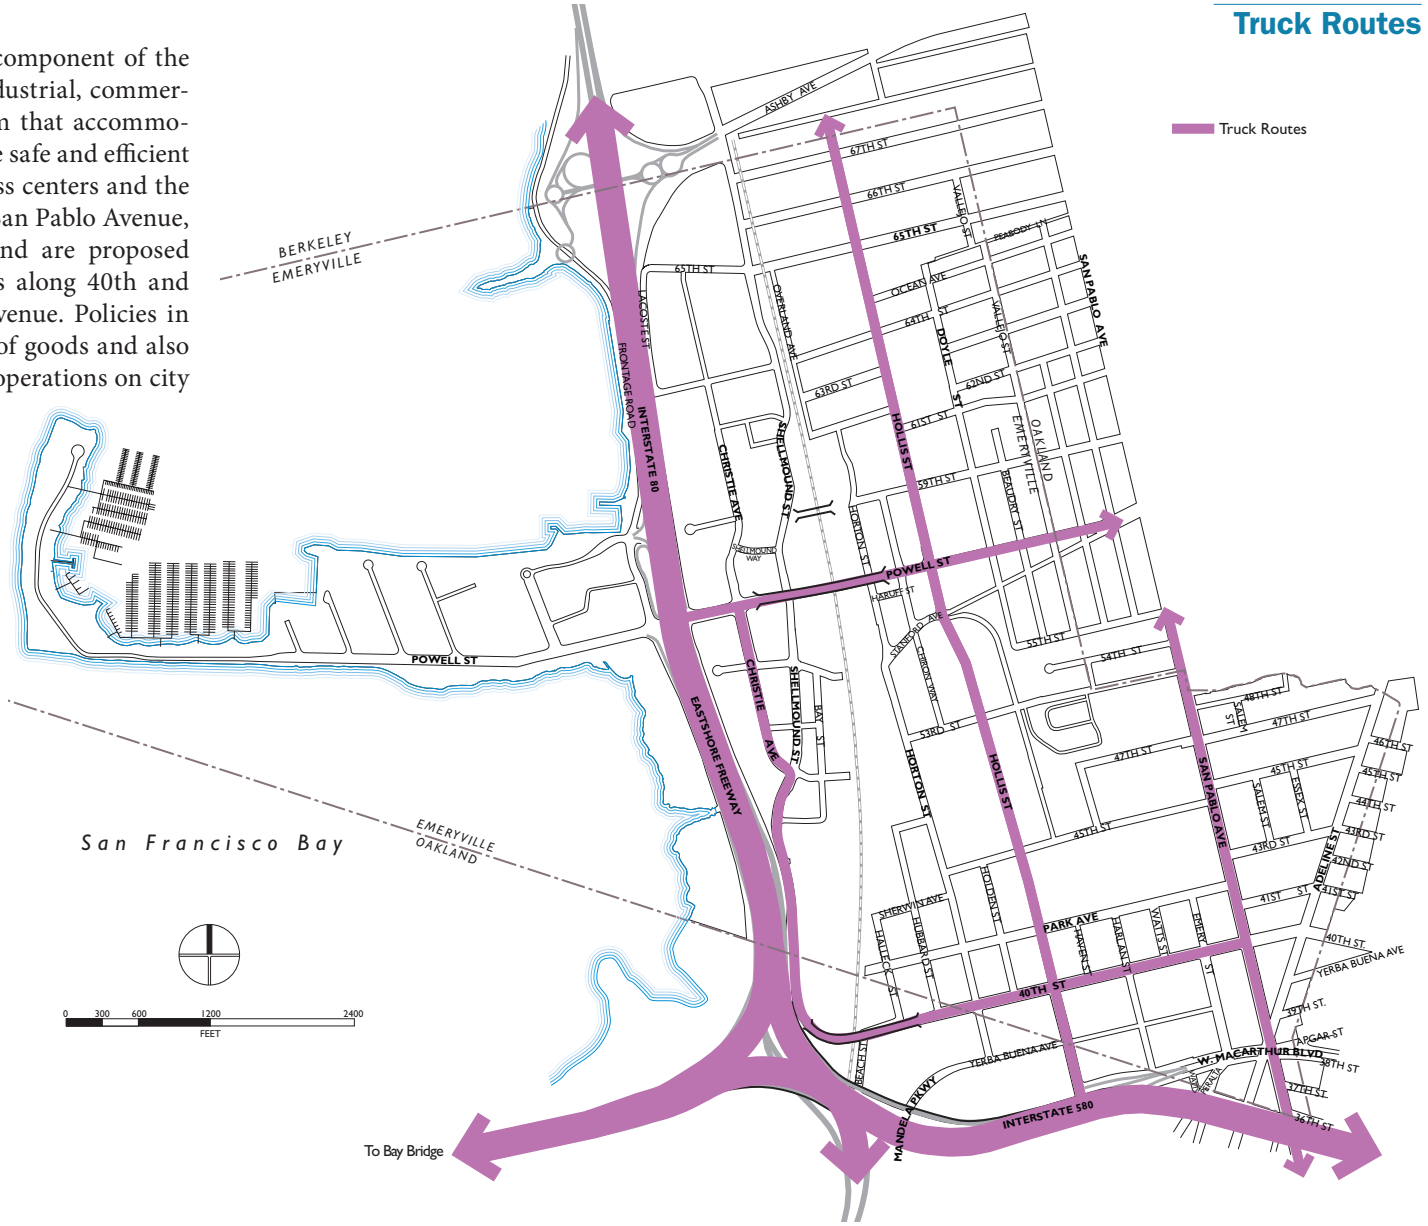
3.7 PARKING

Emeryville currently has an abundance of free parking for residents, visitors, and workers, making driving an attractive alternative to taking public transit, walking or bicycling. In the past, zoning requirements have prescribed parking requirements by land use type, but have not allowed for appropriate off-sets to account for shared parking, transit availability, or to promote bicycling and walking.

Parking costs (including land, construction and maintenance) are substantial in Emeryville and may limit the type of redevelopment that can occur. Flexible parking standards combined with parking pricing of public spaces, works to ensure that appropriate parking supplies are provided and that revenue is generated to offset some of the parking costs. Appropriate materials, screening of parking in pedestrian priority zones, and other design considerations are discussed in Chapter 5: Urban Design. Policies in this section focus on providing sufficient parking for businesses and residents, while protecting adjacent neighborhoods and the environment, and using parking management as a means of encouraging the use of alternative modes of transportation to the automobile.

Currently, surface parking dominates many of the retail areas, supplying ample free parking, but creating consequences for pedestrian connectivity.

The harbor will continue to serve as a functioning marina.



3.8 MARINA

The City of Emeryville's Marina area contains approximately 840 boat slips at the Emery Cove Yacht Harbor and Emeryville Public Marina. In addition, the Marina contains a fishing pier, boat launch, and restaurants, as well as the adjacent Watergate residential complex. There is no public ferry service from the Marina. No major changes are planned for the Marina area.

3.9 GOODS MOVEMENT

Goods movement is an important component of the city's circulation system, serving industrial, commercial, and retail uses. A street system that accommodates trucks is essential to ensure the safe and efficient movement of goods between business centers and the freeways. Trucks routes exist along San Pablo Avenue, Hollis Street, and Powell Street, and are proposed to serve regional retail destinations along 40th and Shellmound Streets and Christie Avenue. Policies in this section support the movement of goods and also seek to reduce the impacts of truck operations on city streets and adjacent land uses.

FIGURE 3-8
Truck Routes

3.10 TRANSPORTATION DEMAND MANAGEMENT

Transportation Demand Management (TDM) refers to a comprehensive strategy to reduce driving by promoting alternatives such as public transit, carpooling, bicycling, walking, and telecommuting. Many of the features that are incorporated into this Transportation Element are part of the City's TDM strategy, including:

- A street typology system that gives priority to alternate modes of travel, including the concept of complete streets.
- Pedestrian and bicycle facilities, including Safe Routes to Schools and safe routes to transit.
- Expanded and enhanced public transit service, including exclusive bus lanes, "fare free zones," and free transit passes.
- Traffic calming measures.
- Parking pricing, "unbundled" parking, parking "cash out," and reduced parking requirements for new development.

These measures are included in the plan for the city's physical transportation infrastructure and implementing actions such as zoning requirements and public transit operations. Additional TDM measures that could be undertaken by the City, private organizations, and employers, include:

- Carpooling and vanpooling: ride-matching services offered by larger employers or by organizations such as the Chamber of Commerce or the Transportation Management Association (TMA). It can be augmented by the provision of preferential parking at employment destinations.
- Car sharing and bicycle sharing programs: membership in a private organization such as Zipcar or City CarShare, where cars are available to members on demand at conveniently located "pods" for a nominal fee. The TMA operates several Zipcar pods in Emeryville. Bicycle sharing is a similar concept involving bicycles.
- Telecommuting, flexible work schedules, and alternative work schedules: Telecommuting involves working from home rather than commuting to an office. This can be facilitated by amenities in residential complexes such as business centers with copiers, fax machines, and Internet service. Sometimes employers provide such facilities to their employees who telecommute. Flexible work schedules and alternative work schedules provide alternatives to the standard "9 to 5" workday. These non-traditional schedules can reduce the number of work trips made during peak commute hours, thereby reducing overall traffic.
- Child care services are often a determining factor in employees' commute schedules. Conveniently located child care with variable schedules, either offered by employers or nearby institutions, can provide commuters with more flexibility in their daily routines. (See Section 4.3: Public Services and Facilities for additional child care policies.)

GOALS AND POLICIES

GOALS

OVERALL CIRCULATION SYSTEM

T-G-1 **A comprehensive transportation system—** A transportation system that is efficient, safe, removes barriers (e.g. accessibility near freeways and rail lines), and optimizes travel by all modes.

T-G-2 **Universally accessible—**A transportation system that meets the needs of all segments of the population, including youth, seniors, persons with disabilities, and low-income households.

T-G-3 **Multi-modal—**A transportation system that eliminates the necessity of owning and/or driving personal vehicles because of the availability of convenient and accessible alternative modes of transportation.

WALKING

T-G-4 **A walkable city—**A universally accessible, safe, pleasant, convenient, and integrated pedestrian system that provides links within the city and to surrounding communities, and reduces vehicular conflicts.

BICYCLING

T-G-5 **A safe, comprehensive, and integrated bicycle system—**A system and support facilities throughout the city that encourage accessible bicycling for all community members.

PUBLIC TRANSIT

T-G-6 **A safe, efficient, comprehensive, and integrated transit system—**A public transit system that allows for a reduction in automobile dependence for residents, employees, and visitors.

STREET SYSTEM

T-G-7 **A multi-functional street system—** A system that will ensure the safe and efficient movement of people, goods, and services and support a high quality of life and economic vitality.

PARKING

T-G-8 **A balanced parking supply system—** Parking supply that balances economic development, livable neighborhoods, environmental and energy sustainability, and public safety, while reducing dependence on the automobile.

GOODS MOVEMENT

T-G-9 **Safe and efficient movement of goods—** Goods movement that supports commerce and industry while maintaining a high quality of life.

MARINA

T-G-10 **An accessible functional harbor—**A harbor and marinas that are accessible to the rest of Emeryville and accommodate the needs of users.

TRANSPORTATION DEMAND MANAGEMENT

T-G-11 **Transportation demand management strategies—**TDM strategies that decrease single-occupant automobile demand and reduce vehicle miles traveled.

POLICIES

Implementing actions supporting each policy are described in Chapter 8: Implementation Program.

OVERALL CIRCULATION SYSTEM

T-P-1 The City's circulation plan shall be as set forth in Figures 3-1 through 3-8 and based on the typologies described in this chapter.

T-P-2 The design, construction, operation, and maintenance of city streets shall be based on a "complete streets" concept that enables safe, comfortable, and attractive access and travel for pedestrians, bicyclists, motorists, and transit users of all ages and abilities.

T-P-3 A "Quality of Service" standard that seeks to optimize travel by all transportation modes shall be developed and used to measure transportation performance. The City does not recognize "Level of Service" (LOS) as a valid measure of overall transportation operations, and sets no maximum or minimum acceptable LOS levels, with the exception of streets that are part of the regional Congestion Management Agency network. (These streets may change, but as of 2008 include San Pablo Avenue, Frontage Road, and Powell and Adeline streets). LOS shall not be used to measure transportation performance in environmental review documents or for any other purpose unless it is mandated by another agency over which the City has no jurisdiction (such as Caltrans, Berkeley, Oakland, and the Congestion Management Agency), and then it shall only be used for the purposes mandated by that agency.

T-P-4 Transportation planning shall be coordinated with emergency service providers to ensure continued emergency service operation and service levels.

T-P-5 The City encourages development that minimizes Vehicle Miles Traveled (VMT).

T-P-6 To the extent allowed by law, the City's Traffic Impact Fee shall include bicycle, pedestrian, transit, and road improvements so that development pays its fair share toward a circulation system that optimizes travel by all modes.

T-P-7 The City shall continue to study and evaluate appropriate traffic and transportation improvements.

T-P-8 Connections across the railroad and freeway shall be provided as noted in Figures 3-1 through 3-6. In addition the City will study, in collaboration with stakeholders and interested agencies and parties, additional pedestrian and bicycle connections across the freeway between the peninsula on the west and high density areas on the east.

T-P-9 The City will work with Caltrans and the City of Berkeley to develop improvements to the Ashby Interchange.

WALKING

T-P-10 The pedestrian circulation system shall be as set forth in Figure 3-4 and based on the typologies described in this chapter.

T-P-11 Sidewalks shall be provided on both sides of all streets; pedestrian connections between new and existing development is required.

T-P-12 The City will plan, upgrade, and maintain pedestrian crossings at intersections and mid-block locations by providing safe, well-marked crosswalks with audio/visual warnings, bulb-outs, and median refuges that reduce crossing widths.

T-P-13 Pedestrian routes will be provided across large blocks, pursuing creative options if necessary such as purchasing private alleys, designating pathways through buildings, and acquiring public access easements.

T-P-14 Establish Pedestrian Priority Zones in Neighborhood Centers, around schools, and in other locations as indicated in Figure 3-4, where wider sidewalks, street lighting, crosswalks, and other pedestrian amenities are emphasized. Link these zones to adjacent land uses to ensure that building frontages respect pedestrians and truck loading takes place on adjacent streets wherever possible.

T-P-15 Walking will be encouraged through building design and ensure that automobile parking facilities are designed to facilitate convenient pedestrian access within the parking area and between nearby buildings and adjacent sidewalks. Primary pedestrian entries to nonresidential buildings should be from the sidewalk, not from parking facilities.

T-P-16 Safe pedestrian walkways that link to streets and adjacent bus stops will be required of new development.

T-P-17 The City will require new development to minimize the number and width of curb-cuts for vehicle traffic to reduce vehicle conflicts with pedestrians.

T-P-18 The City will study, in collaboration with stakeholders and interested agencies and parties, the feasibility of a pedestrian/bicycle trail along the west side of I-80, east of the Emeryville Crescent, to provide access from the Bay Trail to the eastern span of the Bay Bridge.

T-P-19 Following completion of the new east span of the Bay Bridge, the west span should be retrofitted with a pathway to provide continuous pedestrian and bicycle access between San Francisco and the East Bay.

T-P-20 Safe and direct pedestrian access to Aquatic Park and the peninsula will be provided and maintained.

BICYCLING

T-P-21 The City will develop the bicycle circulation system set forth in Figure 3-6 and based on the typologies described in this chapter.

T-P-22 The City's preferred Bay Trail route through Emeryville is set forth in Figure 3-5, including the main trail between Frontage Road in Berkeley and Mandela Parkway in Oakland, and spur trails to the Marina along Powell Street and to the Bay Bridge along the east side of Interstate 80.

T-P-23 On-street bike routes in the City's Bicycle and Pedestrian Plan shall be designated as either Class II (bike lanes) or Class III (signed routes without lanes), as appropriate. These designations are not part of the General Plan and may be changed as circumstances dictate.

T-P-24 Safe, secure, and convenient short- and long-term bicycle parking shall be provided near destinations for all users, including commuters, residents, shoppers, students, and other bicycle travelers. Retail businesses in regional retail areas are encouraged to provide valet bicycle parking.

T-P-25 A numbered bike route system with destination signs, consistent with the regional bike route numbering system shall be developed and implemented with clear signage to bicycle boulevards.

T-P-26 Bicycling will be promoted through public education, including the publication of literature concerning bicycle safety and the travel, health and environmental benefits of bicycling.

PUBLIC TRANSIT

T-P-27 The public transit system will be as set forth in Figure 3-7 and based on the typologies described in this chapter.

T-P-28 Existing public transit to BART, Amtrak, and regional destinations will be supported, and transit within Emeryville for residents, workers, and visitors will be promoted.

T-P-29 The City supports transit service on all Transit Streets, as shown in Figure 3-7. This includes Powell Street to the Marina and east of Hollis Street to the Ashby BART station and downtown Berkeley; Park Avenue west of Hollis Street; and Adeline Street.

T-P-30 The City will undertake a study to enhance transit mobility, including feasibility of transit-only lanes (dedicated, peak-hours only/shared with automobiles at other times, or converted from parking lanes to transit-only during peak hours), especially along congested tran-

sit streets, to provide walking access from most of the city, and connect major destinations within Emeryville and to BART.

T-P-31 The City will develop and implement transit stop amenities such as pedestrian pathways approaching stops, benches, traveler information systems, shelters, and bike racks to facilitate transit stops as place-making destinations and further the perception of transit as an attractive alternative to driving.

T-P-32 Transit stops will be sited at safe, efficient, and convenient locations, and located appropriately within the right of way.

T-P-33 The City supports transit priority on Transit Streets through features such as traffic signal priority, bus queue jump lanes at intersections, exclusive transit lanes, and other techniques as appropriate, with adjustments to technology as conditions change.

T-P-34 The City will continue to support free and/or subsidized transit for both local travel within the City and travel to the regional hubs located at the Amtrak Station, the MacArthur BART station, and San Pablo Avenue at 40th Street.

T-P-35 The City will support the expansion of the Emery Go-Round to accommodate workers, residents, and visitors.

T-P-36 The City supports Transit-Oriented Development with reduced parking requirements, and amenities to encourage transit use and increase pedestrian comfort around the Major Transit Hubs at the Amtrak station and the 40th Street/San Pablo Avenue intersection.

T-P-37 The City will advocate for frequent, direct transit service to all points in Emeryville, especially between the east and west sides of town.

T-P-38 The City encourages Amtrak to allow local travel on Amtrak buses that provide service from Downtown San Francisco to the Emeryville Station.

T-P-39 The City will advocate for AC Transit to provide frequent, direct, two-way service between downtown San Francisco and various points within Emeryville.

T-P-40 The City will investigate and implement, if appropriate, fixed guideway transit systems, such as streetcars or personal rapid transit (PRT).

T-P-41 The City supports a new BART line in the East Bay that includes service to Emeryville along the existing regional rail corridor with a stop at Powell Street.

T-P-42 The City will advocate (in the short term) for BART to rename the MacArthur BART station to "North Oakland/Emeryville" to more accurately reflect the station's market area and to help promote awareness of transit service to Emeryville.

T-P-43 The City supports an additional transbay tube that provides for direct commuter rail service between Sacramento and San Francisco via Emeryville.

T-P-44 The City supports grade-separated crossings and other appropriate measures to mitigate the impacts of increased rail traffic on Emeryville, including noise, air pollution, and traffic disruption.

STREET SYSTEM

T-P-45 The street system will be created as set forth in Figure 3-2, and based on the typologies described in this chapter.

T-P-46 Private developments and major public infrastructure projects will provide adequate rights-of-way for all modes of transportation.

T-P-47 The City supports "traffic calming" and other neighborhood traffic management techniques to enhance the quality of life within existing neighborhoods and to discourage through-traffic on bicycle boulevards and local streets.

T-P-48 The City will establish equal priority to bicycles and public transit (and discourage through-traffic by other modes) on streets in the vicinity of the Amtrak sta-

tion that are designated as both Transit Streets and Bicycle Boulevards.

PARKING

T-P-49 Quality of life and business viability will be promoted by maintaining an adequate supply of parking to serve growing needs, while avoiding excessive supplies that discourage transit ridership and disrupt the urban fabric.

T-P-50 Public garages will be provided strategically, in locations convenient and proximate to eventual destinations.

T-P-51 The City supports parking supply and pricing as a strategy to encourage use of transit, carpools, bicycles, and walking.

T-P-52 Flexible parking standards are encouraged that reflect calculated parking demand for proposed land uses and that allow for appropriate offsets to reduce parking demand and encourage walking, bicycling, carpooling, and transit use.

T-P-53 Employers are encouraged to offer "parking cash out", whereby employees who choose not to drive are offered the cash value of any employee parking subsidy, to be used towards commuting to work by other means.

T-P-54 The City supports public parking strategies, such as variable pricing for on-street and off-street public parking and public use of private garages, to maintain a parking space utilization goal of 85 percent.

T-P-55 The City supports the use of parking revenues within "parking benefit districts" to consolidate public parking, enhance non-motorized connections between parking and land uses, and improve security and the physical environment of the districts.

T-P-56 The City supports shared parking between multiple uses to the extent possible, and will encourage private property owners to share their underutilized off-street parking resources with the general public.

T-P-57 The land area devoted to parking shall be reduced by supporting innovative technologies such as parking lifts and automated parking.

T-P-58 The City supports the expansion of the Residential Permit Parking (RPP) program to ensure adequate parking availability in residential areas, recognizing the need for adequate parking to support neighborhood businesses.

T-P-59 Development will be required to "unbundle" parking spaces from lease payments and condominium purchases, so that property lessees and buyers can choose whether to pay for parking spaces.

GOODS MOVEMENT

T-P-60 Truck freight movement will be accommodated between the freeway system and Emeryville's regional shopping destinations along 40th Street and Shellmound Street, consistent with the typologies described in this chapter.

T-P-61 Truck freight movement will be accommodated to and from local businesses, consistent with the typologies described in this chapter. Through truck traffic is discouraged.

T-P-62 Provide adequate off-street loading areas in large commercial, industrial, and residential developments that do not conflict with pedestrian, bicycle, transit, or automobile movements.

MARINA

T-P-63 The City supports marina and harbor operations and connections to these uses.

TRANSPORTATION DEMAND MANAGEMENT

T-P-64 The City will work with local, regional and state agencies, the Chamber of Commerce, and the Transportation Management Association, as well as employers and residents, to encourage and support programs that reduce vehicle miles traveled, such as preferential carpool parking, parking pricing, flexible work schedules, and ridesharing.

T-P-65 Employers in large new developments will be required to implement comprehensive TDM programs for their employees and customers.

T-P-66 The City supports and encourages the expansion of car-sharing programs in Emeryville.

T-P-67 The City supports and encourages conveniently located child care services with flexible hours.

4 PARKS, OPEN SPACE, PUBLIC FACILITIES, AND SERVICES

Parks, open space, public facilities, and services are a vital part of a livable, sustainable Emeryville. While they are essential in any city, they become even more important in areas of high population density and development intensity. Where homes may not include yard space and landscaping is scarce, green spaces provide opportunities for relaxation, informal sports, passive and active recreation, social and cultural events and a break from the stresses of everyday life.

The General Plan proposes several new open spaces, complementing existing parks, and providing new open space opportunities for existing and future residents.

They also serve as important gathering places in a community. Due to its industrial past, Emeryville has minimal parks and open space. Public facilities and services provide for community needs and amenities for education, social services, and public safety. As the residential and employment populations increase, it is essential to seize every opportunity to create additional parks and open space, and to provide public facilities and services that meet the needs of the community.

As a small incorporated city, Emeryville is able to provide high ratios of public services for its residents with a local orientation, personal attention, and quick responses. However, its small population and constrained geography limits its ability to locate and financially support the broad range of amenities found in larger cities. This chapter reviews the public facilities supplied in the City of Emeryville, including schools, libraries, safety services and other civic facilities, as well as major utility infrastructure systems.

The General Plan addresses two main issues concerning open space provisions: a shortage of park and recreation space, and a lack of accessibility—since most of the existing parkland is concentrated along the shoreline on the western portion of the city.

4.1 PARK AND OPEN SPACE SYSTEM

Framework

The General Plan proposes several different park types to accommodate the needs of present and future residents, workers, and visitors and to create a cohesive network of open spaces. The proposed strategic master plan will outline recommended programming for both active recreation and passive park use. A general framework is described here:

- **Large parks.** Two large parks north and south of Powell Street, are proposed to provide playing fields and other active uses, such as children's play structures and recreation activities.
- **Small open spaces.** Public pocket parks, plazas, tot lots, community gardens and other small open spaces throughout the city will improve residents' access to open space nearer their homes.
- **Greenways.** Two greenways will traverse the city, one north-south and the other east-west. To the extent possible these will be off-street linear parks with pedestrian and bicycle paths, small gathering places, and recreational facilities. Where necessary, the greenways may be along streets. The north-south greenway will follow old railroad spurs, and will connect Berkeley in the north to the Park Avenue District, Bay Trail, and West Oakland in the south. The east-west greenway will generally follow the alignment of Temescal Creek (currently in an underground pipe) and will include water features, daylighted portions above the culverted creek, and other amenities to celebrate the creek. This greenway will connect North Oakland in the east to the Bay Trail and San Francisco Bay in the west.

- **Green Streets.** To improve connectivity between neighborhoods, parks, employment and other activity centers, and to increase the provision of open spaces, a network of "green streets" is established. Green streets are distinguished by elements such as additional trees and plantings, wide sidewalks, pedestrian pathways and public art. This network builds on the greenways to improve connectivity along key streets.

The extent, capacity, and quality of public facilities that serve a community also affect the quality of life enjoyed by those who live, work, and own property there. The proposed Emeryville Center of Community Life will serve as the focal point for community gathering and social services. In addition to new school facilities, the Center may include gymnasiums, a theater, a library, a dance/fitness studio, playing fields, playgrounds, open space, aquatic facilities, and other community facilities.

Together, a cohesive network of open spaces and public amenities will help to create a more vibrant and livable Emeryville.

Existing Park and Recreation System

City Parks and Open Spaces

Emeryville has greatly improved the number, acreage, accessibility, and diversity of its park and recreation assets in recent years; however, these facilities fall short of the needs of the city's expanding population. As shown in Table 4-1, in 2008, Emeryville contained 15 acres of public open space in eight City-owned parks. Most of the municipal parks are small open spaces, such as the .14-acre 61st Street Mini-Park, which provides a playground area for neighborhood children. A majority of city parkland is concentrated in Marina Park on the peninsula and is not easily accessible to the majority of the city's population, who live east of Highway 80.

The City has been developing the Emeryville Greenway—a series of pedestrian and bike paths intended to provide more connectivity within the city. Once completed, this north/south Greenway will link the northeastern residential neighborhoods and new residential developments throughout the city with open spaces and activity centers. It will be complemented by the new east-west Temescal Creek greenway envisioned by this General Plan.

The City also has a lease agreement with Emery Unified School District to use the sports and aquatic facilities at Emery Secondary School during non-school hours. The Community Services Department offers classes, sports programs and activities in these facili-

Christie Park is small, but provides much needed green space in an area of increasing intensity and usage. It is slated to be enlarged and redesigned as part of the Marketplace Redevelopment Project.

ties. In addition, Emeryville is a member of the Joint Powers Authority for the Tom Bates Regional Sports Complex about three miles north in Berkeley.

State and Regional Parks and Open Spaces

State and regional open spaces provide larger green spaces that connect to adjacent communities. The Eastshore State Park constitutes about 2,250 acres of uplands and tidelands along the shoreline of Oakland, Emeryville, Berkeley, Albany, and Richmond, providing a prime location for bird watching and aquatic wildlife preservation. Emeryville's portion—the Emeryville Crescent—contains 30 acres of marsh shoreline and is identified as Conservation Area. The San Francisco Bay Trail runs through the Emeryville Crescent; this regional trail system will encircle the entire Bay once completed. The Trail runs along or near the Emeryville coastline, with a dedicated off-street pathway on and north of the peninsula, but a disconnected segment in its southern half.

Supply and Distribution

Existing City-operated open spaces represent a ratio of 1.56 acres per 1,000 residents (based on 15.19 acres and a 2008 population of 9,727 according to the California Department of Finance). The majority of the City's developed parkland is concentrated to the west of the railroad tracks, with 10.8 acres on the peninsula, making up over 70 percent of City-owned park space. All of the City's recreation facilities, however, are located on the eastern side of Emeryville: basketball courts, recreation fields, and children's play equipment are located east of Doyle Street. A new park is being constructed in the block bound by 61st, 62nd, Hollis and Doyle streets.

Improvements

Open Space System

The General Plan proposes several different park types to accommodate the needs of present and future residents and to create a cohesive network of open spaces: two new large parks, several new pocket parks and small plazas, two greenways, and a series of green streets connecting major activity centers. These proposed park and recreation facilities—which total to between 41 and 46 acres—are described in Table 4-2 and shown on Figure 4-1. The small parks are identified with circles; actual sites will be identified during the planning period.

TABLE 4-2: GENERAL PLAN PARK ACREAGE

Park Type	Acreage

New open spaces will include areas for active recreation as well as facilities for passive activities and contemplation.

SUMMARY OF OPEN SPACE STANDARDS

- Develop 3 acres of parkland per 1,000 new residents
- Develop .25 acres of parkland per 1,000 new employees
- Locate at least one park within a five-minute walk of all residences

Park siting is essential to avoid shading by tall buildings (above).

Standards

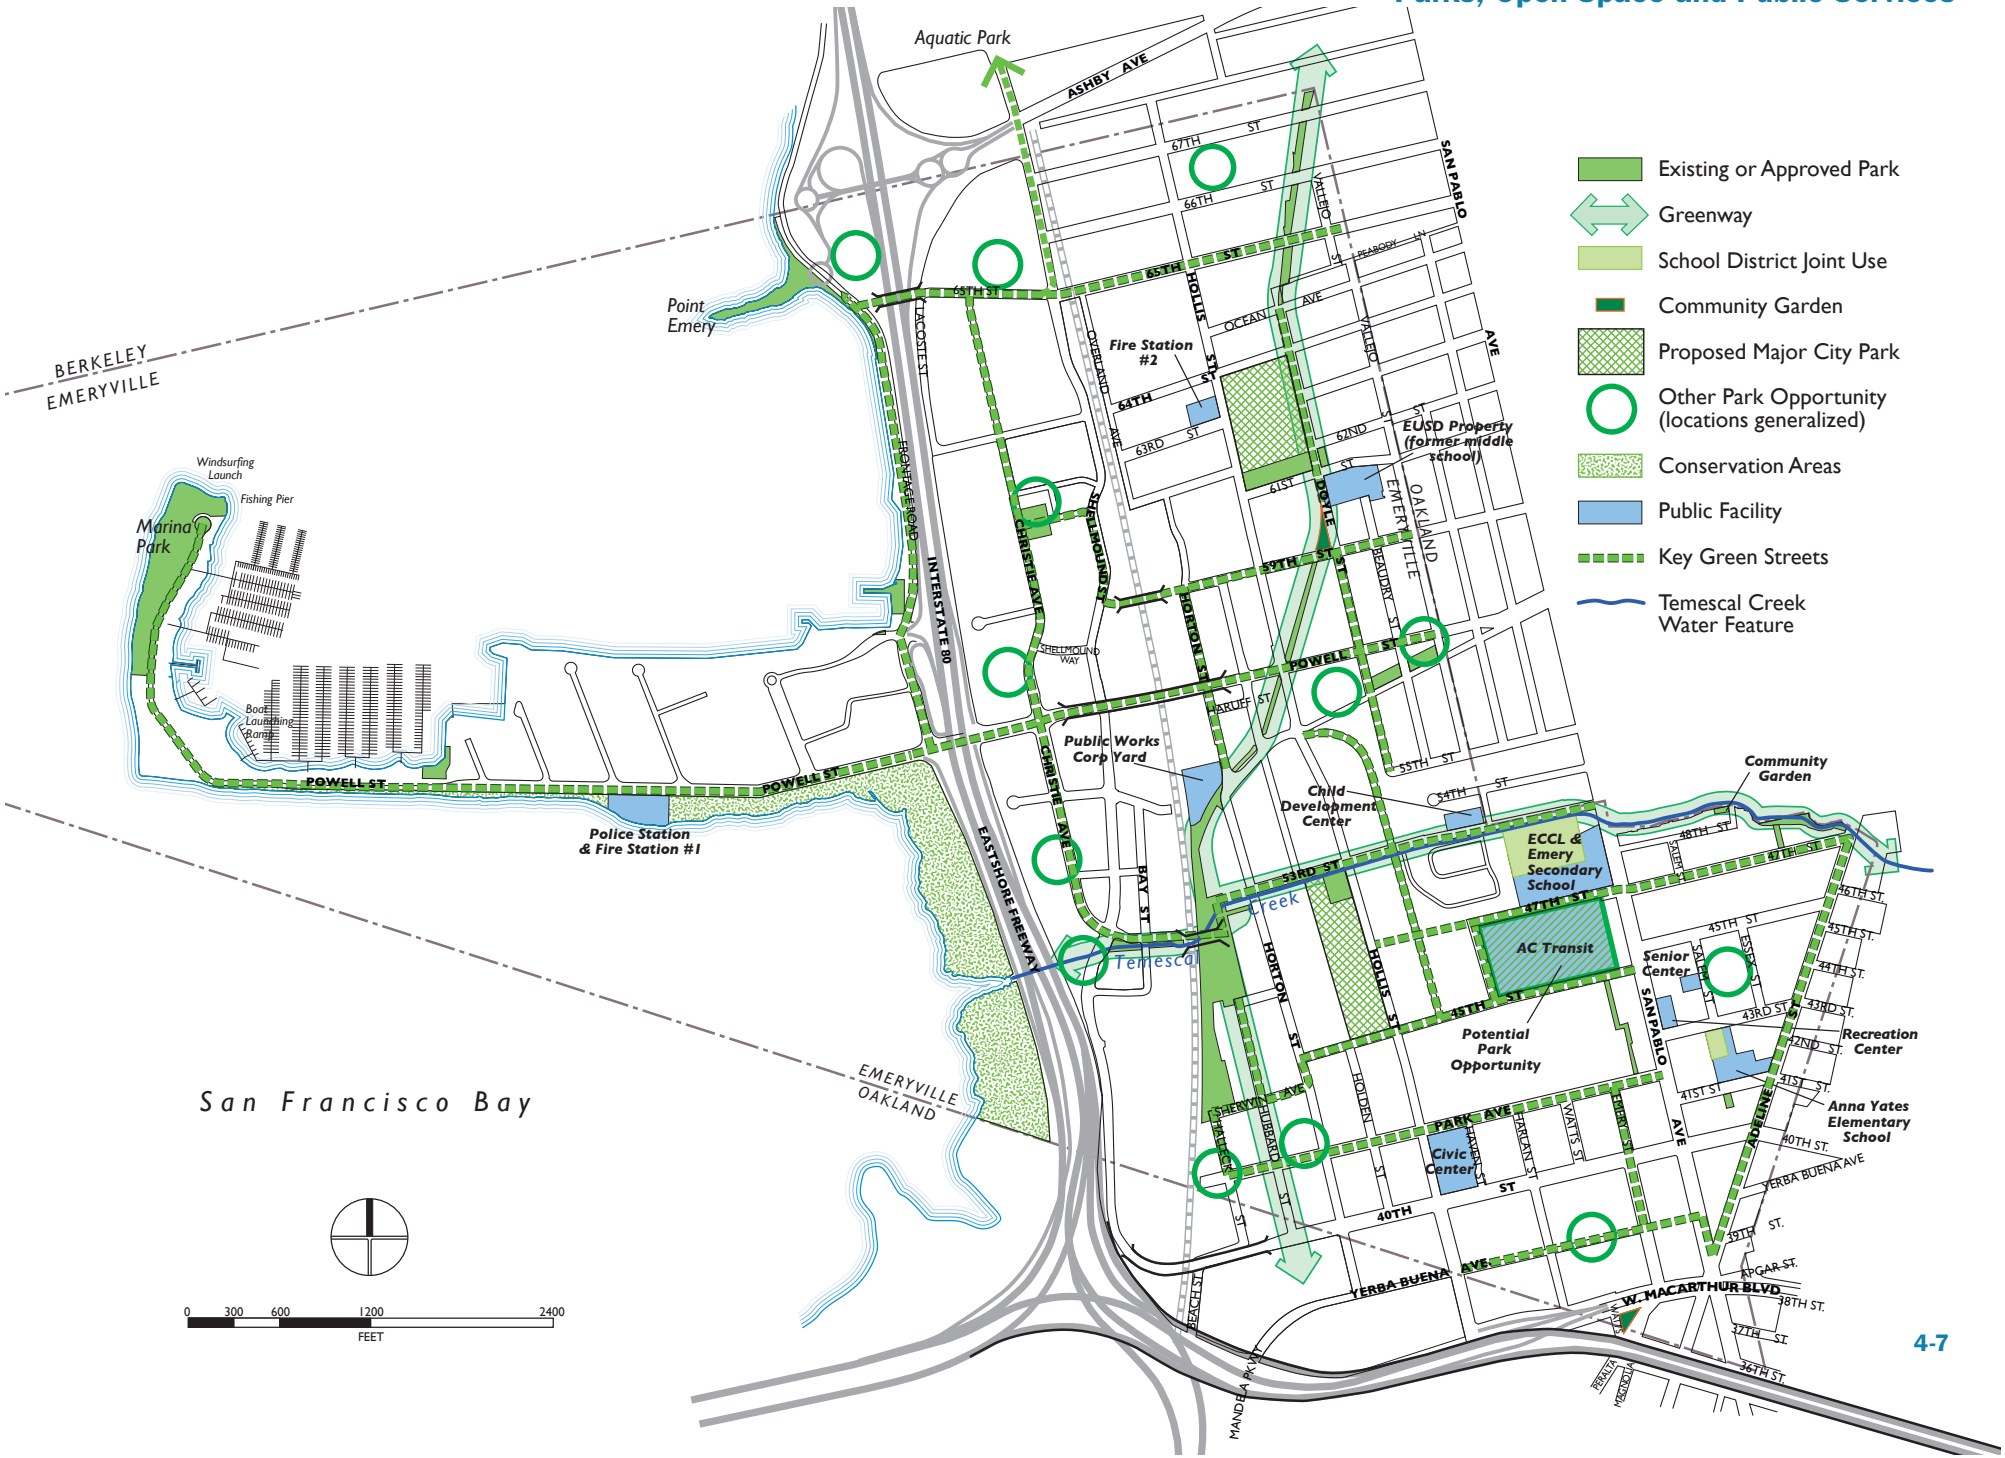
The General Plan establishes a new standard for parkland of three acres of neighborhood parks per 1,000 new residents and .25 acres per 1,000 new employees. Using this standard, the City would need to provide 22 acres of new parkland in order to accommodate the additional 6,500 residents and 10,000 employees expected by the end of the planning period. The General Plan proposes 22 to 25 acres of new neighborhoods parks, as well as approximately five acres of other open space (including plazas and community gardens), thereby meeting the standards set here. Moreover, the City would gain more parkland per capita for all if its residents, not just new arrivals. In total, existing, planned and proposed parks would result in 41 to 46 acres of City-owned parkland, plus the Greenways, green streets, and other trails. This total represents a ratio of 2.5 to 2.8 acres per 1,000 residents.

Although the amount of parkland is an essential component to creating a vital network of open spaces, the quality and accessibility of these spaces are equally important elements. A city should have parks with a distribution and form that allows them to be enjoyed by workers during the day, used by children and senior citizens close to their homes, and to serve as a point of focus for residential neighborhoods. The General Plan seeks to provide a network in which there is an open space accessible within a five-minute walk of each resident's home. To achieve this goal, generalized park locations have been identified throughout the city, where a deficit has been noted within existing and proposed neighborhoods.

4.2 SCHOOLS AND EDUCATION

This section describes educational facilities in the City of Emeryville, including schools, libraries, and other civic facilities. Emeryville houses two public schools serving Grades Kindergarten through 12, the Pacific Rim International School serving 90 students from Pre-School through Grade 6, and three other institutions of higher education and learning. Additionally, this section highlights the Emeryville Center of Community Life as a major public facility investment for the near future.

Emery Unified School District



Current Enrollment & Capacity

The city boundaries are aligned with a single public school district, Emery Unified, which runs two schools: Anna Yates Elementary School (Kindergarten–Grade 6) and Emery Secondary School (Grades 7–12). Emery Unified owns an additional property at 1275 61st Street, previously called the Ralph Hawley School and prior to that, the Emery Middle School Academy. It ceased regular school operations in 2003.

Emery Unified is a small school district and is likely to remain so during the General Plan period. As of the 2007–2008 school year, Emery Unified served 822 students. Both Anna Yates Elementary and Emery Secondary are located on the Emeryville/Oakland border within the 94608 zip code area. Approximately 40 percent of the district's students live outside the school district boundaries. Of those, 85 percent reside within the 94608 zip code. Students who live outside of Emeryville must apply for an inter-district transfer each academic year. Priority is given to returning students, their siblings, and to students whose parents or guardians are employed in Emeryville.

FIGURE 4-1

Parks, Open Space and Public Services

The Emery public schools are Annie Yates Elementary (top) and Emery Secondary (bottom). These schools will be consolidated and integrated into the Emeryville Center of Community Life.

As enrollment of Emeryville residents either increases or decreases, the percentage of students accepted through the inter-district transfer process is adjusted. This flexibility has aided the City's small public school district in maintaining stable class sizes across all grade levels.

Funding

The Emery Unified School District experienced a major fiscal turn-around between 2000 and 2008, helped by several public measures. In 2001 the California Legislature passed AB96, a state takeover with a $1.3 million emergency loan to Emery Unified. In 2002, the City signed a $1.5 million, 40 year agreement with the school district to lease Emery Secondary School's sports facilities during non-school hours. In 2003, Emeryville voters approved a parcel tax to help its schools thrive. On July 1, 2004, full control was restored to the district. Emeryville voters agreed to an expanded parcel tax in 2007 with those funds allocated to strengthen the academic curriculum and/or programs in the following essential areas: school libraries, wellness initiatives, counseling, tutoring and mentoring, technology supports, English language development, professional development and teacher recruitment/retention. Additionally, the district is supported by resources from federal, state, and private foundation sources. In particular, the Emery Education Fund, a local non-profit organization supported by the Emeryville Chamber of Commerce and others, raises private donations for a variety of school programs, teacher mini-grants, and student scholarships.

Projected Enrollment

Projecting student enrollment over the life of the General Plan helps to determine the need for new school facilities over time. Emeryville's population is expected to increase by nearly 7,000 residents over the life of the Plan. As the population ages at the county and state level, the proportion of school-age children is expected to decline despite an actual increase in school-aged residents. Adjusting enrollment based on this factor results in a projection of approximately 1,200 students by 2030—an increase of nearly 400 students. According to a 2008 study, this is a high estimate for potential future enrollment.[1]

The retention of students and their families who can no longer afford to live in the city remains a concern. Emery Unified recognizes the need for an increase in affordable family friendly (3+ bedroom) housing.

Planned Improvements

The future of the Emery Unified School District's facilities is tied to the development of the Emeryville Center of Community Life described in the next section. According to the Center's 2009 Master Plan, the Center of Community Life will accommodate 800-900 students in Grades Kindergarten through 12 with the ability to expand to serve 1,200 students—enough capacity to accommodate the projected enrollment in 2030.

It is further anticipated that the need for services for children aged 0-5 and their families will increase during this period of increased enrollment in grades Kindergarten through 12. The need to serve preschool-aged children in pre-kindergarten programs is likely to increase. Adjunct facilities may need to be utilized to serve the above population including the current Anna Yates Elementary School site once the K-6 program is relocated to the Emeryville Center of Community Life.

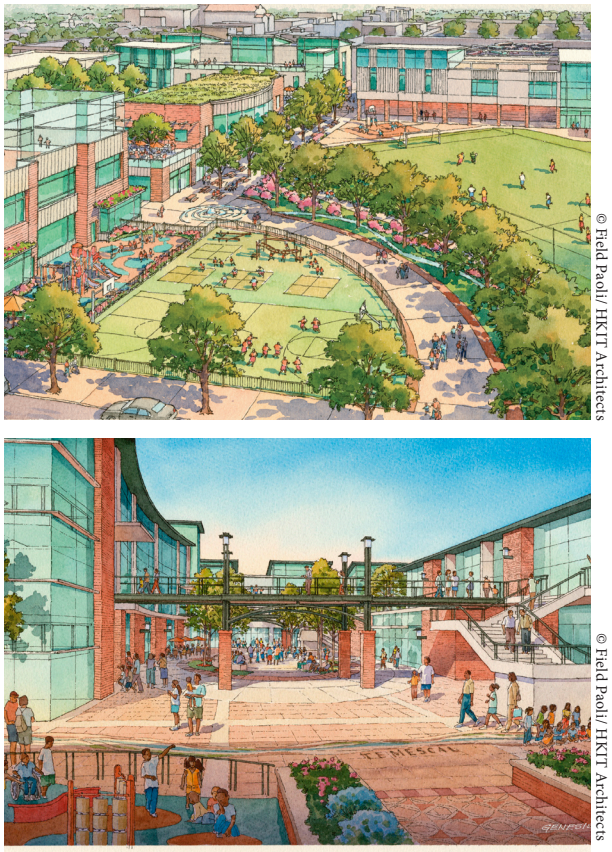
1 *Emery Unified School District Demographic Trends and Forecasts" Presentation by Shelley Lapkoff, Ph.D., Lapkoff & Gobalet Demographic Research, Inc., June 4, 2008.*

Anna Yates Elementary School was partially renovated and expanded in 2008, increasing its capacity to serve students and programs. Although the existing school facilities throughout the district have been adequately maintained over many years of use, they have exceeded their "useful life" period and are now in need of major repair and updating or replacement. Additionally, the existing facilities present significant challenges to operating current programs in spaces designed fifty or more years ago. And finally, the existing building systems are outdated and present obstacles to owning and maintaining a safe, efficient, energy-conscious set of facilities.

Higher Education

Emeryville lies within a region that is rich with higher learning opportunities. With the University of California-Berkeley, located just a few miles away, Emeryville has access to the academic and cultural resources of one of the top college campuses in the country. In addition, the Peralta Community College District, with campuses in Berkeley and Oakland, as well as California State University-East Bay, in Hayward, provide high-quality opportunities for post-secondary degrees and lifelong learning.

Moreover, there are several institutions within Emeryville that provided specialized higher education opportunities. Ex'pression College for Digital Arts, an accredited school founded in 1999, offers bachelor degrees in animation, gaming, motion graphic design and sound arts. The campus is located in northwest Emeryville, on Shellmound Street, between 65th and 66th streets. In 2007, Ex'pression expanded its classroom facilities, resulting in about 78,000 square feet of space. In the 2007-08 academic year, Ex'pression had 1,300 actively enrolled students.



Western Career College (formerly Silicon Valley College) is an accredited private school that offers certificate and associate degree programs in the medical, pharmacy, criminal justice and graphic design fields. It has nine campuses in the Bay Area, including one in the Public Market office tower on Shellmound Street. As of 2008, about 200 students are enrolled at the Emeryville campus.

The National Holistic Institute is a massage therapy school that trains students in massage technique, theory, and career development, preparing students for the national certification exam. The campus is located at 59th and Hollis streets.

Emeryville Center of Community Life

The concept of a Center of Community Life is a once in a lifetime opportunity to combine City and School programs in a state-of-the art facility to be shared by the City of Emeryville and Emery Unified School District. It is central to the City's focus on building and supporting a healthy and vibrant community in Emeryville. Although the School District and the City are separate government entities, the City of Emeryville and Emery Unified have had a close working relationship in recent years. The Center will consolidate grades pre-Kindergarten through 12, and house joint-use facilities for arts, performances, classes, meetings, community programs and services, recreation (indoor and outdoor), and administration.

The goals for the Center include: improving quality of life within Emeryville's dense urban setting; providing a social and community resource; turning the city's public schools into the center of the community through physical and social integration; and providing a place for the mixing of all the lifestyles, ages, and races that make up the Emeryville commu-

Concepts for the proposed Emeryville Center of Community Life.

The City's public services are essential to maintaining a high quality of life for residents. Municipal services are consolidated in City Hall.

The Emeryville Child Development Center provides market rate and subsidized child care services.

nity. Through several years of public meetings, the Emeryville community has also identified key themes to incorporate into the Center: connections to the community; access to facilities and programs; active engagement of the community in these programs, and the expression of an identity for Emeryville.

Initially the concept involved the Emery Secondary School site, and expanding across 47th Street to occupy the AC Transit facility. Due to acquisition and clean up costs, and the potential to build "up" rather than "out," it was determined to build the Center at the current Emery Secondary School site. Usable parts of the current School/District complex will be retained, but the vast majority of buildings will be demolished and replaced by higher structures built around a central courtyard, with flexibility to expand further in the future if enrollment increases.

Phase I of the process, which will be completed by the spring of 2009, involves the creation of a Master Plan for the Emery Secondary School site. While there will be separation of grades for security and safety purposes, there will also be many common areas for sure by all students, as well as the entire Emeryville community. Community services and recreation programs provided by or through the City will also make use of flexible space to maximize community-wide uses, participation, and involvement. Phase II involves construction of these community recreation and educational facilities, anticipated for completion in 2013 or 2014. This process is being overseen by the City/Schools Committee. The Center will come to fruition during the life of this General Plan.

Libraries

There are no public libraries in Emeryville. The Oakland Public Library's Golden Gate Branch, located just outside the city limits on San Pablo Avenue near Stanford Avenue, serves as the main circulation library for Emeryville residents. The Emeryville Secondary School and Anna Yates Elementary School each include a library for use by students. The Emeryville Center of Community Life may include a library, although it would likely focus on serving public school students and would not replace the Golden Gate Branch as the City's main library facility.

Other Community Facilities

Civic Center

Located in the block bounded by Park Avenue and Hollis, Haven, and 40th streets, the Civic Center consists of the historic Town Hall building and an addition completed in 2001. The 1.4-acre Civic Center area is used for City business as well as public meetings. A former industrial building behind Old Town Hall has been purchased by the Redevelopment Agency to be developed as an arts and cultural center. As of 2008, a feasibility study has been completed and a strategic plan is being prepared to determine facility requirements for potential user groups. Design work is expected to be prepared in 2009, construction to begin in 2010 and the completed center to open in 2011.

Emeryville Senior Center

The Senior Center serves older adults from its location in the Triangle neighborhood. It provides services, including meals and financial counseling, and activities for seniors. The American Legion also maintain offices in the Center. Like the rest of the Bay Area and the county as a whole, Emeryville's population is aging. Between 1990 and 2005, the median age in the

city grew slightly from 34.3 to 35.2 years. The population cohort that increased the most over this period was the group between 45 and 60 years old. The City's Commission on Aging has developed a strategic plan for senior facilities and services to accommodate the needs of this growing demographic.

Recreation Center

The City's Recreation Division of the Community Services Department offers classes and programs for children and adults. Located on San Pablo Avenue at 43rd Street, it is near the recreation facilities at Emery Secondary School and the open space at Temescal Creek Park. This location is temporary and once the ECCL is complete operations will be relocated to that site.

Child Development Center

Quality early child care and education can have a positive effect on children's learning and on parents' ability to work and earn income. In addition to family day care homes and public and private centers, the Emeryville Child Development Center (ECDC), located at 1220 53rd Street, offers specific programs for infants, toddlers and preschoolers from age four months to five years. ECDC also provides family support programs through parenting workshops, support groups, and partnerships with multiple service providers.

4.3 PUBLIC SERVICES AND FACILITIES

Public Safety

Police Services

Profile

Emeryville has one police station, adjacent to Fire Station #1 on Powell Street on the Peninsula. The Department employs 39 sworn officers and 20 other staff positions. The result is a ratio of 4.0 sworn officers for every 1,000 residents (based on 9,727 residents in 2008). This is much higher than the countywide ratio of 2.02 officers per 1,000 residents across Alameda County. During the workday, however, the city population swells to 25,000 to 35,000, resulting in a ratio of less than one police officer per 1,000 people. The Records and Communication Section of the Police Department is the public safety answering point for all emergency and non-emergency calls for service. In 2004, the Police Department's dispatch center processed 11,728 emergency calls.

Standards

While the department does not have service ratios or formal response standards, it aims to respond to emergency calls in two minutes and to non-emergency calls in six minutes. The department anticipates that as the city and its population grows, its staffing levels must also grow. While additional development will impact response times, the department does not use set standards for providing service to a growing population.

Planned Improvements

The Police Department has identified a need for additional facilities space. In 2008, the Department proposed a renovation of the existing facilities. Improvements would include an enlarged dispatch area; better east-west circulation within the building; adequate stor-

age and office spaces and renovation of the men's and women's locker rooms. The City Council has reviewed conceptual plans and authorized staff to move forward with the design phase. The current schedule suggests that construction would begin in 2009.

These renovations may not accommodate the future needs of the Department given population projections. There are concerns that the current station would be vulnerable and could be cut off from the rest of the city in the case of a large earthquake. The 1987 General Plan also noted that the police station had poor access to the east side of Emeryville, from which most service calls were originating. In addition, the existing station is considered too small by the Department, which would like a new facility that is 25,000-30,000 square feet in size and able to handle 10 to 15 additional personnel. A new station located on the east side of San Pablo Avenue may be suitable, although some residents of the Watergate complex are concerned about being left unprotected if the station moves from the Peninsula.

The Fire Department responds to emergency calls but also maintains the City's emergency management plan.

Fire Services

Profile

The Emeryville Fire Department (EFD) aims to educate the public, prevent fires, and respond to all emergencies in the city. Fire and emergency medical dispatch is handled through the Oakland Fire Department's communications system. All Emeryville firefighters are certified Emergency Medical Technicians.

The Fire Department employs 31 personnel in two stations: Station #1 at 2333 Powell Street on the Peninsula and Station #2 at 6303 Hollis Street, at the corner of 63rd Street. Station #2 hosts the City's Emergency Operations Center, which is a room that can serve as a disaster coordination center. The department has mutual aid agreements with the fire departments of Oakland and Berkeley. These departments automatically respond to freeway accidents in the area and can be called for help with any other incident.

The Fire Department has an emergency management operations plan for the city. Evacuation routes from the city in the case of an emergency depend on the circumstances, although San Pablo Avenue, Hollis Street, and I-80 are major routes. The City has an informal understanding with AC Transit that they would help evacuate people in an emergency. The department has the ability to monitor the state of emergency routes through webcams.

The Community Emergency Response Team (CERT) Program educates people about disaster preparedness for hazards that may impact their area and trains them in basic disaster response skills, such as fire safety, light search and rescue, team organization, and disaster medical operations. Using the training learned in the classroom and during exercises, CERT members can assist others in their neighborhood or workplace following an event when professional responders are not immediately available to help. CERT members also are encouraged to support emergency response agencies by taking a more active role in emergency preparedness projects in their community.

Standards

The department receives an average of 1,500 calls each year, which includes mutual aid responses to nearby cities. The State requires a minimum response time of eight minutes to emergency calls. The EFD averages just under five minutes time from the inception of an emergency call to their arrival on the scene. Overall, about 60 to 65 percent of the department's calls are medical, with Station #2 handling around 60 percent of all non-fire calls.

Planned Improvements

The EFD is not currently planning for new facilities. Expansion of the city is going to be vertical rather than horizontal. Infill development will require more equipment and staffing rather than an additional location. The department has discussed whether to expand its equipment to include an adaptive response vehicle, which would be smaller and more maneuverable and able to handle different types of calls, although it would require additional staffing. The EFD also sees a need for a backup water pressure and delivery system in the event that an earthquake disrupts the regular system.

The expansion of commercial and residential building space in the city implies a higher daytime and permanent population. This higher population and greater density will create several impacts: more emergency calls, the potential of incidents that affect more people, greater difficulty in evacuating the city, and longer response times to emergencies due to increased traffic congestion.

Utilities and Infrastructure Systems

Providing adequate public infrastructure and utilities is an essential part of a city's physical growth and development. This section provides background on the city's gas and electricity provision and wastewater treatment. Note that other public facilities and services are discussed elsewhere in the General Plan. Chapter 6: Conservation, Safety, and Noise, includes a discussion and policies on water systems—potable, recycled and stormwater management. Chapter 7: Sustainability includes a discussion and policies on energy and waste management.

Gas and Electricity

The Pacific Gas and Electricity Company (PG&E) serves Emeryville with electricity and natural gas. PG&E purchases both natural gas and electrical power from a variety of sources, including utility companies in other Western states and Mexico. PG&E charges connection and user fees for all new development in addition to sliding rates for service based on use.

PG&E delivered 10,605 thousand Megawatt-hours of electricity to customers in Alameda County in 2000. Approximately 60 percent of this energy was sold to commercial and industrial accounts. Electrical power is provided to the City of Emeryville from various distribution feeders located throughout the city; natural gas is provided to the city from several gas lines stretching from Milpitas to San Francisco. Natural gas is delivered from basins in Canada and/or Texas by transmission mains and deposited at PG&E's Milpitas Gas Terminal. PG&E has indicated that gas and electric demand for its entire service area will grow steadily through 2010, and it does not expected to substantially change the electric transmission system in Emeryville.

Wastewater

The City of Emeryville operates a municipal sanitary sewer collection system that conveys wastewater from Emeryville and portions of the City of Oakland. The collection system is divided into five drainage basins, each of which connects to the East Bay Municipal Utility District's (EBMUD) sanitary sewer interceptor, which is generally located along the east side of Interstate 80. The EBMUD interceptor carries sewer flows from the East Bay communities' collection systems to its wastewater treatment facility (SD-1) located at the foot of the San Francisco Bay Bridge in Oakland. Except for one pump station and a forced main at the Emeryville Marina, the City of Emeryville's collection system is generally a gravity-fed system, consisting of over 13.6 miles of pipe ranging in sizes from six to 30 inches.

GOALS AND POLICIES

GOALS

PARK AND OPEN SPACE SYSTEM

PP-G-1 **A comprehensive open space system—** A system that provides a diverse range of active and passive recreation and open space opportunities for residents, workers, and visitors.

PP-G-2 **New public spaces—**A public realm and new public parks and plazas that serve as focal points of the community.

PP-G-3 **Integration of parks and open space—** Parks that are coordinated with surrounding developments to form unified urban compositions and that are integrated into the redevelopment of underutilized areas.

PP-G-4 **Sunlit parks—**Public parks, plazas, and other open spaces that enjoy maximum sunlight access.

PP-G-5 **Sustainable design—**Park designs that are consistent with sustainable design principles and practices, and efficient use of open space.

PP-G-6 **Locally accessible parks—**At least one park located within a five-minute walk of all residences.

PP-G-7 **An accessible waterfront—**Connections from the waterfront to the rest of Emeryville east of the freeway.

SCHOOLS AND EDUCATION

PP-G-8 **A safe, nurturing and enriching environment—**An environment in which children and youth can flourish and become contributing members of society. The foundation of this vision is a strong and active partnership among the City, School District, and all segments of the community, so that powerful learning from the earliest years is a citywide experience and responsibility.

PP-G-9 **Accessible childcare—**An adequate and diverse supply of childcare facilities that are affordable and accessible for families, and provide safe, educational, and high-quality services for children.

PP-G-10 **Vibrancy and diversity—**Expanded arts, cultural and recreation programs that celebrate a vibrant diverse community.

PUBLIC SERVICES AND FACILITIES

PP-G-11 **Public safety—**Police and fire services that are responsive to the citizens' needs to ensure a safe and secure environment for people and property in the community.

PP-G-12 **Adequate public facilities—**Utilities and infrastructure systems that provide safe, reliable, and adequate services.

POLICIES

Implementing actions supporting each policy are described in Chapter 8: Implementation Program.

PARK AND OPEN SPACE SYSTEM

PP-P-1 Increase park acreage to serve the needs of the growing population and address current deficiencies in park and open space standards. Maintain a standard of three new acres of parkland per 1,000 new residents, and 0.25 acres per 1,000 new employees.

PP-P-2 Two new large parks (five acres or larger), one each north and south of Powell Street, shall be provided. Active recreation uses will be a component of these parks. The northern park site is bounded by 61st, 64th, Hollis, and Doyle streets. There are two potential southern park sites:

- One potential southern park site is shown on the PG&E site on Hollis Street, between 45th and 53rd Streets. On this site, consideration shall be given as to how to incorporate the existing buildings, which are rated Tier 1 and Tier 2 in the Park Avenue District Plan, into future park uses.

- The second potential southern park site is located at the AC Transit bus yard between 45th and 47th streets,

adjacent to the proposed Center of Community Life. Should this site become available, the City shall explore the possibility of a public park—along with other public uses. If a large park at this site is feasible and is considered desirable, all or part of the PG&E site may no longer be needed for a public park.

PP-P-3 New smaller open spaces—including public plazas and places, community gardens, and pocket parks—will provide local focus points and diversify the built environment. These should be developed through the identification of underutilized and strategically located parcels, and the redevelopment of larger sites.

PP-P-4 Locate "other park opportunities" (whose locations are generalized on Figure 4-1) to maximize accessibility for residents, such that every resident in the City has access to a park within a five-minute walk from their residence. Parks shall be located outside the 65 dbl noise contour (Figure 6-10).

PP-P-5 A system of greenways and Green Streets, as tree-lined open spaces will be developed as continuous recreational paths for bicyclists, joggers, and pedestrians, linking parks and activity centers.

PP-P-6 The north-south Emeryville Greenway will be expanded, enhancing its role as an open space corridor and connector across the City, and a source of inspiration and community pride. The City will support the expansion of a park at the Sherwin Williams site, in coordination with the development of Horton Landing Park and the Greenway.

PP-P-7 An east-west greenway located generally along the path of Temescal Creek will be created. This will include water features to celebrate the creek and improvements to the riparian corridor, where feasible, while maintaining existing drainage capabilities.

PP-P-8 Locate a series of small parks and plazas along Christie Avenue to create a continuous open space network throughout the district.

PP-P-9 Shading of parks and green streets by buildings will be minimized.

PP-P-10 Efficient use of open space will be achieved through techniques such as rooftop play courts and gardens, joint use of sports and recreation facilities at schools, co-location of parks with child care facilities, and possible use of underground parking below new plazas and parks.

PP-P-11 All large new residential developments shall include a combination of private and common open space.

PP-P-12 Design, landscaping, lighting, and traffic calming measures will be employed to create safe parks and open spaces.

PP-P-13 Open spaces that have deteriorated, have design features that limit access and use opportunities, and/or are in need of activity shall be revitalized.

SCHOOLS AND EDUCATION

PP-P-14 Efforts by Emery Unified School District and childcare service providers to establish, maintain, and improve educational facilities and services will be supported. Encourage a range of child care facilities, including family day care homes, public and private centers, preschool programs, and before and after school programs.

PP-P-15 A strong relationship and communication between City and Emery Unified School District will be maintained.

PP-P-16 The City will continue to partner with Emery Unified School District to optimize the joint-use of school facilities for community use.

PP-P-17 The City will support the development of the Emeryville Center of Community Life.

PP-P-18 Student engagement and learning will be facilitated through expanded programs and activities.

COMMUNITY

PP-P-19 A diversity of lifestyles, ages, and income-levels will be accommodated through zoning and community facilities and programming.

PP-P-20 The growing senior citizen community will be supported by providing appropriate cultural, recreational and assistance programs and services.

PP-P-21 A community cultural arts center will be developed.

PUBLIC SERVICES AND FACILITIES

PP-P-22 Crime will be deterred through physical planning and community design.

PP-P-23 There will be adequate police and fire staff to provide timely response to all emergencies and maintain the capability to have minimum average response times.

PP-P-24 The City will support community involvement in disaster preparation and response through the Fire Department's Community Emergency Response Training program.

PP-P-25 The City will continue to coordinate with Pacific Gas & Electric to ensure gas and electricity access to new development sand high quality service to all customers.

PP-P-26 The City will continue to operate and maintain the City-owned wastewater collection conveyance system and coordinate with EBMUD on the transfer and treatment of wastewater.

PP-P-27 The City will continue to cooperate with EBMUD, the Regional Water Quality Control Board, and other relevant agencies to adopt and implement programs and policies to further reduce inflow and infiltration (I&I) of storm water in the City's wastewater collection system and private sewer laterals during wet weather events.

PP-P-28 The City will continue to require development projects to replace or upgrade as needed, sanitary sewer systems serving the development site to reduce inflow and infiltration (I&I) of stormwater in the City's wastewater collection system and private sewer laterals during wet weather events.

5 URBAN DESIGN

The Urban Design Element focuses on enhancing the public realm and everyday livability, crafting a tapestry of distinctive yet synergistic and connected districts, and strengthening Emeryville's identity and sense of place.

Emeryville has transformed itself from an industrial town into a dynamic mixed-use urban center. A small city with flat topography, and relatively high development intensities, Emeryville has the potential to be an energetic, engaging, and walkable urban setting. However, connectivity in the City is challenging because of the presence of major transportation corridors. Additionally, because of its industrial past, the city has very large blocks, creating a sometimes fragmented, disconnected environment.

The Urban Design Element seeks to enhance livability by emphasizing the public realm—streets and public spaces; promote fine-grained development, and improve connectivity between districts; foster vital and active street life; maximize sunlight penetration into streets and open space; and build upon Emeryville's features and assets to promote richness and diversity. It also seeks to ensure that development is designed with a pedestrian orientation, and provides the framework for more detailed Design Guidelines. Photo simulations, beginning on Page 5-25, illustrate the type of development that is possible under the urban design framework outlined in this Element. The simulations represent five places that are poised for redevelopment or enhancement: East Bay Bridge Center, Sherwin Williams site, Powell Street and Christie Avenue intersection, Greenway along 53rd Street, and Doyle Hollis Park.

This chapter provides policies at a citywide scale, as well as key goals defining the areas that make up the city and the distinct districts within them. Policies in this element should be read together with existing district level plans including the Park Avenue District Plan, North Hollis Area Urban Design Program, and San Pablo Avenue Urban Design Plan, as well as master plans for large Planned Unit Developments including Pixar, Novartis (Chiron), Bay Street, and Marketplace.

5.1 CITY STRUCTURE

Framework

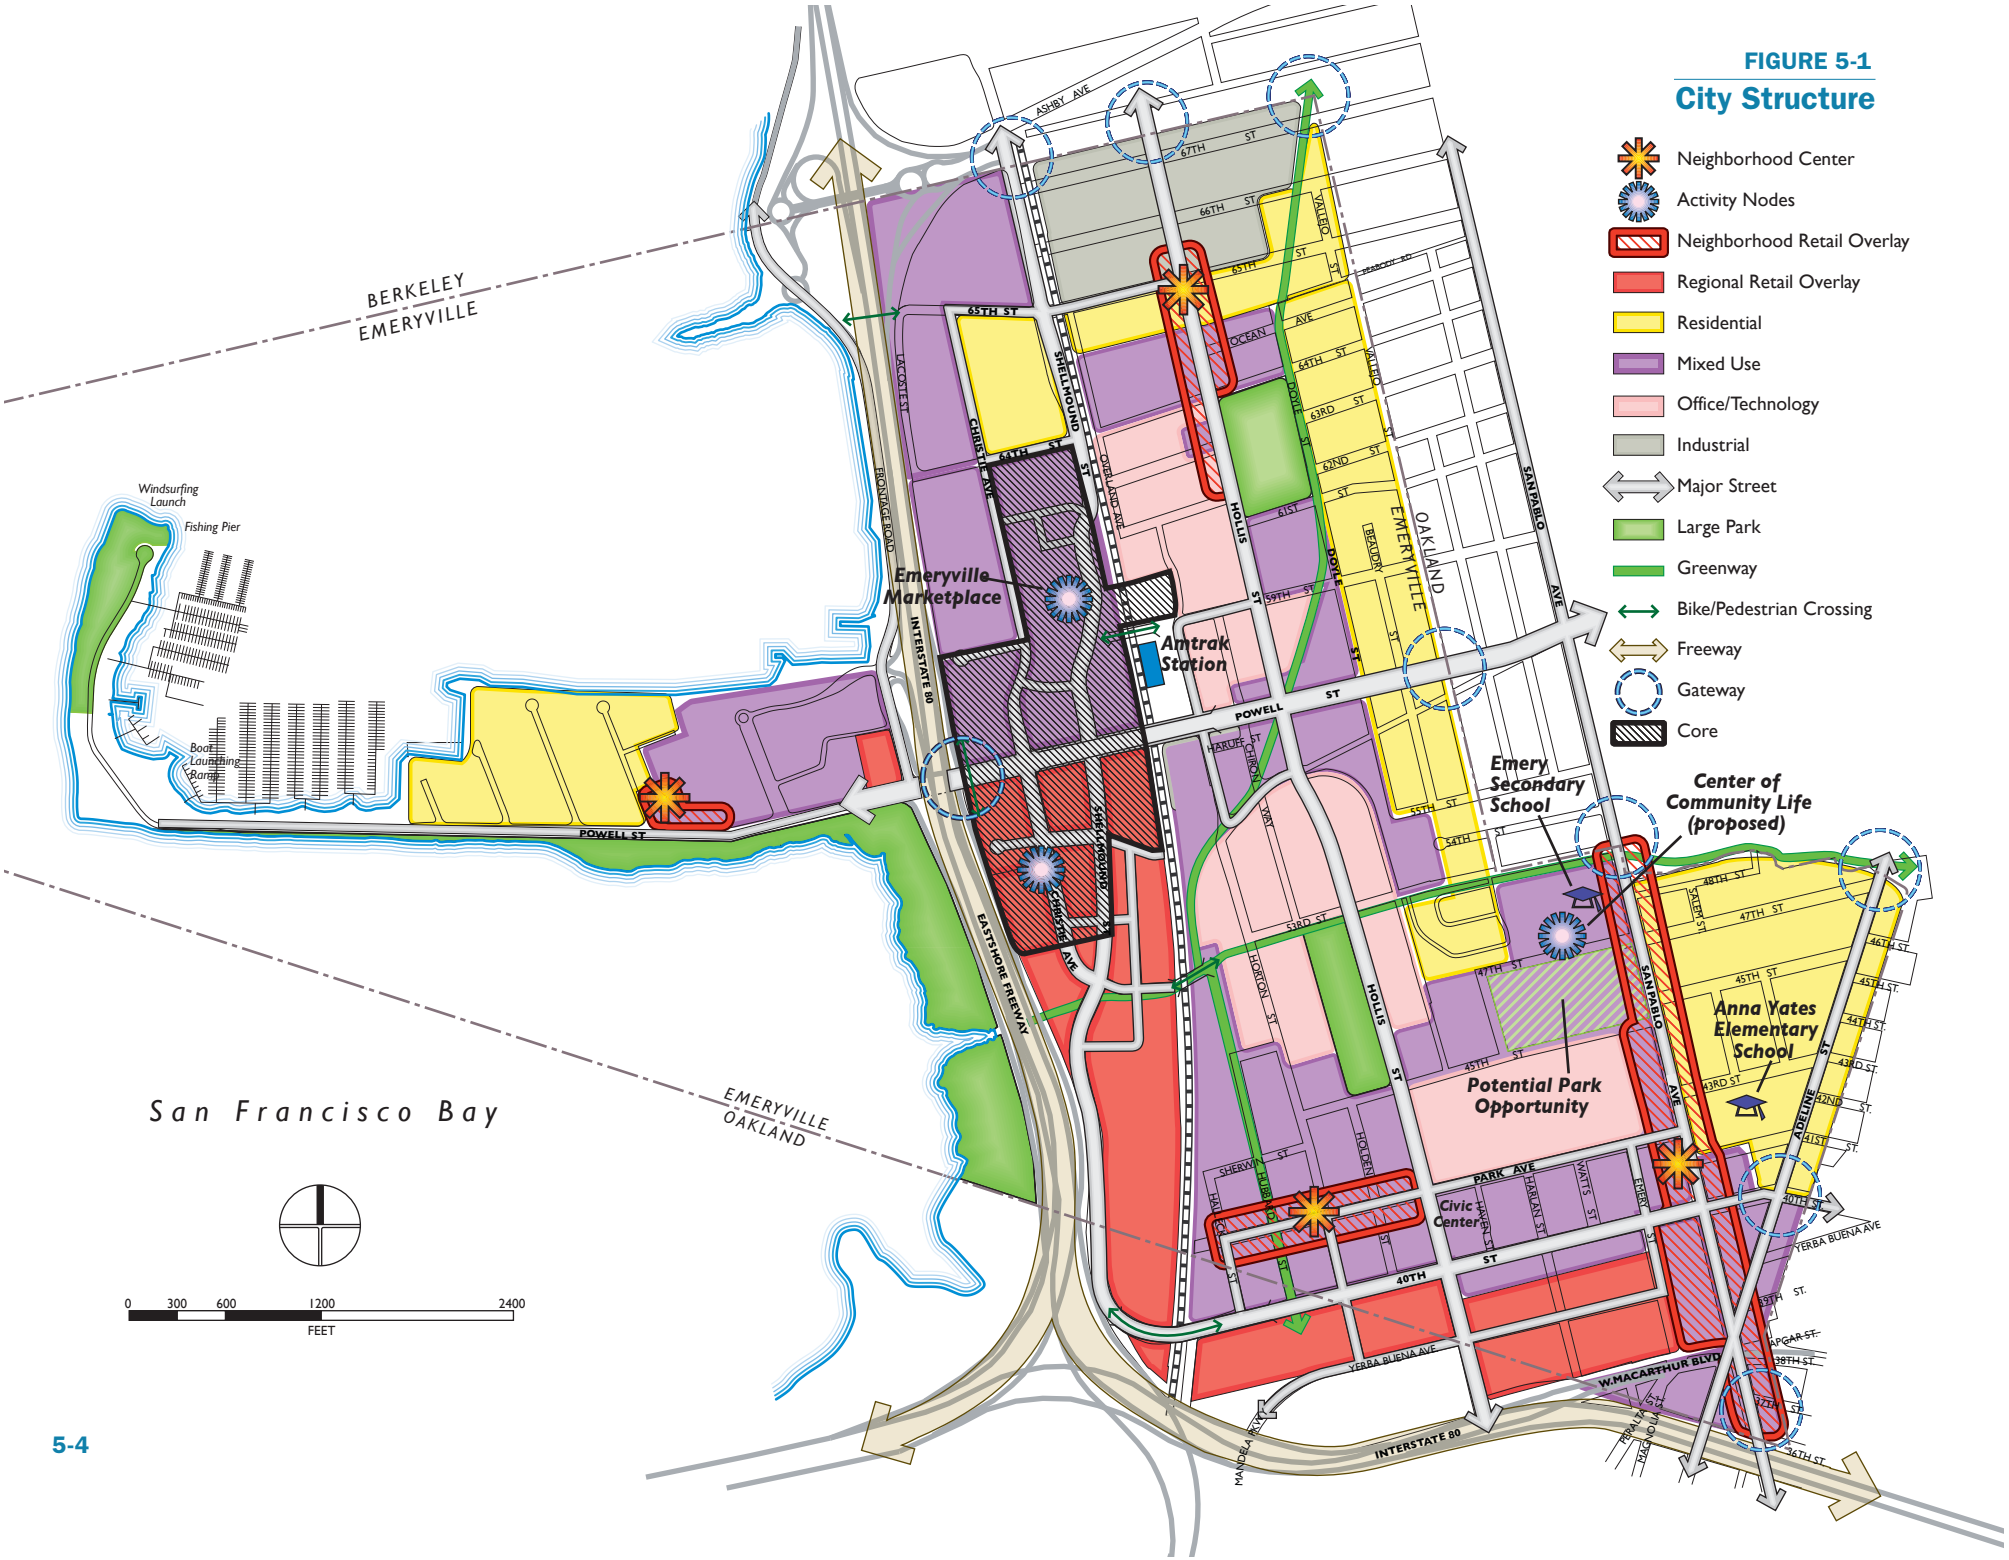
Located between Berkeley and Oakland, Emeryville acts as the primary gateway to the East Bay Area from San Francisco. Highly visible from major regional approaches along Interstates 80 and 580 and the Bay Bridge, the city is geographically framed by two major natural elements—the Berkeley-Oakland Hills to the east, and the San Francisco Bay to the west.

Emeryville is comprised of multiple districts, with their own development typologies and patterns, many of which are evolving. As in other East Bay cities, the waterfront (including the Peninsula) is physically separated from the eastern portion of the city by I-80. However, unlike cities such as Berkeley and Oakland, Emeryville does not have a historic downtown to serve as a central organizing element.

The basic components of Emeryville's existing city structure—its districts and diverse development scales—are built upon to establish an intensified, central city core; expanded street grid and pedestrian connections; new parks and open space; and strong, identifiable neighborhood centers that define an overall organization and character for each district. The arrangement of these components within the overall city structure is shown in Figure 5-1, City Structure. Key design and policy features include:

- **Centrally-located neighborhood centers** with public space and ground floor retail in the North Hollis, Park Avenue, Watergate, and San Pablo Avenue districts create more vibrant and balanced districts, with local shopping and a pedestrian scale.

- **A dynamic urban core** around the intersection of Powell Street and Christie Avenue, with the tallest building heights, a mix of residential and commercial uses, and active street frontages.
- **Other key activity nodes** are defined in places with intensive retail or public uses, including the Marketplace, Powell Street Plaza and Bay Street, as well as the proposed Center of Community Life.
- **Regional retail districts** with mixed commercial and residential uses along 40th and Shellmound Streets, reinforcing regional nodes and encouraging greater activity in these areas.
- **Existing residential neighborhoods**—the Triangle, Doyle Street, and Watergate neighborhoods—are preserved as lower-scale residential districts, enhancing these neighborhoods and their distinct identities.
- **Two large new parks**, centrally located to expand resident and employee access to open space while greening the environment and improving recreational opportunities.
- **Better connections**—A proposed grade separated railroad crossing and a proposed new bridge over I-80 and a greenway network, improving walkability and connectivity, particularly east-west connections to major activity centers, while enhancing the public realm with trees and landscaping.
- **Transit-oriented development** around the city's transit hubs: the Amtrak Station and the intersection of 40th Street and San Pablo Avenue, which is a major hub for AC Transit.
- **Gateways** at the main entrances to the city to celebrate the unique identity of Emeryville.
- **Expanded street grid**—Existing larger block sizes will be reduced wherever possible through extension of streets to create a more accessible pedestrian realm. Developments with large floor space will be accommodated through taller buildings, as well as mid-rise buildings.
- **Appropriate transitions**—While development intensities will be greater, emphasis upon building design and articulation, particularly at the street level, will play a key role in activating and enhancing pedestrian movement. The building heights and intensities from the core will transition to smaller-scale development in adjacent districts such as the Park Avenue District and residential neighborhoods.



By building on the city's existing assets and planning new development within the General Plan's structural framework, Emeryville will evolve into a more livable community, creating a strong sense of place and improving quality of life for its residents and visitors.

The City's character emerges from its many distinct districts and development scales. The General Plan envisions a mixed-use walkable city, creating a high quality of life for residents, workers, and visitors.

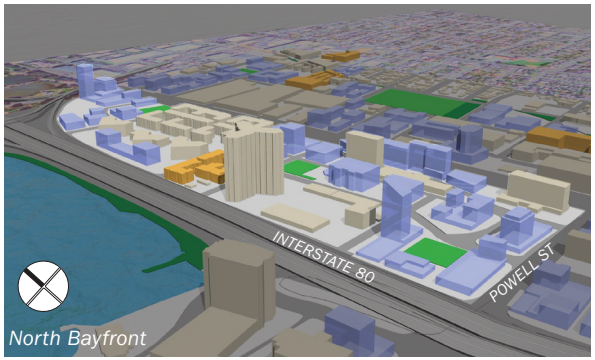
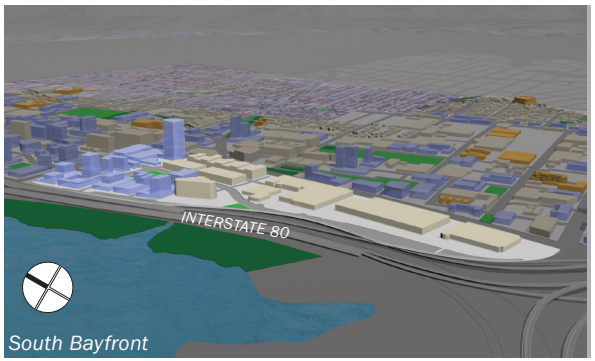
5.2 AREAS AND DISTRICTS



The city can be understood in relation to three large areas—north-south swaths—in which the city is divided (see Figure 5-2). They are:



1. **Bayfront and Peninsula:** West of the railroad, this area includes the central development core, Marina and Watergate districts.
2. **Central Emeryville:** Between the railroad on the west and the lower density neighborhoods on the eastern edge.
3. **Eastern Residential Neighborhoods:** Including the Doyle Street and Triangle neighborhoods.

FIGURE 5-2
Areas and Districts

- *Existing buildings*
- *Approved or recently constructed projects*
- *Hypothetical future projects*
- *Existing or proposed park/open space*

District Character

Bayfront and Peninsula

The Bayfront area between I-80 and the railroad is dominated by large-scale, regionally-oriented retail development; the northern portion of this area includes office, commercial, and residential uses, including the city's tallest structure—the Pacific Park Plaza residential building.

Marina and Watergate

Some of the most visible districts in Emeryville, the Marina and Watergate districts are distinguished by the presence of a large residential community as well as some of the tallest buildings in the city. This district is characterized by larger block sizes and expansive development. High-rise office and hotel development on the east end of the Peninsula, adjacent to the freeway, supports a higher-intensity core at Powell Street and Christie Avenue. To the west, the existing residential development of the Watergate condominiums is characterized by lower building heights and intensities.

Planning focuses on improving access to one of Emeryville's key assets—the beautiful San Francisco Bay—and completing this district with needed convenience shopping and amenities. Additionally, changes to the district will focus on enhancement of streetscape, pathways and trails, and most importantly, pedestrian and bicycle access from the rest of the city.

North Bayfront

Located between Emeryville's waterfront, I-80, and the rail corridor, the North Bayfront district is one of the fastest changing districts within Emeryville—especially at the northern end, where several new high-density residential developments have been located over the past few years.

Powell/Christie Core

The Powell Street/Christie Avenue core is at the center of much of the proposed growth under the General Plan and will experience considerable transformation over the next 20 years. A variety of activities, ranging from retail and entertainment, to office and residential uses will ensure the district maintains a lively, yet community-centered character. Heights will also increase substantially to fill in the Emeryville skyline—thus creating a more consistent pattern to the district's urban form and allowing views of the Bay and the hills. The transit center at the Amtrak Station and the Marketplace development are key projects to fulfill this transit-oriented mixed-use concept.

South Bayfront

Located just to the south of Powell Street, the South Bayfront district is currently one of the busiest locations within Emeryville. Anchored by several major regional retail centers, including the Powell Street Plaza, Bay Street Mall, and IKEA, the district receives a high volume of visitor traffic on a daily basis. However, as the district is narrowly confined by I-80 and the rail corridor, internal circulation is limited to Shellmound Street.

Central Emeryville

This area between the railroad and older residential neighborhoods to the east is a mix of industrial, office, and residential uses with an average block size of five acres and parcel size of a half acre.

Industrial

In the northern-most portion—the Industrial district—the General Plan maintains lower scale development, with building heights and intensities that accommodate some intensification of use, but that act as more of a transition zone between industrial uses to

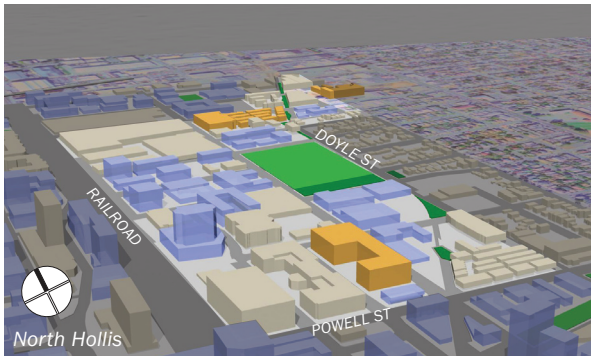
the north in Berkeley, and the finer scale of the Doyle Street neighborhood just to the east.

The General Plan maintains the functionality of this district and allows for a slight increase in intensity of use. However, heights and mix of uses will remain relatively the same—with emphasis on preserving the opportunity for further industrial and employment-oriented development. Industrial building façades will also need to be sensitive to the adjacent pedestrian-oriented environment.

North Hollis

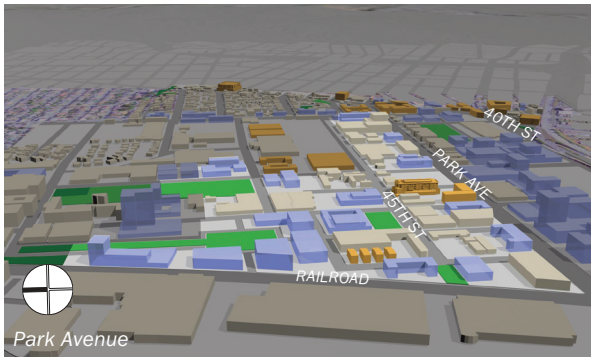
The North Hollis district is one of the most eclectic districts within the City of Emeryville. This district extends north of Powell Street to the northern city boundary. The district is characterized by a mix of new residential and office buildings, and older industrial buildings. The district is also home to several mixed-use and live/work developments, as well as the Emeryville Amtrak Station, located just north of Powell Street.

The General Plan provides a central focus with a community park and new Neighborhood Center. The focus of the design of the public realm will be upon knitting new and existing development into a cohesive, urban, walkable district, with localized activity near the new park and along the northern portion of Hollis Street. Development closer to Powell Street will have more of a focus on employment uses, along with a greater height and intensity—building off of the key transit node at the Amtrak Station.



South Hollis

The South Hollis district has established itself as a key employment center within the city, with minimal residential uses. Several large-scale office and research and development uses (including Novartis and Pixar) have located in the district. These larger properties will coexist with moderate and smaller scale development. This area also includes the Emery Bay Village residential neighborhood and some older industrial and commercial development. Additionally, large-scaled public uses are also located in this district—including Emery Secondary School and the AC Transit yard.



The General Plan maintains the general employment character of the district, and creates a central focus with the location of a new community park and proposed Center of Community Life. Connectivity within the district is also greatly emphasized, with improvements to the pedestrian and open space networks, including water features along Temescal Creek and the Greenway. Most development will maintain the low to mid-rise scale of existing development except for along the rail corridor, where existing and planned office uses includes mid- to high-rise buildings and greater intensities. Surrounding this node, development scale and heights step down to the adjoining Park Avenue, San Pablo Avenue, and Triangle districts.

Park Avenue

In the Park Avenue district, the majority of the district will remain at a smaller scale—true to its existing historic fabric of older industrial and architectural character—with an expanded street grid to extend the smaller block sizes at the Sherwin Williams site along the rail corridor. The General Plan vision for this district includes an extension of the Greenway along Hubbard Street, terminating in a new park, which would also form a focus of new development at the Sherwin Williams site. Smaller pocket parks and a public plaza are located along Park Avenue to create a central focus within this district. A ground floor retail overlay within this district also increases the activity in and around the public plaza, thus providing a foundation for a new neighborhood center and main street. This Plan builds on the Park Avenue Dis-

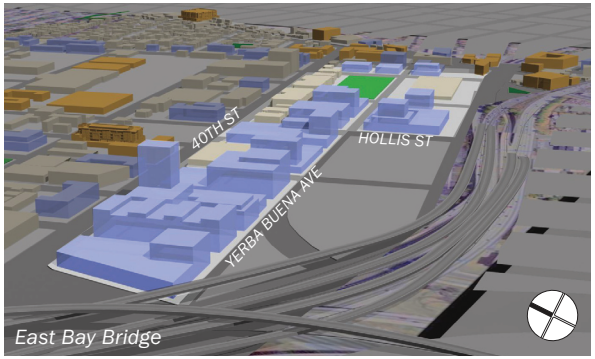
Existing buildings
Approved or recently constructed projects
Hypothetical future projects
Existing or proposed park/open space

trict Plan, adopted in 2006, that provides guidance for design of buildings and public improvements.

East Bay Bridge

The East Bay Bridge center is comprised of multiple regional, large-scale discount and specialty stores, as well as high-density residential development. Although the residential development in the district rises to five stories, the remainder of commercial development has a lower one-story retail profile. Aside from the housing, the entire district is served by extensive surface parking, which is divided by location and use. Thus, circulation through the site and between uses is difficult for both pedestrians and vehicles.

The General Plan structures the district with a gridded street network that lays the foundation for future infill development through reuse of surface parking lots with structured parking in selected locations, or a more comprehensive redevelopment of the site with new multi level retail uses or as part of vertically mixed-use buildings. Additionally, development will also be able to capitalize on transit access—both to the San Pablo Avenue transit center just to the east, as well as the MacArthur BART Station just ¾ of a mile away.



Eastern Residential Neighborhoods

The eastern area of the city is defined by well established residential neighborhoods with a mix of single-family homes and medium- and high-density townhomes and apartments. While improvements to connectivity and public amenities are envisioned in the General Plan, these existing neighborhoods will remain largely unchanged.

Triangle

Occupying the eastern-most edge of the city, the Triangle district has a strong residential core, with existing densities that range from single family homes all the way up to 60-unit/acre multi-family development. Although diverse in housing types and densities, the overall scale of development in the Triangle neighborhood has remained low, with most development rising only two stories or less. Development intensities and heights increase however, at the southern edge of the Triangle, close to Yerba Buena Avenue and the confluence of MacArthur Boulevard, Adeline Street and San Pablo Avenue.

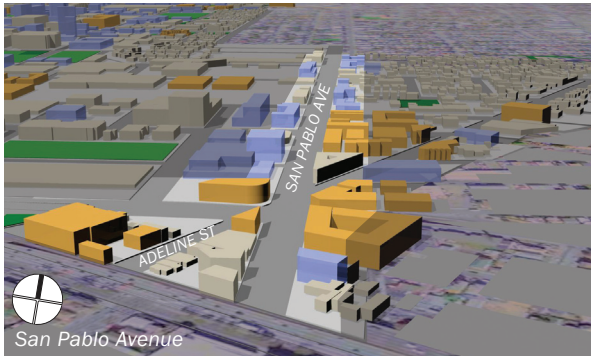
Separated from the rest of the city by San Pablo Avenue, the Triangle district will be enhanced by greater pedestrian connectivity and streetscape improvements, and potentially a new park. While San Pablo Avenue already has improved pedestrian crosswalks, connections across Adeline Street will also be improved.

Existing buildings
Approved or recently constructed projects
Hypothetical future projects
Existing or proposed park/open space

Doyle Street

The Doyle Street district is a well-established residential neighborhood, with a mix of single family, duplexes, and slightly higher-density townhomes. Some of the oldest fabric of the city remains within this neighborhood, with smaller parcel and block sizes, lower heights, and greater vegetation. Like the North Hollis district, access to amenities is limited—very few neighborhood retail opportunities are accessible either in Emeryville or along San Pablo Avenue in Oakland to the east.

The General Plan focuses on protecting the existing scale and character of this neighborhood with lower residential densities and intensities, thus limiting the size and scale of potential new development. However, much of the district will remain unchanged over the Plan horizon.



Doyle Street also plays an important role in the district as it establishes the dividing line between the greater intensities and mix of uses in the North Hollis district and the Doyle Street neighborhood. Emphasis will be upon establishing a strong streetscape theme that reinforces the residential character of the district.

San Pablo Avenue

As one of the most visible district within Emeryville, the San Pablo Avenue District acts as a key gateway and connector within the city. The mixed commercial and residential uses have also served to provide both activity and much-needed neighborhood-oriented retail for surrounding neighborhoods. The existing scale of development along San Pablo Avenue is relatively low—consisting of one and two-story buildings, most of which are at the street edge. However, new development along this stretch of San Pablo has served to enliven the street edge and enhance the district's identity.

Future development under the General Plan will maintain this lower scale within the district, with emphasis on preserving the existing low-scale fabric of adjacent districts. San Pablo Avenue is envisioned as a walkable, mixed-use corridor, supporting a neighborhood center around the intersection of Park Avenue, transit center at 40th Street, and the proposed Emeryville Center of Community Life at the Secondary School site.

Area and Neighborhood Plans

Chapter 1: Introduction describes existing area plans that define development standards and policies for the individual character of neighborhoods. The urban design features of these plans are summarized in this section. The General Plan upholds and builds on the existing plans to guide urban design in the respective districts.

Area and neighborhood plans have guided urban design in several areas of the city, including South Bayfront (top) and Park Avenue (bottom).

North Hollis Area Urban Design Program

The North Hollis Area Urban Design Program, prepared in 2002, focuses on the creation of the corridor as a pedestrian and bicycle-friendly mixed-use district. Streetscape design seeks to facilitate multiple modes of travel and de-emphasizes vehicular traffic. Consistent street elements, through lighting and street tree design are also prioritized. The Program supplies design guidelines for the portion of the greenway in the North Hollis area, describing typical street sections, including setbacks, parking, landscaping, and building interface. In addition, the Program proposes streamlining, or under-grounding of overhead utility lines as a feasible and necessary improvement to the pedestrian environment.

San Pablo Avenue Urban Design Plan

The San Pablo Avenue Urban Design Plan outlines land uses for three phases of "catalyst" projects, establishes goals for public circulation and streetscape improvements, and design guidelines for new development along and near the avenue. The Plan describes standards for new landscaping, paving and lighting, to improve the appearance and experience of traveling and shopping along the corridor. The Plan's design guidelines include: use of materials and architecture consistent with existing brick buildings; entrances aligned with the street grid and close to the sidewalk; "T" intersections terminating in major entries and public spaces; and surface parking in the rear of buildings.

South Bayfront Design Guidelines

The South Bayfront Design Guidelines establish a framework for future development in the areas south of Powell Street between the railroad and I-80. This includes:

- Streets and blocks that create a sense of a downtown neighborhood with pedestrian activity;
- Materials and detailing on buildings and public spaces that create visual interest; and
- Pedestrian and bicycle connections across the railroad tracks.

Many of these guidelines have been implemented since their inception in 1997.

Park Avenue District Plan

The Park Avenue District Plan establishes incentives and development guidelines toward the creation of a vibrant, mixed-use district. District-wide urban design policies seek to preserve architecturally significant buildings, maintain the existing small-lot pattern, and promote walkable and attractive places. More specifically the plan calls for sidewalks punctuated with landscaping and street furniture and unencroached by utilities; signage describing locations of historic structures, routes, and the Greenway; and visually distinct crosswalk treatment to give character to the district and ensure pedestrian safety. Along Park Avenue in particular, the Plan specifies wider sidewalks, corner bulbouts at key intersections, and bicycle racks on every block; it also encourages shared parking and allocated spaces for public parking.

5.3 STREET GRID, CONNECTIONS, AND VIEWS

Street Grid

A city's street grid influences how people move around their city and the accessibility of jobs, services, and other activity centers. Large super-blocks accommodate larger building footprints, but reduce pedestrian and vehicular connectivity. Likewise a disconnected street pattern (e.g. dead end streets) limits options for circulation. On the other hand, a more connected grid of streets and smaller blocks can improve mobility for cars, pedestrians, and alternative transportation modes, since more options are available for travel. This type of fine-grained development pattern is also more visually interesting and secure for pedestrians at the street level.

Evolution

Emeryville has historically had large blocks and limited connectivity. In the early 19th Century, there were no north-south streets at all except for San Pablo Avenue on the east side of town. After the Oakland Trotting Park racetrack closed around 1915, Hollis Street was constructed, connecting the north and south parts of town for the first time. Gradually, additional streets have been built, the street grid has been expanded, and blocks have gotten smaller. In the 1980s, Christie Avenue and Shellmound Street were built in the North Bayfront area. In the 1990s, the East Bay Bridge shopping center was built on the site of an old railroad yard and new streets were added in the south part of town. At the same time, 40th Street was built, Shellmound Street was extended, and a new bridge was constructed across the railroad tracks connecting the Bayfront area with southern Emeryville for the first time. Since 2000, Horton Street and Overland Avenue were extended from 40th Street to 65th Street, creating a north-south alternative to Hollis Street. The Bay Street mixed-use project resulted in additional streets and further expansion of the street grid in the South Bayfront area. In 2008, the Marketplace Redevelopment project was approved which will create additional streets and an expansion of the grid in the North Bayfront area over the next 25 years.

Improvements

Although circulation improvements have been completed, the railroad corridor and the I-80 freeway continue to present challenges for east-west travel. These barriers force circuitous movements for all transportation modes, and make the city difficult to traverse on foot, despite Emeryville's small overall size. With increases in population and employment projected, the General Plan identifies opportunities for enhancement and expansion of the city's street grid by establishing a number of new streets throughout the city. The resulting grid will extend the pedestrian and bicycle networks across a large contiguous area. Areas identified for an expanded street grid include:

- **The North Bayfront District.** A new street through the large block north of 65th Street will connect Christie Avenue with 66th Street. New street segments in the Marketplace Redevelopment project and adjacent areas will serve to break up these long blocks and encourage circulation within, creating extensions of 59th, 62nd, and 63rd Streets in the area. Shellmound Street will be relocated to the west, and Shellmound Way will be relocated to the north, creating smaller, more walkable, blocks.
- **The South Bayfront District.** A southwest extension of Christie Avenue will connect with Shellmound Street, near Temescal Creek, , and new cross streets will be added, making the South Bayfront district more accessible, connected, and walkable.

Historically, Emeryville has had large blocks and limited connectivity, disconnected by large industrial sites, the railroad, and freeway. The General Plan seeks to improve connections for all travel modes by expanding the street grid with new mid-block connections and through-streets.

Activity centers such as neighborhood centers and transit areas have been designated as Pedestrian Priority Zones. These zones represent areas with higher volumes of pedestrian activity, where additional amenities (e.g. streetscape improvements, lighting, traffic calming) are required.

All streets should have active frontages. On streets within commercial areas, such as the Public Market, Bay Street, and San Pablo Avenue, streets should be activated through window and building articulation, parking in the rear, and designs that create safe interesting spaces for pedestrians.

- **The Park Avenue District.** Designed in tandem with the proposed Greenway and development of the Sherwin Williams site, extension of Hubbard Street, and an additional east-west street segment will extend the Park Avenue District's grid north of Sherwin Avenue.
- **East Bay Bridge.** Extensions of Yerba Buena Avenue and Harlan Street will break up the East Bay Bridge Center's large blocks as part of the redevelopment of these surface parking lots into higher density mixed-use districts with structured parking.

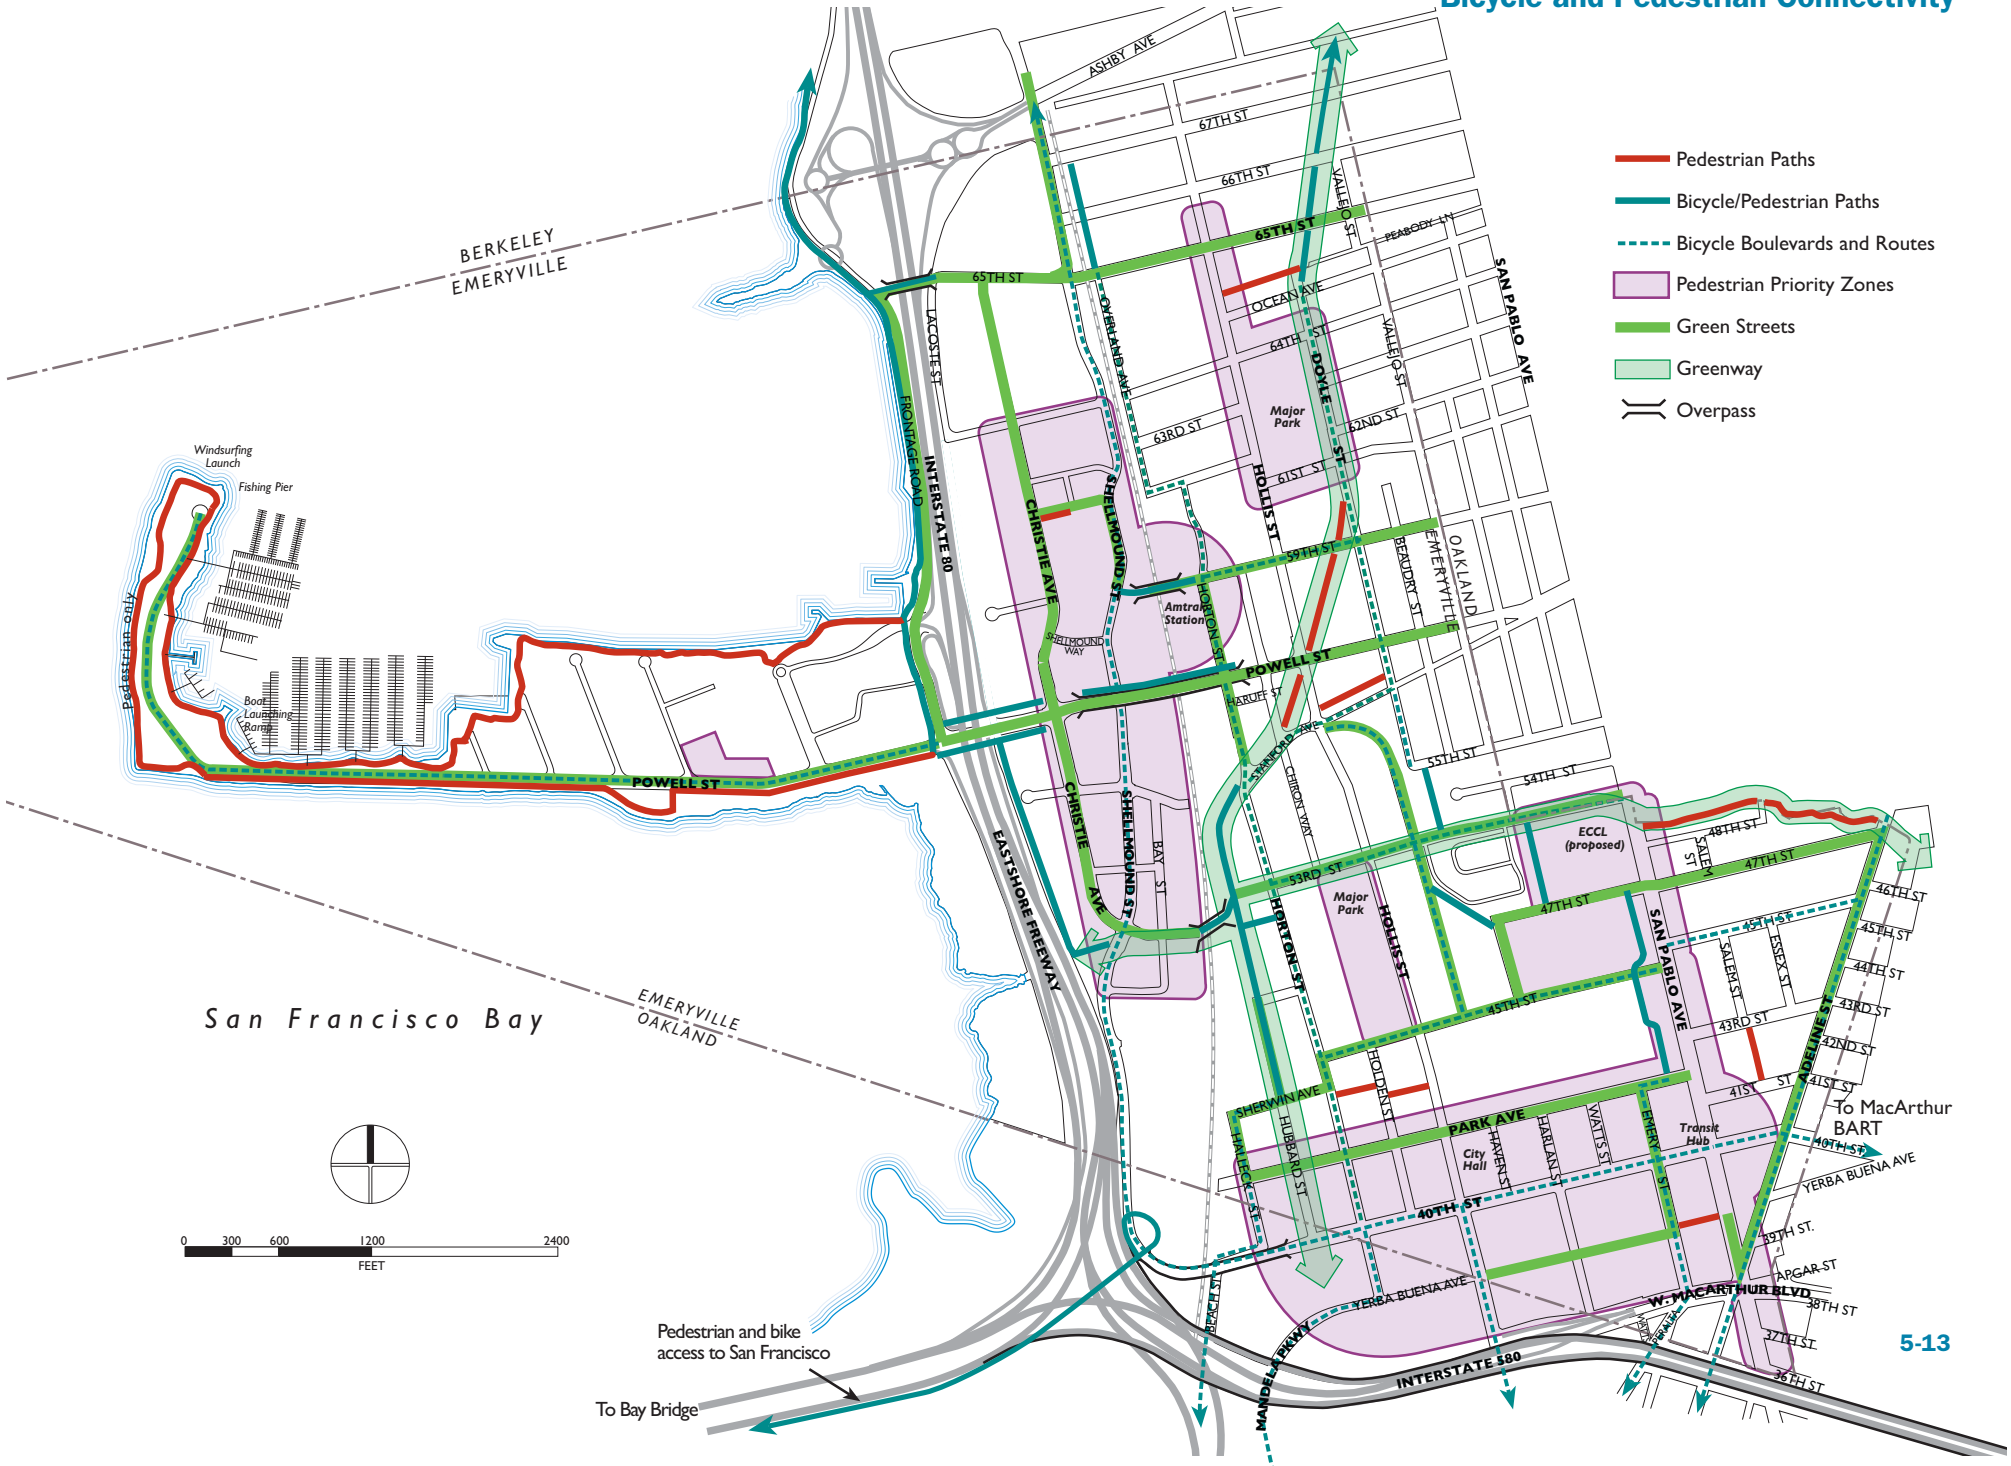
As discussed in Chapter 3, Transportation, Emeryville's street system consists of several different street types: transit streets, connector streets, local streets, and bike boulevards. The new proposed streets fall into all of these categories, as illustrated in Figure 3-6 (Chapter 3: Transportation), and will include accommodation and amenities for vehicular, pedestrian, and bicycle access, according to the typologies defined in the Transportation element.

While the Plan proposes several new streets and extensions to the street grid, additional internal street connections should be encouraged for individual development projects—not only to enhance citywide circulation, but also to provide and encourage walkable and accessible internal circulation.

Connections

The General Plan fosters new pedestrian and bicycle connections between the western and eastern parts of the city; better connections to the Peninsula; and new and safe pedestrian and bicycle linkages to the waterfront and across Powell Street. These connections capitalize on new streets and planned streetscape improvements, and include non-vehicular routes and bridges, as shown in Figure 5-3. Mid-block connections and pedestrian and bike paths provide additional travel routes for pedestrians and cyclists. For a complete description of the General Plan circulation system, including pedestrian, bicycle, transit, and vehicular circulation, see Chapter 3: Transportation (Section 3.2: Circulation System). Green streets are discussed in Chapter 4: Parks, Open Space, Public Facilities, and Services. Other transportation elements that relate to urban design—Pedestrian Priority Zones, and policies for active street frontages, bridges and crossings—are described in this section.

Pedestrian Priority Zones



Although the entire city should be amenable and safe for pedestrians, the Pedestrian Priority Zones highlight areas where pedestrian safety and movement is the top priority. These areas include busy activity centers, such as transit stations, neighborhood centers, schools, and City Hall, as shown in Figure 5-3. In these locations, specific measures, such as streetscape improvements and traffic calming, would be required.

Active Street Frontages

General Plan policies seek to activate street frontages, creating vibrant pedestrian-friendly streetscapes. Active frontage could include retail shops, offices, restaurants, flex spaces or residential units with front stoops so the building façade is not a blank wall or otherwise unwelcoming to passerbys. In the Powell/Christie core area, several regional retail centers, including the Powell Street Plaza, Bay Street, and IKEA, receive a high volume of visitor traffic seeking to park and then walk in the district. It is essential to provide convenient circulation, pedestrian safety measures, and an interesting and inviting streetscape. Surface or structured parking facilities should be located in the rear or should have active uses on the ground floor. (For parking design policies, see Section 5.5.)

FIGURE 5-3

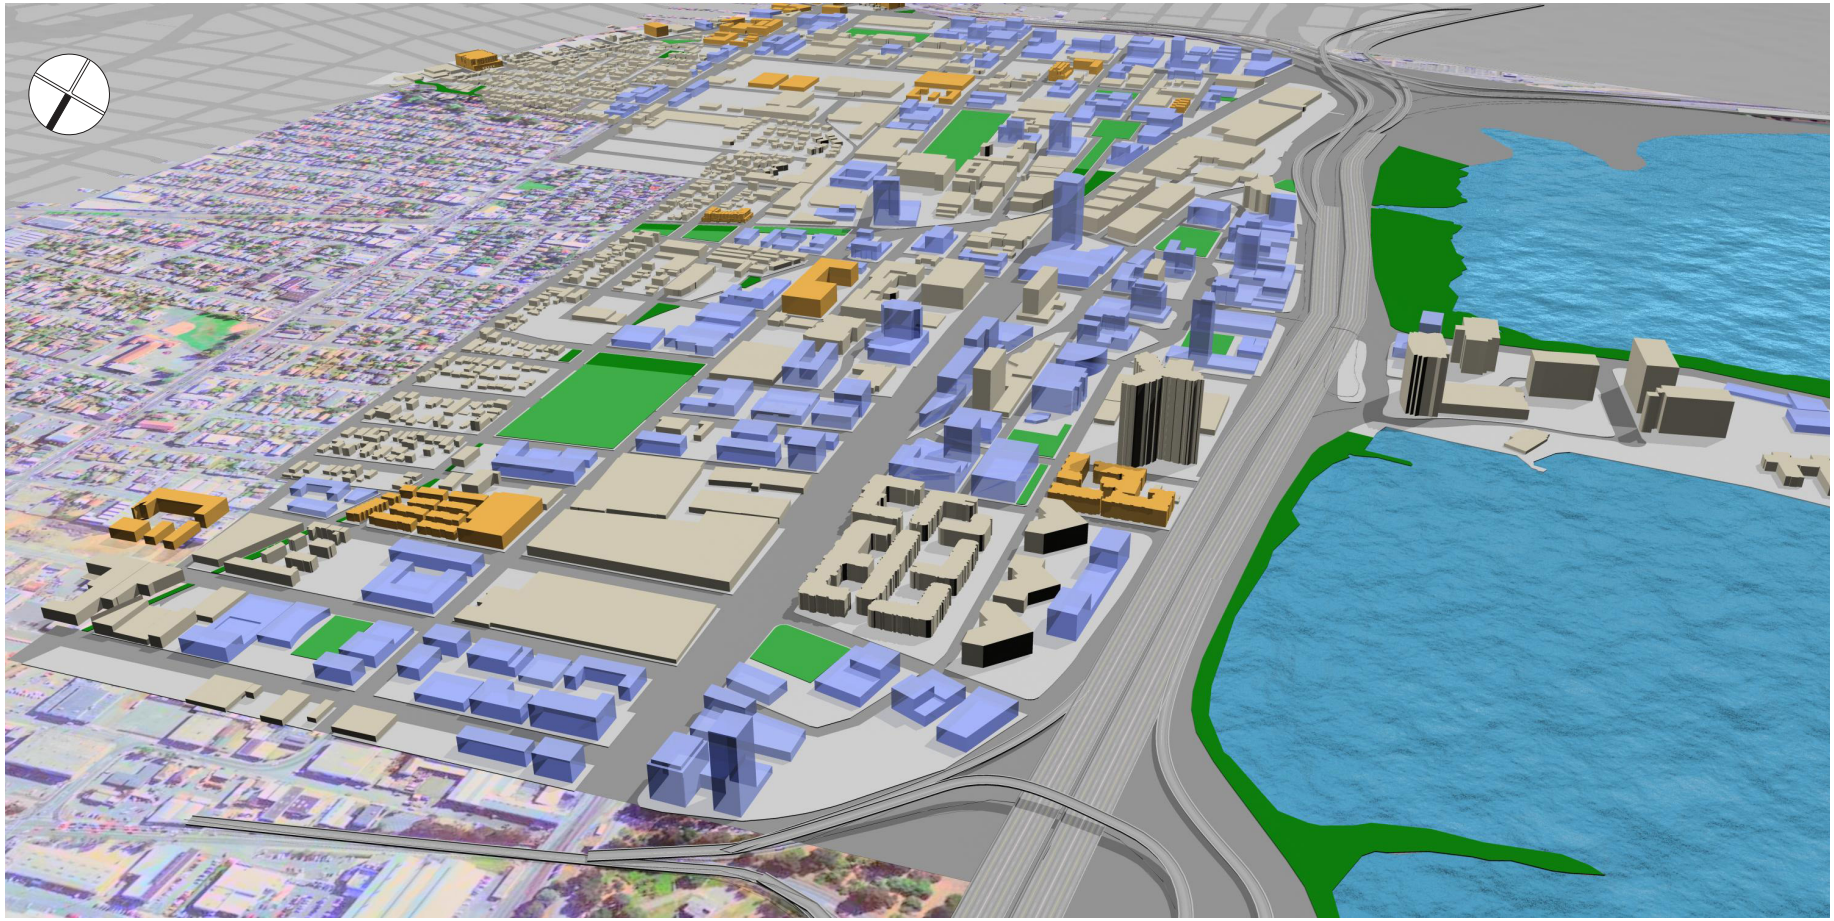
Bicycle and Pedestrian Connectivity

Bridges and undercrossings (top, middle) eliminate conflict points such as at-grade crossings (bottom) but must be made safe for pedestrians through good design, lighting and other safety measures.

Views: East Bay Hills from Marina (top), Powell Street (middle), and waterfront views from Bay Street (bottom).

Bridges and Crossings

Bridges and undercrossings are also important urban design features. Bridges are highly visible and symbolic of the city's investment in connectivity. Undercrossings need to be carefully designed to be inviting and safe. The network includes three existing railroad overpasses (at 40th, 59th and Powell Streets); one approved pedestrian/bicycle railroad overpass (at Temescal Creek); one proposed across Powell Street just east of the freeway; and another proposed across the freeway at 65th Street. Some of these overpasses are intended to accommodate pedestrians and bicycles only, and include either ramps or elevators for disabled and bicycle access. Appropriate lighting and signage, as well as visibility from the street and established bicycle and pedestrian routes will maintain these connections as convenient, safe, and direct links within the bicycle and pedestrian network.



Views

Lastly, overall connectivity is enhanced by views of the San Francisco Bay and the East Bay Hills. These views visually knit the city with its context, and are an important part of how Emeryville is integrated within its surroundings. Additionally, distant views and a sense of expansiveness are important to balance the high development intensities planned for the city, even if the bay cannot be seen by a pedestrian at the ground level.

While new development will inevitably block some views, significant vistas of the Bay and East Bay Hills will remain unobstructed. These views and the overall composition of urban form are shown in Figure 5-4.

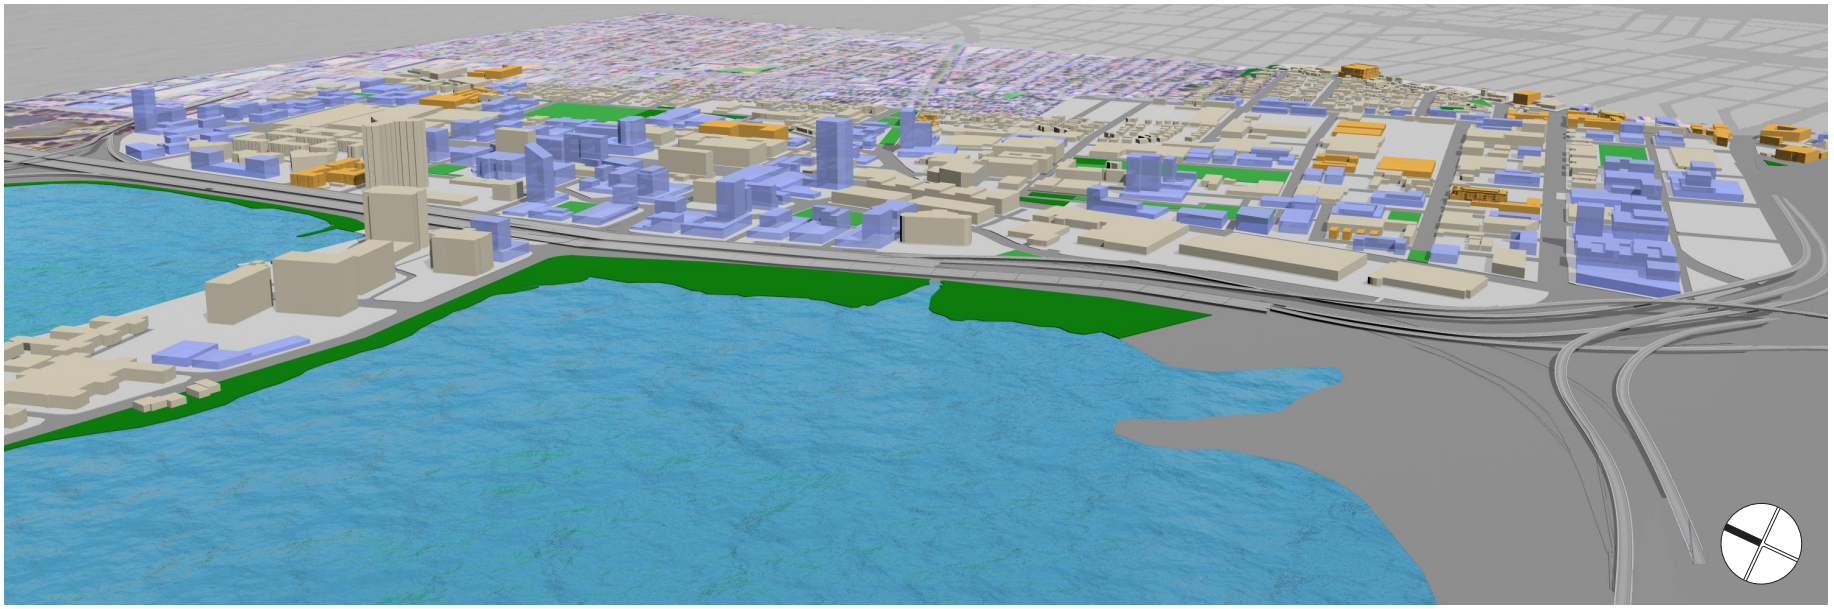


FIGURE 5-4

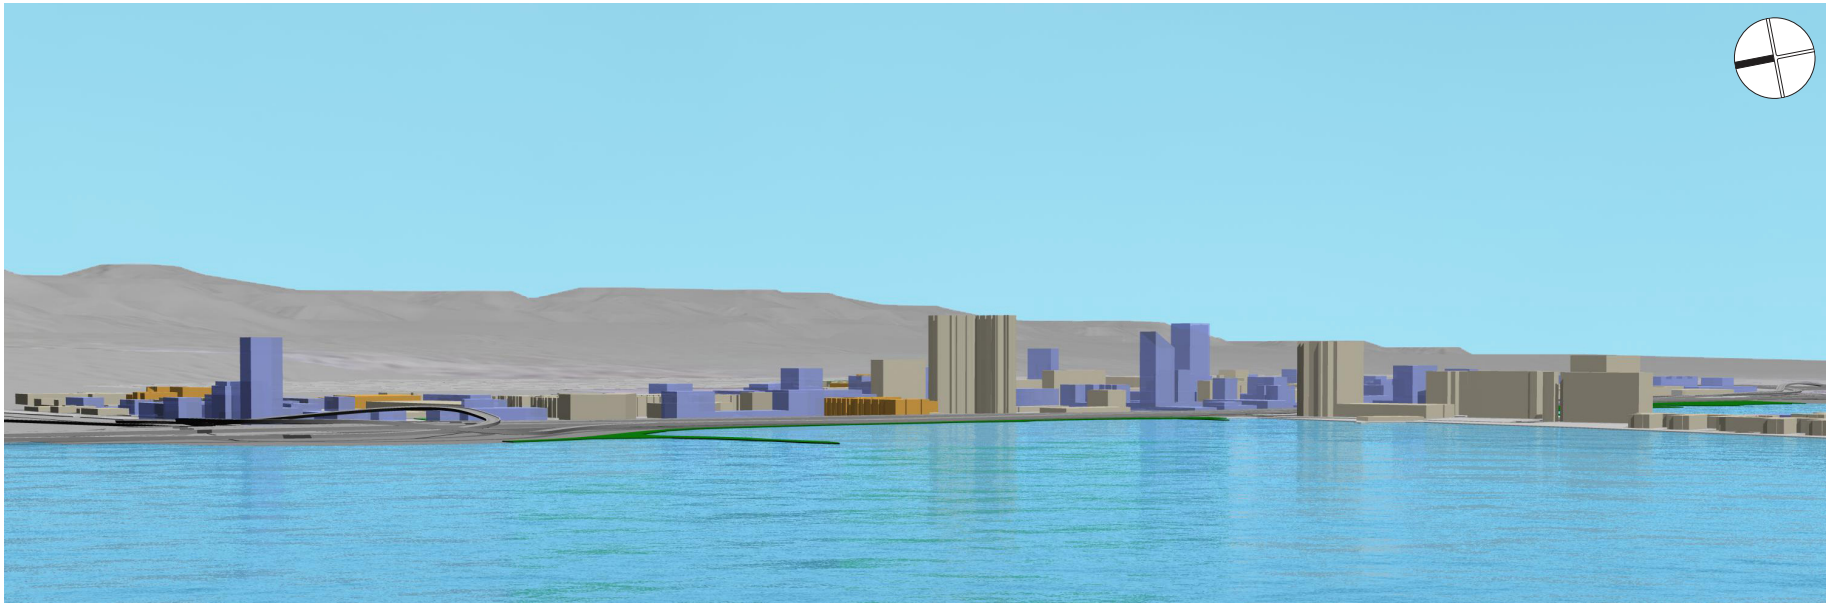

Urban Form Perspectives

These three-dimensional images illustrate the expanded street grid, views, and hypothetical buildout under General Plan land use and urban design policies.

5.4 SKYLINE AND BUILDING BULK

Skyline

Visible from I-80, the San Francisco Bay, Bay Bridge, and the Oakland and Berkeley Hills, the Emeryville skyline acts as a gateway to the East Bay as well as a primary identity for the city from afar. While Emeryville's taller buildings are visually prominent landmarks along the East Bay waterfront, their lack of continuity and centrality create a somewhat undefined quality to the urban skyline. This loose concentration of building heights and volumes has continued as new taller development has maintained a medium-height and decentralized character. This dispersed quality of the Emeryville skyline is exacerbated by poor contextual relationships between high-rises and surrounding development and the physical barriers of I-80 and the rail corridor.

The General Plan encourages the creation of a more cohesive skyline for Emeryville by focusing higher-intensity development within a central core. Building intensity and heights are greatest in this area, just to the north and south of Powell Street in the Bayfront district and at the eastern edge of the Peninsula. These

View of Emeryville (foreground) and San Francisco (background) from the Berkeley Hills.

Taller slender buildings can allow opportunities for public spaces, mid-block connections, and more sunlight (top, San Francisco). Buildings with larger footprints may prevent them (middle). Buildings should step back on upper floors to create public or private open spaces and allow light onto the sidewalk (bottom).

areas build off of the existing Emeryville skyline, providing the opportunity for a more contiguous high-rise zone in the city. Outside of this zone, building heights taper to provide a gradual transition to lower-scale development in the remainder of the city.

Building Bulk

Building bulk and the grain of development will vary across the city—ranging from large, full-block projects to finer-grain development with many different buildings on a single block—reflecting the location, intensity, and land use mixes accommodated.

Bulk and Massing Controls

Bulk controls address massing of specific projects to minimize the visual dominance of buildings, and maximize sky exposure from streets. Detailed guidelines and standards for bulk and massing control are established in the Urban Design Guidelines and Zoning Ordinance. They address the relationship between building width and depth by specifying the maximum floorplates at various heights, correlated with floor area ratios (FARs), street width, and site area. Additionally, the General Plan follows the principle of "stepping down" to lower-scale development in the city, as well as stepping back at upper floors from the street edge in order to transition between various heights and densities.

Floor Area Ratios

Building bulk and massing are also controlled by floor area ratios (FAR). Figure 2-3 shows maximum FARs permitted in each area. The FAR values depicted in the map include all aboveground built space, both residential and nonresidential. Underground storage space is excluded from the FAR allowance (defined more precisely in the Zoning Ordinance). In this way, developers will be encouraged to maximize habitable space aboveground, resulting in buildings that are visually less bulky and more pedestrian-friendly.

Tower Spacing

To ensure generous light and views, upper floors will be stepped back, and towers will be slender and spaced apart.

Fine-Grain Development

Fine-grain development that engages the pedestrian—especially in retail districts and neighborhood centers—is essential in a high-intensity urban setting. Fine-grain development refers to small blocks, lots, and building footprints, allowing for pedestrian comfort, more opportunities for public spaces, and mid-block pedestrian routes. This smaller scale of development provides greater visual interest at the street level, and contributes to a diverse scale and character. Fine-grain development will occur in several parts of the city, including the neighborhood centers, along portions of Hollis street to the north and south, and the San Pablo Avenue districts. The Park Avenue district, as a whole, will also be primarily fine-grain to reflect and retain the historic patterns of the area.

5.5 STREETSCAPES AND BUILDING-TO-STREET INTERFACE

Streetscapes

Multi-Functionality

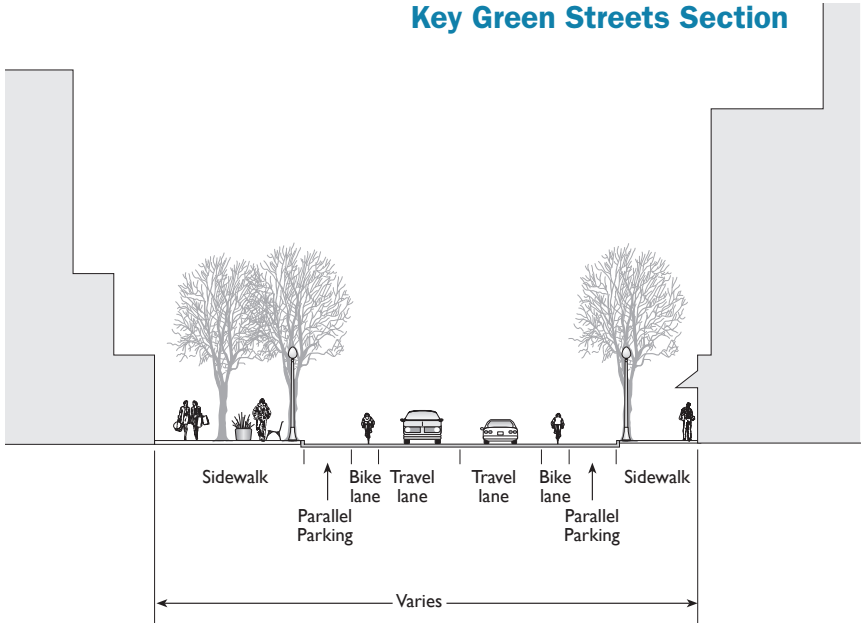
Streets are central to an area's identity, movement, and pedestrian experience. Regardless of the method of transportation used, visitors, residents and workers must travel on streets. The way these are treated physically has an impact on the perception of the area as a whole. Street design can incorporate a wide variety of elements, ranging from benches to paving to tree grates, or even signage. Many of these detailed elements can be grouped into larger categories such as pavement and sidewalk width, landscaping, stormwater management, parking, medians and sidewalk amenities. An effective street design includes enclosure and street wall, continuity, character, relationship between pedestrians and traffic, shade and light.

Many of Emeryville's streets already contain the basic elements of good design, and improvements such as those along Park Avenue, and San Pablo Avenue are providing a higher standard for clear, attractive streetscapes. As new development occurs throughout the city, there are several challenges and opportunities for street design:

- **Design for pedestrians.** Currently, walking in Emeryville can be a challenge—while there are areas within the city that are specifically designed for pedestrian movement, such as the Bay Street area, they are often surrounded by vehicle-oriented streets and development. Emeryville is envisioned to greatly increase its population and non-residential development in the next 20 years, with an increase in the number of visitors and employees in the city on a daily basis. The regional retail districts and the neighborhood centers will need wider sidewalks, well-defined crosswalks, and street design and traffic signalization that gives priority to pedestrians.
- **Unified planting palette to knit districts together.** Distinctive streetscapes with unified tree planting and landscaping promote continuity, distinction, and identity. This is especially critical for major streets that traverse the city. Currently, San Pablo Avenue acts as a key gateway and identifier for the City, with its distinct planting and streetscape design. Other key streets in the city would benefit from this—in particular, Hollis Street and 40th/Shellmound Streets; as well as those streets identified as Green Streets. In addition, landscaping will help to fulfill stormwater management goals. Implementing Bay-Friendly Landscaping practices, including planting native and drought-tolerant plants can help to manage stormwater runoff in wet months, while conserving water in dry months.
- **Multi-functionality.** With the increase in population and related traffic, many streets will need to be designed to do more than just handle traffic flow. They must provide for increased on-street parking in the residential areas and neighborhood centers, ensure smooth transit flow, allow safe and convenient pedestrian routes and small public plazas, and accommodate bicycle facilities on selected streets (see Chapter 3: Transportation). Moreover, streets should be accessible to all users, including children, seniors, persons with disabilities, workers and residents.

As streetscape improvements are implemented, Emeryville's street network will become a realm for public activity with improved sidewalk treatments, seating, distinctive lighting, and public art, as well

Streets should be designed for multiple uses and types of users, by providing pedestrian facilities, such as unobstructed sidewalks, street lamps and benches; bicycle lanes and facilities; and vehicular parking.

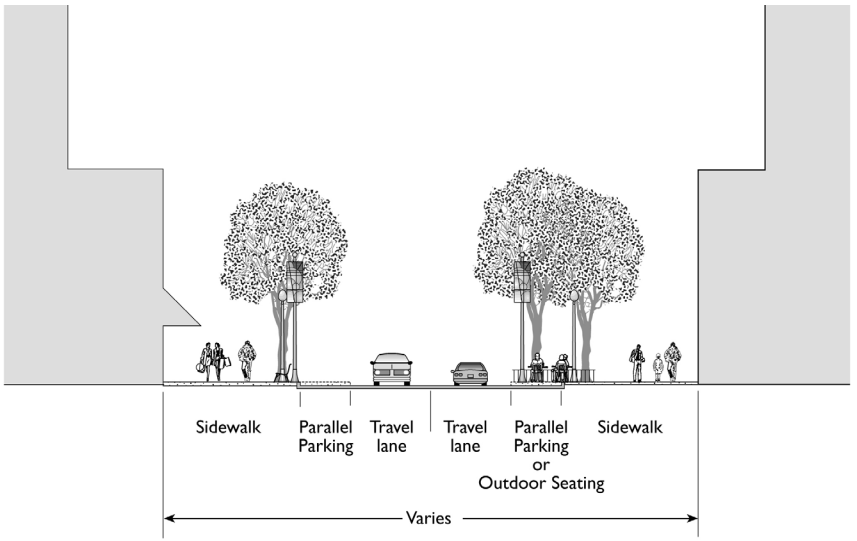


as bicycle facilities in appropriate locations. Coupled with concentrated street-front activity within neighborhood centers and retail areas, the improved street network will foster pedestrian activity and social gathering.

Green Streets and Neighborhood Center Streets

Two specific street types within the city will play a key role in establishing this network: Green Streets (described in Chapter 4) and streets in neighborhood centers. Conceptual sections of these Green Streets and neighborhood center streets are presented in figures 5-5 and 5-6, respectively. As the primary connections between major open space, activity centers, and amenities within the city, Green Streets may contain additional landscaping, such as a double row of trees (where space allows), stormwater treatment measures, and adequate bike lanes. Streets within neighborhood centers are characterized by wider sidewalks, additional pedestrian amenities such as street furniture and wayfinding signs, curb bulb-outs at key intersections, and a consistent street tree theme.

FIGURE 5-5



Key Green Streets Section

- Widened sidewalk with enhanced landscaping
- Two parallel parking lanes, if possible, otherwise one parking lane
- Bicycle facilities, where shown on Figure 3-6: Bicycle System
- Stormwater treatment and Bay-friendly landscaping measures

FIGURE 5-6

Neighborhood Centers Section

- Two travel lanes
- Two parallel parking lanes
- Possible outdoor seating
- Widened sidewalks

Greenways

As described in Chapter 4: Parks, Open Spaces, Public Facilities and Services, there are two greenways envisioned: one is under development, the other is proposed. These create linear open spaces, with amenities such as pedestrian and bicycle paths, small gathering places, and recreational facilities. New development constructed along the greenways should incorporate public open spaces and orient entrances onto the greenway. As shown in Figure 5-1, the north-south greenway follows old railroad spurs, connecting Berkeley in the north to the Park Avenue District, Bay Trail, and West Oakland in the south. The east-west greenway will follow the Temescal Creek alignment along 53rd Street, allowing opportunities to celebrate the creek by pumping some water to the surface while maintaining the culverted flood central system. The proposed Emeryville Center of Community Life is expected to be sited at Emery Secondary School, intersecting the greenway on 53rd Street.

Utilities Placement

Utility boxes and utility wires are an essential part of the city's infrastructure, but overhead wires also create potential hazards and obstruct views. Utility lines and poles can be dangerous during earthquakes and utility boxes and other infrastructure can disrupt movement on sidewalks. The city is already pursuing a policy to underground utilities, thereby eliminating potential hazards and creating more open views and attractive streetscapes. All new and existing on-site electrical and communication lines, including overhead utility wires, must be placed underground when new development is being constructed. Figure 5-7 shows the progress toward undergrounding utilities, as of 2008. The city's major corridors, including San Pablo Avenue, 40th Street, Park Street, Christie Avenue, Shellmound Street, and Doyle Street have ongoing or completed undergrounding projects.

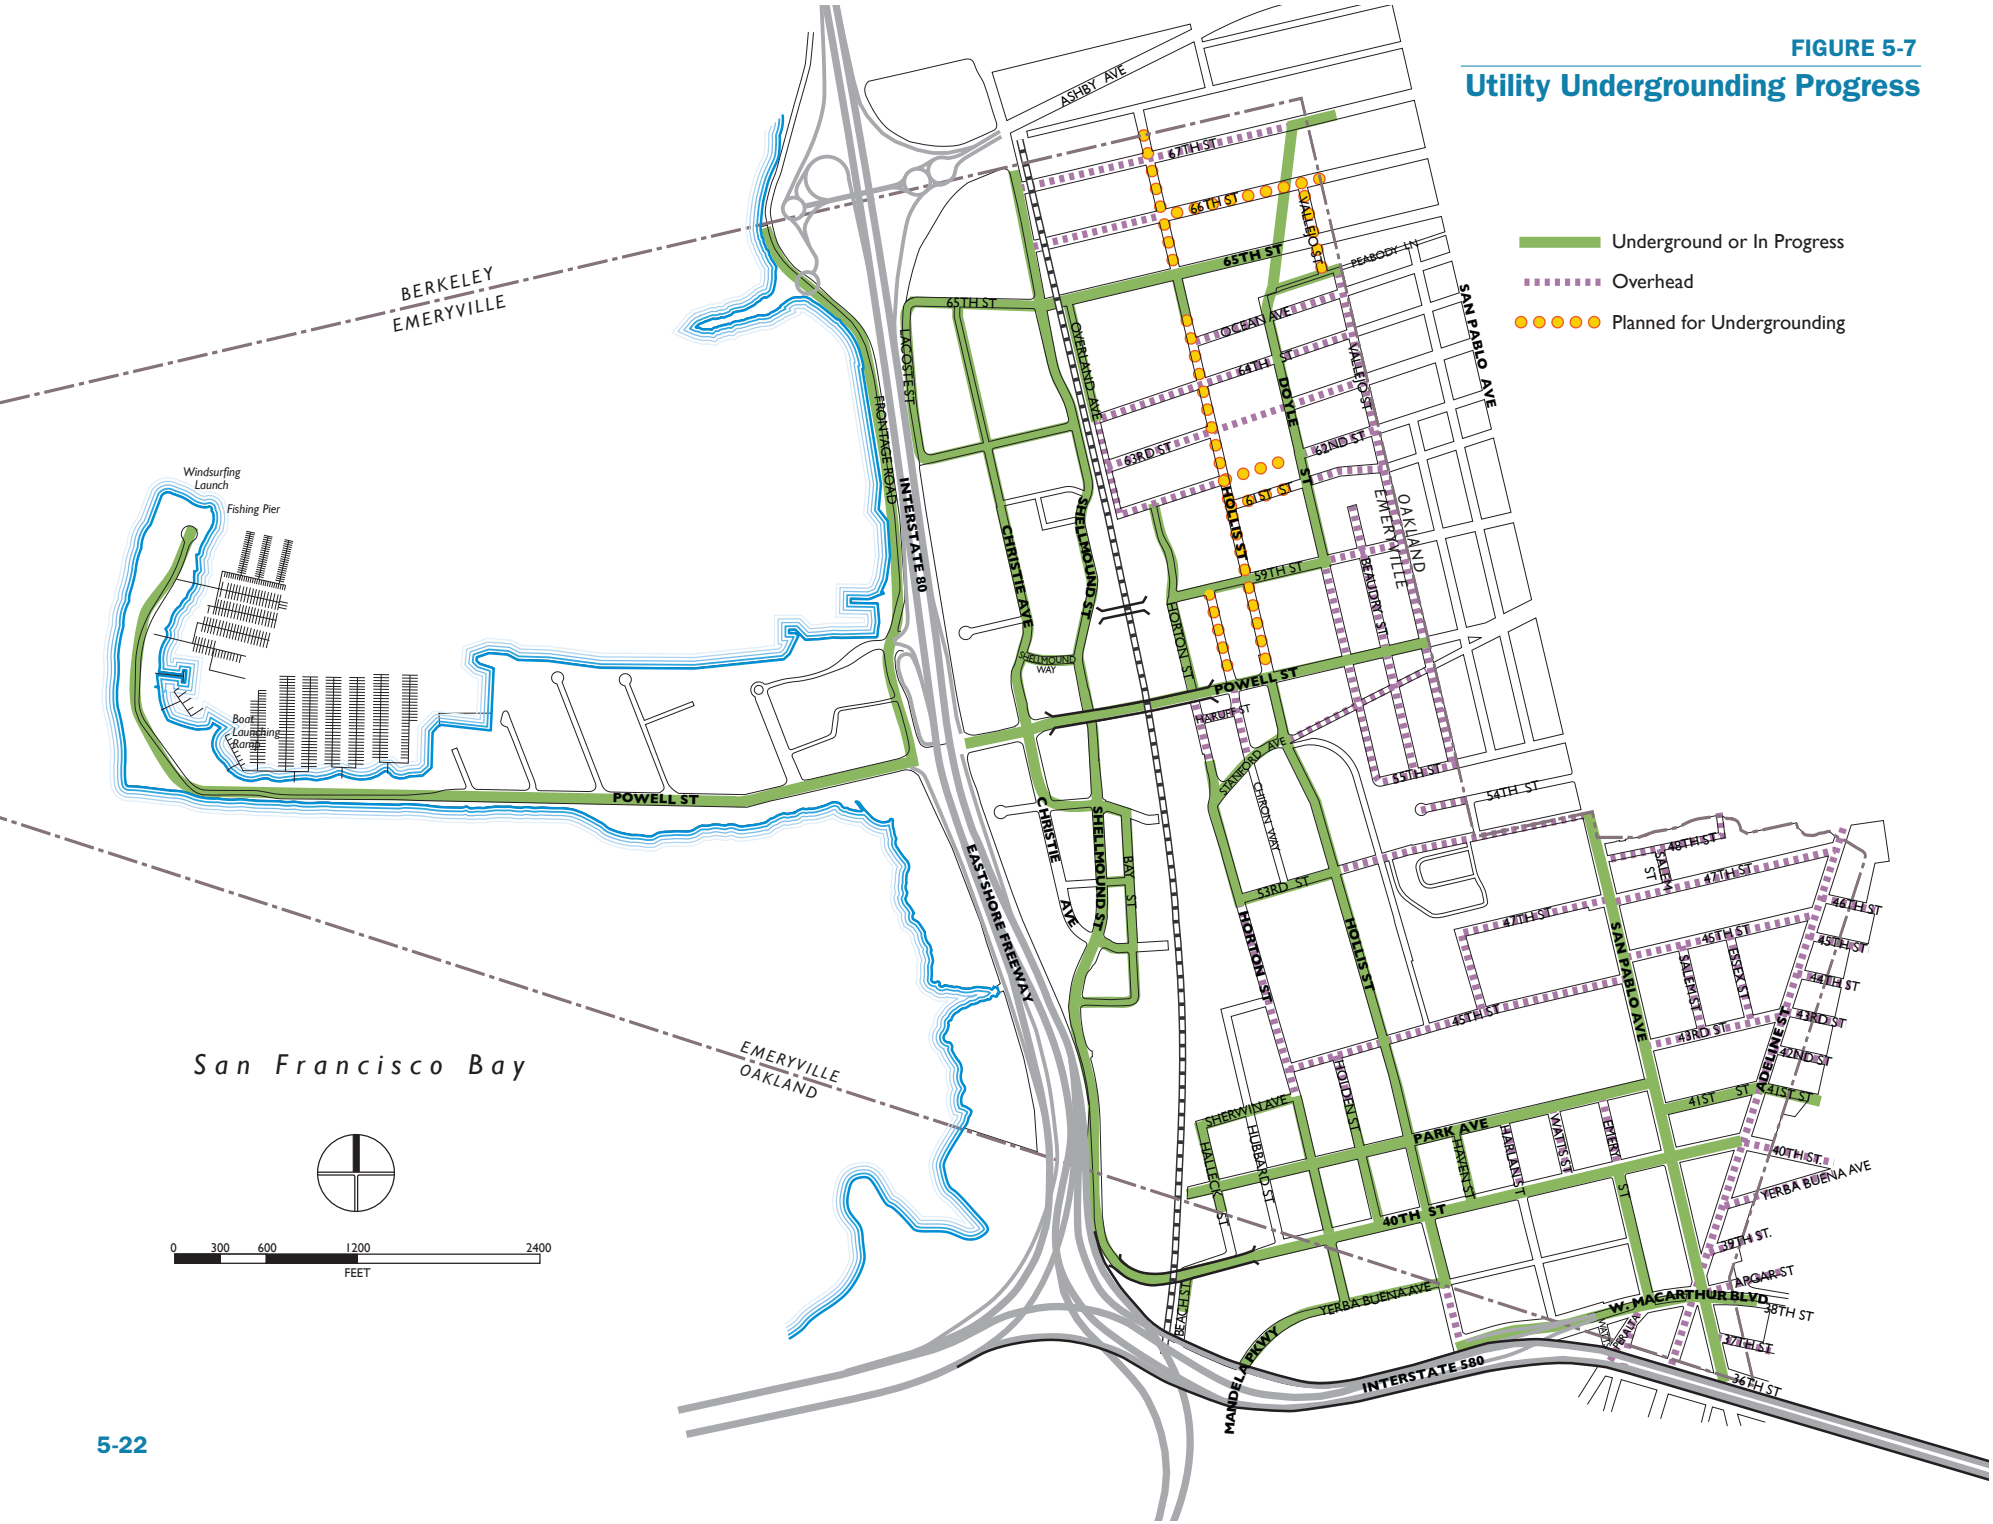
Overall Streetscape Framework

In addition to these specific streetscape typologies, the General Plan outlines the overall vision and framework for Emeryville's streetscape design. Currently, specific design of individual streets occurs through implementation documents like the city's Urban Design Guidelines, as well as detailed plans for specific areas like the Park Avenue District Plan and North Hollis Area Urban Design Program. Development of a citywide streetscape plan would consolidate overarching goals, treatments based on street typologies (see Chapter 3: Transportation, Section 3.2), and design features appropriate for Emeryville. Specific improvements that might be considered include:

- Using a consistent species of trees and planting to define corridors;
- Managing stormwater and improving ecology;
- Widening sidewalks and reducing street pavement area;
- Introducing public art sequences and signage;
- Using resource-efficient materials and lighting;
- Creating a psychological distance between pedestrians and traffic with trees, planters, lights, and sidewalk furniture;
- Adding seating and other pedestrian-oriented furnishings;
- Improving intersections with corner bulb-outs;
- Establishing a consistent street signage or public signage aesthetic;
- Providing places with shade; and
- Placing utilities underground.

Photo simulations at the end of this section illustrate many of these concepts.

Greenways will extend along existing streets, such as Doyle Street as well as the former railroad right-of-way, creating off-street pathways for pedestrians and bicycles and passive spaces for relaxation.



Replacing overhead wires that disrupt views and cause potential hazards (top) with underground facilities allows for safer and more attractive streetscapes (bottom).

FIGURE 5-7

Utility Undergrounding Progress

Streetscapes in Eastern Residential Neighborhoods

Streets in the existing Eastern Residential Neighborhoods have their own character and needs. Front stoops and porches, parking located in the rear, and small front yards all help to create a neighborhood where parents can watch children play and neighbors can interact. In the Triangle neighborhood, enhanced landscaping along the district's internal street network, as well as traffic calming measures, will further enhance the residential and pedestrian character of the neighborhood. In the Doyle Street district, sidewalk and landscape improvements—especially in reinforcing the existing tree canopy—will provide a transition in physical scale, as well as visual mitigation of development scale to the west. Along San Pablo Avenue, a continuous street façade will be established along the length of the district to encourage walkability and reinforce the prevailing character of small shops and services that already exist in the district.

Parking

Parking is a key issue in streetscape and building design. While this section focuses on parking as it relates to urban design, Chapter 3: Transportation (Section 3.7) describes parking policies related to demand and supply. The design and location of parking directly affects the quality and character of the street and pedestrian environment. Commercial development in the Bayfront, Peninsula, and East Bay Bridge districts is characterized by large surface parking lots—ranging from two to seven acres. These lots create a vast expanse of parking, punctuated with intermittent, isolated, and vehicle-oriented developments. A pedestrian-friendly environment is absent both from the street and internal parking lot circulation.

The General Plan presents policies to improve the design quality and pedestrian experience of parking, through use of materials and active ground-floor frontages. In addition, redevelopment of surface parking lots into mixed-use development with integrated structured parking (below- or above-grade), is part of the infill development strategy of the General Plan. For above-grade structures, the interaction of the parking structure with the street is a key element of design. To maintain a consistent and active urban environment, commercial or residential uses should wrap the parking. The City's Design Guidelines detail appropriate guidelines for parking design.

Building-to-Street Interface

In addition to streetscape design, street life and comfort are crucial for a successful public realm. This cultivation of the public realm can be accomplished not only through streetscape improvements, but also through the interplay between the built environment and the street. Methods to foster greater street friendliness include provision of an intimate and interactive building scale through horizontal and vertical articulation; height stepbacks to diminish overshadowing of the public realm; greater number of entrances and building transparency; and habitable and active space at the ground level.

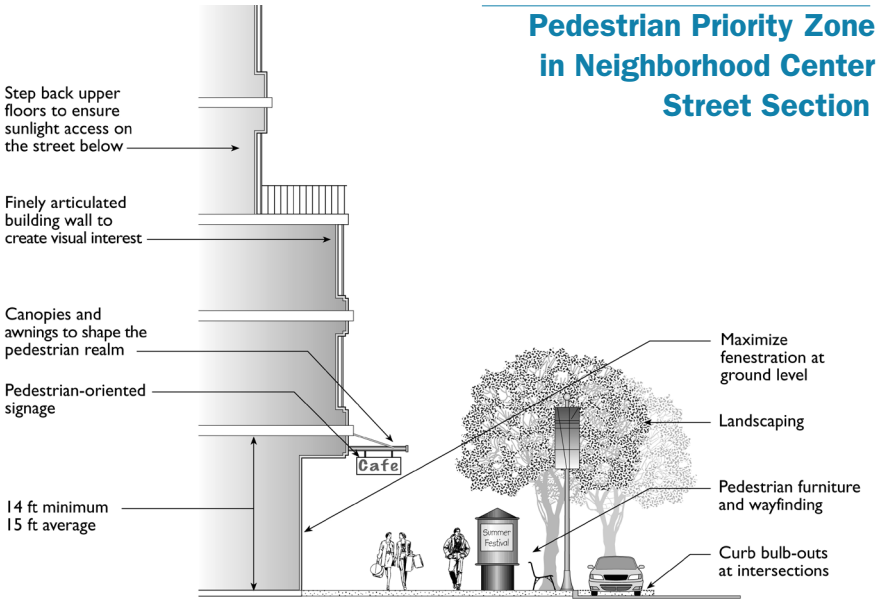
Building Articulation

The General Plan promotes an intimate scale of development along city streets through horizontal and vertical articulation. This includes varied building heights within districts or building clusters, recesses and projections, window articulation and treatments, and roof forms that contribute to overall texture and character. Horizontal building articulation is especially emphasized to provide richness and variety at eye level, particularly for large floorplate structures

Buildings with articulation, that are stepped on the upper floors, and that have interesting design features create a more pleasant and engaging experience for pedestrians. Open parking structures (top) are unattractive and should be avoided.

FIGURE 5-8

Pedestrian Priority Zone in Neighborhood Center Street Section



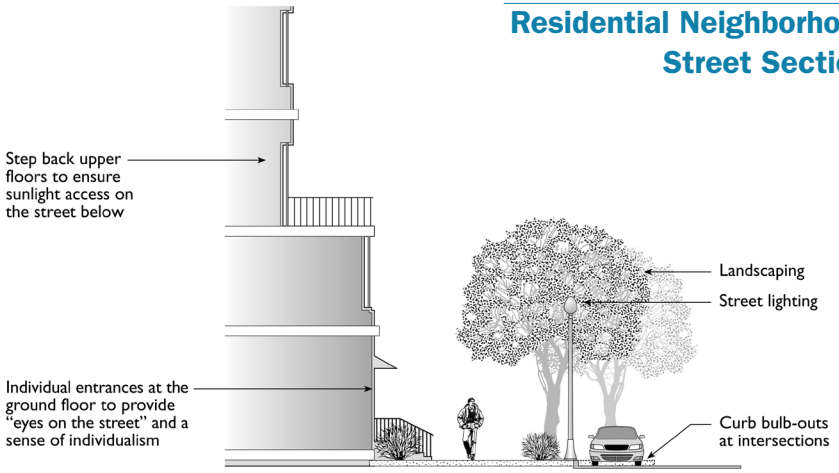


FIGURE 5-9

Residential Neighborhood Street Section

that are characteristic of the light industrial, research and development, and mixed-use commercial development throughout Emeryville. In addition, height stepbacks are also employed along streets because taller buildings at the street edge may overpower and cast shadow onto the public realm.

Building Design Elements at the Sidewalk

Often marked by canopies and awnings that can also serve to break up a building's mass, street-level entrances and windows dramatically contribute to pedestrian scale, visibility, and security. Windows and entries provide both physical and visual relief, as pedestrians are allowed to interact with interior building activities. An engaging, transparent building can help to physically and psychologically pull the pedestrian in from the street edge. Security and visibility are also enhanced along the street as buildings and their interior activities are directed toward the street edge.

All streets should have active frontages, but particularly streets in neighborhood centers and higher-intensity areas, where the quality and character of the pedestrian realm is paramount. General Plan policies reflect a high standard for building articulation, use of fenestration and entries to activate the public realm, and sidewalk/streetscape treatments (see Figure 5-8). Additionally, as the city becomes more intense, conscious strategies to provide living units at the ground level will provide "eyes on the street" for enhanced security, as well as greater visual interest for pedestrians. Ground floor residential requires careful horizontal and vertical layering to mitigate the public to private transition. Units at the lower level with individual entrances will provide a sense of individualism and identity for otherwise large residential developments, and will expand housing options and types particularly in higher-intensity areas throughout the city (see Figure 5-9).

5.6 NEIGHBORHOOD CENTERS

The General Plan establishes concentrations of activity to serve as a focus for retail, community services, and other amenities. These neighborhood centers and the pedestrian streets and open spaces that connect them are identified in Figure 5-10. They are also designated in the General Plan Land Use map by a Neighborhood Retail Overlay district. Neighborhood centers should have an identifiable palette of streetscape amenities and an active street frontage.

Streetscape improvements will be essential to activate these centers, and to foster pedestrian comfort and emphasize neighborhood character. The system of neighborhood centers will be linked by landscaped Green Streets and Greenways. Neighborhood centers will be active at the street level, lined with buildings that engage the pedestrian, with surface parking located in the rear of the building, as shown in Figure 5-11. They are practical destinations for errand running, nodes for local public functions, and gathering areas. Strategic height limitations and building massing requirements will maximize sun exposure.

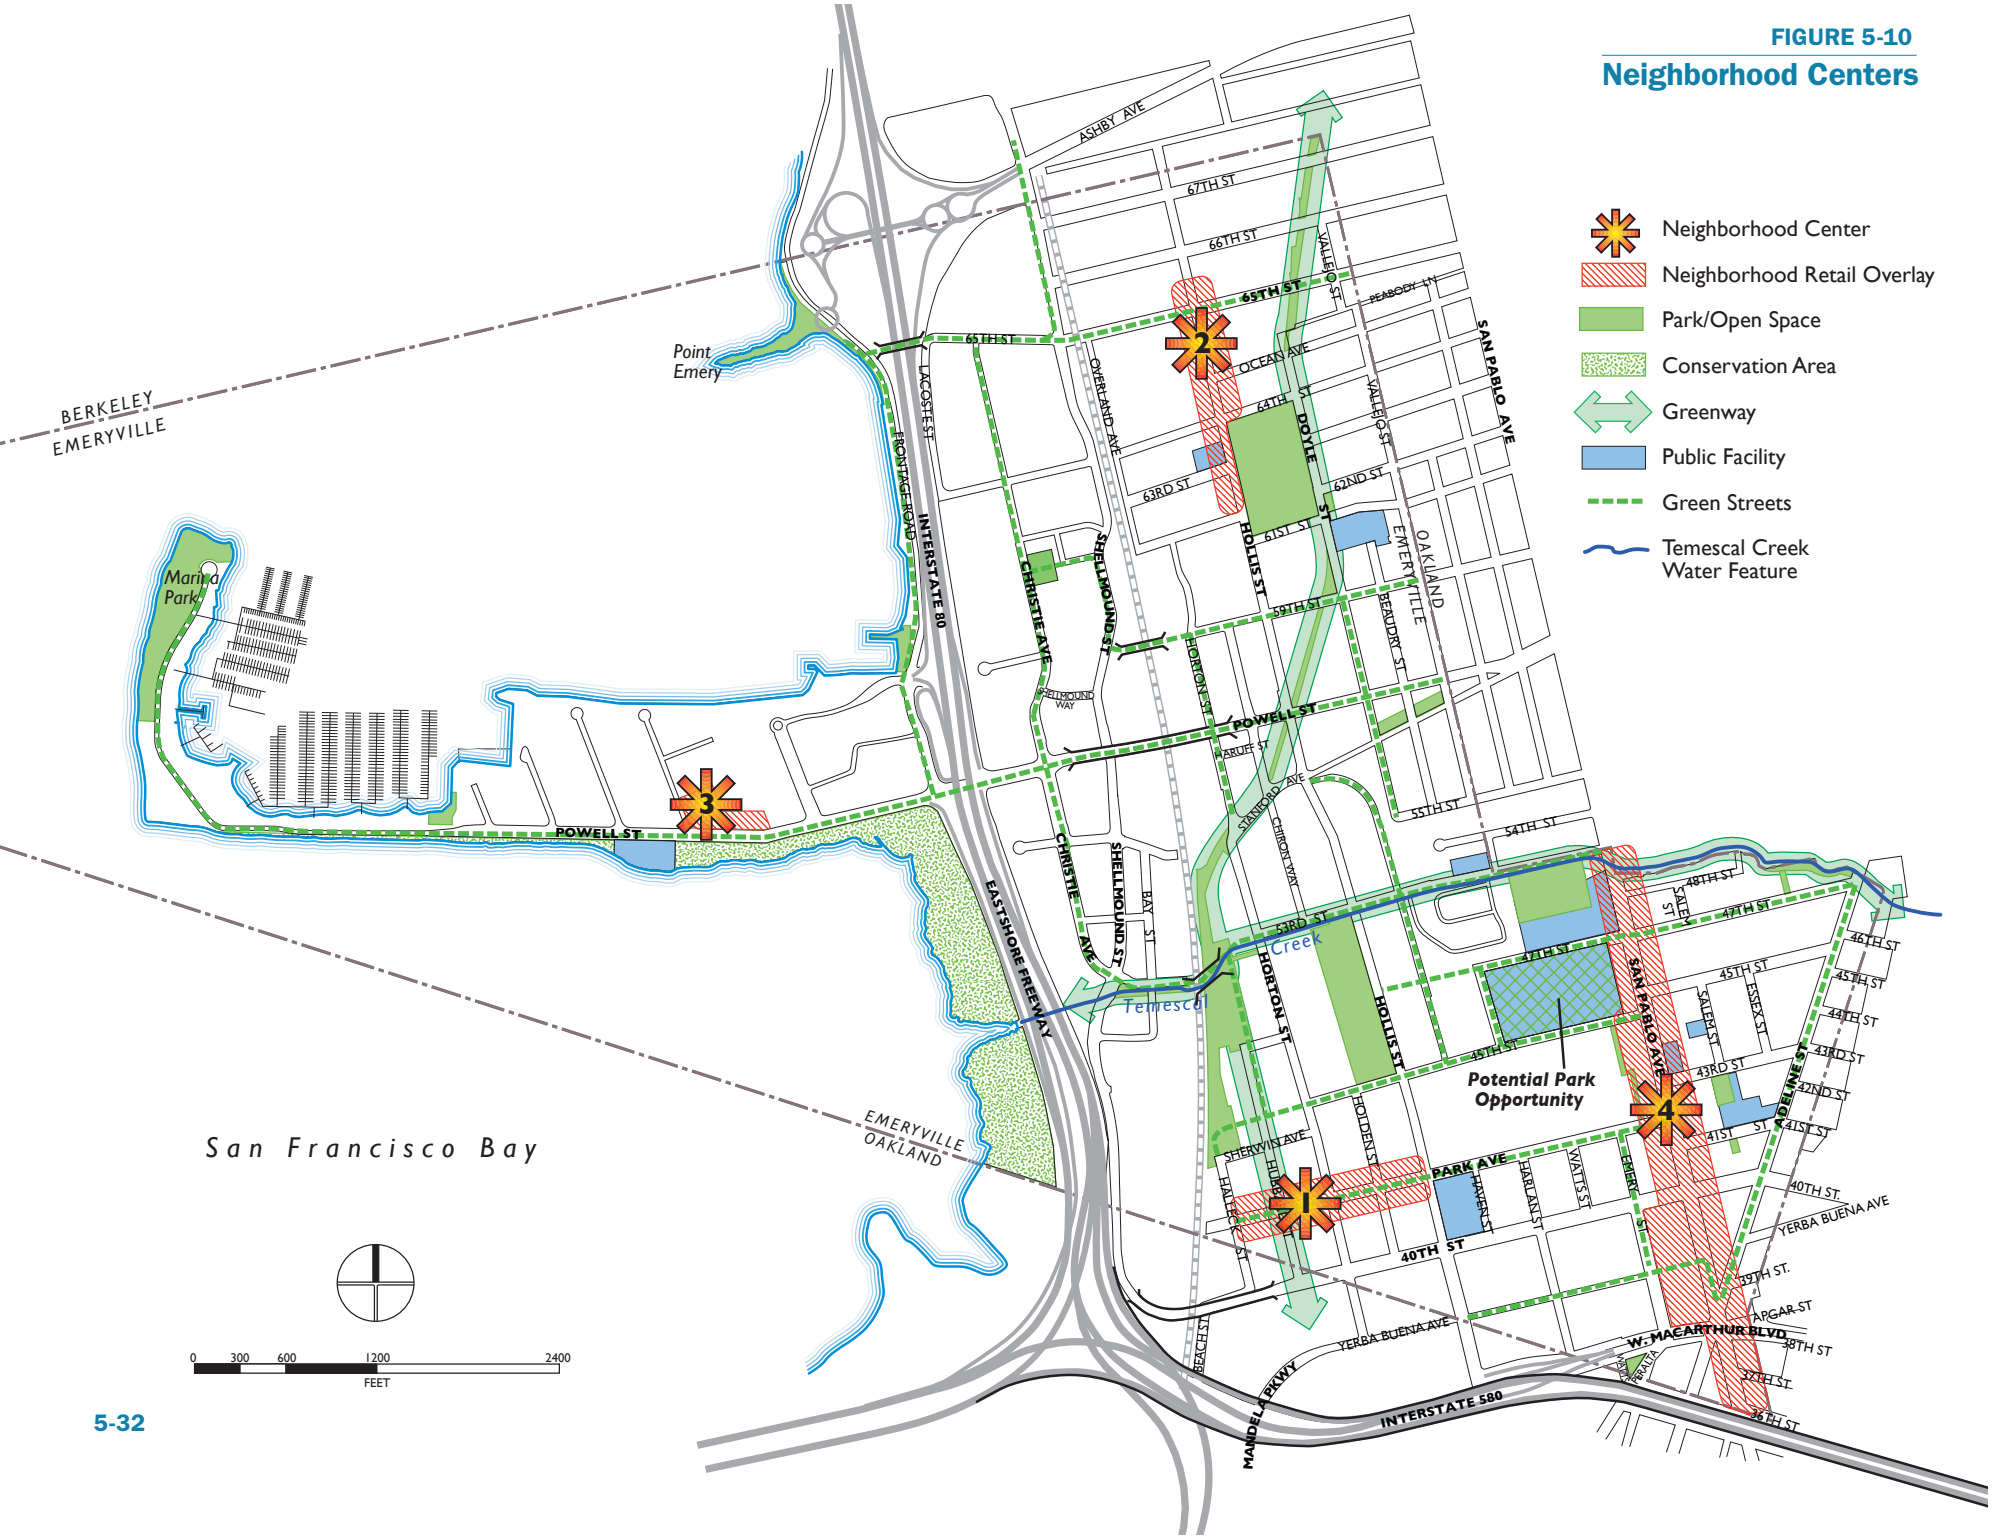
The General Plan identifies four neighborhood centers within the city as shown in Figure 5-10:

1. **Park Avenue:** in the western half of the Park Avenue District. The scale and character of this neighborhood center will be complementary to the surrounding historic Park Avenue structures. A plaza and park will also emphasize the civic role of the area, capitalizing on the presence of City Hall on Park Avenue at Hollis Street.
2. **North Hollis Street:** connecting the northern industrial area with the North Hollis and Doyle Street districts. This center will play a key role in unifying several distinct districts, becoming a gathering place with multiple uses and attractions for both employees and residents. The center also includes access to a new park located off of Hollis Street, further enhancing social gathering opportunities. Specific design guidelines for this center will incorporate those identified in the North Hollis Area Urban Design Program, adopted in April 2002.
3. **Watergate Market Area at Powell Street and Captain Drive:** improving this center to create a central focus point along the Emeryville Peninsula. The center acts as a waterfront retail/restaurant node, serving workers, residents, and visitors, and will provide an important amenity and activity center for the Watergate residential neighborhood and adjoining employment district.
4. **San Pablo Avenue:** creating an important connection between the Triangle district and the rest of the city. The center will stretch along the landscaped boulevard, incorporating neighborhood-oriented retail uses that will reinforce this area as a key destination for the varied inhabitants of surrounding land uses—including high school students, employees, residents, visitors, and transit riders. Moreover, the Emeryville Center for Community Life, proposed on the existing Emery Secondary School campus, will provide a synergy of civic uses. The neighborhood center will have a key node at Park Avenue, creating a linear and visual connection to the historic heart of the city. Design will be guided by the San Pablo Avenue Urban Design Plan.

Neighborhood Centers are being developed in four areas of the city, including North Hollis (top) and Park Avenue (bottom).

FIGURE 5-10

Neighborhood Centers



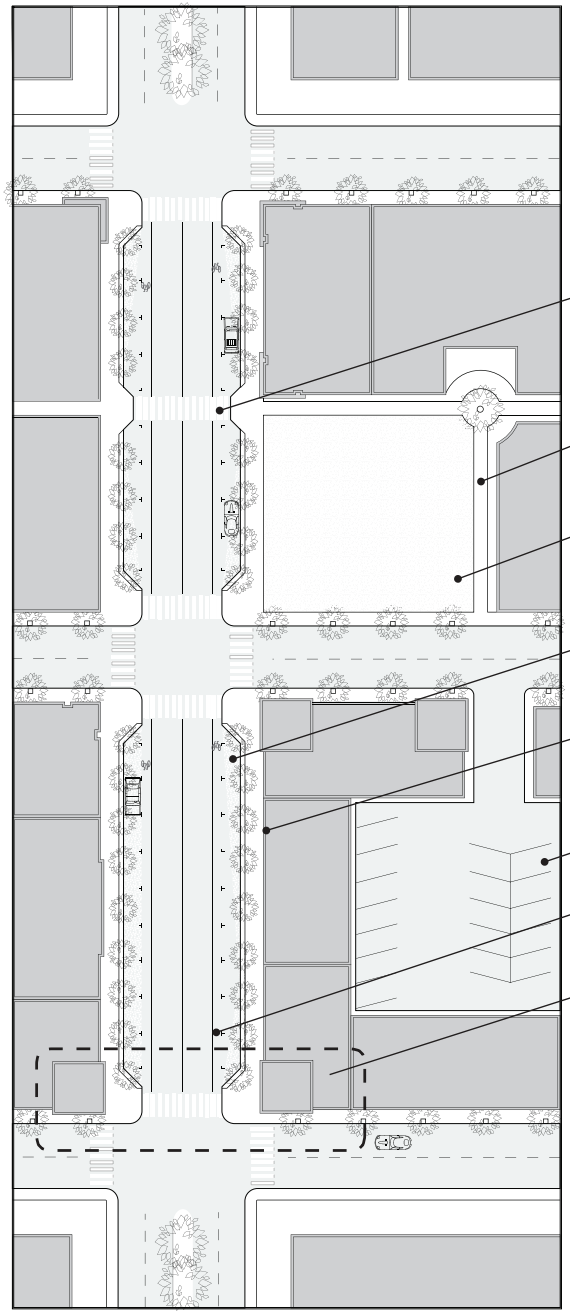


FIGURE 5-11

Neighborhood Centers Concept in Plan

Public art in Emeryville has been integrated into public infrastructure and signage.

5.7 IDENTITY AND GATEWAYS

Public Art

Public art plays an important role in relating the story and identity of the city, and in creating the opportunity for residents and visitors to participate and share in its development. The City's Art in Public Places Program supports public art though a development impact fee and has successfully increased the amount of public art in the city. This ordinance calls for a one to 1.5 percent fee on non-residential development projects to be devoted to the acquisition or installation of publicly accessible art (or into an in lieu public art fund). The General Plan supports the growth of historical, cultural and geographic awareness in the city by emphasizing public art in all areas of the city. In particular, public art within major activity nodes and regional destinations, within established neighborhoods, and along major pedestrian corridors will play a key role in articulating the city's identity. Additional support from the City may include competitions, exhibit space, and public facilities for cultural events and art shows.

Gateways

A critical part of establishing the identity of Emeryville as a whole involves "gateways." These are specially-designed landmark elements to be located at key entrances to the city as shown in Figure 5-1. It is essential that gateway features be unique in design, visible to both motorists and pedestrians, and emblematic of the city they introduce.

At Powell and I-80, the gateway features should announce one's arrival into the city from the freeway, and should speak to the regional destinations within the North and South Bayfront districts. The design of the gateway feature should factor into the scale of nearby buildings, traffic circulation patterns, and the character of the western part of the city. Along the San Pablo Avenue corridor, the gateway features should distinguish Emeryville from neighboring Oakland and Berkeley. Additionally, signage and other features may be appropriate at other gateways to the city.

Signage

Wayfinding signage is envisioned as a a way helping to make Emeryville more navigable and visitor-friendly, by providing signage, kiosks, public art and other navigation tools. Signage is to be provided to address the presence of all major destinations within the city, including key pedestrian and bicycle paths, crossings and overpasses; the Greenway and Key Green Streets; neighborhood centers and activity nodes; the Bay Trail; and major city parks. Signage efforts may also be incorporated into neighborhood streetscape and gateway elements, to become part of an integrated plan for creating and articulating identity. The City Council has already approved a citywide wayfinding program (though it has not yet been implemented) and the General Plan encourages its continuation.

Architecture and Building Materials

The quality of building materials and finishes play a large role in people's judgment of neighborhood quality. The General Plan seeks to provide consistent guidelines and coherence with existing and historic structures, while allowing for variety and freedom of design. To that end, the City's Design Guidelines outline a palette of appropriate materials, building forms, and orientation. Building form should be articulated to create visual interest, prevent bulky structures, and avoid blank walls. High-quality materials and construction are an essential part of creating efficient, attractive, and lasting architecture. Stone, tile, metal, brick, glass, and similar durable and upgradable materials should be used to further the city's architectural identity. As described in Chapter 7: Sustainability, energy-efficient and recycled materials should be used, whenever possible, through renovation and new construction projects. Together, high-quality architecture, construction practices, and urban design can create a more attractive and distinctive city.

Reuse of existing or historic materials as well as the use of new high-quality materials can create a cohesive identity for the city.

GOALS

CITY STRUCTURE

UD-G-1 **An identifiable city structure—** A city structure comprised of a vibrant, intense, and pedestrian-oriented core, and distinctive neighborhood centers and districts augmented with parks and connected by greenways and green streets.

UD-G-2 **A diversity of building types and scales—** Variation to reinforce the identity of individual districts and foster a variety of options for living and working, with continuity in development scale and character and careful transitions between densities and design typologies.

UD-G-3 **A walkable and pedestrian-scaled environment—**A network of streets and connections that expands circulation opportunities for pedestrians and bicyclists.

UD-G-4 **New parks—**Strategically located new parks and outdoor open spaces to enhance Emeryville's livability and pedestrian orientation.

UD-G-5 **Neighborhood Preservation—**Preservation of the existing small-scale residential quality of older neighborhoods.

UD-G-6 **Unique districts throughout the city.**

STREET GRID, CONNECTIONS, AND VIEWS

UD-G-7 **Expanded street grid—**A pedestrian and bicycle path system with extensions that improve connectivity throughout the city.

UD-G-8 **A safe, attractive, and connected pedestrian environment—**Throughout the city, but particularly in areas with high volumes of pedestrian activity.

UD-G-9 **An appealing and functional system of bridges and crossings—**Crossings at major barriers (e.g. freeways and rail lines). Protected public views of the San Francisco Bay and the East Bay Hills.

SKYLINE AND BUILDING BULK

UD-G-10 **A skyline with the tallest buildings concentrated in the central core—**The tallest buildings at the Powell Street/Christie Avenue area, with a gradual transition to lower building heights to the mid- to lower-scale development to the east and west.

UD-G-11 **Sky Exposure—**Building form and massing that furthers sky exposure for adjacent sidewalks and public spaces, especially in gathering places such as the core and neighborhood centers.

UD-G-12 **Uninterrupted sunlight—**During designated periods on all major parks.

STREETSCAPES AND BUILDING-TO-STREET INTERFACE

UD-G-13 **Streets that support multiple functions—**Streets designed for all types of users, including pedestrians, bicyclists, public transit, and automobiles.

UD-G-14 **Streets as an extension of Emeryville's open space network—**Opportunities to linger, stroll, and gather.

UD-G-15 **Development along streets that offers a rich visual experience—**Development that is engaging to pedestrians, is unobstructed by parking facilities, and contributes to street life, vitality, and safety.

NEIGHBORHOOD CENTERS

UD-G-16 **Focal nodes throughout the city—**Neighborhood Centers that act as centers for local services and amenities, and build upon the character and identity of surrounding districts.

UD-G-17 **A walkable and connected city—**Neighborhood centers and other amenities in proximity to employees and residents throughout the city.

IDENTITY AND GATEWAYS

UD-G-18 **A city identity—**An identity that distinguishes Emeryville for the community and its visitors.

UD-G-19 **High-quality—**Design and construction that respects existing architecture, but creates new signature places.

POLICIES

Implementing actions supporiting each policy are described in Chapter 8: Implementation Program.

CITY STRUCTURE

Citywide

UD-P-1 The City shall strive to accentuate activity and presence at the street level, particularly along pedestrian-oriented corridors and in residential areas.

UD-P-2 Parks and open space is required with new development, consistent with Figure 4-1 in the Parks, Open Space, Public Facilities and Services chapter.

UD-P-3 Parks and open space shall be accessible and available to the public through site design standards for minimum size/dimensions, visibility, and location along public rights-of-way, particularly Green Streets (Figure 5-3).

UD-P-4 New development will be required to extend the street grid or pedestrian connections wherever possible.

AREAS AND DISTRICTS

Bayfront and Peninsula

UD-P-5 The tallest buildings and highest development intensities in the city shall be located within the Powell Street/Christie Avenue core, with the exception of the northwest and southwest corners of the city.

UD-P-6 A new neighborhood center around the intersection of Powell Street and Captain Drive will be oriented to support views of the Bay

UD-P-7 A high-intensity mixed-use core will be located near Powell Street and Christie Avenue, and built to the street edge to maintain a vibrant pedestrian-oriented district.

UD-P-8 Improve streetscape treatments, open space connections, and extension of the street grid through Powell Street Plaza.

Central Emeryville

UD-P-9 The overall scale and uses of the industrial district shall be preserved.

UD-P-10 In the Industrial district, transitions will be designed between industrial and residential uses, creating visual continuity through building materials and design, while allowing landscaping or other buffers between uses. Increased fenestration and ground-floor entries will be required to maximize pedestrian safety and visibility.

UD-P-11 A pedestrian and bicycle-friendly mixed-use district will be developed in North Hollis, consistent with the policies and guidelines defined in the North Hollis Area Urban Design Program.

Regardless of land use or development type, new development must interface with the public realm of streets and open space to create a safe, connected, and vibrant Emeryville.

Emeryville's pattern of large blocks and wide streets will be improved through an expanded street grid and additional connections.

Mid-block connections can accommodate a range of users, including drivers, pedestrians, and bicyclists.

UD-P-12 In South Hollis, new development shall provide rights-of-way and greater setbacks where open space and pedestrian connections are planned. Building façades and entries should be oriented toward the Greenway, new open spaces, and the proposed Center of Community Life.

UD-P-13 The Park Avenue District Plan will continue to guide development in the Park Avenue district, honoring its unique civic, arts, and cultural amenities.

UD-P-14 A more urban character will be established for the East Bay Bridge district, by developing taller buildings, a more continuous street façade with pedestrian activity at the ground level, and increased development intensity.

Eastern Residential Neighborhoods

UD-P-15 Infill residential development should incorporate the scale, character and identity of adjacent existing development. To avoid a continuous row of garages along the street, the lot frontage should provide a minimum of 70% active non-parking related uses, provided that a driveway of maximum ten-foot width shall be permitted.

UD-P-16 Streetscape improvements and greater intensity of development will be emphasized to improve the connection between the southwestern portion of the San Pablo Corridor district and the rest of Emeryville to the north.

UD-P-17 Pedestrian character and safety will be enhanced through landscaping and streetscape improvements in the Triangle and Doyle Street Districts.

UD-P-18 The San Pablo Avenue Urban Design Plan will continue to be used to improve landscaping, and streetscape design and guide development in the San Pablo Corridor district.

UD-P-19 Infill development shall provide activation at the lot frontage and minimize visible off-street parking.

STREET GRID, CONNECTIONS, AND VIEWS

UD-P-20 The street grid shall be extended as redevelopment on larger sites occurs.

UD-P-21 Full or partial public street closures by private development shall be prohibited. Where a street closure to vehicular traffic is necessary for public projects, as called for in this General Plan, access for pedestrians and bicycles should still be maintained.

UD-P-22 The City shall maintain and enhance an integrated pattern of streets, pedestrian paths, and bike routes through a fine-grain street grid that enables efficient movement throughout the city.

UD-P-23 Opportunities to extend the street grid through internal connections in large-parcel developments should be considered. Single-point access to new development should be avoided.

UD-P-24 The City shall establish Pedestrian Priority Zones in Regional and neighborhood centers, around schools, parks, and in other locations as indicated in Figure 5-3. While wider sidewalks, street lighting, bulbed crosswalks, and other pedestrian amenities should be employed throughout the city, they are prioritized in these locations.

UD-P-25 Pedestrian Priority Zones shall be linked to adjacent land uses to ensure that building frontages respect pedestrians and truck loading takes place on adjacent streets wherever possible.

UD-P-26 Commercial uses, such as retail, restaurants, hotel lobbies, offices, and flex space shall be required at the ground level in neighborhood centers and regional retail overlay districts.

UD-P-27 All ground-level street frontages should be activated. Driveways, loading zones, and curb cuts shall be provided but minimized.

UD-P-28 Visual distinction and safety shall be prioritized in the design of bridges and undercrossings.

UD-P-29 Public views of the San Francisco Bay and the East Bay hills shall be maintained.

UD-P-30 Streetscape features should not block public views.

SKYLINE AND BUILDING BULK

UD-P-31 In the neighborhood centers and city parks flexibility should be provided in building massing so that sunlight is not blocked.

UD-P-32 Buildings with light-colored finishes shall be encouraged, especially on upper floors and along narrow corridors such as Hollis Street. Standards for building reflectivity shall be maintained to maximize day-light on sidewalks and streets without causing glare.

UD-P-33 Bulky and monolithic buildings shall be prevented through:

- Vertical articulation, such as step backs at higher floors, and less floor area as heights increase to reduce the apparent bulk of buildings.
- Horizontal articulation, such as varied setbacks, recessions/projections, change in materials, and building transparency, especially in Pedestrian Priority Zones.

UD-P-34 Volumetric building development standards shall be maintained to:

- Establish bulk standards based on a variety of considerations, including building height, intensity, and location; and
- Allow bulkier buildings in employment-emphasis areas while striving for less bulk in residential and mixed-use areas.

UD-P-35 Tower separation shall be required to increase sky exposure for developments with multiple towers, and maintain separation standards for buildings taller than 100 feet.

UD-P-36 Where large floorplates are permitted, buildings shall be required to adhere to height, setback, and stepback standards, as required for view and sun access, but less stringent bulk standards shall be permitted.

UD-P-37 Development of a finer-grain scale and texture shall be promoted citywide and required in portions of the North Hollis, Park Avenue, and San Pablo Avenue districts, and around neighborhood centers.

UD-P-38 New developments should employ changes in height, massing, and/or design character to create careful transitions in scale and density.

UD-P-39 New development should not cast significant shadow over existing development.

Building articulation and appropriate massing ensure sun access and creates visual interest.

STREETSCAPES AND BUILDING-TO-STREET INTERFACE

UD-P-40 Neighborhood structure and pedestrian scale development should be prioritized. The scale and character of existing neighborhoods should be maintained to ensure connectivity and continuity of street design within each district.

UD-P-41 Minimize pavement widths (curb to curb) to the minimum necessary to ensure traffic flow and safety, to discourage speeding through neighborhood centers and residential areas, and to prioritize pedestrian and bicycle movement.

UD-P-42 Sidewalks shall be safe, comfortable, and accessible for pedestrians.

UD-P-43 Continuous and consistent street tree planting shall be provided along Green Streets and in Neighborhood Centers.

UD-P-44 Curb cuts shall be minimized to emphasize continuous, unbroken curb lengths.

UD-P-45 Long blocks shall be minimized to allow for ease of pedestrian connectivity.

UD-P-46 Street trees shall be provided on City streets where feasible. Street trees shall be planted in a row along the curb, between the vehicle roadway and sidewalk, unless this is physically impossible due to constraints such as underground water or sewer lines.

UD-P-47 Streetscape landscaping shall follow Bay-Friendly Landscaping guidelines and serve the dual purpose of treating stormwater runoff and providing shade and beauty to the urban realm.

UD-P-48 A design framework for streetscapes shall be established by district and/or citywide.

UD-P-49 City identity shall be enhanced by distinctive streetscapes through the use of street trees and unified landscape treatments

UD-P-50 Cohesive streetscape improvements to streets in neighborhood centers, and designated Green Streets are a priority.

UD-P-51 Impediments to sidewalk safety and movement shall be removed, and utilities and transformers undergrounded where possible. Large new developments shall be required to underground any adjacent existing overhead utility lines.

UD-P-52 Funding and programs to underground utilities and overhead wires shall be continued.

UD-P-53 Use of the greenways shall be reinforced by fronting entrances to both commercial and residential development to the public pathway.

- Encourage open spaces and plazas adjacent to the greenways.

- Encourage other public-oriented ground level uses such as workshops, lobbies, and common areas.

UD-P-54 Generous sidewalks, and bikeways or bike lanes along greenways shall be required. Curbside parking and local vehicular access when greenways share right-of-ways with streets shall be permitted.

UD-P-55 Pedestrian-scaled street lighting, street furniture, and undergrounded utilities along greenways shall be required.

UD-P-56 Setbacks averaging 15 feet for new residential developments shall be required along greenways to create a landscaped front yard. Stairs, stoops, or other architectural encroachments, which contribute to the pedestrian life of the street, are also permitted.

UD-P-57 The Emeryville Center of Community Life building program shall be oriented along 53rd Street to complement and provide access to the greenway and Temescal Creek.

Parking

UD-P-58 Large surface parking lots shall be replaced with structured parking and incorporated into high density mixed-use developments. New or expanded large surface parking lots are not allowed.

UD-P-59 Parking should be screened or concealed. Pedestrian entrances to non-residential buildings should be located on the sidewalk; any entrances from parking areas should be incidental or emergency only.

UD-P-60 Parking should be located below-grade where possible.

UD-P-61 Above-grade parking structures should be wrapped with active uses in Pedestrian Priority Zones (see Figure 5-3).

UD-P-62 If active uses are not feasible on the ground floor of parking garages, frontages should be architecturally attractive. This may include unique designs and materials, such as glass, articulated masonry, murals or landscaping setbacks.

UD-P-63 Motor vehicles and interior lighting should not be visible from the exterior of parking garages.

Building to Street Interface

UD-P-64 Ground floor uses should be emphasized to facilitate pedestrian use, with standards for building frontage, fenestration, and entries.

UD-P-65 Buildings should be designed with ground level windows and building entries along the street.

UD-P-66 For all multifamily residential development, including high-rise, and along pedestrian-oriented streets, townhomes or other units with direct street access should be provided to promote individualization, family-friendly development, identity, and street safety.

UD-P-67 An open relationship between buildings and street edge should be maintained. Fencing and significant landscape barriers should be avoided, except to enclose individual yards.

NEIGHBORHOOD CENTERS

UD-P-68 The City shall foster development of neighborhood centers as identified in Figure 5-10 and described in Section 5.6.

UD-P-69 The pedestrian environment shall be enhanced with multiple neighborhood access points, through-streets, and pedestrian pathways.

UD-P-70 Street-level uses should reinforce neighborhood center streets and allow a vertical mix of a diverse range of land uses including offices, hotels and residential uses compatible with neighborhood center functions.

UD-P-71 Developments adjacent to neighborhood centers, parks or plazas should create an integrated and memorable relationship of architecture and open space. Orient primary building facades and entries to these spaces and maximize visual interest.

UD-P-72 Public space and plazas for gathering and expanded ground-floor retail activities are encouraged. These elements enhance the pedestrian realm and provide opportunities for social interaction.

IDENTITY AND GATEWAYS

UD-P-73 The City will create visual gateways through streetscape design, signage, and building massing to establish identity at key entry points to the city.

UD-P-74 The City will continue to invest in a citywide public art program that contributes to an awareness of the city's history and culture.

UD-P-75 The City will institute sign regulations that create an identity without dominating city and district appearance.

San Pablo Avenue features a Neighborhood Center around the Park Avenue intersection.

6 CONSERVATION, SAFETY, AND NOISE

This chapter establishes goals and policies for the conservation of natural and cultural resources, and for the protection of the community from hazards and excessive noise. While there are many benefits to the compact, mixed use nature of the city, it presents challenges in addressing safety and noise concerns that are not as apparent in cities where potentially harmful activities and residents are separated.

Preserving environmental resources—by maintaining water and air quality, and protecting plant and wildlife habitat—is critical given Emeryville's urban setting and limited open space. Preserving the City's many cultural and historic resources can help further the City's identity. Encouraging developers to renovate existing structures preserves the City's heritage, while reducing environmental impacts of demolition and new construction.

Health and safety issues stem from Emeryville's location within an earthquake-prone region, noise and pollution from highway and rail systems, and hazardous materials from historic industrial activities. Reducing risks associated with these potential hazards—by ensuring emergency preparedness, enforcing building codes, and continuing the City's brownfield remediation program—will create a safer, more livable community. (Note that police, fire, and emergency services are described in Chapter 4: Parks, Open Space and Public Services.)

Noise has an important effect on human habitation, health, and safety. Transportation systems, such as Interstate 80 and the railroad provide great accessibility from Emeryville to other points in and outside the Bay Area, but they also create noise and pollution. This chapter identifies implementing policies, such as appropriate building siting and materials, to lower the risk to human health.

6.1 CONSERVATION

Air Quality

See also Chapter 7: Sustainability for policies related to greenhouse gas emissions and climate change.

While air quality is largely a regional issue, the land use, circulation, and growth decisions made by local communities, such as Emeryville, affect regional air quality. Air quality in Emeryville is generally good due to clean air blowing off the ocean and San Francisco Bay. However, areas of Emeryville along major thoroughfares, such as Interstate 80 and San Pablo Avenue, experience relatively higher pollutant concentrations due to heavy traffic volumes. A 2004 inventory of greenhouse gas emissions showed that the transportation sector in Emeryville was the greatest contributor, with 49% of the total, while the commercial/industrial sector was responsible for 43%. The residential sector and waste sectors represented the smallest share of greenhouse gas emissions, with 5% and 3% of the total, respectively.[1] (See Section 7.3 of Chapter 7: Sustainability for a more detailed description of greenhouse gas emissions.)

Bay Area Air Basin

Emeryville is located in the central portion of the Bay Area Air Basin, which includes most of the nine-county Bay Area. Air basin quality is monitored by the Bay Area Air Quality Management District (BAAQMD), which operates a regional network of air pollution monitoring stations to determine if the national and State standards for criteria air pollutants and emission limits of toxic air contaminants are being achieved. The Bay Area is considered in attainment status for

1 *City of Emeryville Greenhouse Gas Emissions Analysis, July 2008.*

all national standards, except for ozone. It is in nonattainment status for State standards for ozone and particulate matter. As of 2008, BAAQMD was beginning to prepare the 2009 Bay Area Clean Air Plan in accordance with the requirements of the California Clean Air Act. The Plan will address the impacts of ozone control measures on particulate matter, air toxics, and greenhouse gases in order to implement feasible measure to reduce ozone. The Clean Air Plan will also establish emission control measures.

Toxic Air Contaminants

Toxic air contaminants are airborne substances capable of adversely affecting human health effects. They are emitted from a variety of common sources, including gasoline stations, automobiles, dry cleaners, industrial operations, and truck, train, and automobile traffic. Future development under the General Plan could result in sensitive receptors (e.g., residents, open space users) being located near these sources. Working with the Bay Area Air Quality Management District, the City can help to manage air pollutants. Moreover, the City can reduce exposure to sensitive receptors through regulations in the Zoning Ordinance.

Water Supply and Quality

The East Bay Municipal Utility District (EBMUD) supplies water and wastewater treatment services to the City. The primary source of fresh water comes from the Sierra Nevada mountain range, via the Mokelumne Aqueduct. Although EBMUD adopted a long-term program to reliably provide water through 2020, various events—such as earthquakes, drought, contamination, fires, and levee failure—may disturb the availability and reliability of water from the Mokelumne River and watershed runoff. In response to such potential hazards, EBMUD prepared an Urban Water Management Plan (UWMP) which consists of supplemental water supply, banking, conservation, and watershed improvement to help accommodate existing and future demand within EBMUD's ultimate service boundary. EBMUD also participates in transfer and exchange programs with other Bay Area water districts to establish cooperation agreements for times when primary water sources prove unreliable.

EBMUD also supplies recycled water, which, as a result of treatment of wastewater, is suitable for direct beneficial use or controlled use that would not otherwise occur. Emeryville has a Recycled Water Ordinance, requiring residential developments that require subdivisions and buildings with over 100,000 square feet of non-residential development to install a parallel water supply system for elements such as parks, greenbelts, landscaped streets or medians, and any other use that does not require potable water. The goal of using recycled water is to save high-quality water to meet annual potable water needs. Recycled water reduces the demand for EBMUD's potable water supplies, and thus delays or eliminates the need for more potable water facilities, sustains the economy with increased water supply reliability, protects the San Francisco Bay by reducing treated wastewater discharge, and stretches the high-quality potable water supply during times of prolonged drought or disaster.

Water Conservation

Similar benefits to quality and supply of water can also be achieved through conservation efforts. EBMUD has adopted water conservation programs to address both water supply and demand. Demand-side water conservation programs are intended to reduce overall consumption of the water supply through free water audits, rebates and other incentives, regulations, education, and supporting activities to reduce consumption. EBMUD's supply-side conservation measures are directed toward increasing water use efficiency

Pollution from industrial, transportation and other sources can be mitigated to reduce harmful impacts at the local level.

In wet weather, stormwater flows off of impermeable surfaces (buildings, parking lots, streets) and into Temescal Creek and the Bay, picking up particulate and debris along the way.

before or after customer use. These strategies include improvements within EBMUD's distribution system (i.e. leak detection, pipe replacement, and corrosion control) and water recycling programs.

The City can build on these conservation efforts through the development and permitting process. Cisterns can be integrated into building design or rainwater barrels installed post-occupancy in order to capture rainwater and use it for non-potable water needs (e.g. toilet flushing and irrigation). Graywater — water that comes from sinks, showers, and washing machines — may be reused on-site to flush toilets and irrigate non-edible landscape plants. These efforts decrease potable water consumption, while also reducing stormwater runoff. Green roofs can be installed on rooftops, creating many advantages over traditional roofs, such as taking on stormwater, providing a public amenity, and reducing energy consumption and costs.

Surface Water Quality and Pollution

The City of Emeryville lies in the Central Basin within the San Francisco Bay hydrologic region. Although topography is generally flat, the city's elevation ranges from 0 to 60 feet above mean sea level and slopes slightly to the west toward the Bay—the major receiving water body. The other surface water feature in the city is Temescal Creek, which flows west from the East Bay Hills into San Francisco Bay. Historically, Derby Creek also flowed through the city but has been incorporated into the storm drain system. The portion of the Bay near the city is affected by several drainage outlets that include a storm sewer outfall south of the Emeryville Peninsula, a wastewater treatment outfall in the southern portion of Emeryville Crescent in Oakland, and Temescal Creek.

Urban stormwater runoff is a major source of nonpoint water pollution. As a largely urbanized city, Emeryville has a high proportion of impermeable surfaces. Pollutants such as suspended solids, heavy metals, and nutrients are often found in samples of urban stormwater runoff. The pollutants are deposited onto street surfaces and washed into receiving waters. Along the shoreline, nonpoint pollution is caused by overland stormwater flow and urban runoff from dredging activities, marine vessel waste, sediments, sand, industrial fuels, equipment and other operations, infiltration from sewer system, accidental spills of hazardous materials, and construction activities. A further discussion of flooding and drainage, including Emeryville's participation in the National Pollutant Discharge Elimination System permit process, is described in Section 6.4 of this chapter.

Future Demand

EBMUD's service area within Alameda County currently reaches approximately 489,000 customers—including the residents of Emeryville—and is projected to serve nearly an additional 100,000 people by the year 2030. Water consumption within the EBMUD service area has remained relatively level in recent years, despite continuing account growth.

A 2000 study, *Districtwide Update of Water Demand Projections*, projected EBMUD's current water demand for 2005 as 222 millions of gallons per day (mgd) with a total of 391,216 accounts. The study then foresaw development activities in places like Emeryville and throughout the East Bay, pushing demand to reach 281 mgd to 451,689 accounts by the year 2030. However, the total demand figure for 2030 is expected to be reduced to 232 mgd after conservation projects and recycled water programs are implemented.

Although EBMUD's current water supply is sufficient to meet demand during normal years, it is insufficient to meet customer demand in the case of a multi-year

drought, despite its aggressive conservation and water recycling efforts. EBMUD will inevitably face water supply shortages during extended periods of drought, but additional supplemental supply projects currently underway will significantly reduce the severity and frequency of customer rationing.

Habitat

The majority of Emeryville is developed with few open spaces and very little of the native habitat remains.

Sensitive Habitat Areas

The southwestern portion of Emeryville, along the shoreline west of Interstate 80, is known as the Emeryville Crescent and is one of the city's most valuable biological resources. This area is considered a sensitive habitat. Northern Coastal Salt Marshes occur along the shoreline of the Bay that is sheltered from excessive wave action. They support a high amount of vegetation such as cordgrass, pickleweed, eelgrass and saltgrass. The Emeryville Crescent region provides food, cover, nesting and roosting habitat for a variety of wildlife species.

Special Status Species

Searches of the California Natural Diversity Database (CNDDB), California Native Plant Society Electronic Inventory, U.S. Fish and Wildlife Service website species list, and California Department of Fish and Game were used to determine the known and potential presence of species of special concern within the Emeryville area. According to the CNDDB there are five special status wildlife species and seven special status plant species that have the *potential* to occur within Emeryville. These species, along with their scientific names, habitat needs and observed locations are described in Table 6-1. Additional species that have the potential to occur in the city include: Coopers Hawk, Sharp-shinned Hawk, and the Peregrine Falcon.

TABLE 6-1: Federal or State Listed Species and Other Species of Concern

Common Name	Scientific Name	Habitat Needs	Location Notes
California clapper rail	*Rallus longirostris obsoletus*	Nests and forages in emergent wetlands with pickleweed, cordgrass, and bulrush	Observed in Emeryville Crescent Marsh near Bay Bridge toll plaza in several recent surveys
California black rail	*Laterallus jamaicensis coturniculus*	Nests and forages in tidal emergent wetland with pickleweed and cordgrass	Recently observed in the Emeryville Crescent marsh
salt marsh harvest mouse	*Reithrodontomys raviventris*	Saline emergent marsh with dense pickleweed	Observed in Emeryville Crescent Marsh near Bay Bridge toll plaza in several recent surveys
tidewater goby	*Eucylogobius newberryi*	Shallow waters of bays and estuaries	Record in Berkeley's Aquatic Park; potential habitat in Emeryville Crescent
Santa Cruz tarplant	*Holocarpha macradenia*	Coastal scrub, coastal sand dunes, openings in oak woodlands with sandy or gravelly soil	Historical records in Emeryville area; likely extirpated
white tailed kite	*Elanus leucurus*	Nests near wet meadows and open grasslands, dense oak, willow or other large tree stands.	Recent record in Berkeley meadow (on Berkeley marina peninsula)
northern harrier	*Circus cyaneus*	Mostly nests in emergent vegetation, wet meadows or near rivers and lakes, but may nest in grasslands away from water	Recent record in Berkeley meadow (on Berkeley marina peninsula)
alkali milk vetch	*Astragalus tener var. tener*	Alkali flats and vernal pools in valley grasslands	Historical record in Oakland near Emeryville; habitat likely gone
round leaved filaree	*California macrophylla*	Clay soils in cismontane woodland and valley and foothill grassland	Historical records in Oakland
San Francisco spineflower	*Chorizanthe cuspidata*	Alkali flats and vernal pools in valley grasslands	Historical record West of Lake Merritt in Oakland
Kellogg's horkelia	*Horkelia cuneata ssp. sericea*	Closed-cone coniferous forests, coastal scrub	Historical records in East Bay
Point Reyes birds beak	*Cordylanthus maritimus ssp. palustris*	Upper zones of coastal salt marsh	Historical record on Emeryville/Berkeley shoreline

Source: California Department of Fish and Game, 2008; California Native Plant Society, 2005; United States Fish and Wildlife Service, 2005, Environmental Sciences Associates, 2008.

The city's historic resources include the Remar Bakery building (top), now residential units; PG&E North (center); and Old Town Hall (bottom).

Almost all the plant species' records are historical, meaning found around the turn of the century before the heaviest urbanization in the area. All of the species with historical records are likely gone and most of their habitat is marginalized or eliminated. However, there could still be some small habitat patches in Emeryville.

Cultural Resources

Emeryville's cultural resources provide a link to the people and the cultures of the past and enrich sense of community, heritage, and identity. Cultural resources include both prehistoric and historic-period archaeological resources, as well as historic and architectural resources.

Archeological Resources

The Ohlone Indians and their ancestors were the first inhabitants of the San Francisco Bay. Ohlone settlements tended to be situated where freshwater creeks entered the Bay along its original shoreline edges. Remnants from the pre-Ohline occupation include the numerous shellmounds or shell middens found along the Bay shorelines. One of the largest shellmounds in the Bay Area was the Emeryville Shellmound which was estimated to have been 1,000 feet long, 300 feet wide, and 22 feet high located east of Interstate 80 in the vicinity of Temescal Creek.[2] Three major excavations of the shellmound conducted since 1902 have indicated that the resource included artifacts, immense quantities of animal remains, grave goods, and burials, indicating that the site had been occupied for a 2,500 year period between circa 500 B.C. to circa AD 1700.[3] In addition to the Emeryville Shellmound discussed above, four other recorded sites are directly or indirectly associated with this site. There are also 18 recorded historic-era archaeological sites in the city, comprised primarily of the remains of historic-era industrial buildings. This includes the former Bruener's Warehouse.[4]

Historic Resources

Emeryville has a concentration of recorded and potential historic resources in the Park Avenue District, as shown in Figure 6-1 and Table 6-2.

Recorded Historic Resources

The Caltrans Environmental Impact Report for the Cypress Freeway project identified the Emeryville Historic Industrial District developed primarily between 1907 and 1930 with manufacturing and warehouse facilities. The district was constructed predominantly of brick with Classical architectural details. Of the 29 buildings included in the district, 23 are considered contributory resources. Nineteen district contributors still exist. The Emeryville Historic Industrial District is considered to be eligible for listing in the National Register of Historic Places (National Register) and was therefore automatically included in the California Register of Historic Resources (California Register) in 1990. Two historic resources in Emeryville have gone through the process to be listed in or determined eligible for listing in the National and California Registers as individual resources. These are: the former Remar Bakery (Bakery Lofts) located at 1010 46th Street ("D" on Figure 6-1), and a private residence at 3604 Adeline Street ("E" on Figure 6-1).

4 *Northwest Information Center (NWIC), Letter re: Record Search Results for the Proposed Emeryville General Plan and EIR. File No. 05-140. August 16, 2005.*

Recognizing the buildings along Park Avenue and immediate environs as the historic center of Emeryville, the City adopted an area plan for the Park Ave district in August 2006. The City's Park Avenue Overlay District designates 43 buildings as architecturally significant. (See Cultural and Architectural Resources below.) Many, but not all of the buildings designated in the Park Avenue Overlay District are also contributors to the National Register-eligible Emeryville Historic Industrial District. The Historic District also identifies contributors in the Park Avenue District that are not designated by the Park Avenue District Overlay.

Potential Historic Resources

The City also recognizes that there are several areas and structures with local historical and/or architectural merit which characterize the City's heritage. While most of these buildings have not been officially designated as federal, state, or local historic resources, many of these and other properties would likely be determined eligible for listing as official historic resources upon further review and analysis. For example, Emeryville contains numerous buildings and structures that are more than 45 years old (constructed before 1960). Upon further review and evaluation, and depending on their physical integrity, many of these older buildings may be eligible a federal, state, and/or local historic resources, either individually or as a historic district.[5]

Cultural and Architectural Resources

Park Avenue Overlay District

The Park Avenue District Plan establishes incentives and development guidelines for the preservation of a unique historic district and creation of a vibrant mixed-use neighborhood. The Plan encourages cultural arts, streetscape and pedestrian improvements, open spaces, and a variety of transportation options around Emeryville's civic center. Within the Plan, the Park Avenue Overlay District designates 43 architecturally significant buildings within the Park Avenue District as either Tier 1 (primary architectural significance) or Tier 2 (secondary architectural significance). The City's municipal code states that the Emeryville Building Official shall not issue a building permit to move, remove or demolish a Tier 1 or Tier 2 architecturally significant building or structure unless the Emeryville Planning Commission first approves such action.[6]

Emeryville Preservation Ordinance

The City developed a Preservation Ordinance in 2006, to ensure that the character of Emeryville's historic past and setting are maintained for future generations. The Ordinance seeks to protect significant structures from moving, removal, or demolition, and ensures that replacement structures are compatible with the surrounding community. Significant structures are more than 50 years old and contain particular design features on the street-facing façade.[7] The Ordinance does not regulate residential structures or the Park Avenue District, which are covered by other ordinances.

The Park Avenue District then and now.

Historic Resources

6.2 SAFETY

This section and its accompanying implementing policies and actions, describe potential hazards and the measures that can be taken to mitigate these risks and ensure the safety of Emeryville's population and property from seismic, flooding and chemical hazards. Chapter 4: Parks and Public Facilities describes the emergency response standards and policies of the Emeryville Fire and Emergency Services Department, which leads the city's emergency management.

Geologic, Soils, and Seismic Hazards

Geology and Soils

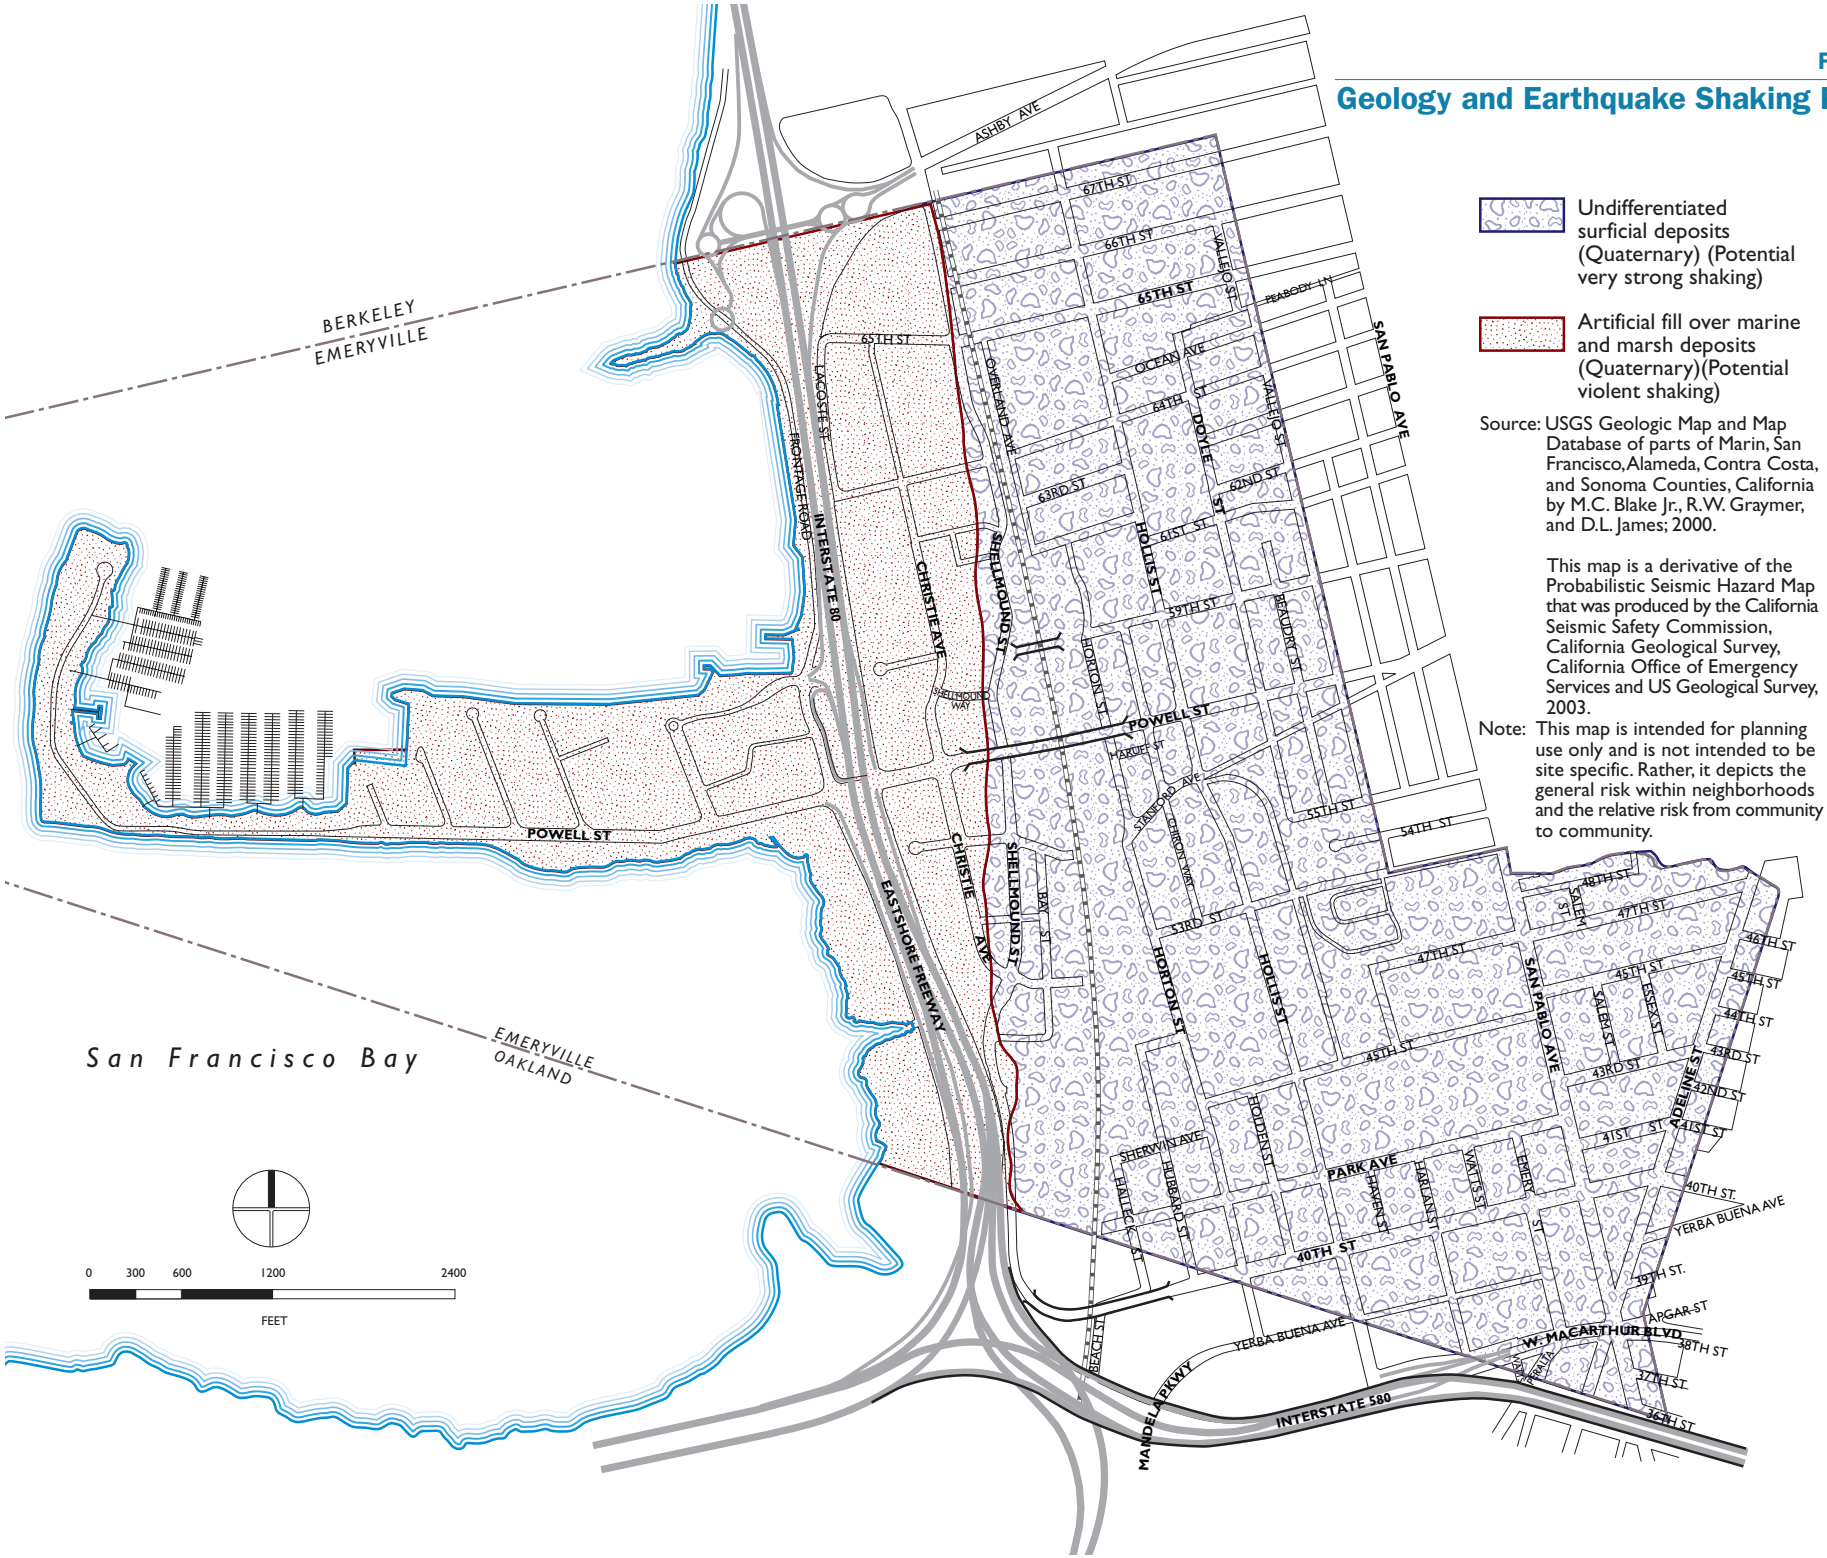
The City of Emeryville lies at the eastern edge of the San Francisco Bay in part of the flatlands which are also referred to as the East Bay Plain. The East Bay Plain consists of alluvial deposits that originated from the Berkeley Hills. The western side of the city contains former tidal sloughs and marshlands that were progressively filled in dating back to the 1900s. The city is essentially flat with many areas on the margin of the Bay located on artificial fill. Where not covered by fill, the city's surface soils consist predominantly of fine-grained alluvium, including silts and clays, as depicted in Figure 6-2. Toward the western portion of the city the alluvium is underlain by bay mud—a natural marine deposit that consists of soft saturated clays that can contain lenses of sand and shell fragments. Development on artificial fill placed over bay mud often presents unique geotechnical engineering challenges because, unless the fill is properly engineered, structures can be damaged by differential settlement and subsidence. Under the bearing load of a new structure, Bay Mud tends to go through a cycle of consolidation that can lead to settlement.

Artificial fill atop bay mud, along the shoreline of Emeryville may be susceptible to violent earthquake shaking.

Excessive soil erosion can eventually lead to damage of building foundations, roadways, and loss of topsoil. Throughout Emeryville, areas that are most susceptible to erosion are those that would be exposed during construction phase and along the shoreline where soil is subjected to wave action. Typically, the soil erosion potential is reduced once the soil is graded and covered with concrete, structures, asphalt, slope protection, or vegetation.

Seismicity

The San Francisco Bay Area is a seismically active region with numerous active faults. Although no active faults run through Emeryville, the city is approximately three miles from the Hayward Fault and 15 miles from the San Andreas Fault, the two most prominent and active faults in the Bay Area, as shown in Figure 6-3. Therefore, the entire city is subject to hazardous ground shaking in a major earthquake, as shown in Figure 6-2. Deep alluvium and bay mud deposits can intensify groundshaking through wave amplification and longer durations of shaking. U.S. Geological Survey and other scientists claim that there is a 62% probability of a magnitude 6.7 or greater earthquake, striking the San Francisco Bay region before 2032.[8] Recognizing this threat, earthquake safety and preparedness are essential components of the General Plan.



Seismic Risks to Development

Earthquake damage to structures can be caused by ground rupture, liquefaction, groundshaking, and possibly inundation from tsunami. The level of damage in the city resulting from an earthquake will depend upon the magnitude of the event, the epicenter distance from the city, the response of geologic materials, and the strength and construction quality of structures.

This map is a derivative of the Probabilistic Seismic Hazard Map that was produced by the California Seismic Safety Commission, California Geological Survey, California Office of Emergency Services and US Geological Survey, 2003.

Note: This map is intended for planning use only and is not intended to be site specific. Rather, it depicts the general risk within neighborhoods and the relative risk from community to community.

FIGURE 6-3

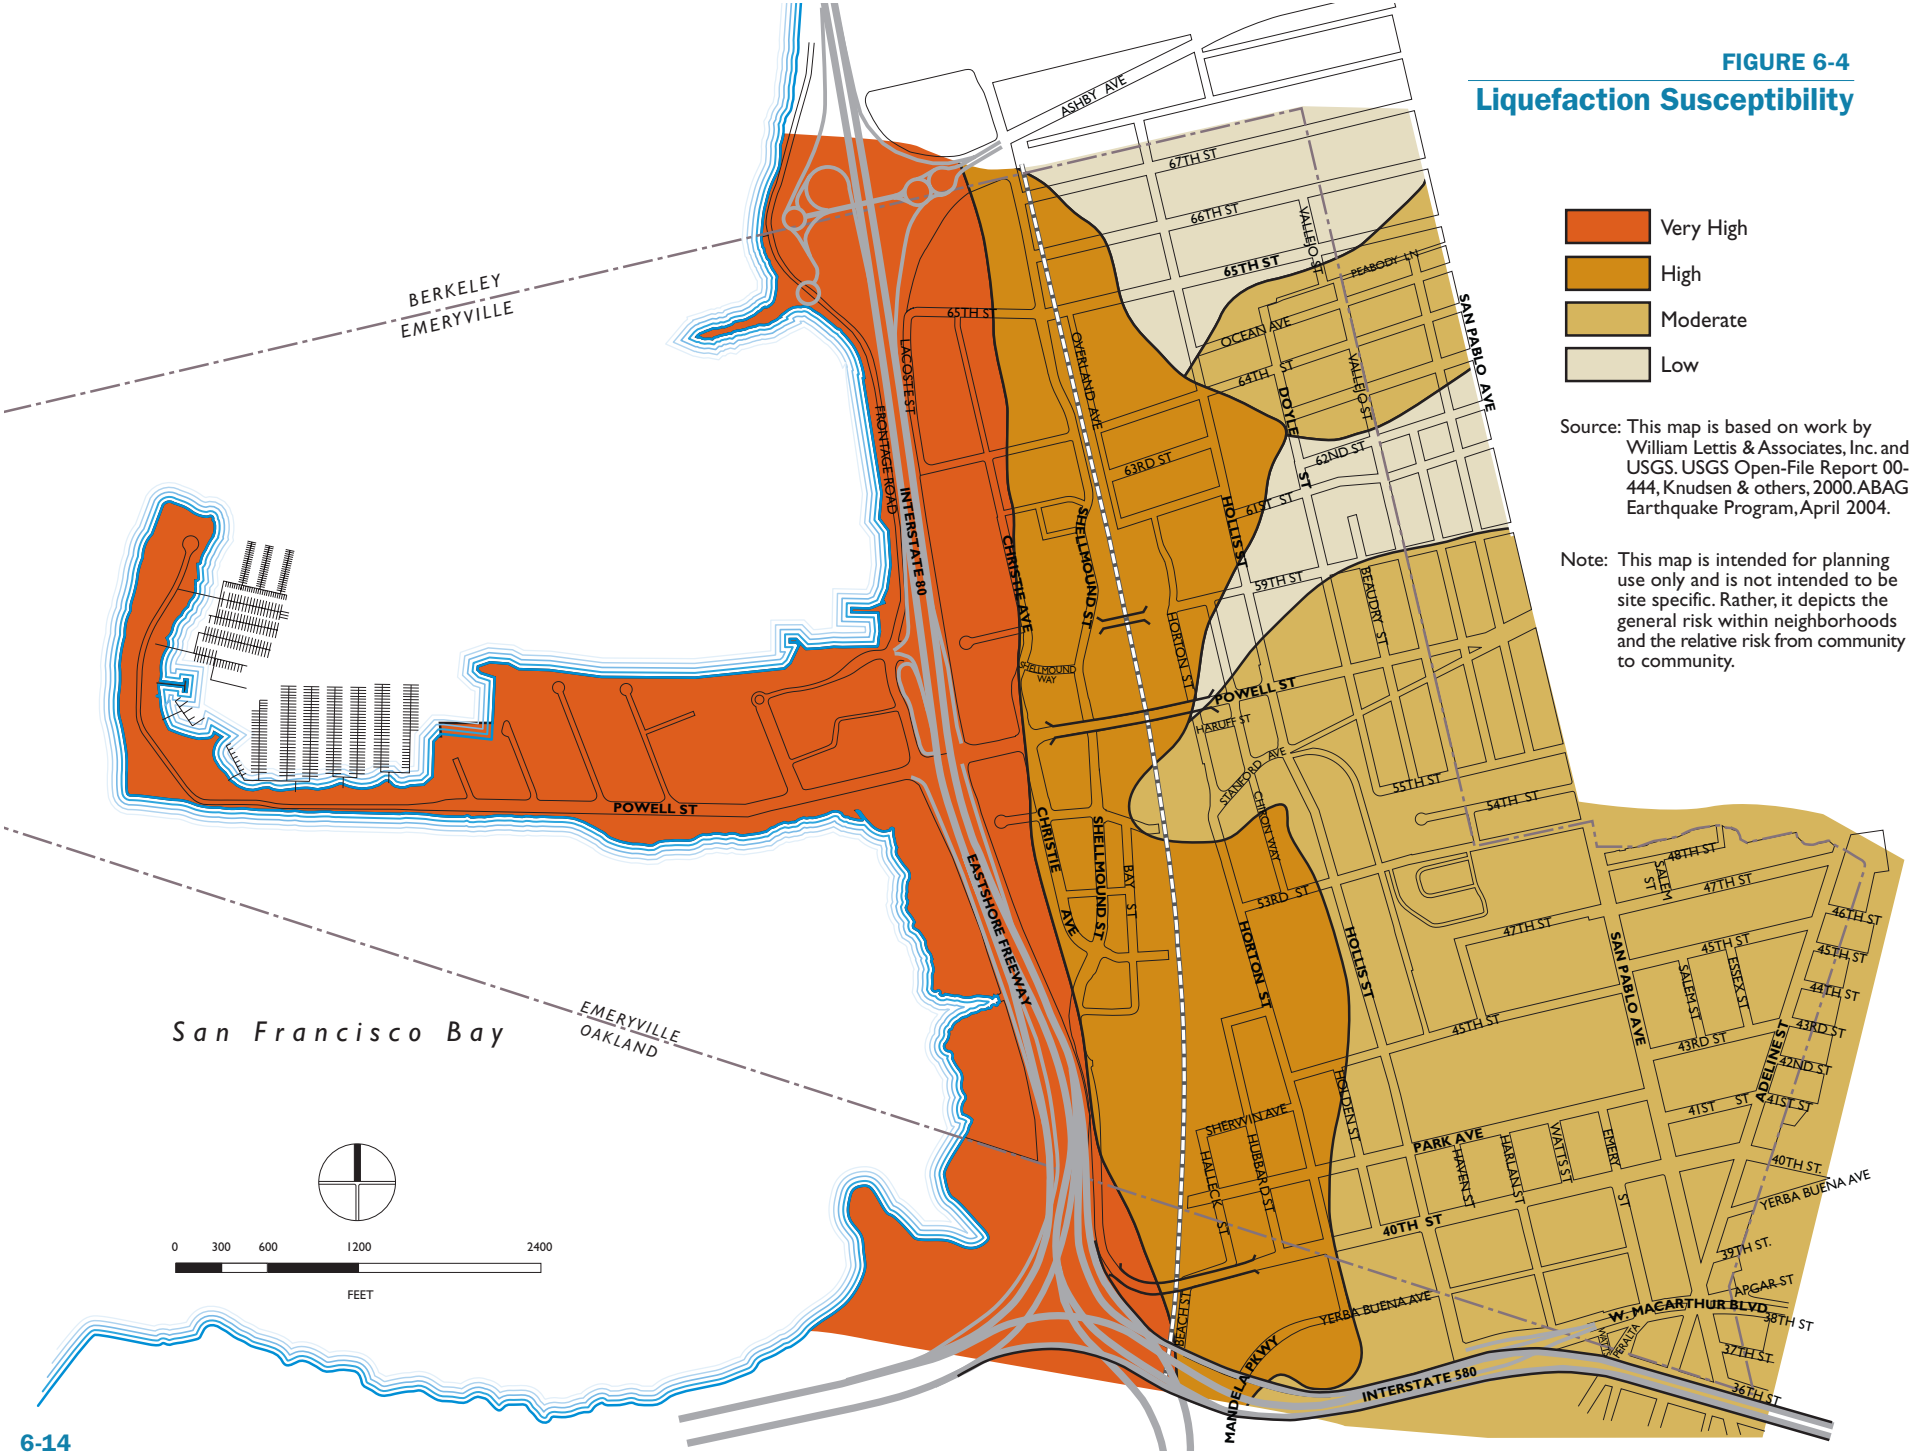
Regional Faults

During an earthquake, shaking of granular loose soil saturated with water can lead to liquefaction. The entire city of Emeryville lies within a liquefaction hazard zone, as shown in Figure 6-4, which presents constraints on development. The Peninsula has a very high susceptibility to liquefaction, while the areas around the rail line and east have a moderate to low risk of liquefaction. Development in a liquefaction hazard zone requires adherence to the guidelines for evaluating and mitigating seismic hazards as required by Public Resources Code Section 2695(a). Before a development permit can be granted for a site within a Seismic Hazard Zone, (i.e. anywhere in Emeryville), a geotechnical investigation of the site must be conducted and appropriate mitigation measures incorporated into the project design. Mitigation of liquefaction hazards can include edge containment structures (e.g. berms, dikes, retaining walls, etc.), driving piles, removal or treatment of liquefiable soils, or modification of site geometry.

The City's Building Division implements and enforces the Emeryville Municipal Code and the California Building Code regulations relative to seismic risk to development. A City Ordinance specifies the need and establishes guidelines for the seismic upgrade of unreinforced masonry buildings. An increase in occupancy or intensification of use triggers the requirement for a seismic upgrade. Over the past ten years 75 percent of the City's unreinforced masonry buildings have been upgraded for seismic safety. The City also provides a program for voluntary upgrades of single family homes.

In 2009, the City is expected to compete a Local Hazards Mitigation Plan to mitigate natural hazards and enhance resistance.

LIQUEFACTION



Liquefaction is a transformation of soil from a solid to a liquefied state, resulting from the buildup of excess pore water pressure, especially during earthquake-induced cyclic loading. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits. Liquefaction and associated failures could damage foundations, disrupt utility service, and cause damage to roadways.

Development must be properly engineered to ensure safety in the event of a major earthquake.

FIGURE 6-4

Liquefaction Susceptibility

Source: This map is based on work by William Lettis & Associates, Inc. and USGS. USGS Open-File Report 00-444, Knudsen & others, 2000. ABAG Earthquake Program, April 2004.

Note: This map is intended for planning use only and is not intended to be site specific. Rather, it depicts the general risk within neighborhoods and the relative risk from community to community.

Hazardous Materials

The City of Emeryville includes a mix of uses and many areas with a high concentration of historical industrial and manufacturing activities. Most of these areas have been largely converted or will be converted to other uses, such as office, commercial retail, and residential. Hazardous material use, storage, transport, and hazardous waste generation within the city can pose hazards to the environment and public health through improper handling or storage.

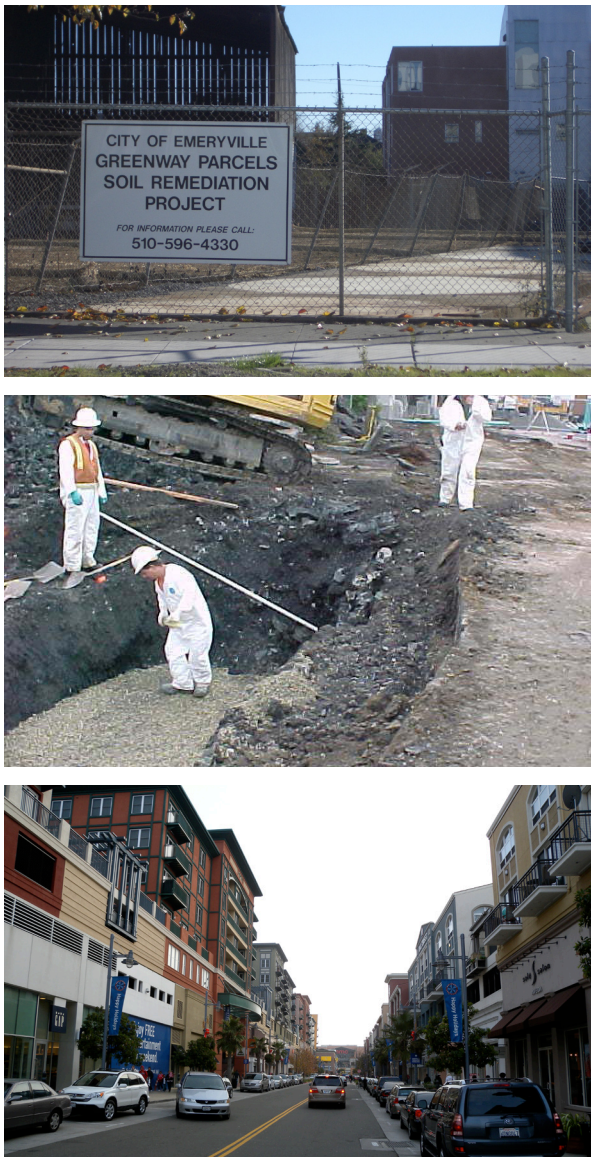
As a result of the historical industrial use, substantial groundwater and soil contamination is present in many locations throughout the city. The presence of contamination can potentially restrict future development of property and require specialized construction practices. Sites should be remediated to the level prescribed by the lead reviewing agency.

Remediation

Emeryville has been a leader in the financing and remediation of brownfields. In 1995, the US EPA initiated a program to help states, communities, and others to redevelop abandoned contaminated land. The program provides grants that support revitalization efforts by funding environmental assessment, cleanup, and job training activities. The City of Emeryville has benefited from the program, which has helped revitalize an area that industry abandoned during the 1970s. As of 2008, more than 40 sites totaling 240 acres had been targeted for cleanup and have been or are identified for redevelopment.

Flooding and Drainage

Surface Hydrology

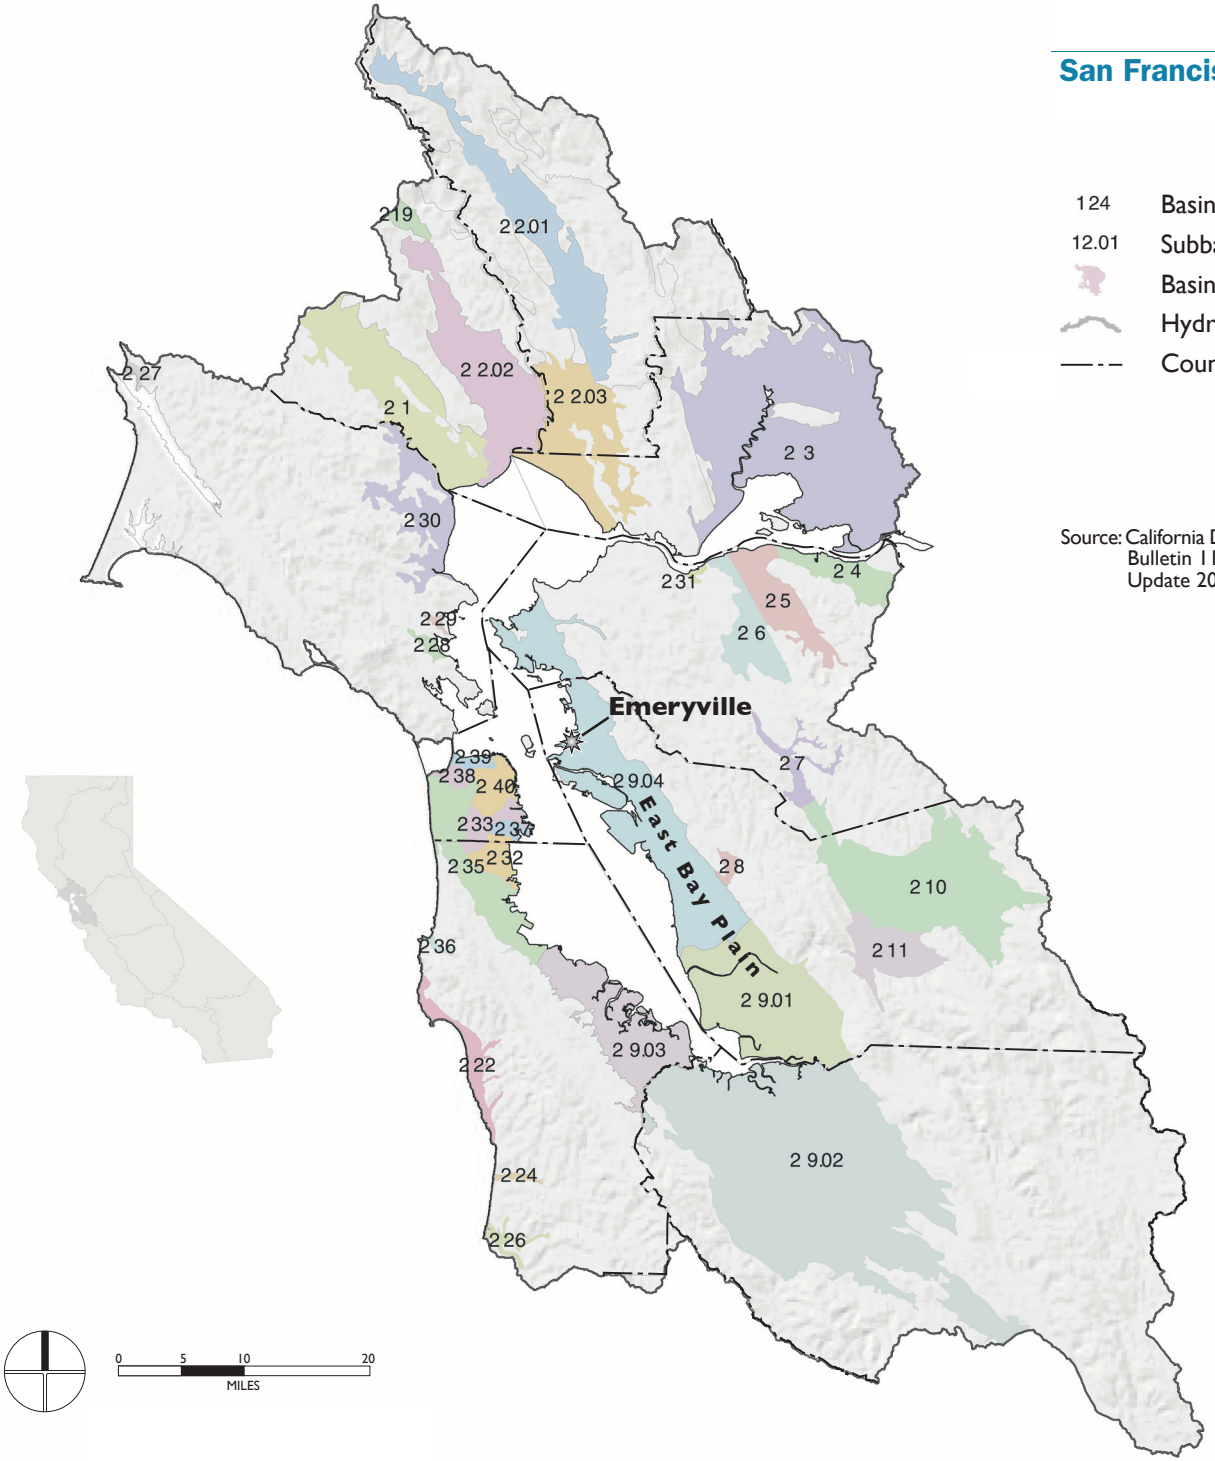


Emeryville lies in the Central Basin within the San Francisco Bay hydrologic region. Although the topography of the city is generally flat, its elevation ranges from 0 to 60 feet above mean sea level and slopes down slightly to San Francisco Bay, which is a major receiving water body. The other surface water feature in the city is Temescal Creek, which flows west from the East Bay Hills into San Francisco Bay.

San Francisco Bay

The city lies in the San Francisco Bay watershed. San Francisco Bay is the most prominent surface water body (see Figure 6-5) that receives surface water runoff from the city and groundwater discharge from the East Bay Plain. The southern portion of the Bay shoreline in the city includes a salt marsh. Rocks have been installed along the deeper waters adjacent to the Emeryville Peninsula for erosion control.

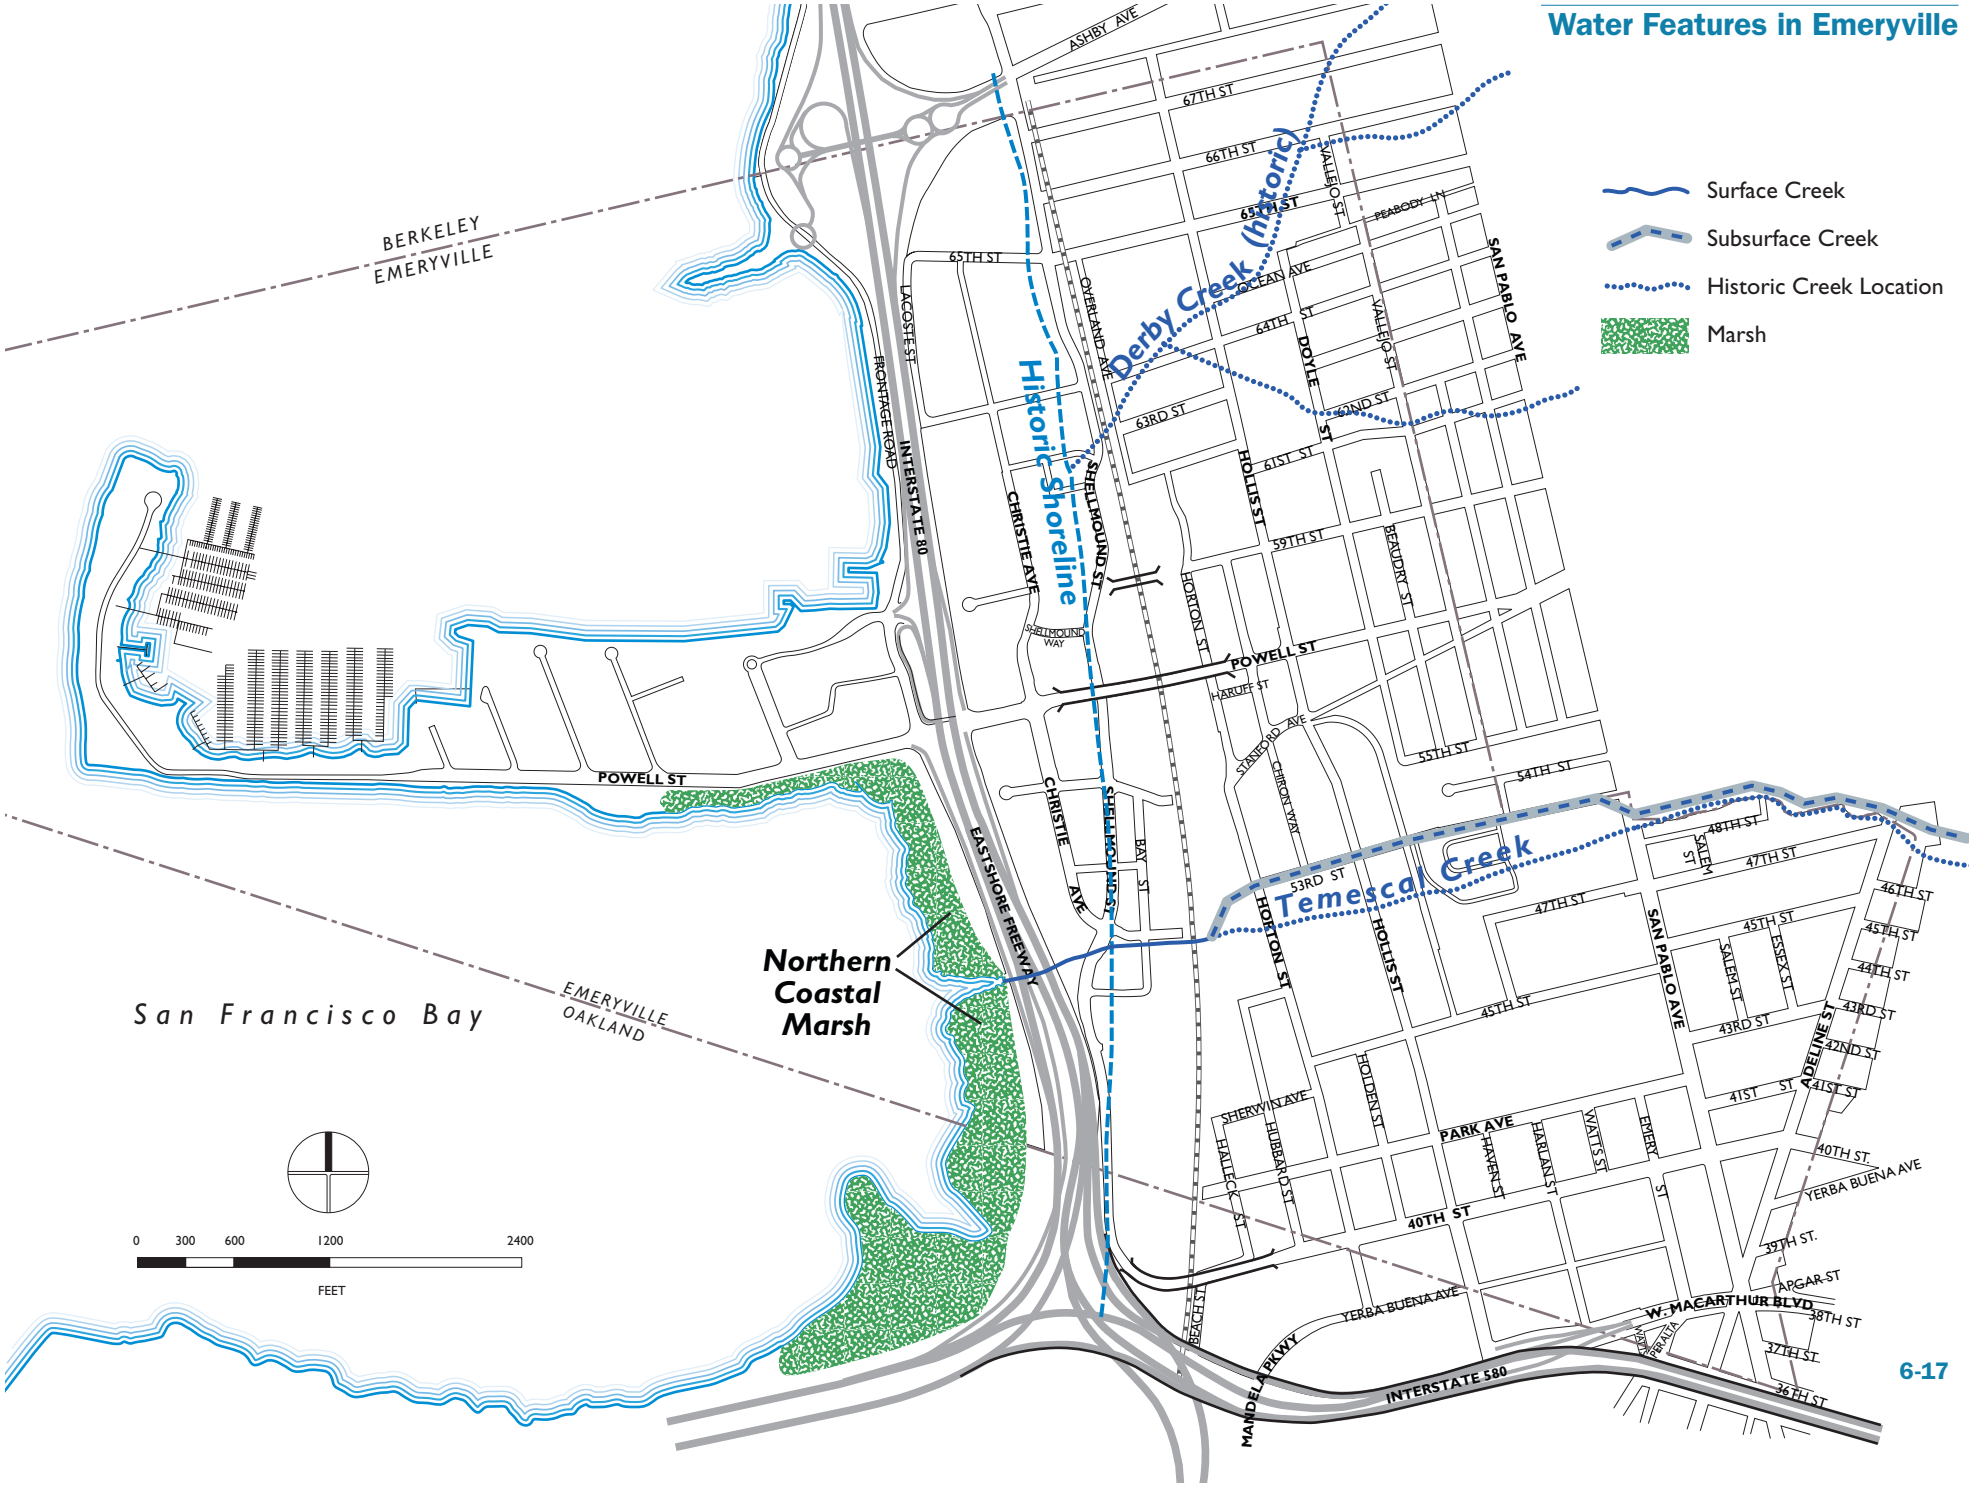
Temescal Creek



Temescal Creek, a main drainage outfall within the city (see Figure 6-6), is a channelized creek draining Lake Temescal. It flows through the city, passes under Interstate 80, and discharges into San Francisco Bay in the Emeryville Crescent. The creek is dry most of the year and runs underground through portions of the city. Currently, the creek flows are partially regulated by the Lake Temescal Reservoir. The General Plan proposes to celebrate the Creek by establishing a greenway along its course, which will include surface water features. For flood control purposes the main channel will remain primarily underground.

The City has been a leader in brownfields remediation. Emery Station (middle) and Bay Street (bottom) were constructed on remediated brownfield sites.

FIGURE 6-5



San Francisco Bay Hydrologic Region

Source: California Department of Water Resources, Bulletin 118, California Groundwater Update 2003.

FIGURE 6-6

Water Features in Emeryville

Groundwater Basins

The city is located within the East Bay Plain groundwater basin 4 in Alameda County (see Figure 6-5). The East Bay Plain extends up to 114 square miles. The water table (or the upper limit of the saturated groundwater zone) in the city is relatively high, occurring only several feet below the ground surface.

Stormwater Drainage

Surface runoff from the city flows through Temescal Creek or is collected in local storm drains and is discharged directly into the Bay. The city is highly urbanized and primarily covered with pavement, buildings, areas of surface-compacted soil, and other features that allow only minimal infiltration of rainfall into the soil. The existing sanitary sewer system in the area is generally old and in poor condition. Although separate sanitary and storm sewer lines exist throughout the city, the lines run parallel to each other. Stormwater from the storm sewer lines can leak into the sanitary sewer lines, causing excessive infiltration into the sanitary sewer collection system. As a result, excess flows of wastewater are released to San Francisco Bay without adequate treatment. The East Bay Municipal Utility District (EBMUD) initiated an East Bay Infiltration/Inflow Correction Program to eliminate wet weather overflows of raw sewage to community streets, creeks, and the Bay. Emeryville's leadership in stormwater management through the permit process and its stormwater guidelines are detailed in Section 7.2 of Chapter 7: Sustainability.

Flood Zones

The Federal Emergency Management Agency (FEMA) prepared new maps of Emeryville's flood risk potential in December 2007, which went into effect on August 3, 2009. As shown in Figure 6-7, the majority of Emeryville is designated as Zone X (i.e., areas outside the 500-year flood zone). The shoreline and marina areas are designated as Zone V and lie within the 100-year flood zone; however, these area do not contain urban uses or structures. Flooding in the city could also occur as a result of storm-induced flooding, inundations from dam failure, and tsunamis as discussed below.

Global Climate Change and Sea Level Rise

While climate change is a global concern, the local effects, in terms of flooding and sea level rise, could be severe in Emeryville. The San Francisco Bay Conservation and Development Commission (BCDC) projects a 16-inch sea level rise scenario at mid-century. This could, in turn, erode bay shores, marshes and wetlands, and increase the salinity of rivers. In addition, if average temperatures increase, this could shorten the snowfall season in the Sierra Nevada Mountains, increasing the amount of rain and the rate of snow melt, thereby threatening even coastal cities, such as Emeryville, with increased flooding.

The BCDC prediction suggests that there are vulnerable areas along the shoreline of the Emeryville Crescent and peninsula, as shown in Figure 6-8; however, there are no structures or urban areas within this zone. Moreover, the BCDC model compares a sea level rise scenario to land-surface elevation data and does not account for shoreline protection; therefore the area south of 64th Street and west of I-80 does not account for the at-grade freeway barrier. BCDC's 2100 scenario, projecting 55-inch sea level rise (not shown) would have implications for Emeryville's urban area, but lies far beyond the scope and planning horizon of the proposed General Plan. Sea level risk threats and mitigations are also discussed in Emeryville's Climate Action Plan and in Section 7.2 of Chapter 7: Sustainability.

Inundation from Dam Failure

The closest dam near the city is the dam at Lake Temescal, which is located approximately 3.5 miles east of the city limits. Lake Temescal Dam is managed by the East Bay Regional Parks Department and is overseen by the California Department of Water Resources, Division of Safety of Dams (DSOD). The DSOD supervises dam maintenance and inspections. Dams are required to adhere to rigorous DSOD standards, which include seismic analysis of existing dams to assure their integrity and conducting regular inspections. As of 2008, the dam was last inspected in September 2007, revealing no concerns for stability—particularly in light of fill from Highway 24 buttressing the dam and its wide cross section.[9] The likelihood of flood hazard is dependent upon the occurrence of a major earthquake and the ability of the dam to withstand seismic activity. If the dam were to fail, it is estimated to cause overflowing of Temescal Creek with inundation of nearly 1,000 feet of land area on either side of the creek within 15 minutes. The water could reach the rest of the city, west toward the Bay, and north approximately to Powell Street within 25 minutes as shown in Figure 6-7.

Tsunamis

Tsunamis are caused by submarine seismic or volcanic disturbances. The U.S. Geologic Survey estimates that a 20-foot wave at the Golden Gate Bridge (an event estimated to possibly occur once in 200 years) could potentially cause a run-up of a 10-foot wave in the Emeryville Peninsula and the shoreline area.

9 *Department of Water Resources. Division of Dam Safety, Correspondence with Regional Engineer, August 2008.*

Fire Hazards

The City of Emeryville does not have the terrain and vegetation conditions for large or devastating wildfires. However, urban fires are a constant threat. The worst case urban fire could be associated with an earthquake. A discussion of and policies concerning the Fire Department and related prevention and firefighting services may be found in Chapter 4: Parks, Open Space, and Public Facilities.

In the event of an emergency, the Fire Department is reliant on sufficient water flows to fight fires. The Department specifies minimum water pressure (e.g. 1,500 gallons per minute for a small building; 2,000 g.p.m. for a larger building). Actual peakload varies with districtwide demand.

Evacuation Routes and Safety Standards

Evacuation routes are designated along San Pablo Avenue, Hollis Street, and Interstate-80, although the actual routes will depend on the circumstances of the emergency. The City has an informal agreement with AC Transit to assist in evacuation in case of an emergency.

In addition, the City specifies minimum roadway widths of 20 feet (exclusive of parking lanes), in order to ensure access for emergency vehicles and other equipment.

Although Emeryville is not susceptible to wildfires like the Oakland hills (background), urban fires present a constant threat. The Fire Department maintains safety standards for road and building construction to ensure the safety of the community.

Note: This map is intended for planning use and is for informational purposes only. Inundation data does not account for existing shoreline protection or wave activity.

6.3 NOISE

Noise can be defined as a sound or series of sounds that are intrusive, irritating, objectionable and/or disruptive to daily life. Background noise is primarily the product of many distant noise sources, which constitute a relatively stable noise background exposure, with individual contributors unidentifiable. Noise levels are also affected by short duration single event noise sources (e.g., aircraft flyovers, motor vehicles, sirens), which are readily identifiable to the individual. The known effects of noise on humans include hearing loss, communication interference, sleep interference, physiological responses, and annoyance.

People in residences, motels and hotels, schools, libraries, churches, hospitals, nursing homes, auditoriums, natural areas, parks and outdoor recreation areas are generally more sensitive to noise than are people at commercial and industrial establishments. Consequently, noise standards for sensitive land uses are more stringent than for those at less sensitive uses. To protect various human activities in sensitive areas, lower noise levels are generally required.

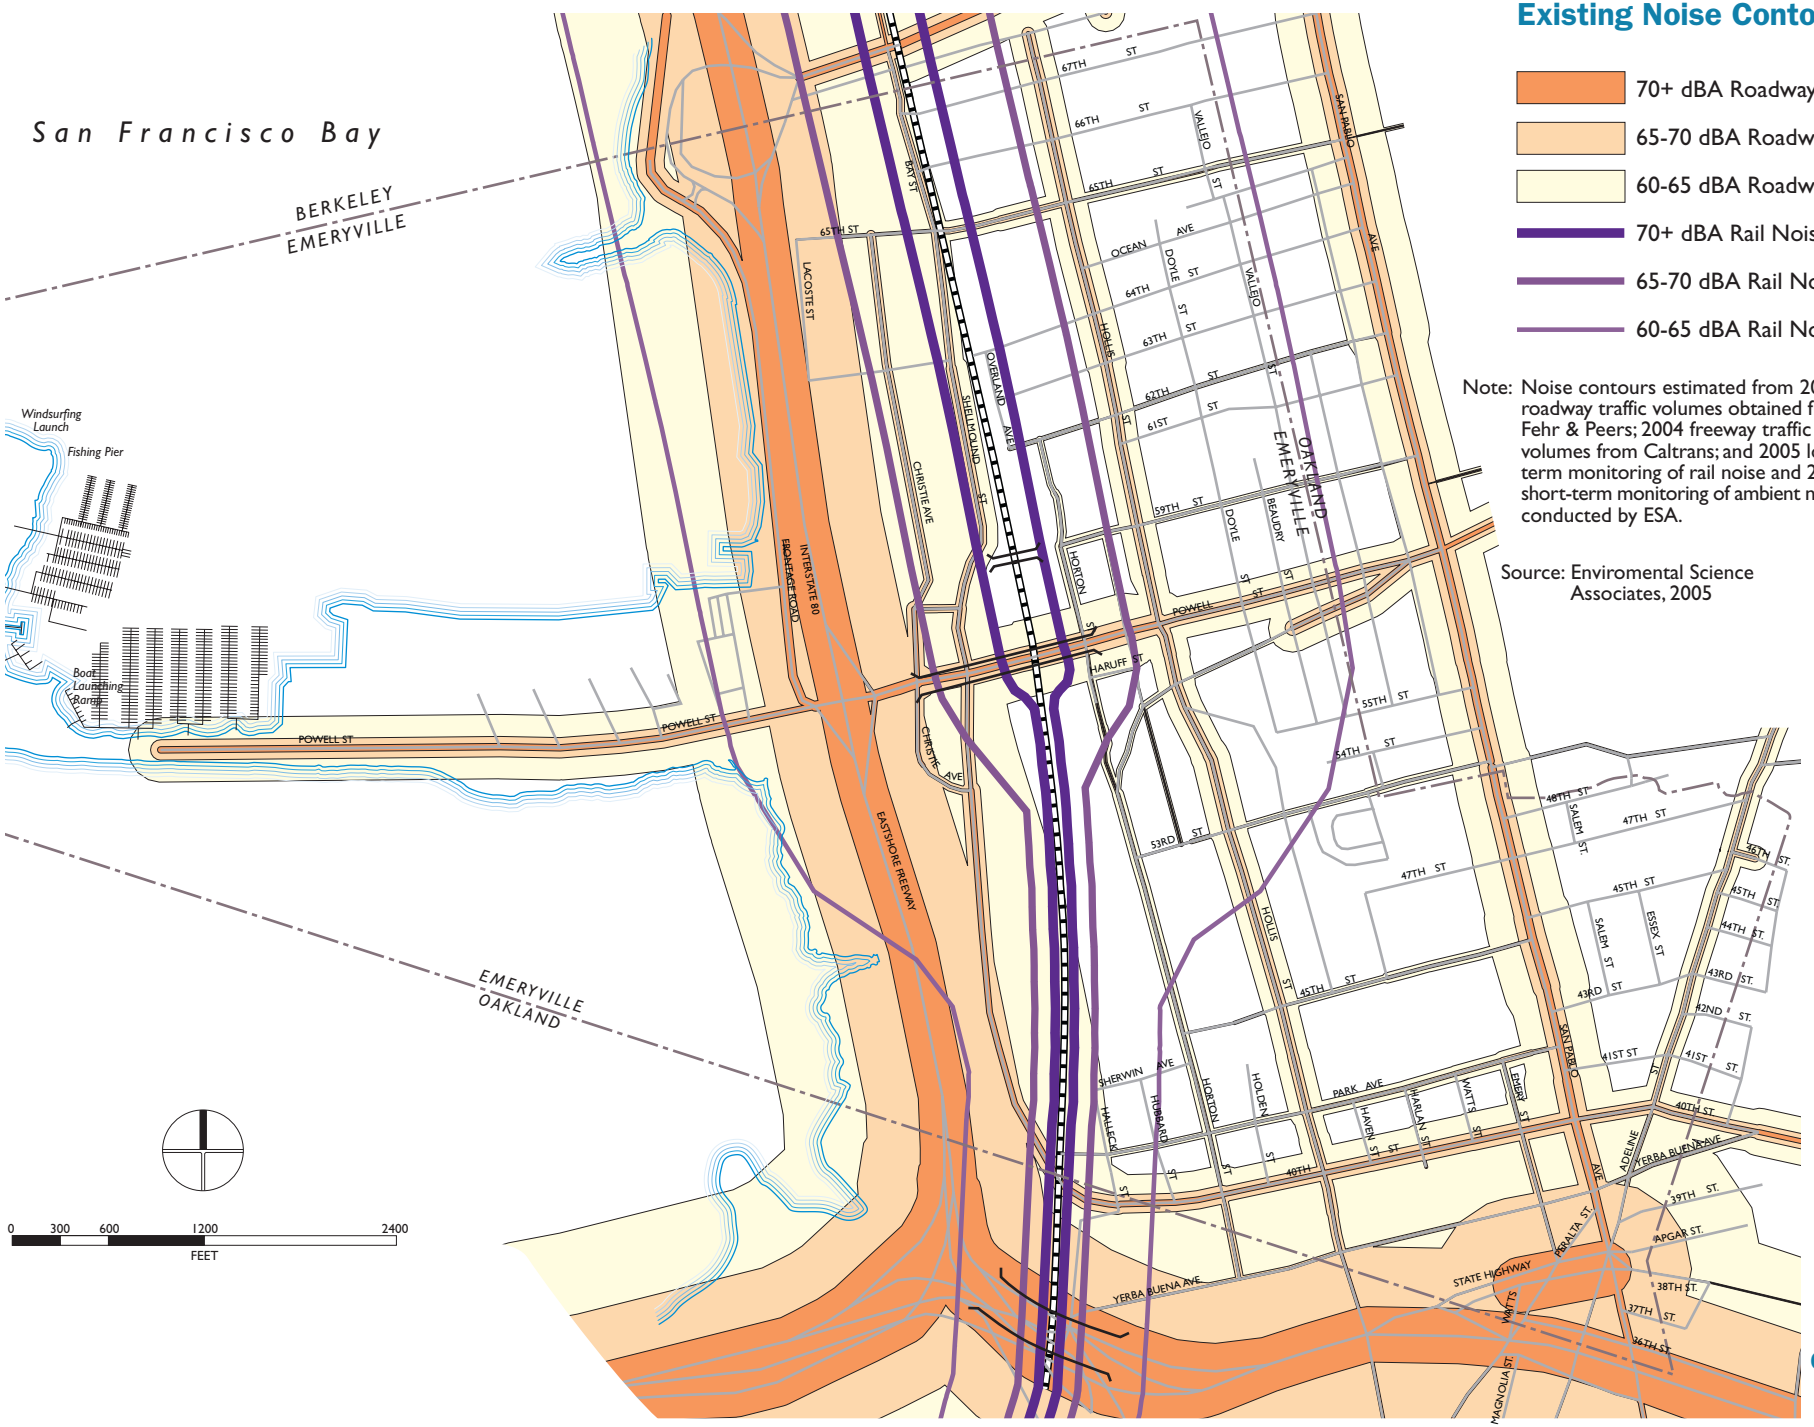
Noise Measurement

When noise levels are reported, they are expressed as a measurement over time in order to account for variations in noise exposure. Levels also account for varying degrees of sensitivity to noise during daytime and nighttime hours. The Community Noise Equivalent Level (CNEL) and Day-Night Noise Level (Ldn) both reflect noise exposure over an average day with weighting to reflect this sensitivity.

Elevated highways and passing trains create prominent levels of noise in Emeryville.

Existing Noise Sources and Levels

Existing Noise Levels



The primary major sources of persistent noise generated by transportation within Emeryville are from major roadway arterials throughout the city (Powell Street, San Pablo Avenue, 40th Street), highways 80 and 580, Union Pacific Railroad and Amtrak train activity, and aircraft overflights from the San Francisco and Oakland International airports.

Ambient noise monitoring was conducted to assess current noise levels in Emeryville at a variety of land uses proximate to major noise sources. Short-term noise measurements were taken during the peak hour traffic periods and adjacent to the major noise sources in the city. These measured noise levels included major noise sources (traffic and/or train passbys) in addition to non-traffic noise sources. Additional long-term (24-hour) noise measurements were taken near rail activity and where other major noise sources could be excluded to the extent possible.

Figure 6-9 reflects the existing noise level contours for 60, 65, and 70 dBA primarily generated by existing local roadway traffic levels (based on noise monitoring and levels calculated along roadway segments that extend from 47 traffic study intersections throughout the city, as presented in Chapter 3: Transportation) as well as freeway traffic levels.

FIGURE 6-9

Existing Noise Contours

Note: Noise contours estimated from 2005 roadway traffic volumes obtained from Fehr & Peers; 2004 freeway traffic volumes from Caltrans; and 2005 long-term monitoring of rail noise and 2005 short-term monitoring of ambient noise conducted by ESA.

Source: Enviromental Science Associates, 2005

Construction activity (top) is restricted to certain hours of the day, but still causes short-term temporary noise impacts. Mechanical equipment that is not appropriately shielded or integrated into building design may lead to unnecessary noise exposure (bottom).

Existing Noise Sources

Freeway and Internal Roadways

Freeways are a major noise source in Emeryville. Most of Emeryville is located between the I-80 and I-580 freeways. I-80 runs north-south towards the western boundary, while I-580 runs approximately east-west just below the southern boundary. The section of I-580 adjacent to Emeryville is elevated. Freeway noise is expected to remain an issue in the future for noise sensitive uses, such as residential development. The city also has busy internal roadways such as Powell Street, 40th Street, and San Pablo Avenue. Noise from these sources can be a significant environmental concern where buffers (e.g., buildings, landscaping, etc.) are inadequate or where there is minimal distance from the roadways to sensitive uses.

Railroad Noise

Train noise, however intermittent, is a major source of noise due to its magnitude. Residents have observed that freight trains often park with diesel engines running for extended periods, which can also be a significant source of railroad-related noise. Locomotive engines and the interaction of steel wheels and rails generate primary rail noise. Train air horns and crossing bell gates contribute to loud noise levels near grade crossings. The freight trains operate with lower speeds in the range of 15 to 20 miles per hour; therefore, the associated maximum noise level is also low. As depicted in Figure 6-9, noise levels vary along the railroad tracks, showing higher noise levels in areas where surface crossings occur, generally north of Powell Street.

Airport Noise

Though the city is not located within the 65-CNEL noise contours for the San Francisco and Oakland International airports, noise from aircraft over flights is audible throughout the city and contributes to the ambient noise environment.

Industrial Noise

Industrial uses are another source of noise that can have a varying degree of impact on adjacent uses. A variety of mechanical equipment, generators, and vehicles all contribute to noise levels at industrial sites. There are also many areas in Emeryville where residential uses are in close proximity to light industrial uses, which are expected to continue according to the General Plan land use diagram.

Construction Noise

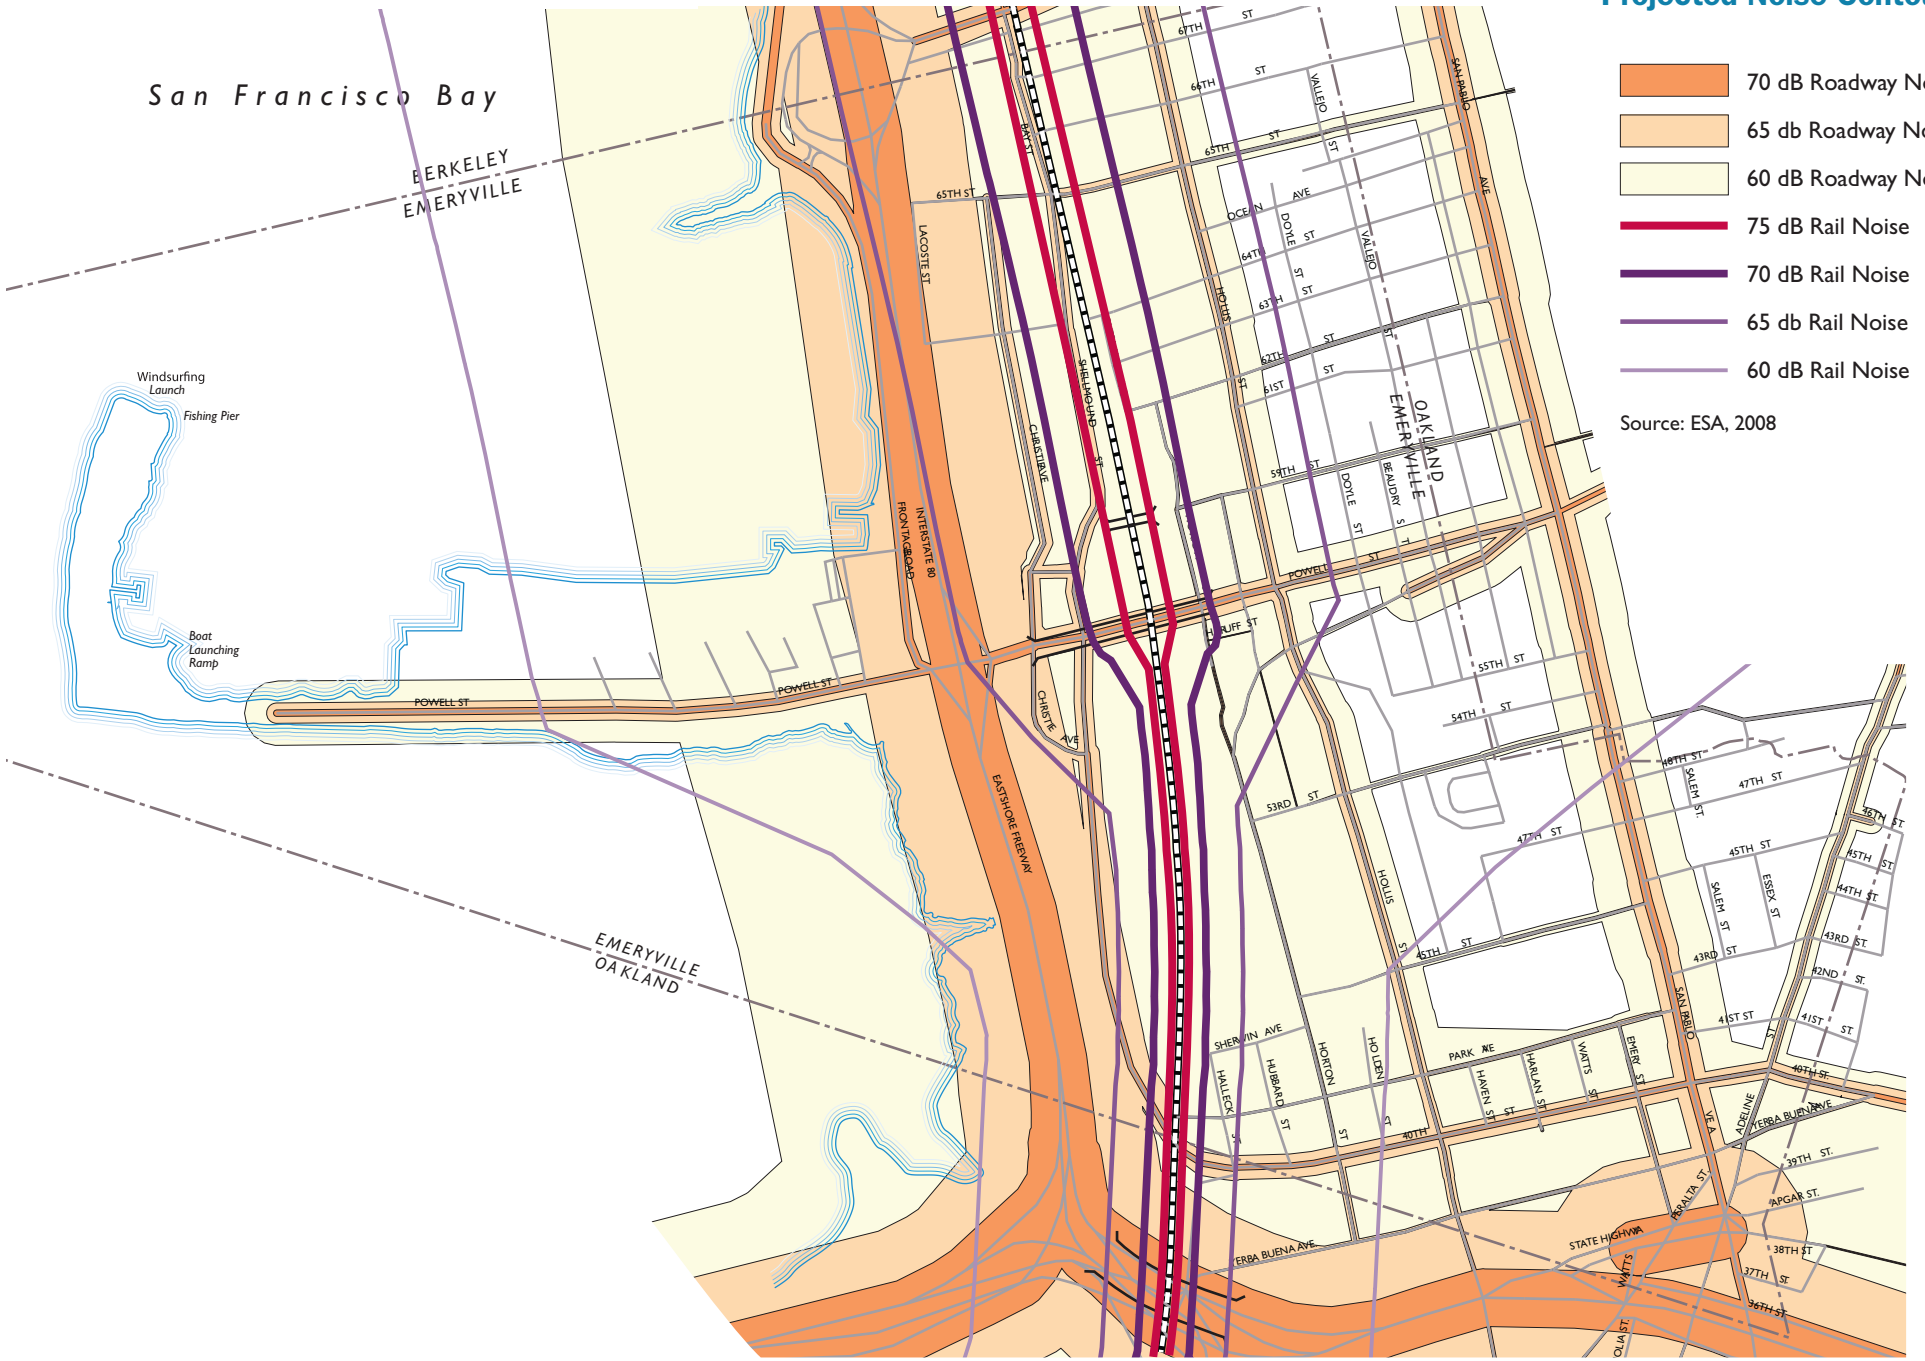
Construction can be another significant, although typically short-term, source of noise. Construction is most significant when it takes place near sensitive land uses, occurs at night, or in early morning hours. The dominant construction equipment noise source is usually a diesel engine without sufficient muffling. In a few cases, however, such as impact pile driving or pavement breaking, process noise dominates. The City currently regulates construction activity through Municipal Code Chapter 13, Section 5-13.05.

Other Equipment Noise

Several other portable or small-scale pieces of equipment may also produce noise effects. Mechanical equipment, such as pumps and fans may produce low noise levels, but continuously and for substantial distances. Portable power equipment, such as leaf blowers and drills, is ubiquitous in the modern city, and can produce very high noise levels at the location of the work. Other amplified sounds, from automotive audio equipment or loudspeakers also create noise exposure.

FIGURE 6-10

Projected Noise Contours



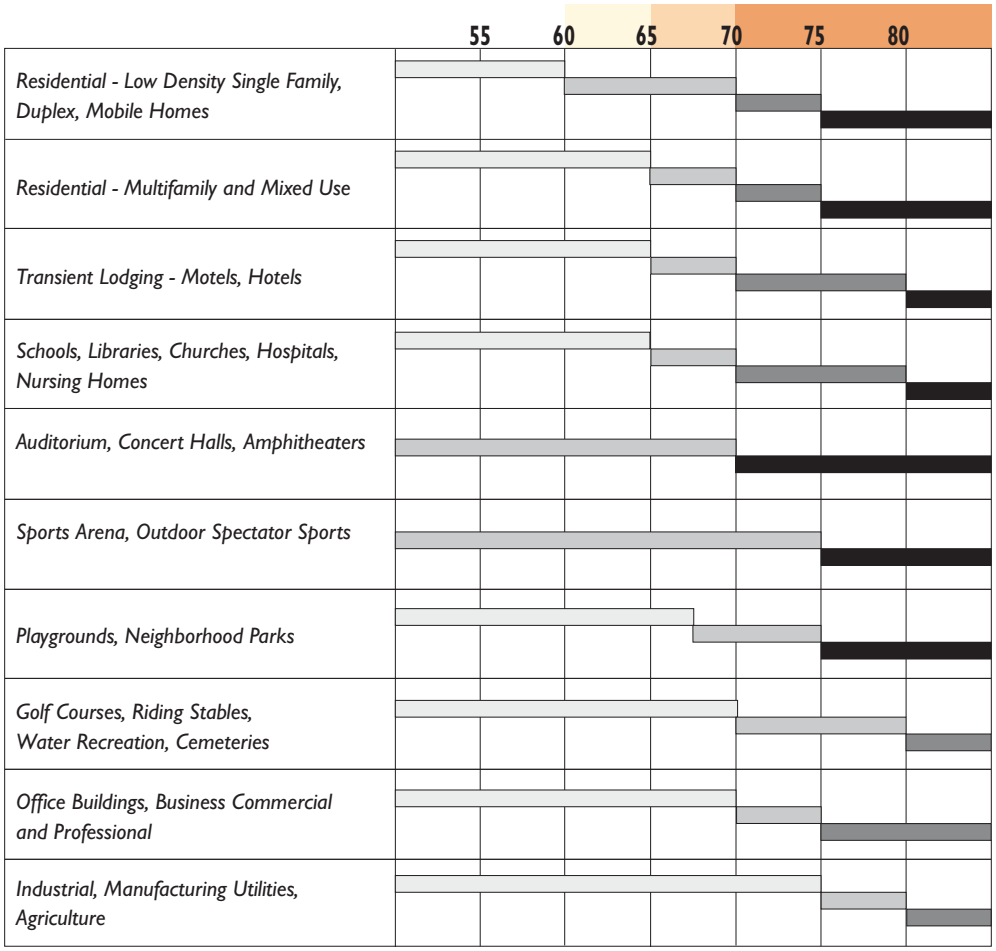


FIGURE 6-11

Community Noise Exposure (Ldn or CNEL, db)

NORMALLY ACCEPTABLE
Specified land use is satisfactory, based upon the assumption that any building involved is of normal conventional construction, without any special noise insulation requirements.

CONDITIONALLY ACCEPTABLE
New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

NORMALLY UNACCEPTABLE
New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

CLEARLY UNACCEPTABLE
New construction or development should generally not be undertaken.

Source: *California Governor's Office of Planning and Research, 1990; Environmental Science Associates, 2008.*

Projected Noise Sources and Levels

Future development within the City's Planning Area along with pass-through traffic will result in increased noise levels. The primary noise sources in Emeryville will continue to be Interstate 80, the railroad, and traffic along other major thoroughfares. Future noise contours are illustrated in Figure 6-10. Compared with existing conditions, noise levels emanating from the freeway represent the greatest increase in potential noise impacts. (Noise levels from the railroad are not expected to increase substantially.) The 70 and 65 dbl contours (the more severe impacts) are only projected to increase slightly over the planning period, while the 60 dbl contour is projected to extend east to Hollis Street.

The noise exposure matrix defined in Figure 6-11 explains the compatibility of land uses, given their respective levels of community noise exposure. This matrix can be used to review land use decisions within a given contour.

Increases in traffic levels may be counteracted by the implementation of alternate forms of transportation and land use design that reduce vehicle miles traveled in the region. In addition, the Plan calls for locating noise-sensitive uses (e.g. residences, schools, other public facilities) away from high-noise areas, such as the freeway and railroad. Where such uses are already planned such as in the North Bayfront, South Bayfront and North Hollis districts, noise studies and additional mitigations are required under the General Plan. These measures including siting residences appropriately near noise sources (see LU-P-25) and requiring design features to reduce impacts, such as double-paned windows or soundproofing.

GOALS AND POLICIES

GOALS

CSN-G-1 **Public health—**A high level of public health and safety.

CONSERVATION

CSN-G-2 **Improved air quality—**Local ambient air quality levels that help meet regional attainment status and contain low levels of air pollutants.

CSN-G-3 **Water quality and conservation—**High-quality groundwater and surface water resources. Improved water conservation, increased use of recycled water, and reduced per capita water consumption.

CSN-G-4 **Reduced per capita water consumption—**By 2030, per capita water consumption will be reduced by 30 percent over 2008 levels.

CSN-G-5 **Preservation and protection of natural resources—**Preservation and enhancement of natural habitat, and protection of biological resources, particularly around the Emeryville Crescent.

CSN-G-6 **Respect for the past—**A community that respects and preserves the cultural resources of its past and integrates that history into future development.

CSN-G-7 **Protection of cultural resources—**Protection of historic, cultural, and archeological resources for the educational, aesthetic, environmental, and economic contribution that they make to Emeryville's identity and quality of life.

SAFETY

CSN-G-8 **Protection from natural and manmade hazards—**Protection of life, natural environment, and property from natural and manmade hazards due to seismic activity, hazardous material exposure or flood damage.

NOISE

CSN-G-9 **Protection from noise—**Protection of life, natural environment, and property from manmade hazards due to excessive noise exposure.

CSN-G-10 **Ambient noise reduction—**Strive to minimize increases in ambient noise levels.

POLICIES

Implementing actions supporting each policy are described in Chapter 8: Implementation Program.

CONSERVATION

Air Quality

(Note that policies within the Land Use, Transportation, and Sustainability chapters also reduce air pollutants, by encouraging walkability and alternative transportation measures, green buildings, and other energy efficiency improvements.)

CSN-P-1 Air quality will be maintained and improved by requiring project mitigation, such as Transportation Demand Management (TDM) techniques, where significant air quality impacts are identified.

CSN-P-2 The City will budget for clean fuels and vehicles in the City's long-range capital expenditure plans, to replace and improve the existing fleet of gasoline and diesel powered vehicles.

CSN-P-3 The City will coordinate air quality planning efforts with local, regional, and state agencies and support the Bay Area Air Quality Management District's efforts to monitor and control air pollutants from stationary sources.

CSN-P-4 Dust abatement actions are required for all new construction and redevelopment projects.

CSN-P-5 All large construction projects are required to reduce diesel exhaust emissions through use of alternate fuels and/or control devices.

CSN-P-6 Adequate buffer distances shall be provided between offensive odor sources and sensitive receptors, such as schools, hospitals, and community centers.

Water Quality and Conservation

CSN-P-7 New commercial and industrial activities, as well as construction and demolition practices, shall be regulated to minimize discharge of pollutant and sediment concentrations into San Francisco Bay.

CSN-P-8 The City will continue to support regional watershed conservation through local land use planning, open space policies, and water quality conservation efforts.

CSN-P-9 The City will continue programs to inform residents of the environmental effects of dumping household waste, such as motor oil, into storm drains that eventually discharge into San Francisco Bay.

CSN-P-10 New development is required to incorporate source control, site design, and storm water treatment to reduce pollutants in stormwater runoff.

CSN-P-11 Exterior uses of water for landscaping and other purposes shall be reduced to minimize or eliminate runoff and water waste.

CSN-P-12 The City promotes use of recycled water on landscaping and other non-food source plantings.

CSN-P-13 The City promotes construction and incorporation of cisterns, green roofs and other rainwater harvesting methods in existing, new and rehabilitation projects.

CSN-P-14 The City will allow homeowners to divert untreated rainwater for non-potable uses, such as outdoor irrigation and toilet flushing, through use of rainwater barrels or similar methods.

CSN-P-15 The City shall consider revising plumbing and building code requirements, as necessary, to allow for graywater and rainwater harvesting systems.

CSN-P-16 The City will continue to support the use of recycled water in new and rehabilitation projects, through the development process.

CSN-P-17 The City supports public education initiatives to encourage conservation of potable water.

Habitat

CSN-P-18 The City will encourage protection of essential habitat for special status species and support habitat protection and enhancement within Emeryville that are within the City's control.

CSN-P-19 The natural environment, including mature trees and landscaping, shall be protected from destruction during new construction and redevelopment. Adequate replacement shall be provided where protection is impossible.

CSN-P-20 The City encourages incorporation of native plants into landscape plans for new developments and City projects and parks and preservation of mature trees on new developments and City projects.

CSN-P-21 The City discourages use of non-native invasive species in any landscaped or natural areas.

CSN-P-22 Provide visual access to the Emeryville Crescent in a manner consistent with the protection of this fragile ecological system.

CSN-P-23 Where new trails or other improvements are proposed in the vicinity of the baylands and essential habitat for special-status species, require adequate avoidance and mitigation necessary to protect sensitive resources.

CSN-P-24 The City shall explore opportunities for habitat restoration and enhancement, particularly in larger parks and open space areas.

CSN-P-25 Appropriate avoidance measures will be implemented to minimize the loss of special status species nesting birds during new construction. This can be accomplished through timing of vegetation removal and building demolition during the non-nesting season or through preconstruction surveys where a potential for nesting remains on proposed development sites.

Cultural Resources

CSN-P-26 The City encourages developers to reuse existing historic or architecturally significant structures.

CSN-P-27 Development that proposes to demolish identified historic resources shall be reviewed on a case by case basis to determine if the benefit of preserving the resource is outweighed by benefit of the new development.

CSN-P-28 The City shall continue to implement ordinances pertaining to architecturally significant structures, and as necessary refine and update these to ensure adequate recognition and incentives for reuse.

CSN-P-29 New development adjacent to historic and architecturally significant structures shall be reviewed for compatibility with the character of the structure and the surrounding neighborhood.

CSN-P-30 Archaeological sites and resources shall be protected from damage. Areas found to contain significant indigenous artifacts shall be examined by a qualified archaeologist for recommendations concerning protection and preservation.

CSN-P-31 If demolition of a historical or architecturally significant building is necessary for safety reasons, attempt to preserve the building façade for adaptive reuse during reconstruction.

CSN-P-32 The City encourages municipal and community awareness and support for Emeryville's historic, cultural, and archeological resources.

CSN-P-33 In order to reduce light pollution and use less energy, lighting (including on streets, recreational facilities, and in parking areas) should be designed to prevent artificial lighting from illumi-

nating natural resources or adjacent residential neighborhoods.

SAFETY

The Fire Department manages an emergency operations plan for the city and a set of evacuation routes in the event of an emergency. Policies are described in Chapter 4: Parks, Open Space, and Public Facilities.

Geologic, Soils, and Seismic Hazards

CSN-P-34 The City will continue to regulate development, including remodeling or structural rehabilitation, to ensure adequate mitigation of safety hazards on sites having a history or threat of seismic dangers, erosion, subsidence, or flooding.

CSN-P-35 The City will require geotechnical investigation of all sites proposed for development in areas where geologic conditions or soil types are susceptible to liquefaction (see "very high" and high" level areas on Figure 6-4). The City also requires submission of geotechnical investigation and demonstration that project conforms to all recommended mitigation measures prior to city approval (as required by State law).

CSN-P-36 The City will continue to require soil erosion control measures during construction.

CSN-P-37 The City will enforce regulation of potentially hazardous structures to be retrofitted and made safe and encourage property owners to abate or remove structural hazards that create unaccepted levels of risk.

Hazardous Materials

CSN-P-38 Prior to reuse, development sites will be remediated, according to relevant State and federal regulations.

CSN-P-39 The City will enforce regulation of local and State laws regarding the production, use, storage, and transportation of hazardous materials and waste.

CSN-P-40 The City requires abatement of lead-based paint and asbestos prior to structural renovation or demolition, and compliance with all State, Federal, Occupational Safety and Health Administration, Bay Area Air Quality Management District, Alameda County, and local rules and regulations.

CSN-P-41 Development on sites with known contamination of soil and groundwater shall be regulated to ensure that construction workers, future occupants, and the environment as a whole, are adequately protected from hazards associated with contamination.

CSN-P-42 The City supports public awareness and participation in household waste management, control, and recycling.

CSN-P-43 Siting of businesses that use, store, process, or dispose of substantial quantities of hazardous materials shall be carefully restricted in areas subject to very strong levels of ground shaking (Figure 6-2)

Flooding and Drainage

CSN-P-44 The City will continue to require development projects to implement on-site stormwater management measures through the City's development permit process.

CSN-P-45 Storm drains shall be maintained, and replaced or upgraded as needed to reduce potential flooding.

CSN-P-46 The City will cooperate with State and federal agencies to address flooding risks due to dam inundation, tsunamis, sea level rise, or major flood events.

Fire Hazards

CSN-P-47 The City will continue to specify minimum water pressure flows to ensure adequate flow in the event of a fire.

Evacuation Routes and Safety Standards

CSN-P-48 San Pablo Avenue, Hollis Street, and Interstate-80 will continue to serve as evacuation routes in case of emergency.

CSN-P-49 The City will continue to require minimum roadway widths to ensure access for emergency vehicles.

NOISE

Chapter 2: Land Use also contains policies regarding how to avoid noise impacts through and use program and siting.

CSN-P-50 The community noise compatibility standards (Figure 6-11) shall be used as review criteria for new land uses.

CSN-P-51 Noise impacts should be controlled at the noise source where feasible, as opposed to at receptor end. This includes measures to buffer, dampen or actively cancel noise sources.

CSN-P-52 Occupants of existing and new buildings should be protected from exposure to excessive noise, particularly adjacent to Interstate-80 and the railroad.

CSN-P-53 A noise study and mitigation measures shall be required for all projects that have noise exposure levels greater than "normally acceptable" levels.

CSN-P-54 Developers shall reduce the noise impacts on new development through appropriate means (e.g. double-paned or soundproof windows, setbacks, berming, and screening). This noise attenuation method should avoid the use of visible sound walls.

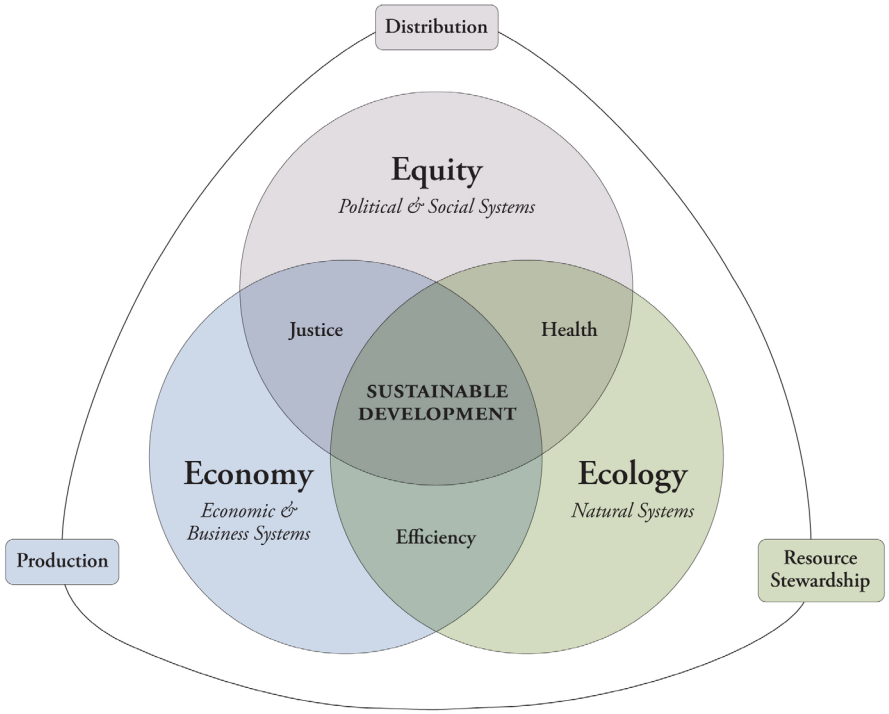
CSN-P-55 Site design, building design, hours of operation, and other techniques, for new developments deemed to be noise generators shall be used to control noise sources.

CSN-P-56 The City will work with the California Public Utilities Commission, other pertinent agencies and stakeholders to determine the feasibility of developing a railroad quiet zone in Emeryville.

CSN-P-57 The City shall require noise buffering, dampening, or active cancellation, on roof-top or other outdoor mechanical equipment located near residences, parks, and other noise sensitive land uses.

CSN-P-58 The City shall limit the potential noise impacts of construction activities on surrounding land uses through Noise Ordinance regulations that address allowed days and hours of construction, types of work, construction equipment, notification of neighbors, and sound attenuation devices.

Page intentionally left blank.



7 SUSTAINABILITY

The purpose of sustainability in Emeryville—and its incorporation throughout the General Plan—is to take responsibility for the urban development and population growth projected during the planning period and their potential impact on the environment. By implementing sustainable design measures and policies, Emeryville can reduce its contribution to global climate change, minimize its reliance on foreign oil and other fossil-fuel sources, and decrease consumption of natural resources.

The very same policies that dictate more sustainable development also enhance quality-of-life and public health: increased energy efficiency, waste diversion and reduction, mixed land uses, convenient access to parks and open spaces, alternative transportation networks, local and organic food sources, stormwater management, and many more initiatives central to this Plan.

The "3 E's" of sustainability—ecology, economy, and equity—provide a framework in which to discuss general plan development policies. The graphic below describes the interrelationship between these systems. Ecology refers to the natural systems, such as species, habitats, and water, inciting a need for stewardship of these resources. The economic component underlies the production of goods and services, integrating sustainability into the management of economic and business systems. Finally, equity refers to the distribution of costs and benefits, reflecting a fundamental human rights issue as well as a holistic perspective that sustainability can only be achieved when all segments of the community are included. Emeryville can improve ecological conditions in a way that enhances the City's already robust economy and provides equal opportunities, in terms of access to housing, transportation, jobs, education and recreation for all residents.

Since the concept of sustainability is an integral part of the Emeryville General Plan, sustainability policies are described within each of the elements. This standalone chapter consolidates these policies, existing City programs, and new goals and policies identified during the development of the General Plan. In this way, the Sustainability Element creates a convenient one-stop resource for Emeryville's sustainability programs. The chapter is organized as follows:

- Section 7.1 provides a summary of the City's leadership and accomplishments toward sustainability and what plans and programs already exist. Existing programs and policies establish a basis on which to implement goals and policies.
- Section 7.2 is a review of sustainability concepts that are included in other chapters of this plan. Sustainability encompasses many dimensions of city building and policies and principles have been woven throughout this document.
- Section 7.3 is a more detailed examination of seven topical areas including energy, waste, land use and urban design, parks and open space, transportation, environmental health and water. This section substantiates the need for additional General Plan goals and policies in certain topic areas and the direction for further work.
- Goals and policies conclude the chapter.

7.1 LEADERSHIP AND EXISTING PROGRAMS

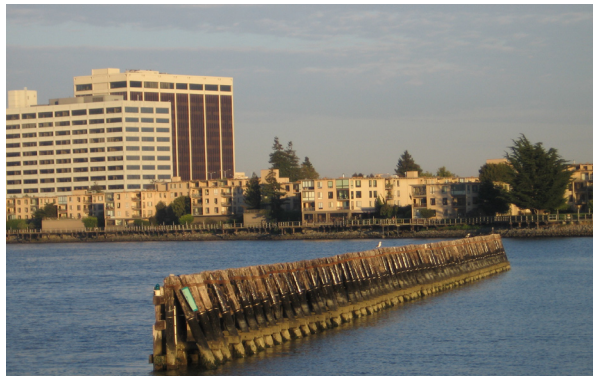
Given its small size and built out nature, Emeryville is in many ways already practicing sustainable development, as it has to make effective use of its limited resources. The City has shown great leadership in the areas of brownfield remediation, stormwater management and local transit through the Emery Go-Round shuttle. It has joined ten other cities in Alameda County to partner with the County and Local Governments for Sustainability (ICLEI) on developing its own Climate Action Plan. Finally, Emeryville has joined cities around the world in a pledge to pursue sustainable development, signing on to the Urban Environmental Accords on United Nations World Environment Day in 2005. The City can build on these existing policies and programs to develop more effective and locally relevant sustainability programs.

Leadership

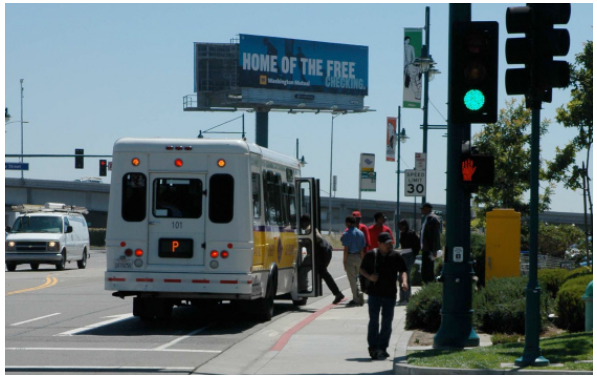
Brownfields Remediation

Through the Emeryville's brownfields programs, made possible in large part through a grant from the US Environmental Protection Agency, the City has cleaned up 240 acres of land with substantial soil and groundwater contamination. These clean-up efforts have brought new life and uses out of former industrial land, adding retail, office and housing development to create new neighborhoods and regional destinations. The City produced risk management measures that were designed to protect public health, deep groundwater resources, and the ecological resources of the San Francisco Bay. At the same time, these measures provided regulatory relief and more cost certainty for property owners, developers, and responsible parties. The collaboration among community members, regulatory agencies and technical professionals and success of the program is a model for other post-industrial cities.

Stormwater Management



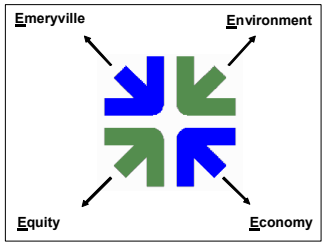
Rain washes pollutants from impervious surfaces, such as roads, rooftops and parking lots, into natural bodies of water. Emeryville has taken responsibility for its bayside location, working to reduce impervious surfaces and clean stormwater runoff before entering into the San Francisco Bay. The City is a participant in the National Pollutant Discharge Elimination System Permit, which is issued and enforced by the San Francisco Regional Water Quality Control Board. This permit system requires new development applicants to incorporate post-construction stormwater treatment systems and best management practices on the site. The City additionally requires that these treatment measures use vegetation to treat pollutants in stormwater runoff (e.g. through rain gardens, bioretention areas and living roof systems).



Emeryville developed Stormwater Guidelines for Green, Dense Redevelopment in 2005, with support from the Environmental Protection Agency (EPA). These guidelines outline strategies for meeting stormwater treatment thresholds using site design, parking strategies, and treatment measures to allow water to flow through vegetation. Design measures could include bioretention basins, biofiltration swales, cisterns integrated into the architecture, and/or green roofs. This set of guidelines won an award from the American Planning Association and has been promoted by EPA as a model strategy for other infill communities.

Emery Go-Round

Emeryville has been a leader in providing convenient and accessible local transit. The Emery Go-Round is a free bus shuttle service connecting key job and activity centers in the City with BART and AC Transit



The City has shown impressive leadership through several key programs: brownfields remediation, stormwater management, and the Emery Go-Round shuttle service.

City of Emeryville
Climate Action Plan
November 2008

The City's Climate Action Plan will serve as the implementation tool to reduce greenhouse gas emissions. The Urban Environmental Accords provide an adopted framework for local policy initiatives.

transportation hubs that carries over one million passengers each year, on seven shuttle routes. The shuttle is a private transportation service, funded by all commercial property owners in the citywide transportation business improvement district and operated by the non-profit Emeryville Transportation Management Association. Since BART does not have a station in Emeryville, the shuttle provides essential connectivity to points within and outside Emeryville, while also helping to alleviate congestion. An expansion of the current system—to cover residential areas—was under consideration in June 2008.

Climate Action Plan (CAP)

Regional efforts establish a more localized approach for sustainability that addresses the unique environmental opportunities and constraints in Emeryville and the Bay Area. In 2006, Emeryville partnered with Alameda County and ten other cities to become members of ICLEI - Local Governments for Sustainability (ICLEI) and participate in the Alameda County Climate Protection Project (ACCPP). The jurisdictions committed to an "ongoing, coordinated effort to reduce the emissions that cause global warming, improve air quality, reduce waste, cut energy use and save money."[1]

ICLEI and the Alameda County Waste Management Authority & Recycling Board (StopWaste.org) helped Emeryville to develop a baseline greenhouse gas emissions inventory, a community-wide emissions reduction target, and a climate action plan that identifies policies that will enable the City to meet its target. The CAP is being drafted, led by the City's Climate Change Task Force. The Plan focuses on three key areas: transportation/land use, waste, and energy, which are described in Section 7.3. This General Plan calls for the implementation of the CAP, rather than duplicate its policies. The CAP was adopted by City Council in November 2008.

Urban Environmental Accords

Global efforts by local leaders provide a useful framework for developing a coherent sustainability program. As part of the United Nations World Environment Day, held in San Francisco in 2005, Emeryville joined other cities around the world as a signatory on the Urban Environmental Accords. These Accords represent a collaborative commitment "to build an ecologically sustainable, economically dynamic, and socially equitable future of our urban citizens." Although this General Plan's Guiding Principles, described in Chapter 1, serve as overarching goals to this Plan, the 21 action items described in the Accords dovetail beneath them, stimulating the City's policies around sustainability described in this Element and through the Plan. Section 7.3 documents the action items of the Accords within each of its seven topic area and describes the City's implementation progress so far.

The intention of the Accords was to have each city pick three action items to adopt each year and implement locally appropriate programs to achieve the Accords. Seven years later, at World Environment Day 2012, cities will again come together and determine their collective progress.

1 *City of Emeryville. Draft Climate Action Plan. October 2008: 5.*

7.2 LINKAGES TO OTHER ELEMENTS

Sustainability issues and policies are integral to each element of the General Plan. This section identifies the interrelatedness of sustainability concepts located in the other elements.

Guiding Principles

The Guiding Principles, stated in Chapter 1: Introduction, describe the overarching principles that guide General Plan goals and policies, including the City's strategy for sustainability. One Guiding Principle, in particular, supports sustainability and innovation, with respect for the past—through redevelopment of brownfields, using green construction techniques, and encouraging low ecological impact. The remaining principles support sustainability by aspiring for vibrant communities with an array of amenities and transportation choices that encourage walking and biking and provide accessibility to essential services.

Land Use Element

The Land Use Element, Chapter 2, describes a vision for a mixed use city, with greater residential and employment densities and enhanced neighborhood centers and services, leading to a more livable compact and efficient city. Orienting higher-density housing and more intensive non-residential uses near transit can reduce vehicle miles traveled.

TABLE 7-1: CROSS-REFERENCED GOALS AND POLICIES FROM THE LAND USE ELEMENT

LAND USE GOALS	
LU-G-1	**An overall balance of uses—**Employment, residential, cultural, destination and local retail—as well as a full range of amenities and services are necessary to support a vibrant community.
LU-G-3	**Community activity centers—**Centers that combine residential, retail, office, and public uses to create areas of identity and activity for residents and visitors.
LU-G-4	**A mix of housing types—**A diversity of housing types to accommodate a variety of household sizes and incomes.
LU-G-6	**Vibrant new mixed-use centers—**Intensification of existing underutilized commercial centers with surface parking (such as Powell Street Plaza and East Bay Bridge Center) as vibrant, multi-story, walkable mixed-use destinations with structured parking and open space.
LU-G-11	**A wide range of economic activity—**An economy that capitalizes on Emeryville's central location, strengthens the City's tax base, and ensures that Emeryville has adequate fiscal resources to fund high quality public services for its residents and businesses.
LAND USE POLICIES	
LU-P-2	The Powell/Christie/Shellmound/I-80 core area will be developed into a compact but high-intensity regional transit hub. This hub will include a retail core, with stores, restaurants, and hotels; a financial and commercial center, creating a daytime work population; and a residential neighborhood, providing vitality during non-work hours.
LU-P-3	The northern (north of Powell) and southern halves of the Powell/Christie core area shall be integrated and connected, and the district shall be walkable, with small blocks, pedestrian-oriented streets, and connections to surroundings.
LU-P-4	Park Avenue (west of Hollis Street), Hollis Street (between 61st and midblock between 65th and 66th streets), Powell Street/Captain Drive, and San Pablo Avenue (between 36th and 47th streets) will be developed as walkable, mixed-use neighborhood centers, with an array of amenities and services—including stores, restaurants and cafes, galleries, and office uses—to serve neighborhood needs, with community-serving uses and active building frontages that engage pedestrians at the ground level.
LU-P-6	The current deficiency of park and open space will be addressed by making parkland acquisition a high priority by the City, and working with private land owners to secure these areas through development incentives, land swaps, and other mechanisms.
LU-P-17	The area around the Amtrak station shall be developed with pedestrian and bicycle amenities, and transit-supportive uses, through measures such as reduced parking requirement, incorporation of public parking in developments, and accounting for transit proximity when considering height and FAR bonuses.

Continues on next page

New residential development will support retail and neighborhood centers in key parts of the city and around transit centers. Encouraging a mix of land uses reduces vehicle trips and promotes circulation by alternative modes.

LU-P-21 The East Bay Bridge, Powell Street Plaza, and Marketplace shopping centers shall be intensified by consolidating parking into structures and converting surface parking lots into residential and mixed-use development—including retail, hotels, and offices; expanding the city street grid through the sites; and developing new parks and public open space. Future redevelopment of these shopping centers should include at least as much retail space as existed when this General Plan was adopted.

LU-P-27 A diversity of commercial uses to insulate the City's fiscal base from downturns in particular markets shall be maintained.

LU-P-28 The City will pursue retail uses that will serve the need of Emeryville residents, and encourage these uses to locate in the Neighborhood Centers.

LU-P-29 The City will encourage the development and retention of small business, start-up firms, partnership incentives, and buildings that accommodate these businesses.

LU-P-31 The City will encourage development of existing Emeryville businesses with the objective of retaining and expanding employment opportunities and strengthening the tax base. Provide assistance to existing businesses that may be displaced by new development to relocate in Emeryville.

LU-P-32 The City will work with existing Emeryville businesses, Chamber of Commerce, and others to address the City's economic needs and stimulate growth.

Transportation Element

The Transportation Element, Chapter 3, pursues a strategy to expand the street grid and enhance alternative transportation options, allowing for more connectivity and walkability between jobs, shopping and other activity centers. Making alternative transportation more pleasant, convenient, and accessible, can reduce vehicle trips and therefore greenhouse gas emissions.

TABLE 7-2: CROSS-REFERENCED GOALS AND POLICIES FROM THE TRANSPORTATION ELEMENT

TRANSPORTATION GOALS	
T-G-1	**A comprehensive transportation system—**A transportation system that is efficient, safe, removes barriers, (e.g. accessibility near freeways and rail lines), and optimizes travel by all modes.
T-G-2	**Universally accessible—**A transportation system that meets the needs of all segments of the population, including youth, seniors, persons with disabilities, and low-income households.
T-G-3	**Multi-modal—**A transportation system that eliminates the necessity of owning and/or driving personal vehicles because of the availability of convenient and accessible alternative modes of transportation.
T-G-4	**A walkable city—**A universally accessible, safe, pleasant, convenient, and integrated pedestrian system that provides links within the city and to surrounding communities, and reduces vehicular conflicts.
T-G-5	**A safe, comprehensive, and integrated bicycle system—**A system and support facilities throughout the city that encourage accessible bicycling for all community members.
T-G-6	**A safe, efficient, comprehensive, and integrated transit system—**A public transit system that allows for a reduction in automobile dependence for residents, employees, and visitors.
T-G-7	**A multi-functional street system—**A system that will ensure the safe and efficient movement of people, goods, and services and support a high quality of life and economic vitality.
T-G-8	**A balanced parking supply system—**Parking supply that balances economic development, livable neighborhoods, environmental and energy sustainability, and public safety, while reducing dependence on the automobile.
T-G-9	**Safe and efficient movement of goods—**Goods movement that supports commerce and industry while maintaining a high quality of life.
T-G-11	**Transportation demand management strategies—**TDM strategies that decrease single-occupant automobile demand and reduce vehicle miles traveled.
TRANSPORTATION POLICIES	
T-P-2	The design, construction, operation, and maintenance of city streets shall be based on a "complete streets" concept that enables safe, comfortable, and attractive access and travel for pedestrians, bicyclists, motorists, and transit users of all ages and abilities.
T-P-5	The City encourages development that minimizes Vehicle Miles Traveled (VMT).
T-P-6	To the extent allowed by law, the City's Traffic Impact Fee shall include bicycle, pedestrian, transit, and road improvements so that development pays its fair share toward a circulation system that optimizes travel by all modes.
T-P-11	Sidewalks shall be provided on both sides of all streets; pedestrian connections between new and existing development is required.

Continues on next page

The Transportation Element seeks to reduce barriers to pedestrian and bicycle connectivity in order to create safe and attractive places for walking and biking.

T-P-12 The city will plan, upgrade, and maintain pedestrian crossings at intersections and mid-block locations by providing safe, well-marked crosswalks with audio/visual warnings, bulb-outs, and median refuges that reduce crossing widths.

T-P-15 Walking will be encouraged through building design and ensure that automobile parking facilities are designed to facilitate convenient pedestrian access within the parking area and between nearby buildings and adjacent sidewalks. Primary pedestrian entries to nonresidential buildings should be from the sidewalk, not from parking facilities.

T-P-16 Safe pedestrian walkways that link to streets and adjacent bus stops will be required of new development.

T-P-19 Following completion of the new east span of the Bay Bridge, the west span should be retrofitted with a pathway to provide continuous pedestrian and bicycle access between San Francisco and the East Bay.

T-P-20 Safe and direct pedestrian access to Aquatic Park and the peninsula will be provided and maintained.

T-P-23 On-street bike routes in the City's Bicycle and Pedestrian Plan shall be designated as either Class II (bike lanes) or Class III (signed routes without lanes), as appropriate. These designations are not part of the General Plan and may be changed as circumstances dictate.

T-P-24 Safe, secure, and convenient short- and long-term bicycle parking shall be provided near destinations for all users, including commuters, residents, shoppers, students, and other bicycle travelers. Retail businesses in regional retail areas are encouraged to provide valet bicycle parking.

T-P-26 Bicycling will be promoted through public education, including the publication of literature concerning bicycle safety and the travel, health and environmental benefits of bicycling.

T-P-28 Existing public transit to BART, Amtrak, and regional destinations will be supported, and transit within Emeryville for residents, workers, and visitors will be promoted.

T-P-31 The City will develop and implement transit stop amenities such as pedestrian pathways approaching stops, benches, traveler information systems, shelters, and bike racks to facilitate transit stops as place-making destinations and further the perception of transit as an alternative to driving.

T-P-32 Transit stops will be sited at safe, efficient, and convenient locations, and located appropriately within the right of way.

T-P-33 The City supports transit priority on Transit Streets through features such as traffic signal priority, bus queue jump lanes at intersections, exclusive transit lanes, and other techniques as appropriate, with adjustments to technology as conditions change.

T-P-34 The City will continue to support free and/or subsidized transit for both local travel within the City and travel to the regional hubs located at the Amtrak Station, the MacArthur BART station, and San Pablo Avenue at 40th Street.

T-P-35 The City will support the expansion of the Emery Go-Round to accommodate workers, residents, and visitors.

T-P-36 The City supports Transit-Oriented Development with reduced parking requirements, and amenities to encourage transit use and increase pedestrian comfort around the Major Transit Hubs at the Amtrak station and the 40th Street/San Pablo Avenue intersection.

T-P-37 The City will advocate for frequent, direct transit service to all points in Emeryville, especially between the east and west sides of town.

T-P-38 The City encourages Amtrak to allow local travel on Amtrak buses that provide service from Downtown San Francisco to the Emeryville Station.

T-P-39 The City will advocate for AC Transit to provide frequent, direct, two-way service between downtown San Francisco and various points within Emeryville.

T-P-40 The City will investigate and implement, if appropriate, fixed guideway transit systems, such as streetcars or personal rapid transit (PRT).

T-P-41 The City supports a new BART line in the East Bay that includes service to Emeryville along the existing regional rail corridor with a stop at Powell Street.

T-P-44 The City supports grade-separated crossings and other appropriate measures to mitigate the impacts of increased rail traffic on Emeryville, including noise, air pollution, and traffic disruption.

T-P-47 The City supports "traffic calming" and other neighborhood traffic management techniques to enhance the quality of life within existing neighborhoods and to discourage through-traffic on bicycle boulevards and local streets.

T-P-48 The City will establish equal priority to bicycles and public transit (and discourage through-traffic by other modes) on streets in the vicinity of the Amtrak station that are designated as both Transit Streets and Bicycle Boulevards.

T-P-49 Quality of life and business viability will be promoted by maintaining an adequate supply of parking to serve growing needs, while avoiding excessive supplies that discourage transit ridership and disrupt the urban fabric.

T-P-51 The City supports parking supply and pricing as a strategy to encourage the use of transit, carpools, bicycles, and walking.

T-P-52 Flexible parking standards are encouraged that reflect calculated parking demand for proposed land uses and that allow for appropriate offsets to reduce parking demand and encourage walking, bicycling, carpooling, and transit use.

T-P-53 Employers are encouraged to offer "parking cash out", whereby employees who choose not to drive are offered the cash value of any employee parking subsidy, to be used towards commuting to work by other means.

T-P-57 The land area devoted to parking shall be reduced by supporting innovative technologies such as parking lifts and automated parking.

T-P-64 The City will work with local, regional and state agencies, the Chamber of Commerce, and the Transportation Management Association, as well as employers and residents, to encourage and support programs that reduce vehicle miles traveled, such as preferential carpool parking, parking pricing, flexible work schedules, and ridesharing.

T-P-66 The City supports and encourages the expansion of car-sharing programs in Emeryville.

T-P-67 The City supports and encourages conveniently located child care services with flexible hours.

Improving connections to transit, reliability, and frequency will encourage increased ridership and reduce vehicle miles traveled and, in turn, greenhouse gas emissions.

Parks, Open Space, Public Facilities, and Services Element

The Parks, Open Space, Public Facilities, and Services Element, Chapter 4, describes an increase in the amount and accessibility of parks and open spaces, proposing spaces for passive and active recreation, while improving air quality and managing stormwater runoff.

Parks and open spaces provide spaces for recreation and relaxation, while also cleaning the air and absorbing stormwater runoff.

TABLE 7-3: CROSS-REFERENCED GOALS AND POLICIES FROM THE PARKS, OPEN SPACE, PUBLIC FACILITIES, AND SERVICES ELEMENT

PARKS, OPEN SPACE, PUBLIC FACILITIES, AND SERVICES GOALS	
PP-G-1	**A comprehensive open space system—**A system that provides a diverse range of active and passive recreation and open space opportunities for residents, workers, and visitors.
PP-G-3	**Integration of parks and open space—**Parks that are coordinated with surrounding developments to form unified urban compositions and that are integrated into the redevelopment of underutilized areas.
PP-G-5	**Sustainable design—**Park designs that are consistent with sustainable design principles and practices, and efficient use of open space.
PP-G-6	**Locally accessible parks—**At least one park located within a five-minute walk of all residences.
PP-G-8	**A safe, nurturing and enriching environment—**An environment in which children and youth can flourish and become contributing members of society. The foundation of this vision is a strong and active partnership among the City, School District, and all segments of the community, so that powerful learning from the earliest years is a citywide experience and responsibility.
PP-G-9	**Accessible childcare—**An adequate and diverse supply of childcare facilities that are affordable and accessible for families, and provide safe, educational, and high-quality services for children.

PARKS, OPEN SPACE, PUBLIC FACILITIES, AND SERVICES POLICIES

PP-P-1 Increase park acreage to serve the needs of the growing population and address current-deficiencies in park and open space standards. Maintain a standard of three new acres of parkland per 1,000 new residents, and 0.25 acres per 1,000 new employees.

PP-P-2 Two new large parks (five acres or larger), one each north and south of Powell Street, shall be provided. Active recreation uses will be a component of these parks. The northern park site is bounded by 61st, 64th, Hollis, and Doyle streets. There are two potential southern park sites:

- One potential southern park site is shown on the PG&E site on Hollis Street, between 45th and 53rd streets. On this site, consideration shall be given as to how to incorporate the existing buildings, which are rated Tier 1 and Tier 2 in the Park Avenue District Plan, into future park uses.
- The second potential southern park site is located at the AC Transit bus yard between 45th and 47th streets, adjacent to the proposed Center of Community Life. Should this site become available, the City shall explore the possibility of a public park—along with other public uses. If a large park at this site is feasible and is considered desirable, all or part of the PG&E site may no longer be needed for a public park.

PP-P-3 New smaller open spaces—including public plazas and places, community gardens, and pocket parks—will provide local focus points and diversify the built environment. These should be developed through the identification of underutilized and strategically located parcels, and the redevelopment of larger sites.

PP-P-5 A system of greenways and Green Streets, as tree-lined open spaces, and as continuous recreational paths for bicyclists, joggers, and pedestrians, linking parks and activity centers.

PP-P-6 The north-south Emeryville Greenway will be expanded, enhancing its role as an open space corridor and connector across the City, and a source of inspiration and community pride. The City will support the expansion of a park at the Sherwin Williams site, in coordination with the development of Horton Landing Park and the Greenway.

PP-P-7 An east-west greenway located generally along the path of Temescal Creek will be created. This will include water features to celebrate the creek and improvements to the riparian corridor, where feasible, while maintaining existing drainage capabilities.

PP-P-10 Efficient use of open space will be achieved through techniques such as rooftop play courts and gardens, joint use of sports and recreation facilities at schools, co-location of parks with child care facilities, and possible use of underground parking below new plazas and parks.

PP-P-12 Design, landscaping, lighting, and traffic calming measures will be employed to create safe parks and open spaces.

PP-P-13 Open spaces that have deteriorated, have design features that limit access and use opportunities, and/or are in need of activity shall be revitalized.

PP-P-16 The City will continue to partner with Emery Unified School District to optimize the joint-use of school facilities for community use.

PP-P-19 A diversity of lifestyles, ages, and income-levels will be accommodated through zoning and community facilities and programming.

PP-P-20 The growing senior citizen community will be supported by providing appropriate cultural, recreational and assistance programs and services.

Several new open spaces are planned and proposed in the General Plan, including a new large park in North Hollis (top) and the extension of the Greenway (bottom).

Urban Design Element

The Urban Design Element, Chapter 5, outlines a form for walkable streets, appropriate building massing, and attractive landscaped streetscapes that invites pedestrians, allows for solar access, and creates a connected street grid. Enhancing the walkability of the street network, by adding additional streets and paths, amenable to pedestrians and bicyclists can potentially reduce the number of vehicle trips and vehicle miles traveled.

The General Plan envisions an intensive core centered in Powell Street/Christie Avenue areas (top), and neighborhood centers distributed throughout the city to provide residents easy access to everyday amenities (bottom).

TABLE 7-4: CROSS-REFERENCED GOALS AND POLICIES FROM THE URBAN DESIGN ELEMENT

URBAN DESIGN GOALS

UD-G-1 **An identifiable city structure**—A city structure comprised of a vibrant, intense, and pedestrian-oriented core, and distinctive neighborhood centers and districts augmented with parks and connected by greenways and green streets.

UD-G-2 **A diversity of building types and scales**—Variation to reinforce the identity of individual districts and foster a variety of options for living and working, with continuity in development scale and character and careful transitions between densities and design typologies.

UD-G-3 **A walkable and pedestrian-scaled environment**—A network of streets and connections that expands circulation opportunities for pedestrians and bicyclists.

UD-G-4 **New parks**—Strategically located new parks and outdoor open spaces to enhance Emeryville's livability and pedestrian orientation.

UD-G-7 **Expanded street grid**—A pedestrian and bicycle system with extensions that improve connectivity throughout the city.

UD-G-8 **A safe, attractive, and connected pedestrian environment**—Throughout the city, but particularly in areas with high volumes of pedestrian activity.

UD-G-11 **Sky Exposure**—Building form and massing that furthers sky exposure for adjacent sidewalks and public spaces, especially in gathering places such as the core and neighborhood centers.

UD-G-13 **Streets that support multiple functions**—Streets designed for all types of users, including pedestrians, bicyclists, public transit, and automobiles.

UD-G-15 **Development along streets offers a rich visual experience**—Development that is engaging to pedestrians, is unobstructed by parking facilities, and contributes to street life, vitality, and safety.

UD-G-17 **A walkable and connected city**—Neighborhood centers and other amenities in proximity to employees and residents throughout the city.

URBAN DESIGN POLICIES

UD-P-1 The city shall strive to accentuate activity and presence at the street level, particularly along pedestrian-oriented corridors and in residential areas.

UD-P-2 Parks and open space is required with new development, consistent with Figure 4-1 in the Parks, Open Space, Public Facilities and Services chapter.

UD-P-3 Parks and open space shall be accessible and available to the public through site design standards for minimum size/dimensions, visibility, and location along public rights-of-way, particularly Green Streets (Figure 5-3).

UD-P-4 New development will be required to extend the street grid or pedestrian connections wherever possible.

UD-P-20 The street grid shall be extended as redevelopment on larger sites occurs.

UD-P-22 The City shall maintain and enhance an integrated pattern of streets, pedestrian paths, and bike routes through a fine-grain street grid that enables efficient movement throughout the city.

UD-P-24 The City shall establish Pedestrian Priority Zones in regional and neighborhood centers, around schools, parks, and in other locations as indicated in Figure 5-3. While wider sidewalks, street lighting, bulbed crosswalks, and other pedestrian amenities should be employed throughout the city, they are prioritized in these locations.

UD-P-40 Neighborhood structure and pedestrian scale development should be prioritized. The scale and character of existing neighborhoods should be maintained to ensure connectivity and continuity of street design within each district.

UD-P-47 Streetscape landscaping shall follow Bay-Friendly Landscaping guidelines and serve the dual purpose of treating stormwater runoff and providing shade and beauty to the urban realm.

UD-P-53 Use of the greenways shall be reinforced by fronting entrances to both commercial and residential development to the public pathway.

- Encourage open spaces and plazas adjacent to the greenways.
- Encourage other public-oriented ground level uses such as workshops, lobbies, and common areas.

UD-P-58 Large surface parking lots shall be replaced with structured parking and incorporated into high density mixed-use developments. New or expanded large surface parking lots are not allowed.

UD-P-69 The pedestrian environment shall be enhanced with multiple neighborhood access points, through-streets, and pedestrian pathways.

UD-P-70 Street-level uses should reinforce neighborhood center streets and allow a vertical mix of a diverse range of land uses including offices, hotels and residential uses compatible with neighborhood center functions.

UD-P-72 Public space and plazas for gathering and expanded ground-floor retail activities are encouraged. These elements enhance the pedestrian realm and provide opportunities for social interaction.

The Urban Design Element describes provides for integrating open space into new development (top) and encouraging drought-tolerant plantings (bottom).

Conservation goals and policies address protection of air, water, biological and cultural resources.

Conservation, Safety, and Noise Element

The Conservation, Safety, and Noise Element, Chapter 6, describes strategies to maintain environmental quality within an urban environment, through stormwater management, creek restoration, water recycling and conservation, and preservation of biological and plant resources.

TABLE 7-5: CROSS-REFERENCED GOALS AND POLICIES FROM THE CONSERVATION, SAFETY, AND NOISE ELEMENT

CONSERVATION, SAFETY, AND NOISE GOALS	
CSN-G-1	**Public health—**A high level of public health and safety.
CSN-G-2	**Improved air quality—**Local ambient air quality levels that help meet regional attainment status and contain low levels of air pollutants.
CSN-G-3	**Water quality and conservation—**High-quality groundwater and surface water resources. Improved water conservation, increased use of recycled water, and reduced per capita water consumption.
CSN-G-4	**Reduced per capita water consumption—**By 2030, per capita water consumption will be reduced by 30 percent over 2008 levels.
CSN-G-5	**Preservation and protection of natural resources—**Preservation and enhancement of natural habitat, and protection of biological resources, particularly around the Emeryville Crescent.
CSN-G-8	**Protection from natural and manmade hazards—**Protection of life, natural environment, and property from natural and manmade hazards due to seismic activity, hazardous material exposure or flood damage.
CSN-G-9	**Protection from noise—**Protection of life, natural environment, and property from manmade hazards due to excessive noise exposure.

CONSERVATION, SAFETY, AND NOISE POLICIES

CSN-P-1 Air quality will be maintained and improved by requiring project mitigation, such as Transportation Demand Management (TDM) techniques, where significant air quality impacts are identified.

CSN-P-2 The City will budget for clean fuels and vehicles in the City's long-range capital expenditure plans, to replace and improve the existing fleet of gasoline and diesel powered vehicles.

CSN-P-3 The City will coordinate air quality planning efforts with local, regional, and state agencies and support the Bay Area Air Quality Management District's efforts to monitor and control air pollutants from stationary sources.

CSN-P-4 Dust abatement actions are required for all new construction and redevelopment projects.

CSN-P-5 All large construction projects are required to reduce diesel exhaust emissions through use of alternate fuels and/or control devices.

CSN-P-6 Adequate buffer distances shall be provided between offensive odor sources and sensitive receptors, such as schools, hospitals, and community centers.

CSN-P-7 New commercial and industrial activities, as well as construction and demolition practices, shall be regulated to minimize discharge of pollutant and sediment concentrations into San Francisco Bay.

CSN-P-8 The City will continue to support regional watershed conservation through local land use planning, open space policies, and water quality conservation efforts.

CSN-P-9 The City will continue programs to inform residents of the environmental effects of dumping household waste, such as motor oil, into storm drains that eventually discharge into San Francisco Bay.

CSN-P-10 New development is required to incorporate source control, site design, and storm water treatment to reduce pollutants in stormwater runoff.

CSN-P-11 Exterior uses of water for landscaping and other purposes to minimize or eliminate runoff and water waste.

CSN-P-12 The City promotes use of recycled water on landscaping and other non-food source plantings.

CSN-P-13 The City promotes construction and incorporation of cisterns, green roofs and other rainfall harvesting methods in existing, new and rehabilitation projects.

CSN-P-14 The City will allow homeowners to divert untreated rainwater for non-potable uses, such as outdoor irrigation and toilet flushing, through use of rainwater barrels or similar methods.

CSN-P-15 The City shall consider revising plumbing and building code requirements, as necessary, to allow for graywater and rainwater harvesting systems.

CSN-P-16 The City will continue to support the use of recycled water in new and rehabilitation projects, through the development process.

CSN-P-17 The City supports public education initiatives to encourage conservation of potable water.

CSN-P-18 The City will encourage protection of essential habitat for special status species and support habitat protection and enhancement within Emeryville that are within the City's control.

Continues on next page

Safety measures include prevention and reduction of seismic, flooding, hazardous materials, and fire risk.

Noise sources, particularly from trains and cars on the freeway, are addressed in the Noise Element to reduce their impacts on nearby residents and other building occupants.

CSN-P-19 The natural environment, including mature trees and landscaping, shall be protected from destruction during new construction and redevelopment. Adequate replacement shall be provided where protection is impossible.

CSN-P-20 The City encourages incorporation of native plants into landscape plans for new developments and City projects and parks and preservation of mature trees on new developments and City projects.

CSN-P-21 The City discourages use of non-native invasive species in any landscaped or natural areas.

CSN-P-22 Provide visual access to the Emeryville Crescent in a manner consistent with the protection of this fragile ecological system.

CSN-P-23 Where new trails or other improvements are proposed in the vicinity of the baylands and essential habitat for special-status species, require adequate avoidance and mitigation necessary to protect sensitive resources.

CSN-P-24 The City shall explore opportunities for habitat restoration and enhancement, particularly in larger parks and open space areas.

CSN-P-25 Appropriate avoidance measures will be implemented to minimize the loss of special status species nesting birds during new construction. This can be accomplished through timing of vegetation removal and building demolition during the non-nesting season or through preconstruction surveys where a potential for nesting remains on proposed development sites.

CSN-P-26 The City encourages developers to reuse existing historic or architecturally significant structures.

CSN-P-33 In order to reduce light pollution and use less energy, lighting (including on streets, recreational facilities, and in parking areas) should be designed to prevent artificial lighting from illuminating natural resources or adjacent residential neighborhoods.

CSN-P-34 The City will continue to regulate development, including remodeling or structural rehabilitation, to ensure adequate mitigation of safety hazards on sites having a history or threat of seismic dangers, erosion, subsidence, or flooding.

CSN-P-35 The City will require geotechnical investigation of all sites proposed for development in areas where geologic conditions or soil types are susceptible to liquefaction. Require submission of geotechnical investigation and demonstration that project conforms to all recommended mitigation measures prior to city approval (as required by State law).

CSN-P-36 The City will continue to require soil erosion control measures during construction.

CSN-P-37 The City will enforce regulation of potentially hazardous structures to be retrofitted and made safe and encourage property owners to abate or remove structural hazards that create unaccepted levels of risk.

CSN-P-38 Prior to reuse, former commercial and industrial sites will be cleaned up, according to relevant State and federal regulations.

CSN-P-39 The City will enforce regulation of local and State laws regarding the production, use, storage, and transportation of hazardous materials and waste.

CSN-P-40 The City requires abatement of lead-based paint and asbestos prior to structural renovation or demolition, and compliance with all State, Federal, Occupational Safety and Health Administration, Bay Area Air Quality Management District, Alameda County, and local rules and regulations.

CSN-P-41 Development on sites with known contamination of soil and groundwater shall be regulated to ensure that construction workers, future occupants, and the environment as a whole, are adequately protected from hazards associated with contamination.

CSN-P-42 The City supports public awareness and participation in household waste management, control, and recycling.

CSN-P-43 Siting of businesses that use, store, process, or dispose of substantial quantities of hazardous materials shall be carefully restricted in areas subject to very strong levels of ground shaking

CSN-P-44 The City will continue to require development projects to implement on-site stormwater management measures through the City's development permit process.

CSN-P-45 Storm drains shall be maintained and replaced or upgraded as needed to reduce potential flooding.

CSN-P-52 Occupants of existing and new buildings should be protected from exposure to excessive noise, particularly adjacent to Interstate-80 and the railroad.

CSN-P-54 Developers shall reduce the noise impacts on new development through appropriate means (e.g. double-paned or soundproof windows, setbacks, berming, and screening). This noise attenuation method should avoid the use of visible sound walls.

7.3 KEY SUSTAINABILITY TOPICS

The following sustainability topics are grouped according to the Urban Accords' subject areas: Energy, Waste Reduction, Land Use and Urban Design, Urban Nature, Transportation, Environmental Health, and Water. Within each topic area, relevant strategies or standards from the City's Climate Action Plan, Urban Accords, and any other adopted policies are described in text boxes.

Topic 1: Energy

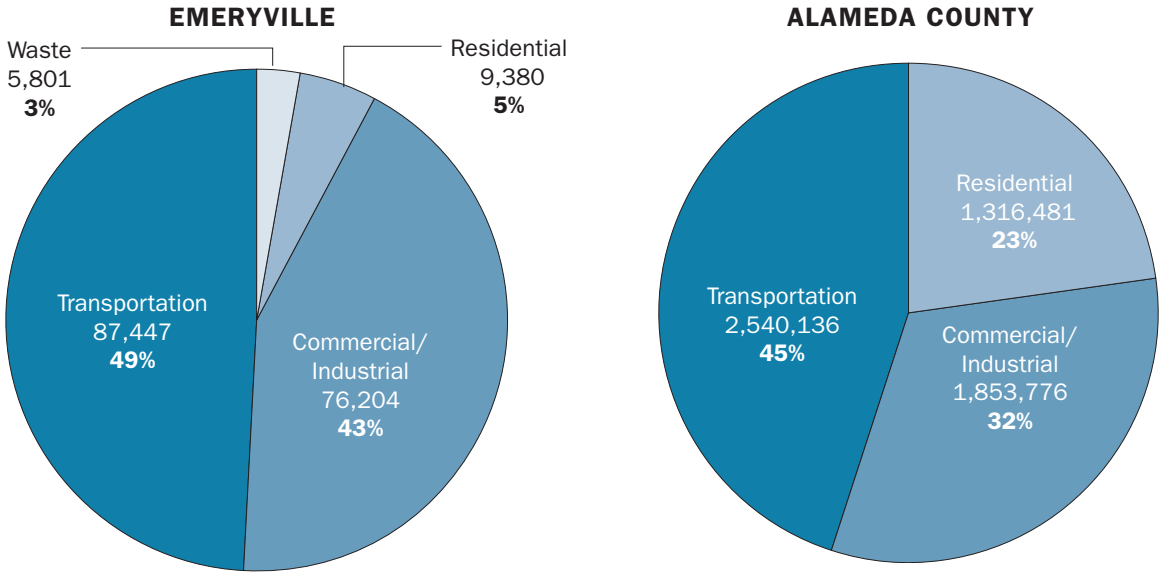
Greenhouse gases are released during energy production and consumption, such as electricity used to power homes and offices, and fuel used to power cars and trucks. Reducing the carbon content of the fuel source (e.g. solar or wind power versus fossil fuels) or reducing energy consumption (e.g. using energy efficient appliances or designing buildings for solar access) may limit negative impacts on global climate change.

Existing Policies and Programs

Climate Action Plan

As a first step toward preparing the CAP, the City completed a baseline inventory of greenhouse gas emissions. The analysis revealed that, in 2004, 178,832 tons of carbon dioxide equivalent (CO_2e) were released into the atmosphere. The inventory includes all energy consumed in Emeryville—even the energy and emissions associated with electricity consumed in the city, but produced elsewhere. As a result of this inventory, the City has set a goal to reduce community-wide greenhouse gas emissions by 25 percent below 2004 levels by 2020. The City currently has two formal energy conservation policies. The first supports programs providing alternatives to conventional private vehicles. The second policy promotes energy conservation and the use of renewable energy resources. The CAP was officially adopted by the City on December 2, 2008.

CLIMATE CHANGE



The Earth's atmosphere is naturally composed of gases that act like the glass panes of a greenhouse, retaining heat to keep the temperature of the Earth stable and hospitable for life at an average temperature of 60°F. These gases include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (NO_2), ozone (O_3) and halocarbons. Recently, elevated concentrations of these gases in the atmosphere have had a destabilizing effect on the global climate, fueling the phenomenon commonly referred to as global climate change. The Intergovernmental Panel on Climate Change (IPCC), a scientific intergovernmental body set up by the World Meteorological Organization (WMO) and by the United Nations Environment Programme (UNEP), predicts that global mean temperature increase from 1990-2100 could range from 2.0 to 11.5 degrees Fahrenheit. It projects a sea level rise of seven to 23 inches by the end of the century, with a greater rise possible depending on the rate of polar ice sheet melting.

Accelerating climate change has the potential to cause a number of adverse impacts in California, including: a shrinking Sierra snowpack; public health threats caused by higher temperatures and more smog; rising temperatures, eroding coastlines; sea level rise; increased wildfire risk; and increased electricity demands. Reducing greenhouse gas emissions—such as those that result from

Chart 7-1 shows the breakdown of emissions for Emeryville and Alameda County. In Emeryville, the transportation sector is the largest contributor to greenhouse gas emissions, responsible for nearly half of all emissions. The transportation sector represents vehicle miles traveled on local roads and state highways within Emeryville. The commercial/industrial sector accounts for nearly 43% of emissions, which is not surprising given the city's concentration of industrial, office, and retail uses. Residential uses and methane generated by waste account for five and three percent of total emissions, respectively. In comparison, the transportation sector in Alameda County is also the largest contributor, responsible for 45% of greenhouse gas emissions. The commercial/industrial and residential sectors account for 32 and 23 percent of total emissions, respectively.

The CAP addresses energy issues through policies promoting fuel and energy efficiency and renewable energy to achieve its emission reduction goal. Measures include promotion of energy efficient appliances and practices for new construction and retrofit projects. Using renewable fuel sources to accommodate the city's power needs can substantially reduce greenhouse gas emissions, compared with production from conventional coal-fired power plants. The CAP seeks to increase the availability of renewable energy sources by offering incentives for individual homeowners to install solar photovoltaic (PV) systems and by constructing a PV system on the roof of City Hall.

CHART 7-1: 2004 GREENHOUSE GAS EMISSIONS, BY SECTOR (METRIC TONS CO_2)

Source: City of Emeryville Greenhouse Gas Emissions Analysis, July 2008 (Emeryville) and City of Emeryville Baseline Greenhouse Gas Emissions Inventory Report, December 2006 (Alameda County).

EMERYVILLE CLIMATE ACTION PLAN ENERGY EFFICIENCY POLICIES

CITYWIDE POLICIES

- Use Energy Star equipment: computers, monitors, printers, copiers, refrigerators, vending machines, water coolers, dishwashers, clothes washers; high efficiency water heaters; and energy efficient chillers and boilers.
- HVAC fan upgrade and maintenance tune-ups
- Switch electric heat to natural gas
- Adopt a High Performance Local Energy Code (such as green building ordinance) for new construction and renovation of facilities
- Adopt strict commercial and residential energy code requirements
- Distribute loans to citizens to make energy efficiency improvements
- Implement energy efficient weatherization of low-income housing and new public/affordable housing projects
- Perform energy efficiency retrofits of existing facilities
- Require energy upgrades of facilities at time of sale
- Distribute free CFL bulbs and/or fixtures to community members
- Install LED exit signs
- Install lighting occupancy sensors
- Retrofit T-12 lamps to T-8 lamps
- Promote energy conservation through campaigns targeted at businesses and residents
- Promote green building practices through a local green building assistance program or incentives
- Promote participation in a local green business program
- Adopt water conservation ordinance
- Install low-flow faucets, low-flow shower heads, and high efficiency toilets
- Use low maintenance landscaping
- Install green and/or reflective roofing
- Install solar photovoltaic panels, solar heating panels, and wind turbines (including via incentives)

MUNICIPAL POLICIES

- Use Energy Star equipment: computers, monitors, printers, copiers, refrigerators, water coolers; high efficiency water heaters; and energy efficient chillers and boilers.
- HVAC fan upgrade and maintenance tune-ups
- Adopt a High Performance Local Energy Code (such as green building ordinance) for new construction and renovation of facilities
- Perform energy efficiency retrofits of existing facilities
- Install LED lighting: exit signs, street lights, and traffic signals
- Install lighting occupancy sensors
- Use low maintenance landscaping
- Install green and/or reflective roofing
- Install solar photovoltaic panels, solar water heating at swimming pool, and solar water heaters

Source: City of Emeryville, Climate Action Plan, December 2008.

URBAN ACCORD ENERGY ACTION ITEMS

- **Action 1:** Adopt and implement a policy to increase the use of renewable energy to meet ten percent of the city's peak electric load within seven years.
- **Action 2:** Adopt and implement a policy to reduce the city's peak electric load by ten percent within seven years through energy efficiency, shifting the timing of energy demands, and conservation measures.
- **Action 3:** Adopt a citywide greenhouse gas reduction plan that reduces the jurisdiction's emissions by twenty-five percent by 2030, and which includes a system for accounting and auditing greenhouse gas emissions.

Source: Urban Environmental Accords. United Nations Environment Programme World Environment Day, 2005.

Topic 2: Waste

Diverting waste from landfills by promoting reduction, reuse, recycling, and composting of materials can also have a substantial impact on reducing greenhouse gas emissions. Recycling and waste prevention programs reduce energy and transportation needed to manufacture and ship resource-intensive products and packaging. Composting food and yard waste, instead of sending them to landfills, reduces the amount of methane produced in landfills.

Existing Policies and Programs

Climate Action Plan

Through the CAP, the City has committed to a goal of reducing waste sent to landfills by 75 percent from 1990 levels by 2010. The City of Emeryville is working closely with Alameda County's StopWaste.org, which has already taken a lead role in developing strategies to divert waste and improve recycling and composting services. The CAP outlines a series of policies to reduce waste generation by increasing participation in County and City compost, recycle, and reuse programs; educating residents about the benefits of sustainable landscaping; and encouraging businesses to participate in the County Green Business program. The City has already adopted an ordinance requiring that restaurants and food vendors use compostable materials for all disposable food service-ware, a clear step toward achieving the waste reduction goal.

New Policies and Programs

Building on existing programs and success, the City can join the growing community of jurisdictions that have adopted the goal of Zero Waste. Zero Waste (or nearly zero) is a set of policies that promote upstream changes to products and services by the manufacturers, instead of letting the consumer and government agencies try to figure out what to do with the discards of society. Extended Producer Responsibility, Take-Back programs and Cradle to Cradle Design are some of the concepts that the City could promote and incentivize in its business community as well as at the State and Federal level. The franchise agreement that the City oversees with its hauling company can also be a powerful tool by setting material disposal rates that incentivize waste reduction, recycling and composting.

EMERYVILLE CLIMATE ACTION PLAN WASTE REDUCTION POLICIES

CITYWIDE POLICIES

Reduce Landfilled Waste in half by 2020 over 2004 levels by:

- Increasing participation in commercial recycling/ reuse programs for paper, cardboard, metal, glass and plastics – rigid and film
- Participating in StopWaste.org's audit and technical assistance program
- Encouraging businesses to participate in the County Green Business program
- Increasing participation in residential recycling programs
- Educating residents and businesses about the benefits of Bay-Friendly Landscaping and Gardening
- Increasing participation in commercial and residential food waste collection program (for composting)

MUNICIPAL POLICIES

Reduce Landfilled Waste in half by 2020 over 2004 levels by:

- Implementing a duplex copying/printing policy in municipal office buildings
- Reducing Landscape Waste in City landscapes by implementing StopWaste.org's Bay-Friendly Landscaping Program. Include practices such as: Increase on-site composting and mulching of municipal plant debris, using compost as a soil amendment, mulch for weed suppression, including the use of drip irrigation systems, a diverse plant pallet to resist pests, and reducing turf and sheared hedges.
- Increasing recycling and composting in municipal facilities

Adopting policies that support reduced waste (and which support other environmental priorities) including the following:

- Environmental purchasing policy
- 75% Diversion Goal
- Construction & Demolition materials recycling ordinance
- Civic Bay-Friendly/Green Building Ordinance
- Residential green building resolution
- Consider mandatory residential & commercial recycling/composting ordinance

Source: City of Emeryville, Climate Action Plan, December 2008.

URBAN ACCORDS WASTE REDUCTION ACTION ITEMS

- **Action 4:** Establish a policy to achieve zero waste going to landfills and incinerators by 2040.
- **Action 5:** Adopt a citywide program that reduces the use of a disposable, toxic, or non-renewable product category by at least fifty percent in seven years.
- **Action 6:** Implement "user-friendly" recycling and composting programs, with the goal of reducing by twenty percent per capita solid waste disposal to landfill and incineration in seven years.

Source: Urban Environmental Accords. United Nations Environment Programme World Environment Day, 2005.

Topic 3: Land Use/Urban Design

Land use and urban design patterns can have a substantial impact on greenhouse gas emissions. The Land Use and Urban Design elements outline a mixed-use land use structure, such that residents, workers, and visitors can easily link multiple trips to residential neighborhoods, workplaces, shopping and public services. Architecture and construction practices are also essential determinants of sustainability in the short- and long-term. For example, recycling waste during the demolition process and implementing energy efficient design principles and appliances, have immediate and long-term benefits to the environment—and potentially to reducing costs. For a discussion of the land use pattern and urban design framework, see Chapter 2 and Chapter 5, respectively. Green building and construction practices are described in the section below.

Existing Policies and Programs

Climate Action Plan

Land use policies, combined with transportation policies, can have a key impact on reducing greenhouse gas emissions. The CAP encourages efficient land use development through focused growth and transit oriented development. The CAP builds on many initiatives that the City is already undertaking, including building on infill and brownfield sties. These measures are consistent with the goals and policies in the Land Use Elements.

LEED™ for Neighborhood Development

Emeryville is also participating in the Leadership in Energy and Environmental Design (LEED™) for Neighborhood Development pilot program, an initiative that seeks to reduce the impacts of urban sprawl, by creating more livable communities, through smart growth and transit-oriented strategies. As a participant, Emeryville obtained LEED™ Platinum certification for the Marketplace Redevelopment Project in 2008. This project will add 674 multi-family housing units and 300,000 square feet of office and retail development.

Green Building and Construction

The City has already taken the initiative to support green building, landscaping, and construction. In May 2008, the City Council adopted a resolution requiring new building or renovation projects with construction costs of at least $3,000,000 or new or renovated landscaping greater than 2,500 square feet or $50,000 in construction costs, to meet green building and landscaping standards. These standards are identified by LEED™ and Bay-Friendly Landscaping, respectively (see text boxes).

New Policies and Programs

Since the City's 2004 emissions inventory revealed that the residential, commercial and industrial sectors together account for nearly half of the City's emissions, improved efficiency in buildings can go a long way toward meeting greenhouse gas reduction goals. Buildings and landscapes that are constructed, maintained and ultimately deconstructed according to sustainable principles need fewer imports and produce fewer exports. Green buildings and landscapes also use local sources for imports and feed their exports back into the local economy for recycling.

Investment in energy-efficient buildings and proper demolition and construction practices can result in a reduction in energy consumption and greenhouse gas emissions. They can also improve indoor air quality and reduce long-term maintenance costs as less energy is required to operate more efficient buildings. With the amount of new construction and rehabilitation projected by the General Plan, this is a great opportunity for the City to initiate policies for green building and construction.

GREEN BUILDING AND CONSTRUCTION

"Green building" refers to creating an energy-efficient building through design and choice of low-impact materials. "Green construction" encompasses the demolition and construction processes, such as the energy used in machines and vehicles, the waste generated at construction sites, runoff, and water and air quality impacts associated with the construction phase of the project.

BAY-FRIENDLY LANDSCAPING: GREEN BUILDING GOALS AND POLICIES

"Bay-Friendly Landscaping" is a whole systems approach to the design, construction and maintenance of the landscape in order to support the integrity of the San Francisco Bay Watershed. "Bay-Friendly Landscapes" reduce greenhouse gases waste, and pollution, conserve water and other natural resources and create healthier communities. Key components of Bay-Friendly landscaping include the following:

- Reducing waste and using materials that contain recycled content;
- Use of native and water conserving plants;
- Nurturing healthy soils with mulch and compost while reducing fertilizer use;
- Conserving water, energy and topsoil;
- Using Integrated Pest Management to minimize chemical use and prevent pollution;
- Reducing stormwater runoff; and
- Creating wildlife habitat.

GOAL

- To encourage, promote, practice and where feasible require Bay-Friendly landscaping practices as defined in the Bay-Friendly Landscape Guidelines, Sustainable Practices for Landscape Professionals within the City of Emeryville.

POLICIES

- All newly designed public and private projects containing landscapes excluding those not subject to landscape review shall use the Bay-Friendly Landscape Guidelines, Sustainable Practices for the Landscape Professional as a reference guide.
- All landscapes maintained by City staff shall be maintained using Bay-Friendly practices to the greatest extent practicable.
- All public landscapes privately maintained shall incorporate Bay-Friendly landscaping practices to the greatest extent possible. Existing contractors shall be asked for voluntary compliance.
- City shall work with Alameda County Waste Management Authority staff to ensure that existing and new landscaping staff obtain adequate training in Bay-Friendly practices/principles.

Source: Alameda County Waste Management Authority.

EMERYVILLE CLIMATE ACTION PLAN LAND USE POLICIES

CITYWIDE POLICIES

- Support transit oriented development
- Establish a Walk-Friendly City - Improve / Expand Pedestrian Infrastructure (e.g., slow traffic, improve sidewalks and safety, ped-only areas)

Source: City of Emeryville, Climate Action Plan, December 2008.

LEED™ NEW CONSTRUCTION POINT CATEGORIES

CATEGORIES	CRITERIA TO EARN POINTS
Sustainable Sites	› Density › Brownfield Remediation › Alternative Transportation Access › Open Space Protection, › Stormwater Management › Heat Island Effect Reduction
Water Efficiency	› Water Efficient Landscaping › Innovative Wastewater Techniques › Water Use Reduction
Energy & Atmosphere	› Optimized Energy Performance › Green Power › Refrigerant Management
Materials & Resources	› Storage & Collection of Recyclables › Building and/or Materials Reuse › Construction Waste Management › Recycled Content › Regional Materials › Certified Wood or Rapidly Renewable Materials
Indoor Environmental Quality	› Performance Measures › Construction Management Plan › Increased Ventilation › Low-Emitting Materials › Controllability of Systems (lighting, thermal comfort) › Thermal Comfort (design, verification) › Daylight & Views
Innovation & Design Process	› Innovative Design › Involvement of LEED™ Accredited Professional

Source: LEED™ for New Construction v2.2, Registered Project Checklist.

URBAN ACCORDS URBAN DESIGN ACTION ITEMS

- **Action 7:** Adopt a policy that mandates a green building rating system standard that applies to all new municipal buildings.
- **Action 8:** Adopt urban planning principles and practices that advance higher density, mixed use, walkable, bikeable and disabled-accessible neighborhoods which coordinate land use and transportation with open space systems for recreation and ecological restoration.
- **Action 9:** Adopt a policy or implement a program that creates environmentally beneficial jobs and "green collar" job training.

Source: Urban Environmental Accords. United Nations Environment Programme World Environment Day, 2005.

Topic 4: Parks, Open Space, and Urban Nature

Parks and open spaces are a vital part of Emeryville's sustainability strategy, adding to the livability of the city and the health of air, water and the city's inhabitants. As a small city, Emeryville contains few parks. As the city continues to grow, in terms of residents, workers, and visitors, Chapter 4: Parks, Open, Space, and Public Facilities Element outlines a strategy to add more parks (small and large), greenways, plazas, and other public open spaces. In addition, the Conservation, Safety, and Noise Element includes policies that seek to preserve existing habitat and special species to ensure that they continue to thrive within the city.

Bay-Friendly Landscaping Standards help to ensure that parks are designed and built using environmentally sound practices.

Existing Policies and Programs

As of 2008, the City enjoys 15 acres of parks, as well as joint-use recreation facilities and the Emeryville Greenway, which is currently undergoing expansion. In addition, the East Bay Regional Parks District manages the Emeryville Crescent, a marsh area that contains plant and wildlife habitat. The City continues to work with regional agencies to protect these species.

URBAN ACCORDS PARKS, OPEN SPACE, AND URBAN NATURE ACTIONS ITEMS

- **Action 10:** Ensure that there is an accessible public park or recreational open space within half-a-kilometer of every city resident by 2015.
- **Action 11:** Conduct an inventory of existing canopy coverage in the city and then establish a goal based on ecological and community considerations to plant or maintain canopy coverage in not less than 50 per cent of all available sidewalk planting sites.
- **Action 12:** Pass legislation that protects critical habitat corridors and other key habitat characteristics (e.g. water features, food-bearing plants, shelter for wildlife, use of native species, etc.) from unsustainable development.

Source: Urban Environmental Accords. United Nations Environment Programme World Environment Day, 2005.

Topic 5: Transportation

An effective transportation network, that accommodates cars, public transit, walking and biking, is an essential component to achieving Emeryville's mobility and sustainability goals. With half of the City's greenhouse gas emissions coming from transportation sources, transportation provides a significant challenge and opportunity to meet the City's sustainability goals. Since automobiles contribute to greenhouse gas emissions, air pollution, and traffic congestion, the Plan seeks to reduce the necessity of driving, by improving alternative transportation modes, and to reduce emissions by reducing the carbon content of fuels and the fuel efficiency of vehicles. Reliable and affordable public transit, along with enhanced pedestrian and bicycle routes and facilities, can reduce these negative impacts, while having the added benefit of improving public health. Chapter 3, the Transportation Element, provides a full description of goals and policies.

Existing Policies and Programs

Climate Action Plan

The CAP outlines four major strategies for reducing emissions from transportation on a citywide basis and within the municipal government: increasing the fuel efficiency of vehicles, promoting the use of alternative fuels (with lower carbon content), implementing trip reduction strategies and transportation demand management practices, and investing in alternative modes of transportation, such as walking, biking, and public transit.

Alternative Transportation

As described in Section 7.1, the City has a legacy of providing free and convenient local transportation service successfully, with the Emery-Go-Round shuttle—which the Transportation Element seeks to build on and expand.

EMERYVILLE CLIMATE ACTION PLAN TRANSPORTATION POLICIES

CITYWIDE POLICIES

- Construct electric vehicle recharging facilities in new large parking facilities
- Allow bikes on trains/buses
- Educate citizens on options for utilizing local low-carbon transportation
- Expand bicycling infrastructure (e.g., lanes, storage facilities)
- Expand EGR bus service in range and / or frequency
- Implement bus rapid transit or shuttle programs
- Implement parking cash-out program
- Increase AC Transit, BART and AMTRAK ridership
- Initiate a car sharing program
- Increase ride-sharing (e.g., carpools)
- Increase telecommuting
- Institute a "safe routes to school" program
- Provide bicycles for daily trips
- Provide high school students with free bus passes
- Procure of hybrid vehicles
- Incentive hybrid vehicles with parking or lane priority
- Procure smaller fleet vehicles
- Install low-flow faucets, low-flow shower heads, and high efficiency toilets
- Use low maintenance landscaping
- Install green and/or reflective roofing
- Install solar photovoltaic panels, solar heating panels, and wind turbines (including via incentives)

MUNICIPAL POLICIES

- Expand bicycling infrastructure (e.g., lanes, storage facilities)
- Implement a police on bicycles program
- Implement parking cash-out program
- Increase EGR & AC Transit, BART & AMTRAK ridership
- Initiate a car sharing program
- Promote telecommuting
- Provide bicycles for daily trips
- Procure Hybrid vehicles
- Procure of smaller fleet vehicles
- Retire old and under-used vehicles
- Utilize fuel-efficient vehicles (e.g., scooters) for parking enforcement

Source: City of Emeryville, Climate Action Plan, December 2008.

URBAN ACCORDS TRANSPORTATION ACTIONS ITEMS

- **Action 13:** Develop and implement a policy which expands affordable public transportation coverage to within half-a-kilometer of all city residents in ten years.
- **Action 14:** Pass a law or implement a program that eliminates leaded gasoline (where it is still used); phases down sulfur levels in diesel and gasoline fuels, concurrent with using advanced emission controls on all buses, taxis, and public fleets to reduce particulate matter and smog-forming emissions from those fleets by 50 per cent in seven years.
- **Action 15:** Implement a policy to reduce the percentage of commuter trips by single occupancy vehicles by ten per cent in seven years.

Source: Urban Environmental Accords. United Nations Environment Programme World Environment Day, 2005.

URBAN ACCORDS ENVIRONMENTAL HEALTH ACTION ITEMS

- **Action 16:** Every year, identify one product, chemical, or compound that is used within the city that represents the greatest risk to human health and adopt a law and provide incentives to reduce or eliminate its use by the municipal government.
- **Action 17:** Promote the public health and environmental benefits of supporting locally grown organic foods. Ensure that twenty per cent of all city facilities (including schools) serve locally grown and organic food within seven years.
- **Action 18:** Establish an Air Quality Index (AQI) to measure the level of air pollution and set the goal of reducing by 10 per cent in seven years the number of days categorized in the AQI range as "unhealthy" or "hazardous."

Source: Urban Environmental Accords. United Nations Environment Programme World Environment Day, 2005.

Topic 6: Environmental Health

Providing a healthy and safe city for all residents, workers, and visitors is critical to the livability of a city and the quality of the natural environment. As a post-industrial city, Emeryville has been a leader in cleaning up contaminants on industrial properties and seeks to continue this legacy of environmental responsibility. In many ways, the City has already accomplished many of the most arduous and costly endeavors to improve environmental health. This section describes smaller-scale programs and policies for prioritizing safe and low-impact supplies as part of municipal purchasing practices, as well as healthy food systems.

Existing Policies and Programs

Brownfields Remediation

As described in Section 7.1, the City has shown great leadership in financing, cleaning up, and redeveloping brownfield sites successfully.

New Policies and Programs

Purchasing

The goods and services purchased by a municipality impact costs, energy consumption, and ultimately greenhouse gas emissions. Sustainability goals may be met through prioritizing Environmentally Preferable purchasing of products, such as post-consumer recycled content office products; Green Seal® certified products and EnergyStar® rated equipment; and standards for city contractors, such as local businesses or companies that are certified green businesses. The City should initiate a purchasing program that addresses the effects of goods and services on pollution, waste, energy consumption, recycled material content, natural resources and public health, and provides a guide for appropriate vendors. The purchasing program should describe a process and identify suppliers for products and services that include recycled content, are durable and long-lasting, conserve energy and water, reduce greenhouse gas emissions, use unbleached or chlorine free manufacturing processes, are lead-free and mercury-free, and use wood from sustainably harvested forests. These products should meet US EPA minimum recycled content standard guidelines and US EPA energy star certification, when practical. The City can also encourage the use of recycled materials and low-impact purchasing among residents and businesses.

Food

As an urban city, Emeryville imports most of its food from farms and purveyors in other parts of the Bay Area and around the world. Agriculture practices often rely on synthetic fertilizers and pesticides, artificial hormones, large amounts of water, long-distance trucking, and factory-style practices for raising livestock and crops. These impacts may be damaging to public health, increase emissions, and use up precious natural resources. Purchasing locally grown and organic foods cuts down on many of these negative impacts.

The City can prioritize sustainable food purchases as a municipality, as well as encourage residents and business to do the same: through providing space for community gardens, fruit-bearing trees, and farmers' markets, and incentivizing relationships with community supported agriculture groups which deliver local fresh produce. With several headquarters for food businesses within its boundaries, food is already a vital part of the City's economy and economic development strategy. City policies can ensure access to local and organic foods, affordability, and cultural relevance for all its residents. In this way, food purchasing exemplifies the 3 E's of sustainability, promoting good ecological practices, supporting a vibrant economy, and ensuring equal access.

Topic 7: Water

From the Bay to the taps, water is an essential resource that City policy can help to protect. Through the management of stormwater, potable and recycled water, Bay-Friendly Landscaping, and conservation initiatives, the City, in collaboration with its water provider, can ensure high-quality water and sufficient supply for years to come. Emeryville's policies for ensuring water quality and supply are detailed in Section 6.1 of Chapter 6: Conservation, Safety, and Noise. The City's leadership in stormwater management and policies for conservation, reclaimed water use, and flood and drainage management, are detailed in Section 6.2 of Chapter 6.

Existing Policies and Programs

Stormwater Management

As described in Section 7.1, the City has shown leadership in stormwater management by providing guidelines for developers and requiring on-site treatment as part of the building permit process.

URBAN ACCORDS WATER QUALITY AND CONSERVATION ACTION ITEMS

- **Action 19:** Develop policies to increase adequate access to safe drinking water, aiming at access for all by 2015. For cities with potable water consumption greater than 100 liters per capita per day, adopt and implement policies to reduce consumption by 10 per cent by 2015.
- **Action 20:** Protect the ecological integrity of the city's primary drinking water sources (i.e., aquifers, rivers, lakes, wetlands and associated ecosystems).
- **Action 21:** Adopt municipal wastewater management guidelines and reduce the volume of untreated wastewater discharges by ten per cent in seven years through the expanded use of recycled water and the implementation of a sustainable urban watershed planning process that includes participants of all affected communities and is based on sound economic, social, and environmental principles.

Source: Urban Environmental Accords. United Nations Environment Programme World Environment Day, 2005.

GOALS AND POLICIES

GOALS

OVERALL SUSTAINABILITY

ST-G-1 **A balance among the three E's of sustainability—**A healthy environment; equity in access to and distribution of goods, services and resources; and a vibrant economy for local businesses and the municipality.

ST-G-2 **Continuous environmental improvement—**Sustainable development through implementation of existing policies and programs.

ST-G-3 **Salient and current—**A municipality and citizenry informed of evolving technology and new approaches to sustainability.

ST-G-4 **Collaboration in sustainability initiatives—**Coordination and collaboration with efforts outside the City to improve local conditions.

ST-G-5 **An advocate for sustainability—**The City will serve as an advocate for sustainability for the municipality and the community.

ENERGY

ST-G-6 **Energy conservation—**Fifty percent reduction in energy consumption for all sectors—transportation, industrial/commercial, residential, and waste, over 2008 levels, by 2017.

The Climate Action Plan describes additional energy goals. This document should be referenced for details.

WASTE

ST-G-7 **Waste reduction—**Fifty percent reduction in waste to landfill, over 2004 levels, by 2020.

The Climate Action Plan describes waste reduction goals. This document should be referenced for details.

LAND USE AND URBAN DESIGN

The Climate Action Plan and Land Use Element of the General Plan sufficiently describe land use goals. The Urban Design Element of the General Plan describes urban design goals. These documents should be referenced for details.

GREEN BUILDING

ST-G-8 **Environmentally-friendly and energy-efficient buildings and landscaping—**Green building and Bay-Friendly Landscaping practices throughout Emeryville in new construction, redevelopment and retrofit projects.

TRANSPORTATION

The Climate Action Plan and Transportation Element of the General Plan describe transportation goals. These documents should be referenced for details.

ENVIRONMENTAL HEALTH

ST-G-9 **Purchasing and consumption to improve public health—**Increased purchasing of Environmentally Preferable products such as those that are biodegradable, recycled-content, reused less-toxic and other low-carbon materials in municipal and community purchasing.

ST-G-10 **Access to healthy foods—**A food system where all residents have financial and physical access to culturally appropriate, affordable, nutritious foods that were grown and transported in an environmentally preferable system.

WATER

The Conservation, Safety, and Noise Element of the General Plan describes water quality, supply, and conservation goals. This chapter should be referenced for details.

POLICIES

Implementing actions supporting each policy are described in Chapter 8: Implementation Program.

ENERGY

ST-P-1 The City shall maintain Climate Action Plan to achieve energy efficiency and conservation goals.

WASTE

ST-P-2 The City shall maintain a Climate Action Plan to achieve waste reduction goals.

ST-P-3 The City shall adopt a Zero Waste Plan and actions for the year 2030, by 2010.

ST-P-4 The City shall negotiate a new Zero Waste Franchise Agreement with a hauling company that uses waste reduction programs and the disposal rate structure to monetarily incentivize recycling and composting which will result in zero tons of methane-producing materials going to landfill by 2030.

LAND USE AND URBAN DESIGN

The Climate Action Plan and Land Use Element of the General Plan describe policies to achieve land use goals. The Urban Design Element of the General Plan describes policies to achieve urban design goals. These documents should be referenced for details.

Green Building

ST-P-5 The City shall encourage, promote, practice, and where feasible, require Bay-Friendly landscaping practices as defined in the Bay-Friendly Landscape Guidelines, Sustainable Practices for Landscape Professionals.

ST-P-6 The City shall collaborate with residents, businesses, and other members of the community, including architects, builders and contractors, to encourage private development within the City to use green building methods and practices and to achieve standards set by LEED™ for commercial buildings and the Alameda County Residential Green Building Guidelines for residential projects.

ST-P-7 The City shall adopt a construction and demolition waste recycling ordinance which will require that, except in unusual circumstances, all construction, demolition and renovation projects meeting a certain size or dollar value, to divert from the waste stream, 100% of all portland cement concrete and asphalt concrete and an average of at least fifty (50) percent of all remaining debris from construction, demolition, and renovation projects.

ST-P-8 The City shall establish incentives for energy retrofits to support implementation of photovoltaic and other renewable energy technologies that result in an energy savings of at least 20 percent when compared to consumption that would occur with traditional energy sources.

ST-P-9 The City shall support companies working in the sustainability sector (such as materials recycling or green building) to locate in Emeryville.

TRANSPORTATION

The Climate Action Plan and Transportation Element of the General Plan describe policies to achieve transportation goals. These documents should be referenced for details.

ENVIRONMENTAL HEALTH

ST-P-10 The City shall develop and implement an Environmentally Preferable Product Purchasing program for municipal purchases that targets products and services, which minimize environmental impacts, toxics, pollution, and hazards to worker and community safety to the greatest extent possible.

ST-P-11 The City shall support education initiatives that encourage private companies and residences to purchase Environmentally Preferable products and services

ST-P-12 The City shall support community outreach and education to improve organic and local food systems in the city.

ST-P-13 The City shall incorporate local and organic food as part of the proposed municipal purchasing program.

WATER

The Conservation, Safety, and Noise Element of the General Plan describes policies to achieve water quality, supply, and conservation goals. This chapter should be referenced for details.

8 IMPLEMENTATION PROGRAM

The General Plan provides specific policy guidance for implementation of plan concepts in each of the Plan elements and establishes a basis for action. The policies in each element of the Plan provide details that will guide program development. This chapter describes, in general terms, the responsibilities for implementation.

8.1 OVERVIEW

The implementation plan outlines specific implementation actions that will be initiated after adoption. The major implementation process for the land use proposals will be administration of the Zoning Ordinance through the Zoning Map. The Zoning Ordinance and Zoning Map will need to be amended to be consistent with the General Plan's policies, and work on these efforts is already underway. In addition, Design Guidelines, adopted concurrently with the General Plan, guide physical planning and building design, as well as landscape treatment in private projects and streetscape design.

With nearly the entire City encompassed within one of two redevelopment project areas, the Redevelopment Agency will play a key role in the financing of capital improvements and implementing the land use program, consistent with redevelopment project area plans and State law. In addition, the City's five-year Capital Improvement Program will continue to be the primary means of scheduling and estimating costs of infrastructure improvements.

In many areas, General Plan implementation will depend on actions of other public agencies and of the private sector that will fund a large portion of the development expected to occur. The General Plan will serve a coordinating function for private-sector decisions. It provides a basis for action on individual development applications, which must be found to be consistent with the General Plan if they are to be approved. The General Plan and the Zoning Ordinance also include criteria for granting Floor Area Ratio and height bonuses, which must be satisfied for the bonuses to be availed.

8.2 RESPONSIBILITIES

Implementing the General Plan will involve the City Council, the Planning Commission, other City boards and commissions, and City departments. The City also will need to consult with Alameda County departments, adjacent cities, and other public agencies about implementation proposals that affect their respective areas of jurisdiction. The principal responsibilities that City officials and staff have for Plan implementation are briefly summarized below; details on their powers and duties are documented in the Emeryville Municipal Code.

City of Emeryville

City Council (CC)

The City Council is responsible for the overall management of municipal affairs; it acts as the legislative body and is responsible for adoption of the General Plan and any amendments to it. The City Council also appoints the Planning Commission and other boards and commissions established under the Municipal Code.

The City Council's role in implementing the General Plan will be to set implementation priorities and approve Zoning Map and the Updated Zoning Ordinance, consistent with the General Plan, and a Capital Improvement Program and budget to carry out the Plan. The City Council also acts as the Redevelopment Agency and, in this capacity, will help finance public facilities and improvements needed to implement the Plan. The Council also approves certain development projects consistent with the General Plan.

City Manager (CM)

The City Council appoints the City Manager who is their key staff advisor and has overall responsibility for the day-to-day implementation of the Plan and preparation of the recommended budget for City Council approval. The City Manager also serves as the Executive Director of the Emeryville Redevelopment Agency.

Planning Commission (PC)

The Planning Commission is responsible for preparing and recommending adoption or amendment of the General Plan, zoning and subdivision ordinances and other regulations, resource conservation plans, and programs and legislation needed to implement the General Plan. The Planning Commission may also prepare and recommend adoption of specific plans, neighborhood plans or special plans, as needed for Plan implementation. The Planning Commission also approves most major development projects requiring use permits and design review.

Planning and Building Department (PB)

The Planning and Building Department has primary responsibility for administering the laws, regulations and requirements that pertain to the physical development of the City. Tasks include administering planning and building permit procedures, providing public information, performing building and code enforcement inspections, maintaining complete public records on planning and building projects and issuing necessary permits, certificates, approvals and enforcement citations.

Specific duties related to General Plan implementation include preparing zoning and subdivision ordinance amendments, design guidelines, reviewing development applications, conducting investigations and making reports and recommendations on planning and land use, zoning, subdivisions, design review, development plans and environmental controls. The Planning and Building Department will have a lead role in implementing the policies of the Land Use and Parks, Open Space, and Public Facilities elements. Finally, the Department will have the primary responsibility for preparing the annual report on the General Plan. (These reporting requirements are described in Chapter 1 of the General Plan.) The Planning and Building Department also approves minor development projects.

City Attorney (CAO)

The City Attorney is retained by the City Council and Redevelopment Agency to act as the legal advisor and administrator of the legal affairs of the City and Agency.

The City Attorney renders legal advice to the Council, Redevelopment Agency, City Manager, Department Heads, and all City officials on matters of law pertaining to official activities. The City Attorney represents the City and Agency in litigation and reviews all legal documents, including ordinances, resolutions, leases, contracts, and deeds, and approves each as to form. The City Attorney's Office also negotiates development agreements with private parties on behalf of the City Council and Redevelopment Agency.

Finance Department (F)

The Finance Department is responsible for managing all financial aspects of City and Redevelopment Agency operations. The Department handles all accounting; oversees the annual audit; tracks and accounts for all revenues received by the City and Redevelopment Agency; bills regularly for Business License accounts; and processes purchasing, accounts payable, and payroll. The Department is responsible for preparation and management of the Annual

Budget and Annual Financial Report. The Department also complies with a host of State and Federal requirements involving filing of reports and information regarding City/Agency finances. The Department manages all of the City/Agency cash, handles investments under the investment policy adopted by the City, and handles bond financing and assessment district financial management.

Economic Development and Housing Department (EDH)

The Economic Development and Housing Department coordinates programs and projects of the Emeryville Redevelopment Agency. These responsibilities include redevelopment-financed projects, brownfields remediation programs, business development, and infrastructure improvements improvements. Housing programs include assistance to local businesses and a full service housing rehabilitation program to maintain and improve the housing stock available to low to moderate income residents. This department also has substantial implementation responsibilities for the Housing Element of the General Plan, in addition to the Land Use Element.

Public Works Department (PW)

The Public Works Department consists of four divisions: Administration, Engineering, Environmental, and Maintenance. The Department is responsible for designing, inspecting, and managing City's Capital Improvement Projects, including City's parks, sidewalk and street reconstructions/constructions, street lights, traffic signals, storm drains and sanitary sewer. The Department will take the lead in the implementation of many of the General Plan's sustainability initiatives. It will also have specific implementation responsibilities for portions of the Land Use, Circulation, and Conservation and Natural Environment elements, as well as redesign of streets in accordance with the Design Guidelines.

Community Services Department (CS)

The Community Services Department is responsible for managing the City's parks and recreation programs as well as senior services and child care. The Community Services Department will have responsibility over the programming of parks and open spaces, and coordinate with the Emery Unified School District and School Board to develop and oversee delivery of service in the Emeryville Center of Community Life.

Police and Fire Departments (PD, FD)

Within the City, responsibility for public safety is assigned to the Police and Fire departments. The Police Department is responsible for preventing crime and maintaining law and order. The Emeryville Fire Department aims to educate the public, prevent fires, and respond to all emergencies in the city. These departments are responsible for implementing public safety policies described in the Conservation and Natural Environment and Parks, Open Space, and Public Facilities elements.

Emery Unified School District (EUSD)

The Emery Unified School District, led by the School Board, manages the public schools in the city. Together, the District and the City are pursuing the development of the Center of Community Life, which will consolidate the public schools in addition to a range of community services and facilities.

Emeryville Transit Management Association (ETMA)

The Emeryville Transit Management Association operates the Emery Go-Round free shuttle service. The Emery Go-Round provides service within Emeryville and between the MacArthur BART Station and the

city. The shuttle system is funded through property taxes on local businesses. The Transit Management Association will continue to be responsible for operating the Emery-Go-Round as its mission expands to serve residents in addition to employees, as called for in the General Plan. The TMA also coordinates the car share program and other transportation services.

Other Boards and Committees

The City has established a number of other boards and committees, some of which will be involved in Plan implementation in their respective areas of expertise. These may include the AC Transit/Emeryville Liaison Committee, Bicycle/Pedestrian Advisory Committee, City/Schools Committee, Housing Committee, Marina Committee, Public Safety Committee, Public Works Committee, and Emeryville Education and Youth Services Advisory Committee. The General Plan does not envision any substantive change in the responsibilities assigned to these boards and commissions. They will be administering new or amended regulations adopted pursuant to Plan policies, and their actions will need to be consistent with the General Plan.

Regional, State, Federal, and Private

Association of Bay Area Governments (ABAG)

The Association of Bay Area Governments is the regional council of governments that includes Emeryville and others in the nine-county Bay Area. ABAG does not have authority over land use in Emeryville, but it does provide overarching land use goals for the region. In particular, ABAG supports growth in the inner urban ring of the Bay Area—which includes Emeryville—as opposed to building in the remaining greenfield portions of the region. To that end, ABAG, along with three other regional agencies, has started the FOCUS initiative, prioritizing funds for "Priority Development Areas" (PDA) that have high level of transit accessibility and potential for redevelopment. The City of Emeryville has submitted to ABAG an application for designation of all of Emeryville, with the exception of the lower density neighborhoods and the area west of Interstate 80, as a PDA.

Metropolitan Transportation Commission (MTC)

The Metropolitan Transportation Commission serves as both the regional transportation planning agency (a State designation) and as the region's metropolitan planning organization (a federal designation). MTC is responsible for the Regional Transportation Plan, a comprehensive plan covering transit, roads, airports, ports, rail, bicycle and pedestrian facilities. It also administers funds to local jurisdictions and transit agencies based on this Plan. MTC has several grant programs including:

- Transportation for Livable Communities (TLC): supports projects that enhance community vitality and promote walking, bicycling and transit use.
- Housing Incentive Program (HIP): assists housing construction near transit hubs.
- Low Income Flexible Transportation (LIFT): funds services that assist low-income residents travel to and from work, school and other essential destinations.

East Bay Regional Parks (EBRPD)

Serving Alameda and Contra Costa counties, the East Bay Regional Park District manages 98,000 acres of parkland in the East Bay. It operates the Eastshore State Park along Emeryville's waterfront and the funds from the District's Measure CC, approved by voters in 2004, which created a 15-year special excise tax to improve public access, wildfire protection, pub-

lic safety and environmental maintenance of District parks and trails.

Alameda County (ACo)

Alameda County encompasses 14 cities, including Emeryville, and unincorporated land. Its Board of Supervisors has jurisdiction only in the unincorporated portions of the County. However, Alameda County has pursued several initiatives, particularly around sustainability measures (e.g. Bay-Friendly Landscaping, StopWaste.Org, that have been integrated into City policy. Alameda County is also the umbrella for the Alameda County Congestion Management Agency (CMA), which was created in 1991 by a joint-powers agreement between Alameda County and all its cities. The CMA's goals, duties and composition make it easier for local governments to tackle the increasingly complex problem of traffic congestion. The CMA helps local governments meet the requirements of federal, state and local transportation laws by providing technical assistance. The CMA also coordinates with county and regional transportation organizations. Over the past six years, the CMA has built a framework to plan and obtain funding for Alameda County transportation services and projects.

AC Transit (AC)

The Alameda-Contra Costa Transit District (AC Transit) is the transit authority for Alameda and Contra Costa counties. AC Transit provides bus service to Emeryville along nine routes, in addition to school routes. An AC Transit bus yard is located on 45th Street at San Palo Avenue.

Union Pacific Railroad (UP)

Union Pacific owns the right-of-way along the north-south railroad tracks, operating freight trains on as line-haul vehicles. Although UP is not a public agency, the City must coordinate with UP about crossings and noise mitigations that the City pursues as part of the General Plan. With the anticipated expansion of the Port of Oakland, freight rail traffic through Emeryville is anticipated to increase dramatically.

Amtrak (AMTK)

Amtrak provides national passenger rail service and serves Emeryville with a station located on Horton Street. Four Amtrak routes serve this station, including the Capitol Corridor and San Joaquin commuter service routes. In 2008, these four routes had 44 trains per day serving Emeryville.

Bay Conservation and Development Commission (BCDC)

The Bay Conservation and Development Commission regulates new development within the first 100 feet of the San Francisco Bay shoreline. Its purpose is to protect the Bay and ensure public access to the Bay. The agency has authority over land use, construction, and subdivisions of property. In Emeryville, BCDC's power of review mainly affects any changes to land uses or structures along the Peninsula and at the Interstate-80 Ashby Avenue interchange. By agreement, Watergate and Trader Vic's are regulated only to mean high tide, not 100 feet. On the other hand, the entire marina is included in BCDC's jurisdiction, even beyond 100 feet inland.

California Department of Transportation (DOT)

The Department of Transportation, or "Caltrans", is the State agency that owns and operates freeways and state routes that provide access to and through the city, including Interstates 80, 580, and 880, and State Route 123 (San Pablo Avenue). Particularly along San Pablo Avenue and interchanges, where changes have been identified in the General Plan, coordination between the City and the Caltrans is critical.

California Environmental Protection Agency (CEPA)

The California Environmental Protection Agency is charged with developing, implementing and enforcing the state's environmental protection laws that ensure clean air, clean water, clean soil, safe pesticides and waste recycling and reduction. It includes several sub agencies that have jurisdiction over environmental elements in Emeryville, including:

- Department of Toxic Substance Control (DTSC)
- Regional Water Quality Control Board (RWQCB)
- The Air Resources Board (ARB)

East Bay Municipal Utility District (EBMUD)

The East Bay Municipal Utility District is a publicly owned utility that supplies water and provides wastewater treatment for parts of Alameda and Contra Costa counties on the eastern side of San Francisco Bay in northern California.

8.3 THE PLAN AND THE REGULATORY SYSTEM

The City will use a variety of regulatory mechanisms and administrative procedures to implement the General Plan. Under California law, Emeryville is required to have the Zoning Ordinance be consistent with the General Plan. In fact, the consistency requirement is the keystone of Plan implementation. Without a consistency requirement, there is no assurance that Plan policies will be implemented and that environmental resources earmarked for protection in the Plan will be preserved. Nevertheless, minor and routine maintenance and repair of existing buildings or alteration of addition to existing buildings that do not add significant floor areas nor facilitate a chance in use are not intended to trigger an evaluation of weather such activity is consistent with the General Plan. Other regulatory mechanisms, including subdivision approvals, building and housing codes, capital improvement programs, and environmental review procedures also will be used to implement Plan policies. All project approvals must be found to be consistent with the General Plan.

Zoning Regulations

The City's Zoning Ordinance translates plan policies into specific use regulations, development standards and performance criteria that govern development on individual properties. The General Plan establishes the policy framework, while the Zoning Ordinance prescribes standards, rules and procedures for development. The Zoning Map provides more detail than the General Plan Diagram.

Regulations for zoning districts will be established as part of the comprehensive zoning update being undertaken concurrently with the General Plan update. The

use regulations and development standards for existing zoning districts will need to be amended to conform to Plan policies. The City will bring both the Zoning Ordinance and the Zoning Map into conformance with the General Plan. When the General Plan is amended in the future, the Zoning Ordinance and Zoning Map also may need to be amended to maintain consistency between the Plan and zoning.

Subdivision Regulations

No subdivision of land may be approved under California law and the City's Subdivision Regulations unless its design and proposed improvements are found to be consistent with the General Plan. Update of the City's Subdivision Regulations (contained in Title 9 of the Municipal Code) to conform to the updated General Plan policies is underway.

Building and Housing Codes

No building permit may be issued under California law (*Gov. Code Section 65567*) unless the proposed development is consistent with the City's open space plan and conforms to General Plan policies.

8.4 CAPITAL IMPROVEMENTS PROGRAMMING

The Five-Year Capital Improvements Program (CIP) is the infrastructure funding plan for the city. It includes a list of public works projects that the City intends to design and construct in coming years. As a capital plan, the CIP represents one-time expenditures, as opposed to ongoing funding for operations expenses. The current CIP covers fiscal years 2006-2007 through 2011-2012. Redevelopment funds comprise 69 percent of total CIP funding with $147 million. Private and State/Federal sources each contribute an additional $18 million. Future funds are expected to make up the remaining funding needs with $26 million.

The General Plan has identified a range of capital outlays that will be implemented and funded through the CIP:

- Parks (specifically two new large parks);
- Street and intersection improvements;
- Bike boulevards and bikeways;
- Bridges and underpasses;
- Pedestrian Priority Zone improvements;
- Streetscape design; and
- Facility plan updates (e.g. water, wastewater, stormwater).

City Council reviews and adjusts the CIP every two years to reflect changes in priority, funding availability and need, and the general economy. With input from other departments the Finance Department and City Manager prepare and update the CIP. The Public Works Department has the lead role in carrying out the capital improvements.

8.5 IMPLEMENTATION ACTIONS FOR PLAN POLICIES

The tables on the following pages summarize implementation actions that the City will undertake to carry out the policies proposed in each element of the General Plan. (Note that the Housing Element contains its own implementation program.) Each action item implements one or more policies (the policy number is given in the table below, the actual policy is listed in the individual elements). The code listed first in the "Responsibility" column, represents the lead agency or department. In the final columns, an implementation schedule specifies the short- or long-term nature of implementation actions: ongoing, 0-5 years, 6-10 years, or 11-20 years.

Annual Report

As discussed in Chapter 1: Introduction, the City is required to prepare an annual report on progress in implementation of the General Plan. The action items that follow provide a template to monitor this progress. The annual report will be prepared by the Planning Department and submitted to the City Council, and to the Govenor's Office of Planning and Research.

IMPLEMENTATION RESPONSIBILITY CODES

Code	Department/Agency
CITY OF EMERYVILLE	
CC	City Council
CM	City Manager
PC	Planning Commission
PB	Planning and Building Department
EDH	Economic Development and Housing Department
PW	Public Works Department
CS	Community Services Department
ETMA	Emeryville Transit Management Association
F	Finance Department
CAO	City Attorney's Office
FD	Fire Department
EUSD	Emery Unified School District
ETMA	Emeryville Transit Management Association
REGIONAL, STATE, FEDERAL, AND PRIVATE	
ABAG	Association of Bay Area Governments
MTC	Metropolitan Transportation Commission
EBRPD	East Bay Regional Parks
ACo	Alameda County
AC	AC Transit
UP	Union Pacific Railroad
AMTK	Amtrak
BCDC	Bay Conservation and Development Commission
DOT	California Department of Transportation (Caltrans)
EMBUD	East Bay Municipal Utility District
CEPA	California Environmental Protection Agency

Action Number	**Implementation Actions**	**Policy Numbers**	**Responsibility**	**Ongoing**	**0-5 Yrs**	**6-10 Yrs**	**11-20 Yrs**
T-A-17	Require all new development (residential and non-residential) to contribute to the Emeryville Transportation Management Association to ensure that Emeryville residents are well served by transit.	T-P-34, T-P-35 T-P-46	PB, ETMA	X			
T-A-18	Monitor, as appropriate, public parking supply and utilization to identify deficiencies and optimize efficiency to 85 percent. Adjust pricing and supply as appropriate and apply other parking management strategies such as Residential Permit Parking (RPP) to ensure adequate parking availability in residential areas, recognizing the need for adequate parking to support neighborhood businesses.	T-P-49, T-P-50, T-P-51, T-P-52, T-P-53, T-P-54, T-P-55, T-P-56, T-P-57, T-P-58, T-P-59	PW, PB	X			
T-A-19	Study and implement a citywide Transportation Demand Management Program and explore funding mechanisms.	T-P-53, T-P-64, T-P-65, T-P-66, T-P-67	PB, PW, ETMA, CAO, F		X		
T-A-20	Coordinate with stakeholders and interested agencies and parties to explore the feasibility of a bicycle and pedestrian trail adjacent to the Emeryville Crescent.	T-P-18, T-P-20, T-P-22	PB, CAO, PW, EBRPD, State Parks		X		
T-A-21	Maintain designated truck routes to dictate appropriate routes for truck traffic.	T-P-60, T-P-61, T-P-62	PW	X			

TABLE 8-3: Implementation Actions for Parks, Open Space, Public Facilities and Services

				IMPLEMENTATION SCHEDULE			
Action Number	**Implementation Actions**	**Policy Numbers**	**Responsibility**	**Ongoing**	**0-5 Yrs**	**6-10 Yrs**	**11-20 Yrs**
PP-A-1	Prepare a strategic parks master plan. Plan should identify needs, prioritize acquisition, and facilitate a significant reduction in the current deficit in parks and open space acreage. The plan shall also identify options for park financing and implementation, recognizing the challenges of providing new parks in a built-out city.	PP-P-1, PP-P-2, PP-P-3, PP-P-4, PP-P-5, PP-P-6, PP-P-7, PP-P-8, PP-P-10, PP-P-12, PP-P-13	CS, PB, PW, F		X		
PP-A-2	Develop a park-programming plan based on assessment of user needs. Plan should maximize open space use and balance active and passive recreational needs for all segments of the community.	PP-P-1, PP-P-2, PP-P-3, PP-P-4, PP-P-8, PP-P-10	CS		X		
PP-A-3	Explore additional joint park facilities and use agreements with surrounding communities and agencies.	PP-P-4, PP-P-10, PP-P-14, PP-P-15, PP-P-16, PP-P-17	CS, EUSD	X			
PP-A-4	Coordinate east-west greenway creek improvements and water features with community members and design professionals.	PP-P-7	PB, PW, CS, EUSD, EDH, CAO			X	
PP-A-5	Update and implement Five-Year Capital Improvement Program.	PP-P-1, PP-P-2, PP-P-3, PP-P-4, PP-P-5, PP-P-6, PP-P-7, PP-P-8, PP-P-13, PP-P-17, PP-P-21	F (updates), PW (implements), EDH		X		
PP-A-6	Update zoning and subdivision regulations and the zoning map.	PP-P-9, PP-P-10, PP-P-11, PP-P-14, PP-P-22	CAO			X	
PP-A-7	Continue to negotiate with landowners on the acquisition of land to supplement the Center of Community Life. Identify funding opportunities and implement the entire concept.	PP-P-2, PP-P-15, PP-P-16, PP-P-17	CS, EUSD, F	X			
PP-A-8	Work with other public agencies, including PG&E, AC Transit, Amtrak, the Post Office and the School District and local neighborhoods on appropriate land uses for sites no longer needed by the respective public agency.	PP-P-2, PP-P-3, PP-P-4, PP-P-15, PP-P-16, PP-P-17	PB, CS, EUSD	X			

Continues on next page

				IMPLEMENTATION SCHEDULE			
Action Number	**Implementation Actions**	**Policy Numbers**	**Responsibility**	**Ongoing**	**0-5 Yrs**	**6-10 Yrs**	**11-20 Yrs**
PP-A-9	Continue to provide ongoing and one-time cultural and recreation events for all members of the community—youth, adults, and seniors. Promote programs through City newsletter and website.	PP-P-18, PP-P-19, PP-P-20	CS	X			
PP-A-10	Prepare a strategic plan and design documents for an Arts and Cultural Center.	PP-P-21	EDH		X		
PP-A-11	Conduct a feasibility study for a new location and building for Police Administration facilities.	PP-P-22, PP-P-23	PD, PW				X
PP-A-12	Continue to operate the Community Emergency Response Team (CERT) Program.	PP-P-24	FD	X			
PP-A-13	Continue to coordinate with utilities service providers as necessary (i.e. PG&E, EBMUD)	PP-P-25, PP-P-26, PP-P-27	PW	X			
PP-A-14	Continue to require development projects to replace or upgrade sanitary sewer systems.	PP-P-27, PP-P-28	PW, PB	X			

TABLE 8-4: Implementation Actions for Urban Design

				IMPLEMENTATION SCHEDULE			
Action Number	**Implementation Actions**	**Policy Numbers**	**Responsibility**	**Ongoing**	**0-5 Yrs**	**6-10 Yrs**	**11-20 Yrs**
UD-A-1	Prepare Design Guidelines for the following design elements: › Site planning › Building orientation and entries › Open space › Parking and service areas › Building height and mass › Building form and articulation › Façade composition › Building materials, detailing, and color › Residential livability › Streets › Sustainability objectives › Landscaping › Signage › Gateways	UD-P-1, UD-P-3, UD-P-10, UD-P-15, UD-P-19, UD-P-20, UD-P-21, UD-P-22, UD-P-23, UD-P-24, UD-P-25, UD-P-26, UD-P-27, UD-P-28, UD-P-29, UD-P-30, UD-P-31, UD-P-32, UD-P-33, UD-P-34, UD-P-35, UD-P-36 UD-P-38, UD-P-39, UD-P-40, UD-P-43, UD-P-45, UD-P-46, UD-P-47, UD-P-51, UD-P-53, UD-P-54, UD-P-55, UD-P-59, UD-P-60, UD-P-61, UD-P-62, UD-P-63, UD-P-64, UD-P-65, UD-P-66, UD-P-67, UD-P-68, UD-P-70, UD-P-71, UD-P-72	PW		X		
UD-A-2	Prepare, update, and implement neighborhood and area plans.	UD-P-5, UD-P-6, UD-P-7, UD-P-8, UD-P-9, UD-P-10, UD-P-11, UD-P-12, UD-P-13, UD-P-14, UD-P-15, UD-P-16, UD-P-17, UD-P-18, UD-P-37, UD-P-48, UD-P-68	PB, PW, EDH	X			
UD-A-3	Update the Zoning Ordinance: › Parking › Building mass › Signage › Districts › Development standards › Streets	UD-P-5, UD-P-9, UD-P-10, UD-P-15, UD-P-19, UD-P-26, UD-P-31, UD-P-34, UD-P-35, UD-P-36, UD-P-38, UD-P-54, UD-P-55, UD-P-56, UD-P-58, UD-P-59	PB, CAO	X			
UD-A-4	Prepare citywide streetscape plan.	UD-P-1, UD-P-8, UD-P-16, UD-P-17, UD-P-18, UD-P-41, UD-P-42, UD-P-43, UD-P-44, UD-P-45, UD-P-46, UD-P-47, UD-P-48, UD-P-49, UD-P-50, UD-P-51, UD-P-69	PB, PW, EDH			X	

Continues on next page

				IMPLEMENTATION SCHEDULE			
Action Number	**Implementation Actions**	**Policy Numbers**	**Responsibility**	**Ongoing**	**0-5 Yrs**	**6-10 Yrs**	**11-20 Yrs**
UD-A-5	Update Capital Improvements Program.	UD-P-2, UD-P-20, UD-P-48, UD-P-52	F, PW, EDH	X			
UD-A-6	Utilize Site Plan Review › Identify options for pedestrian circulation › Extend street grid wherever possible › Require buildings within identified gateway areas to emphasize entry into the city through architectural elements.	UD-P-4, UD-P-5, UD-P-7, UD-P-8, UD-P-11, UD-P-12, UD-P-13, UD-P-14, UD-P-20, UD-P-37, UD-P-57, UD-P-58, UD-P-69	PB	X			
UD-A-7	Invest in signage, public art, and streetscape improvements at identified city gateways.	UD-P-1, UD-P-73, UD-P-74, UD-P-75	EDH, PW	X			
UD-A-8	Improve the city's physical appearance through maintenance and façade renovations of older residential and industrial building stock. Support community-driven neighborhood beautification programs by emphasizing rehabilitation grants and low-interest loans.	UD-P-9, UD-P-10, UD-P-13, UD-P-15, UD-P-19	EDH, PB, PW	X			
UD-A-9	Utilize the City's Public Art Fund to expand public art within the city along key pedestrian streets and at major gateways like Hollis Street, San Pablo Avenue, and Powell Street. Continue support for developer and city contributions to the Emeryville Arts in Public Places Program, with special emphasis on locating art in new parks and greenways.	UD-P-73, UD-P-74	EDH	X			
UD-A-10	Develop and implement new sign regulations.	UD-P-73, UD-P-75	CAO	X			

TABLE 8-5: Implementation Actions for Conservation, Safety, and Noise

				IMPLEMENTATION SCHEDULE			
Action Number	**Implementation Actions**	**Policy Numbers**	**Responsibility**	**Ongoing**	**0-5 Yrs**	**6-10 Yrs**	**11-20 Yrs**
CSN-A-1	Plant new trees and other plantings, and maintain existing healthy trees to improve air quality and reduce the urban heat island effect.	CSN-P-19, CSN-P-20	PW	X			
CSN-A-2	Continue working with the San Francisco Regional Water Quality Control Board in the implementation of the National Pollutant Discharge Elimination System permit process for the protection of surface and groundwater quality.	CSN-P-7, CSN-P-8, CSN-P-10, CSN-P-44	PW	X			
CSN-A-3	Implement EBMUD Water efficiency requirements for new and rehabilitation projects.	CSN-P-12, CSN-P-13, CSN-P-14, CSN-P-15, CSN-P-16, CSN-P-17	PW		X		
CSN-A-4	Disseminate information about the potentially harmful effects of toxic chemical substances and safe alternative measures, for home and garden use.	CSN-P-9	ACo, PW	X			
CSN-A-5	Support the East Bay Regional Parks District in the maintenance and protection of the biological resources in the Emeryville Crescent portion of the Eastshore State Park, while studying the feasibility of a bicycle and pedestrian trail adjacent to the Emeryville Crescent.	CSN-P-18, CSN-P-19, CSN-P-22, CSN-P-23, CSN-P-24, CSN-P-25	PW, EBRPD, State Parks	X			
CSN-A-6	Identify historic and cultural resources within Emeryville and continue to refine and implement ordinances pertaining to architecturally significant structures, to ensure adequate recognition and incentives for reuse.	CSN-P-26, CSN-P-28, CSN-P-32	PB		X		
CSN-A-7	Offer funding through the Redevelopment Agency for façade preservation projects.	CSN-P-26, CSN-P-31	EDH	X			
CSN-A-8	Cooperate with appropriate government agencies and public and private organizations to address seismic hazards and flooding risks due to dam inundation, tsunamis, sea level rise, or major flood events.	CSN-P-34, CSN-P-35, CSN-P-44, CSN-P-46	PB	X			
CSN-A-9	Implement and update emergency management operations plan, including evacuation routes, cache of supplies, training of City staff, as necessary, as the city continues to develop.	CSN-P-48, CSN-P-49	FD	X			

Continues on next page

				IMPLEMENTATION SCHEDULE			
Action Number	**Implementation Actions**	**Policy Numbers**	**Responsibility**	**Ongoing**	**0-5 Yrs**	**6-10 Yrs**	**11-20 Yrs**
CSN-A-10	Periodically update the Local Hazard Mitigation Plan (LHMP).	CSN-P-34, CSN-P-37, CSN-P-38, CSN-P-39, CSN-P-40, CSN-P-41, CSN-P-43, CSN-P-48, CSN-P-49	FD, PD, PW, PB	X			
CSN-A-11	Continue to work with the Alameda County Waste Management Authority & Recycling Board (StopWaste.Org) regarding disposal of hazardous materials.	CSN-P-9, CSN-P-38, CSN-P-39, CSN-P-40, CSN-P-41, CSN-P-42, CSN-P-43	PW, ACo, FD	X			
CSN-A-12	Continue working with the Alameda County Flood Control and Water Conservation District.	CSN-P-44, CSN-P-45, CSN-P-46	PW, ACo	X			
CSN-A-13	Utilize Site Plan Review process to ensure public health and safety, and the protection of natural and cultural resources.	CSN-P-1, CSN-P-19, CSN-P-25, CSN-P-27, CSN-P-29, CSN-P-30, CSN-P-33, CSN-P-34, CSN-P-35, CSN-P-41, CSN-P-43, CSN-P-48, CSN-P-50, CSN-P-58, CSN-P-59	PB	X			
CSN-A-14	Update Zoning Ordinance.	CSN-P-4, CSN-P-5, CSN-P-6, CSN-P-11, CSN-P-12, CSN-P-13, CSN-P-14, CSN-P-15, CSN-P-16, CSN-P-33, CSN-P-34, CSN-P-35, CSN-P-36, CSN-P-39, CSN-P-50, CSN-P-57, CSN-P-58	PB, CAO	X			
CSN-A-15	Update Capital Improvements Program.	CSN-P-2, CSN-P-20, CSN-P-22, CSN-P-23, CSN-P-24, CSN-P-45	F, PW, EDH	X			
CSN-A-16	Implement Climate Action Plan in coordination with all City departments.	CSN-P-2, CSN-P-3, CSN-P-11, CSN-P-12, CSN-P-13, CSN-P-14, CSN-P-15, CSN-P-16, CSN-P-20, CSN-P-21	PW		X		
CSN-A-17	Establish conditions of approval for mechanical equipment with potential noise impacts.	CSN-P-51, CSN-P-53, CSN-P-55, CSN-P-57, CSN-P-58	PB	X			
CSN-A-18	As part of development review, ensure that all development located within future noise exposure (as shown on Figure 6-10) levels greater than “Normally Acceptable” must complete a noise study and implement appropriate mitigation measures to bring interior noise levels to “Acceptable” levels.	CSN-P-52, CSN-P-53, CSN-P-54	PB	X			
CSN-A-19	Coordinate with the Public Utilities Commission and other public agencies to develop railroad quiet zones.	CSN-P-56	PB	X			

TABLE 8-6: Implementation Actions for Sustainability

				IMPLEMENTATION SCHEDULE			
Action Number	**Implementation Actions**	**Policy Numbers**	**Responsibility**	**Ongoing**	**0-5 Yrs**	**6-10 Yrs**	**11-20 Yrs**
ST-A-1	Implement Climate Action Plan in coordination with all City departments.	ST-P-1, ST-P-2, ST-P-3, ST-P-4, ST-P-9	PW		**X**		
ST-A-2	Adopt the United Nations Environmental Accords by Resolution with a plan for implementing 14 of the 21 actions by 2012.	ST-P-1, ST-P-2	PW		**X**		
ST-A-3	Incorporate site-appropriate standards described by Build-It-Green GreenPoint rating system and/or Leadership in Energy and Environmental Design (LEED™), and Bay-Friendly Landscape Scorecard into all new construction and rehabilitation projects.	ST-P-5, ST-P-6, ST-P-7, ST-P-8	PW		**X**		
ST-A-4	Implement civic green building resolution requiring City projects to follow green building and Bay-Friendly Landscaping requirements.	ST-P-5, ST-P-6, ST-P-7, ST-P-8	PW	**X**			
ST-A-5	Implement green building ordinance requiring Public-Private Partnership projects to be follow green building and Bay-Friendly Landscaping requirements. (pending)	ST-P-5, ST-P-6, ST-P-7, ST-P-8	PW	**X**			
ST-A-6	Develop and implement an environmentally preferable municipal purchasing program.	ST-P-10, ST-P-11, ST-P-13	PB, EDH	**X**			
ST-A-7	Identify sites for developers to provide sites for farmers' markets.	ST-P-12	PB, EDH	**X**

EXECUTIVE SUMMARY

This Emeryville Housing Element establishes the City's housing goals, policies and programs for the period of 2009 to 2014. Its primary purpose is to guide decisions and identify programs that will facilitate housing availability during the five year period.

Included in this document is information on existing conditions and characteristics that provides the basis for its goals and policies. These goals and policies will be achieved through a Housing Action Plan specifically designed to fit the local needs and opportunities. Key findings and goals of the 2009-2014 Emeryville Housing Element are summarized as follows:

Housing Needs Assessment

Population and Households

- **Emeryville's population is growing at a rapid rate:** Since the 2000 Census, Emeryville's population has grown 41%, from 6,822 to 9,727 persons.
- **Non-family households represent the bulk of this growth:** Non-family households were the fastest growing household type between 1990 and 2000, and comprise 70% of all households in Emeryville. In 2000, 51% of Emeryville's population lived in non-family households, up from 44% in 1990.
- **One- and two- person households comprise the majority of all households:** One-person households grew at a faster rate than all households combined, and increased their share of total households to 55%, followed by two person households at 30%.
- **Emeryville is increasingly attractive to those 21-24 years old, and those older than 45 years old:** 21-24 year olds represented 33% of total population growth between 1990 and 2000, but those 45-64 accounted for 48%.
- **Emeryville's racial and ethnic composition is very diverse**: In 2000, of the non-Hispanic population (91% of the total population), 42% was white, 19% was black or African-American, 1% was American Indian or Alaskan Native, and 26% was Asian, Native Hawaiian, or Pacific Islander. Nine percent of the population was Hispanic. The greatest population growth from 1990 to 2000 was in the Non-Hispanic Asian, Native Hawaiian, or Pacific Islander group.
- **Special Needs Populations**: Large families and single parent families may face housing affordability issues, particularly female-headed households. Seven percent of Emeryville's families with a female head of household and no spouse present were below the poverty level in 2000. Other special needs groups identified in the Housing Element that may have affordable housing issues include Emeryville's seniors and disabled people. Those at risk of homelessness or who are homeless also are

identified as special needs because they are likely to have greater difficulty obtaining affordable housing with appropriate supportive services.

- **Local Opportunity Groups:** The Housing Element identifies certain groups that are important to the Emeryville community including families with children, artists, city employees, and employees of the Emery Unified School District.

Housing Characteristics

- **Emeryville's housing stock expanded even faster than the population between 2000 and 2008:** Since 2000, the city has added 1,997 housing units, a 47% increase.
- **Housing in Emeryville increasingly consists of large-scale projects with few rooms per unit:** 71% of all housing in Emeryville in 2008 was in structures with over 50 units, and the average unit has about 3 rooms, compared with 5 in Alameda County.

Income Characteristics

- **Emeryville is attracting households with higher incomes faster than those with lower incomes:** Only households earning $50,000 and more grew at a faster rate than total household growth; they accounted for 49% of all households in 2006.
- **There are income differences amongst renter and owner households:** More than half of Emeryville's renter households in 2000 (55%) were extremely low, very low, or low income. 30% of owner households were in these income levels.
- **Housing costs remain high for many Emeryville renters:** 45% of renting households pay greater than 30% of their income to rent; the majority of these households were extremely low, very low, or low income.

Economic Characteristics

- **Industry trends in Emeryville indicate growth in high and low income jobs, and a decline in middle income jobs:** The fastest growing industries in Emeryville are finance, retail, and food service and accommodation, while manufacturing, wholesaling, and administrative support are in decline.

Resources and Constraints to Housing Development and Affordability

Land Use and Zoning

- **Emeryville's land use policies and zoning regulations encourage residential and mixed use development**: Multi-family developments of five or more units represent 78 percent of the total housing stock. The zoning ordinance allows residential development and/or live work in six of the nine zoning districts.
- **Constraints imposed by the zoning regulations are related to development standards:** Parking requirements are particularly difficult to achieve in infill development, frequently resulting in a scaled-back project.

Sites and Facilities

- **For a small city, Emeryville has been aggressively developing housing in recent years and has opportunity sites for additional housing:** Building permits for approximately 1,281 dwelling units are anticipated by 2014. The city's most significant constraint is its small size.

Housing Costs

- **Housing development costs continue to increase as a result of increasing costs of land, materials, labor, site preparation and insurance:** A sampling of recent developments in Emeryville show construction costs range from $360,000 to $450,000 per unit.
- **Recent market rate for-sale housing prices in Emeryville significantly exceed the prices considered affordable by redevelopment law and the gap between affordable rents and market rents is largest for very low and low income households.**

Housing Resources

- **There are a variety of Federal, State and City programs to support housing supply and affordability:** Emeryville programs include the Affordable Housing Set Aside ordinance, the Redevelopment Agency's Low and Moderate Income Housing Fund, the Ten-Year Housing Compliance Plan, and several developer and homebuyer subsidy programs.
- **There are several non-governmental resources:** housing developers, lenders, and non-profit housing advocacy organizations**.**

Achievement of 2002 Housing Element

The City annually reports on implementation of the adopted housing element. Key outcomes on the four goals of the 2002 housing element, during the period of January 1, 2002 to December 31, 2008 are summarized below:

- **Goal I. Preserve existing housing stock:** The City offers a wide range of grant and loan programs through the Housing Rehabilitation Program with the goal of preserving the City's older, existing housing stock. Between 2002 and 2008, the City assisted with improvements to 103 dwelling units.
- **Goal II. Promote a variety of housing types and affordability levels:** The City has a strong record of expanding its housing supply and will continue to support development of a wide range of housing types and affordability levels in the coming years. Between January 1, 1999 and June 30, 2006, the previous Regional Housing Need Allocation period, over 1,800 units were added to the City's housing stock.
- **Goal III. Promote housing for special needs groups:** The Courtyards apartment project includes 3 units for developmentally disabled households. In 2006, the City approved AgeSong Assisted Living project, which will feature 121 assisted living units, 28 independent living units, a dining room, and a publicly accessible café. In 2008, the Redevelopment Agency approved a new project to renovate a four-plex building as an affordable supportive housing project for five developmentally disabled adults.
- **Goal IV. Promote equal opportunity in housing:** Anti-discrimination clauses are standard in the City and Agency's agreements with housing developers, and failure to comply with fair housing laws is a violation of the City and Agency's agreements. The City contracts with Housing Rights, Inc. to provide fair housing counseling services to both tenants and landlords, including counseling, tenant/landlord mediation, attorney and small claims court referral, and housing discrimination investigation.

Housing Goals and Implementation

There are seven housing goals for this 2009 to 2014 housing element:

- **Goal I. Preserve existing housing stock.**
- **Goal II. Promote a range of affordability levels.**
- **Goal III. Promote development of affordable housing for persons with special needs.**
- **Goal IV. Ensure that the City has a variety of housing types to meet the diverse needs of its residents as well as attract new residents.**
- **Goal V. Maintain and expand activities designed to prevent those currently housed from becoming homeless and to assist those who are homeless.**
- **Goal VI. Promote equal opportunity in housing.**
- **Goal VII. Promote environmental responsibility and long-term sustainability of City's housing development through remediation of brownfields and promotion of "green" housing development.**

Each goal is supported with objectives, policies, and implementation programs. The Housing Action Plan specifies the measurable outcomes, funding sources, responsible agents for implementation, and action steps.

CHAPTER 1. INTRODUCTION

The city of Emeryville is located in the San Francisco Bay Area region at the gateway to the East Bay. Emeryville is one of the smallest cities in the Bay Area, covering an area of just 1.2 square mile. It is located between the city of Berkeley to the north, Oakland to the south, and the San Francisco Bay to the west. Emeryville is located at the eastern end of the San Francisco Bay Bridge, a major crossing between the East Bay and San Francisco. Emeryville was incorporated in 1896 as a city of industry and business at transportation cross roads. Today Emeryville is a bustling mixed use city that includes a and vibrant arts community, high-tech industries such as software, animation, and biotechnology, retail and entertainment destinations, and a wide range of residential housing, from older single family neighborhoods, to converted live/work lofts, and higher-density rental and ownership housing. This Housing Element is intended to guide decisions that will facilitate the development, rehabilitation and availability of housing in the city of Emeryville over the five-year period from July 1, 2009 to June 30, 2014. Included in this Housing Element is an action program to implement its goals and policies.

Legal Context

The housing element is one of seven State-mandated elements of the Emeryville General Plan. Emeryville's Housing Element was last revised in 2000, adopted in 2001, and certified by the State Housing and Community Development Department (HCD) in 2002. By State law, housing elements are required to be updated every five years. Due to extensions in the State schedule, this five-year planning document applies for the period of July 1, 2009 to June 30, 2014, and replaces the 2002 Housing Element. It fulfills the State requirement for planning to meet the housing needs of all economic segments of the community. It also meets the mandate for consistency with the other elements of Emeryville's General Plan. [1]

State requirements for housing elements are more detailed and specific than for other general plan elements. This housing element meets the requirements of housing law specified in California Government Code Article 10.6, Sections 65580-65589.5. The law emphasizes the availability of housing as a statewide priority and requires participation from regional and local governments as well as the private sector. State law says that the housing element "shall consist of an identification and analysis of existing and projected housing needs and a statement of goals, policies, quantified objectives and scheduled programs for the preservation, improvement, and development of housing".

Regional Housing Need Allocation

This housing element addresses the requirements of Section 65584 of Article 10.6 of the Government Code, namely, the identification of sites suitable for residential development to accommodate Emeryville's housing need allocation assigned through the Regional Housing Need

[1] Concurrently with this Housing Element, the other six mandatory elements of Emeryville's General Plan, plus two optional elements, are being updated, as are the City's zoning regulations. A new comprehensive general plan and regulations, and a set of design guidelines, were completed in early 2009 and are anticipated to be adopted in mid-2009. This Housing Element and the progress of the other elements will be regularly evaluated and adjusted for consistency up until adoption.

Allocation (RHNA) process. On March 20, 2008, the Association of Bay Area Governments (ABAG), the Council of Local Government for the nine-County Bay Area region, approved the final housing need allocation for the RHNA for each jurisdiction in the Bay Area for the 2007 through 2014 period. Emeryville's allocation for this period is 1,137 units, broken down by income category as shown below. Chapter 3 of this housing element provides an analysis of potential sites for additional housing that will accommodate the 1,137 housing units assigned through the RHNA process.

Very low income units:	186	(16.4% of total)
Low income units:	174	(15.3% of total)
Moderate income units:	219	(19.3% of total)
Above-moderate income units:	558	(49.0% of total)
TOTAL:	**1,137 units**	

Contents

Emeryville's Housing Element identifies development sites adequate to accommodate a variety of housing types for all income levels, analyzes resources as well as constraints to housing development and affordability, and outlines policies to promote housing opportunities for all persons. Following this introductory chapter, the Housing Element's components are arranged as follows:

Chapter 2:	An assessment of local housing needs, including demographic information.
Chapter 3:	An analysis of government and non-government resources and constraints to housing development and affordability.
Chapter 4:	A progress report outlining the City's achievement with respect to goals, policies, and programs found in the 2001 Housing Element for the reporting period of January 1, 2002 through December 31, 2008.
Chapter 5:	The new goals, objectives, policies and programs that will be implemented during the Housing Element period.
Chapter 6:	A housing action plan for implementing the new goals, objectives, policies and programs identified in Chapter 5.
Appendices:	Technical data and background information supporting the Housing Element.

Review Process and Public Participation

The City of Emeryville began working on the Housing Element Update in summer 2007, with the intention of completing a first draft by summer 2008 that could be submitted to the State of California Department of Housing and Community Development (HCD) for its initial review and comment. Over a period of eight months, from August 2007 through April 2008, the Emeryville Housing Committee worked with city staff to create a draft document for further public review. A citywide public workshop on the first draft of the Housing Element was held on March 15, 2008 and attended by over twenty people not including staff. The draft was presented by staff and followed by a discussion and comment period. The draft was presented to the Planning Commission on April 24, 2008 as part of a public hearing and to the City Council on May 20, 2008 for comments and acceptance prior to forwarding to State HCD. All Housing Committee, Planning Commission and City

Council meetings during this period were fully noticed and open to the public. Over 400 individuals on a Housing Element interest list were notified of the March 15, 2008 workshop as well as the Planning Commission meeting.

To encourage full public participation, an article was published in the February 2008 edition of the *Emeryville Connection,* a Chamber of Commerce newsletter that is sent to all Emeryville addresses. The article announced the housing element update and community workshop and invited community members to get involved. The article listed upcoming opportunities for public participation including the March workshop and the public meetings. An informational flyer was broadly distributed and posted in store windows, at local restaurants, and in other visible locations. Information was also posted on the City's website. The first draft of the Housing Element was made available on the City's website, at City offices, and at the local library.

In August 2008, State HCD provided written comments on the City's first draft Housing Element. These comments were addressed and incorporated into the current version of the Housing Element. In fall 2008 and early 2009, City staff began its update to the draft Housing Element, based on the written comments from HCD. A second community workshop was held on March 28, 2009 to discuss and comment on the revised Housing Element. A number of public outreach efforts were made to encourage attendance at the workshop. Announcements were made via Emeryville's public access television station, E-TV, which reaches all households in Emeryville, with information regarding the Housing Element Workshop. An article announcing the Housing Element Update was included in the March 2009 Emeryville Chamber of Commerce newsletter which reaches all households and businesses in Emeryville. Flyers announcing the Workshop were posted around town at coffee shops, retail stores, and restaurants, at Emeryville City Hall, and at outlying departments that serve a broad range of the population, including the Emeryville Child Development Center, the Emeryville Senior Center, and the Emeryville Recreation Department which runs the after-school programs for the Emery Unified School District serving many of the families in Emeryville. Flyers were also provided to the Public Information Exchange Officer at the Emery Unified School District. To encourage participation in the Housing Element review process by lower and moderate income persons, the flyers were sent with a cover letter directly to the Home Owner Association contacts and Property Management Offices for housing developments in Emeryville that contain Below Market Rate rental apartments or ownership units. The contacts were requested to post the flyer in public notice locations within their buildings to encourage participation. The flyer was also sent electronically to several residents in the community who maintain list-servs for their neighborhoods. Postcard announcements were sent to over 350 individuals on the City's Housing Element update interest list, as well as City Committees, the Emeryville Planning Commission, the Emeryville City Council, housing developers, and housing advocacy organizations with an interest in housing issues in Emeryville. Along with these public outreach efforts, Emeryville's mayor announced the Housing Element update and March 28th workshop at the March 17th City Council meeting which is televised to Emeryville residents on the local cable access station. The proposed Housing Element was made available in its entirety online, with a request feature to sign up for the Housing Element interest list.

The revised Housing Element was presented to the Housing Committee at its April 1, 2009 meeting, to the Planning Commission on April 23, 2009 as part of a public hearing and to the City Council on June 16, 2009 for comments and acceptance prior to forwarding to State HCD. All Housing Committee, Planning Commission and City Council meetings during this period were fully noticed and open to the public. Copies of related public information materials may be found in Appendix H.

CHAPTER 2. HOUSING NEEDS ASSESSMENT

Population Characteristics

Population, Households, and Families

Emeryville's Housing Element was last updated in 2001. Since the 2001 update Emeryville has experienced rapid population and housing growth. Between 1990 and 2000 the city's population grew by almost 20% from 5,740 to 6,882 persons. From the 2000 Census through January 1, 2008, the estimated population increase has been 2,845 persons, a 41% gain to the estimated population of 9,727 persons as of January 1, 2008, the date for which the most current population estimate is available from the State Department of Finance. This growth rate exceeded that of Alameda County, whose population increased by 4.6% between 2000 and 2006. Projections by the California Department of Finance predict 9,300 residents in Emeryville by 2010. Table 2-1 provides data on the total Emeryville population between 2000 and 2008, as well as the breakdown of households by family type between 2000 and 2006. Overall, Emeryville's total population increased 41% from 2000 to 2008, with the addition of 2,845 persons so far this decade. Non-family households have been and remain the largest share of all households (70%), and grew at a slightly faster rate than family households between 2000 and 2006. Non-family households are defined as those in which the householder lives alone or with non-relatives only. In terms of household size trends since 1990, household size and family size have remained relatively steady since 1990, at 1.7 and 2.8 persons in 2000, respectively. Alameda County's average family size of 2.9 in 2000 was similar to that of Emeryville's. Non-family households, which account for a majority of Emeryville's households, had 1.3 persons on average in 2000. Emeryville's non-family households have markedly fewer persons than those in Alameda County where the average non-family household had 2.7 persons in 2000.

Table 2-1: Population and Households

	2000		2008		% change 2000 - 2008
Population	6,882		9,727		41%

Table 2-2 provides data on changes in household composition in Emeryville between 1990 and 2000. Household growth in Emeryville was robust between 1990 and 2000, with the city adding 764 total households, for an increase of 24%. The rate of growth for non-family households was greater than family households by a wide margin, increasing the share of non-family households from 65% to 70% citywide. In absolute terms, the city added 698 non-family households, a household type which represents 91% of all households added in that period.

For family households, married couples with children under 18 years increased at twice the rate of total household growth, and continued to make up the largest single share of family households (68%). There was a marked increase in the number of male family householders with children under 18 years, though in absolute numbers it was small (9 in 1990 to 87 in 2000). Female family householders decreased over the same period, falling by approximately 20% from 282 to 226. Female family householders with children fell even more precipitously, declining from 208 to 131 (37% decrease).

Table 2-2: Household Types

	1990	% of Total Households	2000	% of Total Households	% Change 1990 - 2000
Total Households	**3,204**	**100%**	**3,968**	**100%**	**24%**

Non-family households	2,084	65%	2,782	70%	33%

Sources: US Census, 1990, 2000 SF3

As shown in Table 2-3, which tracks household composition trends between 1990 and 2000, in addition to the number of family households declining in relation to non-family households, the share of Emeryville's population that lives in family households grew only slightly (1%) but shrank proportionally. In contrast, the non-family population increased at a rate of 41%, over twice the rate of the city's growth as a whole. In 2000, 51% of the city's population lived in non-family households, up from 44% in 1990.

The composition of family households in Emeryville was relatively unchanged between 1990 and 2000, although the number of grandchildren in Emeryville families decreased dramatically, from 86 to 15. The total number of children in Emeryville family households declined slightly as well. "Other relatives" living in family households marked the biggest percentage increase from 1990 to 2000. In sum, families in Emeryville in 2000 had slightly fewer children and grandchildren but had more of other relatives than in 1990. For non-family households, there were two remarkable shifts. First, the share of total females heading non-family households grew at a much faster rate than the total population, so that by 2000 there was roughly an equal number of female and male non-family householders. Most of these females in 2000 lived alone (83%), comparable to 1990 (82%). In contrast, the proportion of male heads of household living alone declined from 1990 to 2000 (79% and 75%, respectively). Second, non-relatives living in non-family households also increased dramatically (79%) from 423 to 756.

Table 2-3: Household Composition

	1990		2000		% Change 1990 - 2000

Sources: US Census, 1990, 2000 SF3

Table 2-4 shows the number of persons per occupied housing unit. Between 1990 and 2000 the number of units with one occupant increased 31%, a faster rate than all other categories, increasing the share from 53% to 55%. In 2000, there were 2,205 occupied units in Emeryville with one person living in them. Units with three and four persons declined proportionally while units with 5 or more persons maintained a 3% share.

Table 2-4: Persons Per Occupied Housing Unit 1990 - 2000

	1990	% of Total Housing Units	2000	% of Total Housing Units	% Change 1990-2000

Source: US Census, 1990, 2000 SF3

In summary, between 1990 and 2000 the total share of Emeryville's population that lived in family households declined from 56% to 48%. Married couples and male heads of households with children increased at a rate faster than general household growth while female headed households, especially those with children, declined. In 2000, 48% of the city's population lived in family households (down from 56% in 1990). One third of the population lived alone, and 11% were unrelated individuals living in non-family households (up from 7% in 1990). Female householders living alone were one of the fastest growing groups, and in 2000 they represented 17% of the city's population.

Age Characteristics

Emeryville's age profile (Table 2-5) marked an increase in the overall age of the population between 1990 and 2000. The population of people 18 years and younger declined, while population of 35 years and older grew. The population of people over 65 remained more or less the same even though its largest growth occurred among those 75 and older. These trends are reflected in an overall increase in the median age in Emeryville by two years from 1990 to 2000, from 34.4 years to 36.4 years.

Table 2-5: Median Age (years)

	1990	2000
Emeryville	34.4	36.4
Alameda County	32.7	34.7

Source: US Census, 1990, 2000 SF3

As shown in Table 2-6, between 1990 and 2000, the total share of the population under 18 fell from 14% to 11%, reflecting an 8% decline. Growth in the 18-65 age bracket was greater than growth for the population as a whole, having its most dramatic increase among 21- 24-years old (91% increase). 21-24 years old registered the largest proportional increase in population share from 7% to 11% (366 out of 1,142), to which one third of the population growth in the city from 1990 to 2000 can be attributed. In contrast, there was no growth in the 25-34 age bracket which comprised the largest bracket at 22%, (down from 27%). Combined, the 21-24 and 25-34 age brackets make up 33% of the city's total population. Those in the age brackets between 35 and 64 years increased their share of the city's population from 38% to 43%; this group made up 66% of the total population increase between 1990 and 2000. The majority of this population is clustered in the 35-44 age bracket, representing 19% of the city's population (unchanged from 1990). Those 45-64, while evenly distributed, made up 48% of the city's population growth. In sum, the city's 35-64 age bracket lost population, while people in older brackets added population. The population of people over 65 increased by 12%; this increase helped maintained its number at 9% of the total population. On average, there was a larger group of people over 65 in 2000 than there was in 1990, with a net loss in the 65- to 74- year bracket and dramatic growth among 75-84 and 85 and older.

Table 2-6: Age Distribution

	1990		2000		% Growth 1990-2000

Sources: US Census, 1990, 2000 SF3

A comparison of growth rates in each age bracket illustrates Emeryville's population shifting towards people of older age. Compared with the citywide population growth rate of 20%, the under-18 age brackets grew slowly, or declined (ages 10-14), and thus, declined in its share of the population. On the other end of the scale, strong growth among those 45-59 helped push the city's age profile up. Notably, the 21-24 age bracket grew dramatically. However, the 25-34 age bracket remained unchanged from 1990 levels. While those age 84 and over grew at the fastest rate (134%), their absolute numbers represent just 1% of the total population.

The proportional decline of those under 18 years old prompts several interpretations. One is that the need for housing that can accommodate families is in decline; another is that new housing construction that occurred during the 1990-2000 period was not designed to be family-oriented (i.e. projects were built with predominantly smaller units with fewer bedrooms). It appears that Emeryville has been very attractive to those who are typically younger than most new parents (i.e. those 21-24, recently out of college) and those who are older than the typical childbearing years (i.e. those 45-59 and older than 65).

Comparing Emeryville's population to that of Alameda County will help highlight Emeryville's unique context: The proportion of Emeryville's population that was under 18 years old in 2000 was 11%; in Alameda County it was 24%. Concurrently, those 18-65 years old in Emeryville made up 81% of the population; in Alameda County it was 65%.

The upshot is that a third of the population, those in the 21-24 and 25-34 brackets, is more likely to need housing units that are smaller than single-family detached homes. Studios and one-bedroom units are likely to be the most attractive housing type for those 21-24, while one and maybe two-bedroom units may be more attractive to young couples in the 25-34 year old bracket. The high rate of growth of individuals living alone (32% of the population in 2000) also reflects a trend in the residential units types being developed in that a greater percentage of new units are one-bedrooms than larger sized units. This is discussed further below in the section on Housing Unit Characteristics.

The 45-59 age group is more likely to already have children, but the absolute decline in children between 1990 and 2000 suggests that those who moved to Emeryville either did not have children or had children who are grown or moved to college etc. Current or future "empty nesters" appear to have been attracted to Emeryville. One and two bedroom unit lofts are likely to be popular housing products for this group.

Finally, although proportionally small, the growth in population over 65 is worthy of discussion. Combined, this group represented 9% of the city's population in 2000, and was skewed toward those 75 and older. Indeed, the number of people in the age 85 and over age group grew from 38 people in 1990 to 89 people in 2000, a 134% increase. Managed care and independent living units may be needed to accommodate this population.

Education Characteristics

In 2000 Emeryville's educational attainment profile was that of a fairly highly educated population. As shown in Table 2-7, over half of the population held at least a bachelor's degree (54%), compared with about one-third in Alameda County (34%). Because incomes typically rise with educational attainment, a greater share of Emeryville's population has more financial resources to devote to housing than Alameda County as a whole.

Table 2-7: Educational Attainment for Residents 25 Years and Over

	Emeryville	% of Total Population	Alameda County	% of Total Population
Total Population 25 years and over	5,115	100%	953,716	100%
Less than 9th Grade	135	3%	76,513	8%

Doctorate degree	238	5%	20,214	2%

Source: US Census 2000, SF3

As shown in Table 2-8, a sizable minority of Emeryville's population, 16%, was enrolled in undergraduate or graduate school in 2000. This was respectively greater than the Alameda County and Statewide figures of 9% and 8%. Emeryville's proximity to the University of California, Berkeley and other institutions in Emeryville and Oakland likely explains this figure.

Table 2-8: School Enrollment

	2000	% of Total Population
Total Population 3 years and over	6,702	100%
Enrolled in nursery school, preschool:	50	1%
Enrolled in kindergarten:	29	0%

Racial and Ethnic Characteristics

Table 2-9 compares race and ethnicity changes from 1990 to 2000 in Emeryville. Between 1990 and 2000, all racial and ethnic groups in Emeryville increased in number, though not all at the same rate as the total population increased. The result was a modest evening out of racial and ethnic distribution in the form of a proportional decrease of Whites and Blacks, corresponding with the growth of Asians and those identifying as "Other".

In general, Emeryville's population remained predominantly Non-Hispanic in 2000 (91%). Non-Hispanic Whites still remain the largest racial group even though it fell proportionally from 49% to 42% of the total population. Non-Hispanic Asians, Native Americans, and Pacific Islanders became the second largest racial group, over 25%. This group essentially switched places with Non-Hispanic Black or African Americans, whose share declined from nearly a quarter to about one fifth of the total population. Those identifying as Non-Hispanic "Other" increased from 1% to 4% of the total population, representing the largest growth rate of all racial groups. The Hispanic population increased, but in 2000, it still made up about one tenth of the city's population (the same as it was in 1990). Approximately half of the Hispanic population identified as "Other race," with the next largest share identified as White (38%).

In summary, the population of Non-Hispanic Asians, Native Hawaiians, and Pacific Islanders grew most substantially at a rate of 69% and accounted for the largest share of total population added to the city from 1990 to 2000, 724 people (63%). The growth rate of Non-Hispanic Whites and Non-Hispanic Black or African American population was small, respectively 3% and 1%. The dramatic increase (33%) in Non-Hispanic "Other race" is likely attributed to changes to the reporting formats between the 1990 and 2000 Decennial Census. The Hispanic population grew at a rate somewhat faster than the total population, but overall, Hispanics in 2000 made up the same proportion of the total population as in 1990. The "Other race" group represented the most substantial increase within the Hispanic category, accounting for 78 of the 122 persons added (63%).

Table 2-9: Race and Ethnicity

	1990		2000		% change 1990 - 2000
Total Population	5,740	100%	6,882	100%	20%

Special Needs Populations

This section describes groups in the City of Emeryville with a range of housing and supportive service needs, including groups defined in State Housing Element law as having special needs. These groups consist of agricultural workers, large families, female-headed households, the elderly, persons with disabilities, and homeless people.

Agricultural Workers

According to the 2000 Census, only 12 people, or 0.3% of Emeryville's population, work in the fields of agriculture, forestry, fishing and hunting, or mining. Emeryville's agricultural worker population is generally composed of boat workers and garden store employees. Neither of these groups requires special housing.

Emeryville's Large Families

Large families are identified as a special needs population in State Housing Element law because with a limited supply of adequately sized units to accommodate larger households, large families can face difficulty located adequately-sized affordable housing. Large households are defined by the U.S. Census Bureau as households containing five or more persons (related or unrelated). As shown previously in Table 2-4, the majority of households in Emeryville in 2000 were occupied by one or two persons, although in this year there were also 114 households with five or more persons, representing 3% of total occupied units. This was a 24% increase in the number of large family units since 1990 (22 more units). The break-down by tenure is shown in Table 2-10 below. Two percent of owner-occupied housing units were occupied by households with five or more persons (24 units), and 5% of renter-occupied housing units were occupied by households with five or more persons (90 units).

Table 2-10: Family Size by Tenure

	1-4 persons		5+ persons		Total	
	Number	Percent	Number	Percent	Number	Percent
Owner Occupied	1,440	98%	24	2%	1,464	100%
Renter Occupied	2,421	95%	90	5%	2,511	100%
Total	3,861	97%	114	3%	3,975	100%

Source: US Census 2000 SF3

Emeryville's Single Parent Families

State housing element law considers single female-headed households to have special needs. Single mothers often rely on one income to meet all household expenses, and on average, women earn less than men in similar occupations. As shown in Table 2-11, the 2000 Census identified 131 single-mother households (with their own children) in Emeryville, 3% of Emeryville's total households.

According to the 2000 Census, 7.1% of Emeryville families with a female householder and no husband present were below poverty level. These single-mother households may experience a significant housing affordability gap.

In addition to economic problems, single mother families are often vulnerable to displacement due to domestic violence. According to the Alameda Countywide Homeless and Special Needs Housing Plan, published in April 2006, assistance is only available to a small percentage of these families. In Alameda County there are over 150 shelter beds available exclusively for women escaping domestic violence. There are over 70 units of transitional or permanent housing specifically for victims of domestic abuse. The City of Emeryville annually allocates a portion of its federal CDBG allocation to the Berkeley Food and Housing Project (BFHP) in support of that organization's transitional housing project for women and children.

It is interesting to note that single-mother households in Emeryville declined between 1990 and 2000, whereas single-father households grew, as shown in Table 2-11. This may be due to changes in family law courts resulting in an increasing number of fathers receiving custody of their children. In Alameda County, single-father and single-mother households both grew from 1990 to 2000, though single-father households experienced greater growth.

Table 2-11: Single-Parent Households

	1990	% of Total Households	2000	% of Total Households	% Change 1990-2000
Alameda County					
Single-father households	7,833	2%	10,853	2%	39%
Single-mother households	34,478	7%	35,482	7%	3%
City of Emeryville					
Single-father households	9	0%	87	2%	867%
Single-mother households	208	6%	131	3%	-37%

Emeryville's Elderly People

As of the 2000 Census, 9% of Emeryville residents were 65 years of age or older and the group was skewed toward those 75 and older (see Table 2-6). Many seniors live on fixed incomes, which can translate to seniors having difficulty with housing costs if rents or ownership housing costs increase. The tenure profile of Emeryville's seniors is shown in Table 2-12. Of the total 537 units occupied by seniors ages 65 years and older, 44% were occupied by renter households (236 units) and 56% by owner households (301 units).

Table 2-12: Occupied Units by Tenure by Age

Household Age	Renters		Owners		Total	
65 to 74 years	96	40.7%	124	52.5%	220	41.0%
75 to 84 years	102	43.2%	127	53.8%	229	42.6%
85+ years	38	16.1%	50	21.2%	88	16.4%
Total	236	100.0%	301	127.5%	537	100.0%

Source: US Census 2000 SF3

This is a fairly high rate of ownership by senior households for a group that comprises just 9% of Emeryville's population. Seniors' ownership rate is higher than the City's overall ownership rate, which was 37% in 2000. As shown in Table 2-13, however, most seniors have low or very low incomes. Among elderly renter households, fully 74% have incomes that are extremely or very low income. Among elderly owner households, there is also a high percentage who are extremely or very low income (49%). Table 2-13 also shows that all lower income elderly renter households (those less than 80% of the area median income) had some form of housing problems (either experienced cost burden, paying more than 30% of their income on housing costs, overcrowding, and/or substandard kitchen or plumbing facilities). (Housing problems and overpayment issues are described later in this chapter under "Housing Affordability" section.) Among elderly owner households, a majority of extremely low income and very low income seniors experienced housing problems.

Table 2-13: Elderly Households by Income and Tenure; % with Housing Problems

Household Age	Elderly Renter Households	As % Total	% with Housing Problems	Elderly Owner Households	As % Total	% with Housing Problems	Total	As % Total

Source: CHAS Data, Housing Problems, 2000

Two apartment buildings in Emeryville are reserved for very low-income seniors including Emery Villa (which contains 50 units) and Avalon Senior Apartments (which contains 66 units). By reserving units at very low income rents for seniors, these two developments assist in alleviating the cost burden issues that many seniors face.

According to the Alameda County Social Services Department, 130 Emeryville residents are involved with the In-Home Supportive Services Program (IHSS). The percentage of those receiving support has increased by only 0.1% since 2004**.**

The Alameda County Area Agency on Aging is the local arm of the national aging network that works to advance the social and economic health of elders (60 and over) within the county. In 1994 they completed a study expressing the need for a higher level of

care and assistance for the elderly within Emeryville. Since then, a Needs Assessment Report has been completed concerning issues facing seniors. This 2005 report includes data and surveys from those residing in the North County (defined as the cities of Alameda, Albany, Berkeley, Emeryville, Oakland, and Piedmont). Twenty-eight percent of North County seniors have been residents for over 30 years, and 72% of the elderly in the North County are female.

According to data collected through a focus group survey as part of the 2005 Needs Assessment, 15% of respondents think that housing is a serious problem for seniors, many of whom in the low income range. The 2005 Needs Assessment also reveals that 64% of married North County seniors have a monthly income below $1,781, with the county wide average being 51%. Fifty-nine percent of single seniors in the North County have a monthly income of below $937 while the countywide average is 47%. Given that the estimated mean rent for a one-bedroom apartment in Emeryville exceeds $1,300 (based on a March 2007 City of Emeryville survey), there is a significant imbalance between rents and what seniors can pay. It may be surmised that some seniors are living in substandard housing, are living with relatives, or have been able to secure subsidized housing.

The second phase of the 2005 Needs Assessment was the facilitation of six focus groups, each with ten to twenty participants. Housing was a key topic of discussion. The participants identified financial abuse as a significant concern, as well as home safety. Difficulty with landlords was a recurrent theme, especially when modifications to the home were requested (such as grab bars and banister repair). Many seniors said that they were unfamiliar with what resources were available to them and were afraid of being overcharged for services. Two seniors suggested an agency be created that cater to 'senior friendly' services. The majority of seniors were unwilling to consider shared housing situations for fear that they would become the caregiver of someone who became disabled. This conclusion was unanimous across regions. Participants were reluctant to burden family members but welcomed the idea of supportive housing and more structured care. None expressed an aversion to a nursing home or institutional care, but they feared a lack of resources would not give them any choice in the type of housing they would be able to have. Lower income seniors from the North County were more averse to institutional care. The majority viewed new housing developments as less than accessible, feeling that what developers propose for low income seniors rarely resulted in truly 'low-income' housing.

The 2005 Needs Assessment also indicates that many of the elderly in Emeryville may need assistance performing daily tasks. Thirty-seven percent of seniors in the North County reported an inability to do heavy housework, 26% are unable to shop, 23% can not prepare their own meals, and 28% have no means of transportation. Of those unable to manage or who have serious difficulty with certain activities, 66% of seniors in the North County had no help managing money, 74% had no help getting to the bathroom, 65% had no help bathing, and 46% had no help preparing meals.

Forty-seven percent of North County seniors live alone. Of those that live with others, 38% of North County seniors share their home with a spouse or partner, 22% live with other family members, and 2% live with a friend or caregiver. The largest percentage (49%) of North County seniors reside in a house while 38% live in an apartment or condominium/townhouse; 4% live in senior housing, an assisted living facility, or a residential care home; and 1% are homeless.

The Emeryville Senior Center functions as a community focal point for older adults in Emeryville and the surrounding community. It provides an array of services that promote healthy aging, such as in-home care, health services, financial counseling, subsidized transportation, and social activities. In 2006, the Emeryville Senior Center served an average of 430 seniors per month and a total of 5,152 seniors during the year.

Emeryville's Disabled People and Housing Resources for People with Disabilities

Disabled households (either elderly or non-elderly) include households that have members who are disabled due to a physical handicap, a mental illness, or developmental disabilities. In general, persons with disabilities have lower incomes, especially in those cases where the disability limits the ability to hold a job. Moreover, disabled people often experience significant barriers to adequate housing due to physical or structural obstacles.

According to the 2000 U.S. Census, 1,029 (19.5%) of Emeryville residents between the ages of 21 and 64 years had some type of disability. Employment disability, where a physical, mental, or emotional condition lasting 6 months or more that makes it difficult for an individual to work, was the most prevalent disability type. Of those individuals with one disability, 57% reported having an employment disability. Other disability types included sensory disability (blindness, deafness), physical disability (difficulty walking or reaching), mental disability (difficulty learning, remembering, or concentrating), self-care disability (difficulty dressing, bathing, or getting around inside the home), and going outside the home disability (difficulty shopping or visiting a doctor's office alone).

According to the 2000 U.S. Census, 42% of the population over 65 years of age had a disability. Over 25% of those over age 65 had more than one disability. Of those with one disability, 73% were physically disabled.

The cost and availability of housing is a significant barrier. Disability incomes in Alameda County were just $870 per month in 2008. Many with disabilities depend on Supplemental Security Income (SSI) as their sole source of income, and would be considered as extremely low-income. The area median income for a one-person household in Alameda County was $60,300 in 2008. In comparison, in 2008 SSI was an equivalent of $10,440 per year to a disabled single person under 65. This is just 17% of Alameda County's median income for an individual. SSI payments alone leave recipients near the poverty level, established at $10,400 per year in 2008.

Physical Disabilities. Table 2-14 lists permanent housing located in or near Emeryville that is available to physically disabled people and people with limited mobility. The majority of the developments listed below are affordable senior housing projects that also allow physically disabled residents over the age of 18. Therefore, though there appears to be a large number of units available for the physically disabled, it should be noted that a large portion of these units are occupied by seniors who may or may not have a physical disability. Providence House in Oakland, Adeline Street Apartments in Berkeley, and Ocean Avenue Apartments in Emeryville are dedicated solely to very low income, physically disabled individuals and their families. Ocean Avenue Apartments is located in Emeryville and consists of six affordable units; this development was built in 1997.

Table 2-14: Permanent Housing For People with Physical Disabilities

Sponsor/Owner	Project Name	Number of Units

Mental Illness. People with behavioral health problems, including mental illness and/or substance abuse, face substantial challenges obtaining and maintaining stable housing. In Alameda County, there are approximately 30,000 adults and children with serious mental illness or serious emotional disturbance living in households with incomes at or below 200 percent of the poverty level (State of California Department of Mental Health Statistics and Data Analysis, Prevalence Rates of Mental Disorders, Updated October 2004). Table 2-15 below provides data on the housing situation of adults living with mental illness who are in care managed by the Alameda County Behavioral Health Care Services (BHCS). BHCS served more than 18,000 adults in 2002. Consumers who are seriously and persistently mentally ill and have the most acute service needs are assigned by BHCS to Service Teams for care. In July 2004, there were 4,074 adults on Service Teams.

Available data from the "Alameda Countywide Homeless and Special Needs Plan" published in April 2006 (now known as the "EveryOne Home Plan") indicates that 866 adults with mental illness are homeless at any given time in Alameda County. Because of the extremely low incomes of the majority of single adults and households with someone living in them with serious mental illness, the *EveryOne Home Plan* estimates a need for housing assistance for approximately 17,818 low income adults and heads of family household with mental illness who are at-risk of homelessness.

BHCS operates a short-term partial rent subsidy program referred to as '20% Rent Subsidies'. This program provides 20% of monthly rent to help people with mental illness move from homelessness to stable housing. A total of 494 permanent supportive housing units at seven sites in Oakland and Berkeley are linked to supportive services through the Health, Housing, and Integrated Service Network (HHISN) Pathways Project in Alameda County. Teams of public and private nonprofit organizations deliver integrated services to residents. Evaluations have shown that service-enriched housing improved access to care and reduced total public costs by 15% by shifting demand towards less expensive services.

Developmental Disabilities. The Courtyards Apartments in Emeryville, a project built in 2004, has 331 units. Sixty-three units in the development are reserved as Below Market Rate (BMR) units pursuant to the City's Affordable Housing Set Aside Ordinance. When the City entered into an Agreement on Affordable Units with the owner, the City negotiated the inclusion of three of the BMR units as reserved for households living with developmental disabilities. Two of these units are reserved for moderate income households; one unit is for a very low income household. The Affordability Agreement requires the owner to obtain referrals from the Regional Center of the East Bay, which is the local agency for the East Bay serving this population. In 2008, the Emeryville Redevelopment Agency issued a Request for Proposals to solicit affordable housing projects for a four-plex structure that it owns at 4001 Adeline Street. The Agency has selected Housing Consortium of the East Bay (HCEB), whose mission is to provide affordable housing opportunities for persons living with developmental disabilities, to renovate the four-plex as five units serving extremely low income developmentally disabled households with support services provided through HCEB and the Regional Center. The project is anticipated to be completed by fall 2010.

Emeryville's Persons Living with HIV/AIDS. The number of AIDS cases and case rates for the seventeen cities in Alameda County has decreased over time. Historically, the largest number of cases and the highest case rate has been in Oakland, the largest city in the county. Case rates (per 100,000 residents) in Emeryville have been higher than in Oakland in recent years (67% in Emeryville and 26% in Oakland from 2003 to 2005); as only 16 cases (versus 324 in Oakland) were actually diagnosed during this time period, this high case rate is most likely due to the small overall population of Emeryville.

According to the AIDS Epidemiology Report from Alameda County prepared by the Alameda County Public Health Department and released in August 2006, the number of cases diagnosed in a single year peaked in 1992 (621 cases) and has been declining steadily since, with 143 cases diagnosed in 2005. This decreasing trend is similar to that observed in California and the United States as a whole. As of December 31, 2005, the majority of people living with AIDS in Alameda County were male (82%) and the racial/ethnic group with the highest proportion of cases was African American (47%). Fifty-four people in Emeryville were diagnosed and living with AIDS as of 2005; 85% of these residents were male, 48% of were white, and 43% were African American.

People with HIV and AIDS often encounter significant housing problems similar to the elderly and disabled. This can be due either to limited incomes or to the structural capacity of the housing supply to accommodate their physical needs. There are few available services within Emeryville that cater to those with HIV and AIDS. However, the Baybridge Apartments project in Emeryville includes six units for very low income households living with HIV/AIDS.

The HIV/AIDS services system within Alameda County updated a housing plan in 1998. Two new programs were developed as part of the implementation of that plan: Project Independence and the AIDS Housing Information Project. The current housing and service system is supported by two federal programs: HUD's Housing Opportunities for Persons with AIDS (HOPWA) program and the Ryan White CARE Act. HOPWA funds are used for the development of emergency, transitional, and permanent housing. Since 1999, the US Health Resources and Services Administration, HRSA, has determined that Ryan White funds can no longer be used for permanent rental or ownership housing, and the use of HOPWA for services should be limited to 35% of the total grant amount in a given project.

Alameda County has implemented a partial rent subsidy program for people living with HIV/AIDS since 1996. Project Independence provides partial rent subsidies, support service coordination, and accessibility improvements to people living with HIV/AIDS who are at risk of homelessness. The project was initiated in the 1996 *Alameda County Multi-Year AIDS Housing Plan,* and its funding has since been renewed.

Table 2-17 provides a complete list of permanent housing available for people living with AIDS/HIV in Alameda County. Emeryville's Bay Bridge Apartments is reserved for six very low income households living with AIDS/HIV.

Homeless Profile in Emeryville and Alameda County

Homelessness and housing crises have wide-ranging negative impacts. When individuals are homeless or at-risk of becoming homeless, they are unable to reach their full potential at home, at work, at school, or in the community. Homelessness is a symptom of a wide range of challenges and characteristics. The high cost of housing in Alameda County increases cases of homelessness and presents a barrier to its prevention. According to the National Low Income Housing Coalition, Alameda County is one of the ten least affordable counties in the nation. Approaches to end homelessness need to combine services with housing and emphasize the importance of permanent housing options that are affordable to households with extremely low incomes. Many homeless adults and youth are living with mental illness, substance abuse issues, HIV or AIDS-related illness, and/or other disabilities. The profile of people who are homeless is wide-ranging as well. There are single adults who are homeless (men and women), youth who are emancipated out of the foster system, families with children, and seniors.

Alameda County, of which Emeryville is a part, has made a significant investment in affordable housing and services related to homelessness, behavioral health, and HIV/AIDS. In April 2006, the "Alameda Countywide Homeless and Special Needs Plan" (now known as the "EveryOne Home Plan") was released by a collaborative of sponsoring agencies, including the Alameda County Housing and Community Development Department, Alameda County Behavioral Health Care Services, Alameda County Social Services Agency, Alameda County Public Health Department Office of AIDS Administration, the Cities of Oakland and Berkeley, and the Alameda County Homeless Continuum of Care Council. As of early 2009, nearly every jurisdiction in Alameda County as well as numerous other organizations, have endorsed the *EveryOne Home Plan*.

EveryOne Home Plan

The vision of the *EveryOne Home Plan* is to end chronic homelessness in Alameda County by 2020 through five major goals: preventing individuals from becoming homeless in the first place by focusing on providing appropriate services for those exiting foster care, hospitals, or prison; increasing housing opportunities for those who are homeless or have special needs through delivery of 15,000 new units County-wide of housing for people who are homeless or living with AIDS/HIV or mental illness; delivering flexible services to support stability and independence; measuring success and reporting outcomes so that successful programs can be identified; and developing long-term leadership, community support, and political will to implement the Plan. The *EveryOne Home Plan* is seeking to address homelessness, which crosses borders in its effects and characteristics, through a collaborative, regional, county-wide approach.

Homeless Count

The findings of the Alameda Countywide Shelter and Services Survey May 2004 Report formed the background data for the recommendations of the *EveryOne Home Plan.* The report was based on a comprehensive homeless count the Alameda County Continuum of Care Council sponsored in February 2003. The 2003 count was based on surveys conducted with clients at homeless services sites over a four-week period in February 2003. The survey involved an in-depth interview of clients and data was sub-divided amongst the cities of Oakland, Berkeley, the south and east county, and the mid- and north county. The survey revealed that there are as many as 16,000 people who are homeless during the course of a year in Alameda County, and more than 6,000 who are homeless on any given night. Children comprise 28% of the county's homeless population and families comprise 43% of the county's homeless. The urbanized areas of the north part of the County, Berkeley and Oakland, have higher percentages of adults unaccompanied by children. More suburban areas of the County have higher percentages of families with children (including single parent families). The 2004 Survey also included these findings:

- 58% of homeless adults have one or more disabilities.
- Over 30,000 people with mental illness have extremely low incomes and are at-risk of homelessness in Alameda County.
- Homeless persons are more likely to rely on emergency room care.
- 20% of homeless adults have been in an institution such as foster care or juvenile justice prior to age 18.
- In Alameda County, there are nearly 5,000 people living with AIDS/HIV who are extremely low income and at risk of becoming homeless.

In the 2003 Count, the City of Emeryville was included in data collected at the "Mid- and North-County" level, which also included the cities of Alameda, Hayward, and San Leandro as well as the mid-county unincorporated areas including Castro Valley. The survey found that a much higher number of single adults were amongst the homeless in the cities of Oakland and Berkeley, while the "Mid and North County" region and South and East County had a higher proportion of adults with children. The findings of the homeless county by sub-regional area are shown in Table 2-18.

Table 2-18: Homeless Count Estimates by Sub-Regional Area, 2003 Count

Definition (See Notes)	Oakland	As % of Total	Berkeley	As % of Total	Mid & North	As % of Total	South & East	As % of Total	Totals
HUD Homeless									
Adults	1,921	78%	773	94%	436	47%	474	54%	3,604
Children with surveyed adult	529	22%	48	6%	489	53%	411	46%	1,477
Total	2,450	100%	821	100%	925	100%	885	100%	5,081
Community Homeless									
Adults	2,475	81%	785	94%	532	50%	668	53%	4,460
Children with surveyed adult	571	19%	50	6%	532	50%	592	47%	1,745
Total	3,046	100%	835	100%	1,064	100%	1,260	100%	6,205

Notes: HUD Homelessness includes persons living on streets, abandoned buildings, or residing in shelter, transitional housing, or hotels paid by service agency, in vehicle, or place not meant for human habitation. Community homelessness extends HUD definition to include persons whose living situation is transient and those who lack place of their own, or for whom homelessness may be imminent.

Source: Alameda countywide Shelter and Services Survey County Report, May 2004. The complete report may be downloaded at the EveryOne Home website, at www.everyonehome.org.

Emeryville's inclusion in the Mid and North County totals in the 2003 survey may be problematic in that Emeryville's profile of homelessness tends to be more similar to that found in the cities of Oakland and Berkeley, in terms of greater numbers of single adults. This is based on anecdotal evidence provided by the Emeryville Police Department, as well as the data for clients using shelter services at the Berkeley Food and Housing Project.

County-wide Housing Resources for Homeless Populations

According to the *EveryOne Home Plan*, there are approximately 20,000 units of subsidized housing in Alameda County, 20% of which is owned and operated by public housing authorities, and 80% of which is owned by nonprofit and private owners. While these units are an important resource, many of them are still not affordable to people who are homeless, mentally ill, or living with HIV/AIDS. According to the Plan, housing resources for these latter populations in Alameda County include:

- 747 emergency shelter beds for single individuals and 73 emergency shelter units for families that can accommodate 485 people in families.
- 543 transitional housing beds for single individuals and 326 transitional units for families that can accommodate 1,077 people in families.

- 1,369 permanent housing beds or units for single individuals plus 650 beds for individuals in Board and Care homes and 10 beds in a residential care facility. For families, the unduplicated permanent housing inventory includes 358 permanent housing units that can accommodate 1,022 people in families.

Local Efforts

Due to the small size of its city staff, the City of Emeryville does not collect data on the number of homeless persons in the City. City staff consulted with the Emeryville Police Department about the nature and profile of homeless persons that the Police Department encounters and how it addresses providing referrals to these individuals. Because of the proximity of Emeryville to Oakland and Berkeley, the Police Department indicates that most homeless persons who officers encounter tend to be single adults. There is also a recycling center located in Oakland on Peralta Street, about five blocks south of Emeryville's border, where many individuals bring bottles and cans that they have collected. It is presumed that a fair number of the individuals that are seen on-foot travelling to this recycling center are homeless. For those homeless individuals the Police encounters, police personnel provide resources including providing information on the county-wide "2-1-1" phone hot-line that provides emergency service and housing information, and directing homeless individuals to the City of Berkeley Men's Shelter and Women's Shelter, operated by the Berkeley Food and Housing Project in Berkeley.

The emergency shelters nearest to Emeryville are those operated by the Berkeley Food and Housing Project (BFHP). BFHP provides emergency shelter, transitional housing, food, services, and outreach services. Emeryville contributes to the program's operating budget in order to cover the cost of providing shelter to those who come from Emeryville, using funds from the City's allocation of Community Development Block Grant (CDBG) funds. The City's contract with BFHP includes the goal to serve nine homeless clients per quarter who indicate Emeryville as a former place of residence.

In addition to supporting BFHP, the City of Emeryville provides CDBG funding to the Emeryville Community Action Program (ECAP), which is in charge of collecting food donations and providing hot meals to community members in need. This service continues throughout the year with additional special holiday programs. ECAP provides food bags every week on Monday through Thursday as well as Saturday. The program director indicated that each day in excess of 200 people are provided emergency food bags. While ECAP does not collect data on how many of these clients are housed versus homeless, the program director told city staff that it is likely that a fair number of the clients are homeless or extremely low income. The high demand for this program is evident of the fact that a large number of people are living with very little means and in need of emergency food assistance.

Another major support service location for the homeless is one mile south of Emeryville on the San Pablo Avenue corridor (an AC Transit bus route) -- the Society of St. Vincent de Paul of Alameda County (SVdP). SVdp's main Community Center is located at this site and provides a wide range of services, including a free dining room which serves a hot daily meal to 1,000 people in need, food bank, drop-in health clinic two to four times per month, referral services for homeless and very low income men, women and children, and job training assistance. The SVdp Community Center also serves as one of the host sites for the Alameda County Homeless

Court, a program instituted in 2004 to assist homeless individuals with non-violent, low-level misdemeanors to solve legal issues if they are actively working to seek support services to work on obtaining a "clean slate." The Homeless Court is a collaborative effort by the Superior Court of California for Alameda County, the County District Attorney's Office, the EveryOne Home Program, and the Alameda County Public Defender's Office.

Each year, the City of Emeryville provides an allocation of CDBG funds to support the *EveryOne Home Plan's* "InHOUSE Housing Management Information System" (HMIS). Beginning in 2005, this program has been implemented to track the number of homeless individuals receiving housing and service throughout Alameda County.

The *EveryOne Home Plan* sponsored an update to the 2003 Homeless Count in late January 2009. In this recent count, a similar service-site methodology was employed at 27 service sites throughout the County, conducted on one day, January 27, 2009. Over 1,200 surveys were completed, which will provide a very robust data set. The data from 2009 Homeless Count is expected to be available by late 2009. In the new Homeless Count, the data will be provided at the Berkeley and Oakland city levels, other North County (including Albany, Emeryville and Alameda), South County, and East County. Having Emeryville's data included with other North County cities, and not included with Mid-County jurisdictions, will be helpful in achieving a better profile of the sub-regional nature of homelessness in the Emeryville area.

The Action Plan of this Housing Element includes objectives and policies supporting the broad efforts of the *EveryOne Home Plan* to provide supportive housing with services for extremely low income, special needs populations as well as those who are homeless or at-risk of homelessness. The Emeryville City Council has endorsed the *EveryOne Home Plan* and is the City is represented through a staff person on the EveryOne Home Leadership Board. The Housing Element Appendices contain excerpts from the *EveryOne Home Plan* and a homelessness fact sheet. The full plan may downloaded at the EveryOne Home website at www.everyonehome.org.

Local Opportunity Groups

Based on the review of this Housing Element by the Emeryville community, Housing Advisory Committee, Planning Commission, and City Council, several local opportunity groups have been identified for which the City would like to also focus its housing efforts. The Action Plan for this Housing Element identifies specific objectives to encourage housing opportunities for these groups. The local opportunity groups are identified as families with children, artists, City employees, and employees of the Emery Unified School District (EUSD).

Emeryville's Families with Children

According to the 2000 Census, 30% of Emeryville's total 3,968 households at the time were family households and 70% were non-family households. A total of 500 family households had children living with them under 18 years of age. This data is shown earlier in this chapter at Table 2-2. As shown in Table 2-19, there were 75 Emeryville families living below the poverty level in 1999 which represented 6.3% of all families, slightly less than Alameda County's rate of 7.7%. 2006 projections show an increase to 106 families living in poverty, representing 7.1% of families citywide, with the largest increases occurring in female headed households, from 16 to 31 families. As of 2007, 8.2% of Alameda County families lived in poverty.

Table 2-19: 1999 Families Below Poverty Level

	Emeryville 1999	% of Total Families	Alameda County 1999	Emeryville 2006	% of Total Families 2006	% Change 2000 - 2006
Total Families Citywide	1,186	100%		1,484	100.0%	25%
Families Living Below Poverty Line	**75**	**6.3%**	**7.7%**	**106**	**7.1%**	**41%**

Female householder	16	1.3%	3.8%	31	2.1%	94%
With children under 18 years	5	0.4%	3.3%	9	0.6%	80%

Sources: US Census 2000, SF3; Claritas Demographic Snapshot Report, 2007

Based on Census data collected at the School District level, Table 2-20 provides a comparison of child poverty in the Emery Unified School District (EUSD) with three other Alameda County school districts, Albany, Berkeley, and Oakland, based on 2007 estimates released in December 2008. The Census estimate is based on the number of children living in the district. Out of a total of an

estimated 501 school age children (children ages 5 to 17) living in the EUSD, 74 children (14.9%) lived in families with incomes below the federally defined poverty threshold. This compares to 7.5% in Albany, 11.5% in Berkeley, and 20.3% in Oakland.

Table 2-20: Children in Albany, Berkeley, Emeryville and Oakland, 2007 Estimates

	Population	Age 5-17	Percent Children	Age 5-17 in families in poverty	Percent children in poverty
Albany	16,697	2,640	15.8%	197	7.5%
Berkeley	104,104	9,889	9.5%	1,135	11.5%
Emeryville	6,980	501	7.2%	74	14.8%
Oakland	405,237	68,084	16.8%	13,842	20.3%

Source: US Census Small Area Income and Poverty Estimates (SAIPE) Program; December 2008 Release of 2007 Estimates

The Emeryville estimate above does not take into account inter-district transfers. The EUSD has approximately 800 students, of which 446 live in Emeryville. The City has taken efforts to promote affordable housing opportunities for Emeryville families. The City's Affordable Housing Set Aside (AHSA) Ordinance (inclusionary housing ordinance) requires that a preference be applied in the lotteries for new Below Market Rate housing, which enables Emeryville families to have an opportunity to apply for and obtain affordable rental or for-sale BMR housing. In some Redevelopment Agency-assisted developments, such as the Oak Walk renovated single family homes, and Adeline Place, both of which are opening in 2009, the top preference is applied for lower and moderate income families with children in the Emery Unified School District. A secondary preference for EUSD teachers with children is also being applied at the Oak Walk project.

Based on the housing needs for families with children in Emeryville, the Action Plan of the Housing Element contains policies to encourage the development of family-oriented affordable housing development which would contain appropriate unit sizes (such as three- or more bedrooms) and inclusion of amenities such as community rooms, computer lab space, and outdoor play space for a variety of ages.

Emeryville's Artists

Emeryville is a city well endowed with artists. Various groups within the city enrich the area with their talent. According to the numbers of participants who participated in the Emeryville Arts Exhibition, there are an estimated 400 artists living in the city. The Emeryville Artist Co-Op, set up by the Emeryville Redevelopment Agency, consists of 56 live-work units that are affordable to low and moderate income persons. It provides some space for resident artists, but not nearly enough to support the already sizeable

community. The City has and continues to recognize the artists currently living here and encourages the growth of the community within Emeryville. Seventeen projects in Emeryville include live-work units. The majority of these projects were completed by 2006. The Housing Action Plan contains policies to support a variety of housing types, including live/work housing and housing designed to accommodate groups such as artists.

Emeryville's City and School District Employees

It can be seen as in the public interest for city and school district employees to live in Emeryville. Workers who live nearby can spend less time and energy commuting, and essential service employees such as Fire Department and Police Department personnel are closer in case of emergency. City employees also might have more of an interest in the community than non-residents and can get to work if the regional transportation fails. The City has 163 full-time, 8 permanent part-time, and 74 seasonal employees in its employment. As of January 2009, these include 26 sworn fire personnel, 38 sworn police officers and 16 non-sworn other police personnel. Currently, 21 City employees live in Emeryville.

To encourage city and Emeryville Unified School District (EUSD) employees to live in Emeryville, the City has special assistance available through its First Time Homebuyer Program (FTHB) for both market rate units and Below Market Rate (BMR) units for these groups. The FTHB Program offers special assistance for city employees and teachers in the EUSD in which the City will provide silent-second downpayment assistance loans of up to 20% of the purchase price, with no downpayment requirement. This is greater than the maximum loan amount offered to other applicants through the FTBB equal to one and a half times the buyer's downpayment up to 15% of purchase price. Also, the City waives its first-time homebuyer requirement and the income limits, if the applicant is a teacher in the EUSD or is a City employee, although applicants purchasing BMR units must have incomes that do not exceed the moderate income limits.

Two City employees and one EUSD teacher has taken advantage of these special financing terms to purchase homes in Emeryville. While the City has made these loans available, some City employees, particularly Fire Department and Police Department personnel, and EUSD teachers have indicated that they wanted to keep their personal and work lives separate by living in a different community, to protect both their own privacy and the privacy of the residents whom they serve.

Another mechanism for encouraging residency in Emeryville is that the AHSA Ordinance includes a preference, employed when lotteries are conducted for BMR units, in which people who work in Emeryville are given second preference after people who live in Emeryville. The combination of these preferences has enabled many individuals seeking affordable rental and for-sale housing who either live or work in Emeryville to have a better chance of obtaining the housing.

Housing Characteristics

Housing Unit Production

Since 2000, Emeryville has added a substantial number of new housing units, shown in Table 2-21. According to data maintained by the Emeryville Department of Housing and Economic Development, 1,822 housing units were permitted and completed over the course of the previous January 1, 1999 – June 30, 2006 Association of Bay Area Governments (ABAG) Regional Housing Needs Allocation (RHNA) period. This represents a 42% increase in total housing units over the period, and it exceeded the City's total goal under the RHNA by 234%. A detailed accounting of the housing projects permitted and constructed during the previous RHNA period may be found in Table 2-55. An additional 175 units were completed in 2007 and 2008, for a total of 6,271 units in the City as of the end of 2008, a 47% increase over the 2000 level.

Table 2-21: Housing Unit Production 2000-2008

Total Housing Units as of 2000 Census	4,274
Units Produced Previous RHNA Period 1999-2006	1,822
Units Produced 2007-2008	175
Total Housing Units through 2008	6,271
Percent Change 2000 - 2008	47%

Source: US Census 2000, SF3, Emeryville Department of Housing and Economic Development 2008

Housing Tenure

As shown in Table 2-22, between 2000 and 2008, the balance of housing tenure (renter- versus owner-occupied) in Emeryville shifted slightly. The citywide increase in housing units between 2000 and 2008 was 47% (1,997 units), but owner occupied units were added at a faster rate (66%). The number of rental units grew substantially, but at a lower rate of growth (41%) than overall housing production. As a result, ownership units increased as a proportion of the total housing stock, from 37% of the total housing stock in 2000 to 41% of the total housing stock in 2008. Alameda County's tenure profile is still more heavily weighted toward ownership than Emeryville's. Fifty-five percent (55%) of units in the County were owner-occupied in 2000.

The growth in ownership housing built in Emeryville during the first several years of this decade reflects, in part, Bay Area-wide market conditions that favored condominium over rental apartment development. Availability of financing for condominium development and high demand fueled much of the condominium market growth during the decade. However, the downturn of the real estate market and broader economy that the Bay Area and nation have experienced since the beginning of 2008 have significantly

changed the outlook for residential development for the next several years, particularly the development of condominium projects, which are likely to not be developed in the coming two to three years.

Table 2-22: Housing Tenure Changes 2000-2008

	2000	% of Total Units	2008*	% of Total Units	% Change
Total Occupied Housing Units	3,975	100%	5,972	100%	50%
Owner Occupied	1,464	37%	2,433	41%	66%
Renter Occupied	2,511	63%	3,539	59%	41%

*Includes 1999-2006 ABAG RHNA Period as well as completed units through 12/31/08. 2000 figure based on Census and represents occupied units. 2008 figure based on City's count of completed units 2000-2008; this explains the discrepancy in total count between Table 15 and Table 16.

Housing Production by Project Size

Emeryville's housing stock was primarily shaped by three major phases of construction. Prior to 1970, single family homes and small apartments in the eastern neighborhoods typified residential housing in the City. In the 1970s and 1980s two large residential projects (Pacific Park Plaza and Watergate) together added 1,830 units. In 2000 these two projects represented 30% of the city's total housing stock. In the 1990's construction of live-work lofts, medium-density, mixed-use, and single-use residential projects typified development. Since 2000, this pattern of adding medium- to high- density housing and mixed-use housing has continued.

Both the 1990 and 2000 Census included a rough measure of housing project size by tabulating how many units were in a structure (e.g. 1 unit, 2-4 units, etc.). As shown in Table 2-23, between 1990 and 2000 Emeryville added 713 occupied housing units, an increase of 20%. The largest increase took place in structures with 50 or more units, adding 689 units; projects with 50 or more units represented 65% of the total housing stock in 2000, up from 59% in 1990. Structures with 5-19 units also registered strong growth, adding 123 units for a 52% increase. One and 2-4 unit structures made up about a quarter of the city's housing stock in 2000, down from nearly a third in 1990.

Table 2-23: Distribution of Units per Structure 1990-2000

	1990	% of Total Units	2000	% of Total Units	% Change 1990 - 2000
Total Housing Units*	3,524	100%	4,237	100%	20%
1 Unit (attached or detached)	515	15%	542	13%	5%
2-4 Units	505	14%	484	11%	-4%
5-19 Units	238	7%	361	9%	52%
20-49 Units	203	6%	198	5%	-2%
50 or more	2,063	59%	2,752	65%	33%

*Does not include "Other" (n=116) in 1990 or "RV, Vans, Boats" (n=26) in 2000
Source: US Census 1990, 2000, SF3

An estimate of unit production since 2000 shows that the city's housing production has continued to be concentrated in larger structures of 20 or more units; all other structure sizes added few or no units. As shown in Table 2-24, the largest buildings (those with 50 or more units) still make up a substantial share of new housing production, adding 1,670 units for a 61% increase. Medium sized structures (20-49 units) also more than doubled their contribution by accounting for 272 units; this category grew at a faster rate than the largest projects. In fact, the two largest categories (20-49 units and 50 and more units) were the only two to increase their proportional share of the city's housing stock.

As the largest parcels in Emeryville are developed, projects with fewer units will probably fill in the gaps. But for the time being, Emeryville's housing production is primarily in the form of large projects that can make use of economies of scale to overcome high land and remediation costs.

Table 2-24: Estimated Distribution of Units per Structure in 2000-2008

	2000*	% of Total Units	2008**	% of Total Units	% Change 2000 – 2008
Total Housing Units	4,237	100%	6,234	100%	47%
1 Unit (attached or detached)	542	13%	542	9%	0%
2-4 Units	484	11%	487	8%	<1%
5-19 Units	361	9%	373	6%	3%
20-49 Units	198	5%	470	8%	137%
50 or more	2,752	65%	4,422	71%	61%

Housing Unit Characteristics

As defined by the U.S. Census Bureau, "rooms" include living rooms, dining rooms, bedrooms, and dens, but not kitchens, bathrooms, or closets. Emeryville's average housing unit has fewer rooms than those in Alameda County or statewide, by a factor of almost two. Interestingly, the city's rooms per capita figure in 2000 was somewhat higher than in Alameda County or California. This means that while Emeryville's units tend to have fewer rooms, its households also tend to be proportionally smaller.

Table 2-25: Rooms per Unit Indices 1990 - 2000

	1990	2000	Alameda County	California
Median Rooms per Unit	n/a	3	4.8	4.8
Average Rooms per Unit	3.4	3.3	5	5
Rooms per Capita	2.1	2.3	2	1.7

Source: US Census 1990, 2000 SF3

Emeryville tripled the number of one-room housing units between 1990 and 2000, from 311 to 944. As a share of total occupied housing units, one-room units increased from 9% to 22%. There is no information available about the total square footage of these units, but it can be assumed that they consist of studios or lofts. Two-room units grew modestly. Interestingly, there was a net decrease in three- and five-room units. This could be attributed to the subdivision of houses into separate condo units, differences in interpretation of "room" between 1990 and 2000 census, and/or a statistical aberration due to sampling variation.

Table 2-26: Rooms Per Unit 1990 - 2000

	1990	% of Total Units	2000	% of Total Units	% Change 1990 - 2000
Total Housing Units	3,640	100%	4,274	100%	17%
1 Room	311	9%	944	22%	204%
2 Rooms	632	17%	739	17%	17%
3 Rooms	1,186	33%	877	21%	-26%

5 or more	762	21%	759	18%	0%

Source: US Census 1990, 2000, SF3

Another example of Emeryville's unique housing stock is the preponderance of studio or loft, one-bedroom, and two-bedroom units. In 2000 these unit types accounted for 93% of the city's housing stock, compared with 54% in Alameda County. Growth in no-bedroom units has been the strongest; between 1990 and 2000 the city added 560 studio or loft units, a 119% increase. One-bedroom units declined slightly, but still comprise the largest share of Emeryville's housing stock. It is notable that three-bedroom units grew at approximately the same rate as overall housing units, and in 2000 represented 6% of the city's housing stock (compared with 29% in Alameda County).

Table 2-27: Bedrooms per Unit 1990 - 2000

	1990	% of Total Units	2000	% of Total Units	% Change 1990 - 2000
Total Housing Units	3,640	100%	4,274	100%	17%
No Bedroom	471	13%	1,031	24%	119%
1 Bedroom	1,812	50%	1,758	41%	-3%
2 Bedrooms	1,080	30%	1,182	28%	9%

Overcrowding

Overcrowded units, as defined by the U.S. Census Bureau, have 1.10 to 1.50 persons per room; "Severely Overcrowded" units have 1.51 or more persons per room. The number of Emeryville's overcrowded units increased dramatically between 1990 and 2000, at an overall rate of 66%, and increased the proportion of overcrowded units to total occupied housing units from 7% to 9%, as noted in Table 2-28. Broken down by "overcrowded" and "severely overcrowded", the former more than doubled. Severely overcrowded units increased at a high rate (41%), and continued to represent the highest proportion of overcrowded units, 5% of the citywide occupied housing units.

It should be noted, however, that this definition may overstate whether there is, indeed, an overcrowding problem in Emeryville. For example, a large loft unit that technically consists of one room housing two people would be considered "Severely Overcrowded" (2 persons per room). A two-bedroom, two-bath unit with a living room housing a family of four would be classified as "Overcrowded" (1.33 persons per room). Furthermore, Emeryville's overcrowding rates are somewhat lower than those of Alameda County or the State of California. In 2000 Alameda County's overcrowded units accounted for 12% of all occupied units (5% overcrowded, 7% severely overcrowded), and statewide, 15% of all units were overcrowded (6% overcrowded, 9% severely overcrowded).

Table 2-28: Overcrowded Housing Units

	1990	% of Total Units	2000	% of Total Units	% Change 1990 - 2000
Total Occupied Housing Units	3,227	100%	3,975	100%	23%
Total Overcrowded Units	223	7%	370	9%	66%
Overcrowded Units	71	2%	155	4%	118%
Severely Overcrowded Units	152	5%	215	5%	41%

Source: US Census 1990, 2000, SF3

Table 2-29 shows overcrowding data by tenure. In 2000, most overcrowded units were renter-occupied (288 out of 370 total overcrowded units, or 78%), with an even split between overcrowded and severely overcrowded. Overcrowded owner-occupied units represent a very small share of the total 3,975 occupied housing units in 2000 (82 units, or 2%), but the vast majority of them are classified as severely overcrowded. To address overcrowding, the Housing Element includes policies to promote the supply of larger sized family units with three and more bedrooms, and to expand affordability by working with affordable housing developers to develop multi-family rental developments with larger sized units.

Table 2-29: Overcrowding by Tenure in 2000

	Owner Occupied	% of Total Units	Renter Occupied	% of Total Units
Total Occupied Housing Units	1464	100.0%	2511	100.0%
Overcrowded Units	9	0.2%	146	3.7%
Severely Overcrowded Units	73	1.8%	142	3.6%
Combined Overcrowded Units	82	2.1%	288	7.2%

Source: US Census 2000, SF3

Table 2-30 reports densities for a selection of projects and neighborhoods in Emeryville. Density is equal to units per gross residential acre (an acre being 43,560 square feet). Gross residential acres include public or private internal roads and open spaces in addition to the building coverage area. The projects are listed in descending order by density. The 30-story Pacific Park Plaza is the densest project in the city. Emeryville's early 20th century neighborhoods have lower densities. Those projects completed or proposed after 2000 have densities of at least 39 units to the acre. Interestingly, the second densest prospect is a midrise building

Table 2-30: Densities of Selected Projects and Residential Areas

Project	Location	Units	Acres	Units/Gross Acre	Year Built
Pacific Park Plaza	6363 Christie Ave.	583	5.86	99.5	1981

Housing Conditions

In 2007 city staff surveyed the exterior conditions of houses in the city's original early 20th century neighborhoods, using a uniform rating system to classify each structure. The survey results (shown in Table 2-31) found that 75% of the units in these neighborhoods had only one or two minor problems or no problems at all (Units with an "A" or "B" rating). This was a reduction from city staff's 2001 survey, which found that 78% of the units had an "A" or "B" rating. Units with a "C" rating--two to three major problems or three to four minor problems--comprised about a quarter of the these units (compared with 19% in 2001). While it may appear that these neighborhoods have higher proportion of "C"-rated units than in 2001, it should be noted that the survey method and interpretation of structural problems were not exactly the same.

Table 2-31: Conditions Survey of Early 20th Century Neighborhoods

**Total percentages do not equal 100%, due to rounding.

Source: City of Emeryville Planning Division

The housing conditions survey rated the housing stock on nine different factors including roofs, walls, foundations, paint, and yard upkeep. Overall, the majority of problems were minor in nature. None of the four neighborhoods surveyed had a disproportionately large share of minor or major problems, with the exception of paint; about 10% of units in both Doyle Street neighborhoods had major paint problems. Eleven percent of the units in the Doyle Street South neighborhood had major landscaping problems.

The incidence of minor problems consisted mainly of paint (chipping or fading) and landscaping (unkempt lawns, broken concrete walkways, etc.). Major problems also consisted mainly of paint, with 75 units (7% of total units surveyed) in structures that have severely deteriorated paint on one or more exterior walls. Units accessed by badly sagging or deteriorated porches or stairs made up 57 or 5% of total units surveyed.

Source: City of Emeryville Planning Division

The survey also broke down problems by structure, because many of the housing units in these neighborhoods are in multi-unit buildings. Because incidence of problems is divided by the number of structures and not units, in general the percentage of incidence is higher. Conversely, of course, repairs and maintenance performed on multi-unit buildings will reduce the number of units with problems at a higher rate.

As with units, the distribution of minor and major problems in each factor across the four neighborhoods was fairly even. Landscaping and paint top the incidence of factors, with 67% and 65% of structures having these problems, respectively. The top major factor was paint, with 16% of all structures having seriously deteriorated paint on one or more exterior wall.

Emeryville's Housing Rehabilitation Program provides funding for the replacement of chain-link fences with wrought iron. .The City had a Security Bar Retrofit program which replaced fixed bars with operational bars. The program was put on hold due to issues regarding approved bars and uses. The housing condition survey found the highest concentration of units with door bars in the Doyle South neighborhood, where 25% had them installed. Window bars were evenly distributed, for an average of 7% of units in all four neighborhoods. Chain-link fences were most common in both Doyle North and South neighborhoods, with 8% and 9%, respectively.

Table 2-34: Units with Doors/Window Bars, and Chain-link fences

Income Characteristics

Mean and Median Incomes

Table 2-35 shows the reported and projected Mean Household Income from 2000 to 2010 for Emeryville, its surrounding cities, and Alameda County. Household median income steadily increased in Emeryville between 2000 and 2005 and is projected to increase at the same pace through 2010.

Table 2-35: Mean Household Income for Emeryville and Surrounding Cities

	2000	2005	2010
Emeryville	$70,900	$73,200	$75,400
Oakland	$70,500	$68,800	$72,600
Berkeley	$84,300	$83,500	$88,500
Alameda County	$90,300	$88,500	$92,900

Source: ABAG 2000 and 2007 Projections

Table 2-36 compares median income by family type in Emeryville and the County as of 1999. In 1999 Emeryville's median non-family household income was almost $2,000 higher than that of Alameda County. However, the median family household in Emeryville earned almost $8,800 less than its Alameda County counterpart. Per capita income in Emeryville was higher than Alameda County, reflecting a population made up of proportionally fewer children and a smaller non-working population.

Table 2-36: Household Income Indices in 1999

	Emeryville		Alameda County
Median household income	$ 45,359	$	55,946
Median Family Income	**$ 57,063**	$	65,857
Median Non-family Income	**$ 38,664**	$	36,795
Per Capita Income	$ 33,260	$	26,680

Source: US Census 2000, SF3

Median household income projections between 1999 and 2006 are shown in Table 2-37. In 2006 the median household income in Emeryville was estimated at $48,876, an 8% increase over 1999. The median family household fared better than all households, experiencing a 19% increase. Per capita income also increased at a healthy rate of 13%. In both 1999 and 2006 the median Emeryville household had an income about 80% of that in Alameda County. Similarly, the median family income in Emeryville was about 90% of that in Alameda County. Non-family median income information was not available for 2006.

Table 2-37: Projected Comparative Income Indices 1999-2006

	Emeryville			Alameda County		
	1999	2006	% Change	1999	2005	% Change
Median household income	$ 45,359	$ 48,876	8%	$ 55,946	$ 61,014	9%
Median Family Income	$ 57,063	$ 68,080	19%	$ 65,857	$ 74,662	13%

Household Income Characteristics

Table 2-38 shows projections of Emeryville's households by income level from 1999 to 2006. There is a trend toward growth in higher earning households. Only households earning $50,000 and more grew at a faster rate than total household growth (27%). Households earning less than $50,000 all increased in number but declined slightly as a proportion of total households. The fastest growth rate was among households earning $150,000 and more, at 57%. Households earning $50,000 or more accounted for 49% of all households, up from 45% in 1999.

Table 2-38: Household Incomes 1999

	1999		2006		% Growth in Income Bracket 1999-2006
Total Households	3,968	100%	5,056	100%	27%
Less than $15,000	622	16%	749	15%	20%
$15,000 to $24,999	502	13%	560	11%	12%
$25,000 to $34,999	433	11%	522	10%	21%
$35,000 to $49,999	628	16%	753	15%	20%
$50,000 to $74,999	746	19%	982	19%	32%
$75,000 to $99,999	443	11%	587	12%	33%
$100,000 to $149,999	391	10%	584	12%	49%
$150,000 and more	203	5%	319	6%	57%

Sources: US Census 2000, SF3; Claritas Demographic Snapshot Report, 2007

Family households demonstrate an even more dramatic shift in income levels, shown in Table 2-39. According to projections, the only family household income group earning below $75,000 per year to increase at a greater rate than the overall family household growth rate were those earning $15,000 to $24,999. This income group maintained its proportional share of 5% total family households, while the remaining groups below $75,000 declined. The largest percentage increase was among those earning $150,000 or more, at 82%. Families earning $50,000 or more in 2006 accounted for 63% of the city's total family households, up from 58% in 1999.

Table 2-39: Emeryville Family Household Income

	1999		2006		% Growth in Income Bracket 1999-2006
Total Family Households	1,186	100%	1,484	100%	25%
Income Less than $15,000	132	11%	131	9%	-1%
Income $15,000 - $24,999	60	5%	76	5%	27%
Income $25,000 - $34,999	119	10%	132	9%	11%

Sources: US Census 2000, SF3; Claritas Demographic Snapshot Report, 2007

Non-family households, which in 2000 represented 70% of Emeryville's population, exhibit a slightly more even growth by income bracket, but have also tended to skew toward the higher income levels, shown in Table 2-40. Only those earning $15,000 to $24,999 and $75,000 to $99,999 grew at markedly lower rates than the overall non-family growth rate of 28% (10% and 14%, respectively). The highest growth rates were clustered in those groups earning $50,000 and above (with one exception, those earning $75,000-$99,999), with the highest growth rate among those earning $100,000 to $149,999 (60%). Non-family households earning $50,000 or more represented 43% of non-family households in 2006, a slight increase from 40% in 1999.

Table 2-40: Emeryville Non-family Income

	1999		2006		% Growth in Income Bracket 1999-2006
Total Non-family Households	2,782	100%	3,572	100%	28%
Income Less than $15,000	490	18%	618	17%	26%
Income $15,000 - $24,999	442	16%	484	14%	10%
Income $25,000 - $34,999	314	11%	390	11%	24%
Income $35,000 - $49,999	427	15%	543	15%	27%
Income $50,000 - $74,999	499	18%	715	20%	43%

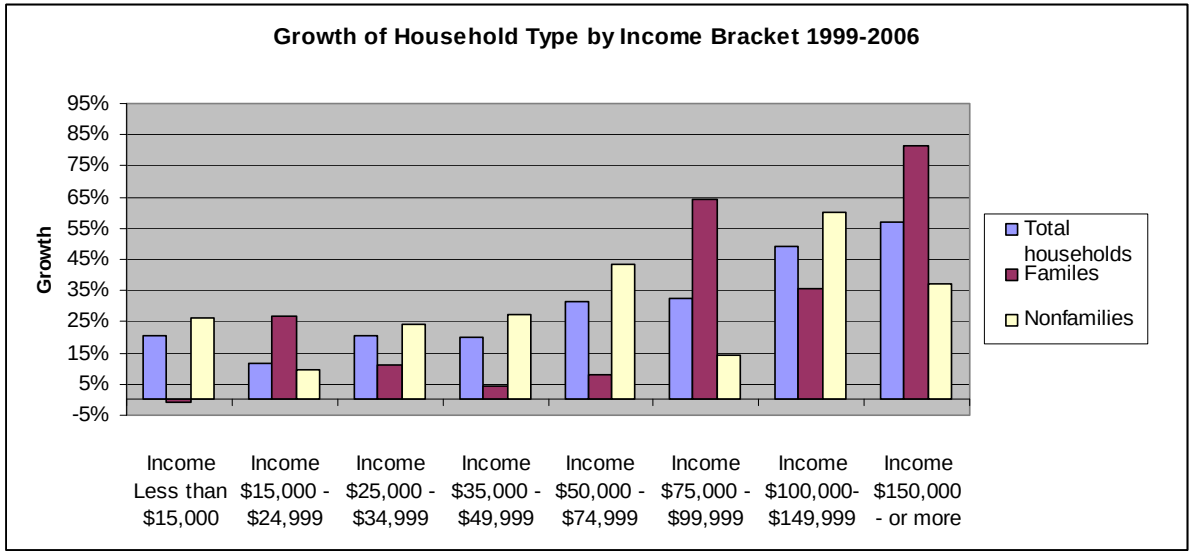
Sources: US Census 2000, SF3; Claritas Demographic Snapshot Report, 2007

In sum, family households added to Emeryville between 1999 and 2006 have tended to be wealthier. In 2006 they made up approximately half of the top earning households in the city, while representing just a minority of total households. In contrast, growth of non-family households was more evenly distributed, but also skewed toward the higher income brackets. See Figures 2-1 and 2-2.

Figure 2-1



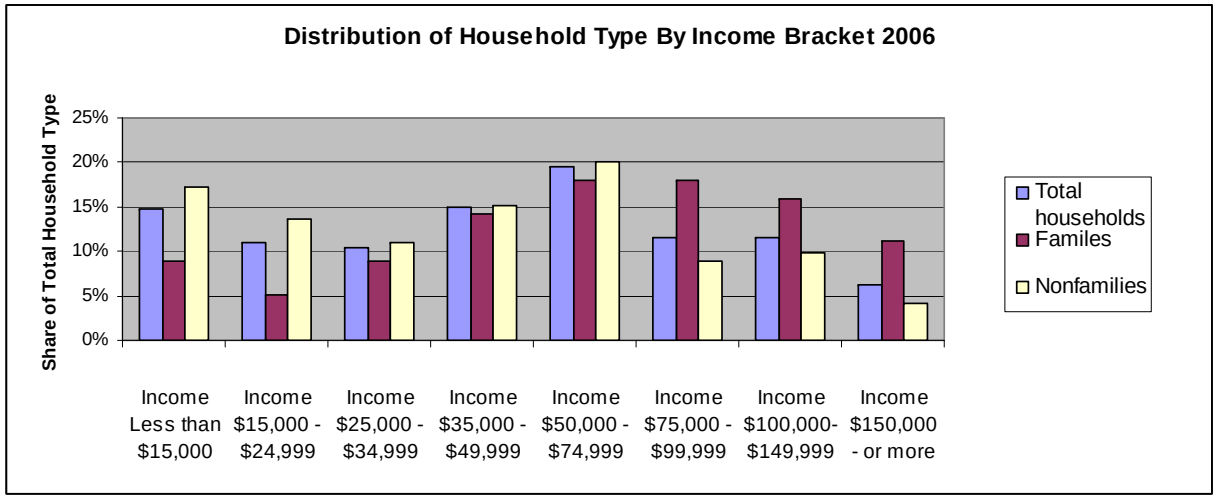


Figure 2-2

Emeryville's Public Benefits Recipients

In 1999, 13% of Emeryville residents had incomes below the federal poverty level, which at that time was $17,050 (U.S. Census, 2000). The federal poverty level was established in 1964 and has been adjusted only for inflation since that year. It does not take into account regional variations in the cost of living. Therefore, many localities use the Self-Sufficiency Standard to measure poverty as it is modified to account for geographical differences in the costs of child care, housing, transportation, and health care. The Self-Sufficiency Standard for Alameda County in 2000 was calculated to be $46,976 ($45,965 in 1999 dollars) annually for a family of two adults with a preschooler and a school-age child; this is 276% of the 2000 federal poverty guideline of $17,050. In 1999, 39% of 4-person families in Emeryville had a family income of less than $45,000 (U.S. Census, 2000), indicating that a large proportion of Emeryville families may not be meeting this Self-Sufficiency Standard.

While data is not available for 1989, approximately 4% of the city's households received Supplemental Social Security (SSI) in 1999. The number of households receiving public assistance income declined by about one-third between 1989 and 1999. This could be attributable to Federal Welfare reform in the mid-1990s, successful transition to full-time employment, or these households moving out of the city. The number of households with retirement income increased slightly, indicating that retirees did not move to Emeryville at the same rate as the working population during this period. In all, 10% of Emeryville's households in 1999 received some form of retirement income, with an average annual income of $18,000. Data is shown in Table 2-41.

Table 2-41: SSI, Public Assistance, Retirement Income

	1989	% of Total Households	1999	% of Total Households	% Change 1989 - 1999

Source: US Census 1990, 2000 SF3

According to the Alameda County Social Services Agency**,** the distribution of public benefits recipients in Emeryville was as follows for the third quarter of 2004: 123 CalWORKs recipients; 438 MEDI-CAL only recipients; 168 food stamps recipients; 33 general

assistance recipients. Based on these figures, the percentage of public benefits recipients in the City (0.6 – 0.7% of the Alameda County recipients per category) appears to be in line with the City's current share of Alameda County's population (0.5% of the Alameda County population).

CalWORKs (California Work Opportunity and Responsibility to Kids), a state-wide program operated locally by county welfare departments, is a temporary financial assistance program for low-income families with children; as an employment-based program, it requires employable adults to participate in work-related activities in order to receive aid. A report on the Alameda County CalWORKs Needs Assessment and Outcomes Study, released in December 2002, was conducted to assess the associations of barriers with welfare, work, and income and to determine critical service and treatment elements for programs that may assist Alameda County in better addressing the service needs of its welfare clients. During this study, over 400 CalWORKs cash benefit recipients were interviewed at a baseline date and then again 15 months and 27 months later.

Barriers to employment and successful welfare departure were experienced by the majority of the respondents in the CalWORKs Needs Assessment and Outcomes Study. Over 80% of those interviewed were facing one or more of these barriers, including logistic barriers (such as problems with transportation), health-related barriers (such as alcohol dependency, daily illegal drug use, partner violence), and family responsibility barriers (such as lack of child care or a new pregnancy). During the course of the CalWORKs Needs Assessment study, the prevalence of those facing a housing barrier (defined as living in temporary housing or homeless in the past year) increased by 1.2%.

Housing Affordability

Household Income Characteristics

Table 2-42 provides detail on the tenure by income level for households in Emeryville. In 2000, 45.2% of Emeryville's households were at less than 80% of the Median Family Income (MFI) for Alameda County. The MFI for Alameda County was $69,200. Renter households were more likely to be below 80% of the MFI than owner households, with approximately 55% of renter households in this category and just 30% of owner households in this category. Forty percent (40%) of renter households were either extremely low income (defined as households with less than 30 percent of area median income) or very low income (households between 31 and 50 percent of area median income), for a total of 982 households. Together, extremely and very low income owner households represented 17.6% of total owner households.

Table 2-42: Households by Income Level, 2000

	Renter Households	As % of Total Renter Hhs	Owner Households	As % of Total Owner Hhs	Total Households	As % of Total Households
Extremely Low Income <30% MFI	560	22.4%	115	7.8%	675	16.9%
Very Low Income 31-50% MFI	422	16.9%	145	9.8%	567	14.2%
Low Income 51-80% MFI	374	15.0%	184	12.4%	558	14.0%
Above Low Income >80% MFI	1,144	45.8%	1,039	70.1%	2,183	54.8%
Total Households	2,500	100.0%	1,483	100.0%	3,983	100.0%

Note: "MFI" is Median Family Income
Extremely Low Income level - $20,750; Very Low Income - $34,600; Low Income - $50,050; MFI - $69,200
Source: State of the Cities Data Systems: Comprehensive Housing Affordability Strategy (CHAS) Data

Extremely Low Income Households Needs

In 2000, there were 675 households in Emeryville who were extremely low income (nearly 17% of the total households). This corresponds to an annual income of $20,750 or less for a four-person household. Of these, the majority were renter households (560 households, representing 22.4% of total renter households) and 115 were owner households (7.8% of the total owner households). Households with extremely low incomes have a variety of housing situations and needs. Most families receiving public assistance income or disability insurance are considered extremely low income households. Depending on household size, many minimum wage occupations would be considered extremely low income with an annual income of $16,640 or less based on the State of California minimum wage of $8.00 in effect as of January 1, 2008.

Housing Element law requires analysis of the projected housing needs for extremely low income households, including an estimate of the number of projected households with extremely low incomes. Since updated Census data is not available from the 2000 Census on

the number of households in this subset of the very low income category, pursuant to State Housing Element law the City has presumed that one half of the Regional Housing Need Allocation (RHNA) for the very low income level qualifies as extremely low income households. The RHNA assigned for the very low income level for the 2006-2014 period is 186 units; as a result, half of this amount, or 93 units, is the projected extremely low income housing need. It is likely, based on the 2000 Census CHAS data, that most of these households will face cost burden unless housing is provided at an affordable housing cost. Some of the households may be special needs households and require supportive services. To address the needs of extremely low income households, the Housing Element includes in its Housing Action Plan programs and policies to support the inclusion of affordable units for this income level in Redevelopment-Agency sponsored projects where possible, to seek leveraging of Redevelopment Agency funding by other state and federal funding sources to support deeper targeting of units' affordability, the promotion of a variety of housing types, and encouraging the provision of supportive services in affordable housing developments for specific special needs populations.

Rent Burden and Housing Costs

It is important to consider housing affordability and housing problem measures for lower income households, particularly extremely low income households, to determine housing needs An important measure of housing affordability is how much of a household's income is devoted to rent. A household is considered to be overpaying for housing, and is "cost burdened" if it spends more than 30% of its gross income on housing. Severe housing cost burden occurs when a household pays more than 50% of its income on housing. The prevalence of overpayment varies by income, tenure, household type and household size.

Data from the Comprehensive Housing Affordability Strategy documents cost burden as well as other housing problems. "Housing problems" are defined as cost burden greater than 30% of income and/or overcrowding and/or without complete kitchen or plumbing facilities. As shown in Table 2-43, nearly half (49.3%) of all households in Emeryville in 2000 had housing problems, 42% were cost burdened and 20.7% were severely cost burdened. Renter households were relatively more likely to have housing overpayment problems than owner households overall.

Table 2-43: Emeryville Households with Cost Burden and other housing problems

	Renter Households	Owner Households	Total Households
Extremely Low Income <30% MFI	**560**	**115**	**675**

Note: MFI is Median Family Income; Source: State of the Cities Data Systems: Comprehensive Housing Affordability Strategy (CHAS) Data, 2000

Table 2-43 demonstrates how housing problems, particularly cost burden, affect households living below 80% of the area median income. Amongst extremely low income and very low income households, the problems of overpayment are most acute, as the majority of households in these income categories experience housing problems of some kind, whether they are renter or owner

households. This data suggests the affordability gap between market rents and for-sale housing and affordable housing costs for lower income households.

Cost burden (overpayment) also fluctuates by household type and size in Emeryville, as shown in Table 2-44. Overall, cost burden is predominantly found in the "All Other Households" category. Sixty-six percent of all renter households with cost burden fell into this category, followed next by small related households (19.3% of the total.) Fifteen percent of renter households with cost burden were elderly. The statistics shift somewhat for owner households. The "other households" category had the majority of those with cost burden, followed next by elderly households, representing 26% of the total owner households with cost burden, followed by small related households (20.7%). Large families represented a small portion of total households with cost burden issues. Most housing problems related to this household type relate to overcrowding issues.

Table 2-44: Households with Cost Burden by Household Type

	Renter Households	As % of Total Renter Hhs with Cost Burden	Owner Households	As % of Total Owner Hhs with Cost Burden
Elderly 1 and 2 member households	165	14.6%	145	26.1%
Small Related (2-4)	218	19.3%	115	20.7%
Large Related (5 or more)	0	0.0%	10	1.8%
All other households	745	66.0%	285	51.4%
Total Households with Cost Burden	1,128	100.0%	555	100.0%

Table shows number of households with cost burden by particular household type. Source: State of the Cities Data Systems: Comprehensive Housing Affordability Strategy (CHAS) Data, 2000

To address the housing issues raised by overpayment and other housing problems, the Housing Action Program of this Housing Element promotes the development of affordable housing for a range of income levels in order to reduce the incidence of housing problems including cost burden, particularly for those living at the lower income levels.

Rental Market Conditions

In February 2009, city staff sampled the average market rents and units of several large rental projects. The data from this rent survey is shown in Table 2-45. Rents for a studio ranged from $1,645 to $1,850 per month; one bedroom units ranged from $1,423 to $2,235; two bedroom units had rents ranging from $1,865 to $2,860; and three bedroom units (or two bedroom with loft) ranged from $1,945 to $3,795.

Table 2-45: Rental Housing Market Rent and Unit Size

Unit Type	Project	Average Rent	Average Sq Ft	Rent/Sq Ft
Studio				
	Archstone	$1,645	575	$2.86
	Avenue 64	$1,703	549	$3.10
	Bakery Lofts	$1,850	720	$2.57
1BR/1BA				
	Archstone	$1,930	695	$2.78
	Avenue 64	$2,063	751	$2.75
	Bakery Lofts	$1,925	1,100	$1.75

Maids and Housekeeping Cleaner	$ 10.98	$ 22,838	30%	$ 571

Source: 2007 CA EDD Occupational Employment Statistics for the Oakland Primary Metropolitan Statistical Area, 2006
Notes: (a) Assumes one wage earner per family of three, (b) Maximum monthly housing expense defined as 35% of total income for moderate income households and 30% of income for low and very-low income households

When comparing average rents and the selection of representative occupations, families of three persons with incomes between $38,750 and $59,600 per year (i.e. low income families with incomes between 51 and 80% of the area median income for 2008) have to spend more than 30% of their income on rent for a typical market rate two-bedroom unit in Emeryville. For example, a three-person family where the sole earner works as a drywall and ceiling tile installer and can devote $1,421 a month to rent, but the lowest average two bedroom unit identified by the survey is $1,865 per month. Furthermore, housing production in the city has been overwhelmingly concentrated in studio and loft units without separate bedrooms. Another perspective, however, is that rents in Emeryville are high because many more households have dual incomes and no children, thus allowing more income to be devoted to housing than otherwise.

Ownership Market Conditions

A significant amount of for-sale ownership housing was added to Emeryville's housing stock between 2000 and 2008, as was described earlier in this chapter. During this period, the cost of ownership housing also increased. Table 2-47 shows a comparison between 2007 and 2008 median sales prices for single family homes and condominiums, as well as the high and low prices in each category. The median sales price for a condominium in 2001 was $277,000. This had risen by $119,500 by 2007. The increased cost of single-family homes was considerably higher. The median price in 2001 was $242,000. The median price in 2007 was $486,000. The median sales price of single family homes decreased from 2007 to 2008 by 18% due to the downturn in the economy. The median sales price of condos increased modestly, by 7% between 2007 and 2008; however, due to the slumping economy it is anticipated that sales prices in both single family homes and condominiums will decrease from 2008 levels during 2009.

Table 2-47: Sales Prices in 2007 and 2008

		12-Month Period 2007	12-Month Period 2008	% Change 2007-2008
Condominiums				
	High	$800,000	$925,000	16%
	Median	$396,500	$425,000	7%
	Low	$205,000	$230,000	12%
Single Family Homes				
	High	$539,500	$437,500	-19%
	Median	$486,000	$399,000	-18%
	Low	$380,000	$321,000	-16%

Source: Realquest 2009; City of Emeryville Department of Economic Development and Housing

Broken down by the year the housing unit was built, average sales prices per square foot (when available and not including BMR units) from 2005 through 2008 show some interesting patterns, shown in Table 2-48. Overall, price per square foot increased between 2005 and 2006, but it has been falling steadily since then, with a 25% decrease overall between 2005 and 2008. Price per square foot

rose between 2005 and 2006 for the oldest units (those built 1900-1950) as well as the newest units (those built 2001-2008). The most dramatic decrease over the period has occurred with the newer housing, which has experienced a 28% decline between 2005 and 2008. If looking at the decline of average sales price for the housing built since 2001 between 2006 (its highest point) and 2008, the decline is more steep, with a 32% drop. The lower average sales prices for housing in Emeryville provides some relief for the affordability gap; however, with the difficult conditions for obtaining mortgage financing in the current recession, and unemployment on the rise, the lower priced housing is likely still out of reach for many households.

Table 2-48: Average Sales Cost Per Square Foot by Year Unit Built

		Year Unit Built			
Year of Sale	Overall Average $/SQFT	1900-1950	1951-1980	1981-2000	2001-2008

Foreclosure Crisis

In 2007, the number of foreclosures in the Bay Area, California, and nationwide rose dramatically, due to a number of factors including home values leveling off or depreciating and the wide-spread use of looser loan underwriting and riskier loans, including sub-prime mortgages. The number of Bay Area homes lost to foreclosure in the second quarter of 2007 was the highest level in two decades. Nearly half of the notices of default resulted in homes being lost to foreclosure, as compared to just 12% the year prior. Notices of Default in Alameda County, as reported by East Bay Economic Development Alliance in their East Bay Indicators 2007 report, increased 252% from the second quarter of 2005 to the same quarter of 2007. The Center for Responsible Lending estimated in its "Losing Ground: Foreclosures in the Subprime Market and Their Cost to Homeowners" report that 19% of all subprime loans originated in 2005 and 2006 would result in foreclosure.

High foreclosure rates destabilize communities and can also cause displacement of tenants who are impacted if their property owners default and foreclose. A November 18, 2007 New York Times article reported that, according to ForclosureRadar.com, 22% of foreclosed properties in California were non-owner-occupied. Rents have also escalated, in part, due to increased demand for rental units by residents displaced by foreclosures, so that it is more difficult for displaced residents to find affordable rentals.

In December of 2007, the Emeryville City Council adopted an 8-point Predatory Lending Prevention and Foreclosure Prevention Strategy to take a proactive approach to addressing the foreclosure crisis. The Strategy has been implemented throughout 2008 and will continue to be implemented in 2009 and beyond depending on the on-going nature of the foreclosure crisis. The Strategy includes a number of components, including providing resource information to Emeryville residents, sponsoring information workshops, and offering individual counseling to owners facing foreclosure. In addition, the Strategy includes keeping monthly track of foreclosure incidence in Emeryville.

Unfortunately, the incidence of foreclosures throughout the Bay Area has increased during 2008 due to the general economic recession. From December 2007 through February 2009, there have been 138 Emeryville properties in some phase of foreclosure, including homes that have received Notices of Default (NOD's) (91 properties); foreclosure auctions currently scheduled or the auctions have been postponed (12 properties); and homes that have been lost through foreclosure (35 properties). Of the total 138 properties, four homeowners who have participated in City homeowner programs are in default or are having difficulty making mortgage payments. Of these, three are occupied by homeowners who own BMR unit and one has a grant through the City's Rehabilitation Program. As part of the Strategy, the City works directly with these individuals to refer them to HUD-certified organizations who provide homeowner foreclosure counseling. Emeryville has historically had a very low foreclosure rate in its homebuyer programs. Up through Fiscal Year 2006/2007, there was just one foreclosure on the first mortgage financing out of over 440 loans issued through the City's First Time Homebuyers Program, representing a 0.23% default rate.

Below Market Rate Housing Production

The City of Emeryville's inclusionary housing ordinance (called the Affordable Housing Set Aside Ordinance) and the Redevelopment Agency's use of its Low and Moderate Income Housing Fund "housing set-aside" funds have helped facilitate the production of 362 Below Market Rate (BMR) housing units during the previous 1999-2006 Regional Housing Need Allocation (RHNA) period of January 1, 1999 through June 30, 2006. While the city produced 234% of the total 777 units set out as the total goal for the previous RHNA period, the majority of added units were market rate. The city was able to perform very strongly, however, in the Very Low, Low, and Moderate Income categories, by meeting 71%, 66%, and 76%, respectively, of the RHNA goals. The comparison of the actual production during the previous RHNA cycle compared to the RHNA goals is shown in Table 2-49. Detailed project-specific information for the RHNA period may be found in Table 2-55 at the end of this chapter.

Table 2-49: Housing Production by RHNA Period of January 1, 1999 – June 30, 2006, by Affordability Level

ABAG RHNA 1999-2006 Period	Total Number of Units	Very Low	Low	Moderate	Market Rate
Permitted Units	1,822	127	63	172	1,460
ABAG RHNA Goals	777	178	95	226	278
% of Goals Met	234%	71%	66%	76%	525%

Source: City of Emeryville, Economic Development and Housing Department, 2009

As shown in Table 2-50, during the 1999-2006 RHNA period, 61% of the BMR units (220 out of 362) produced were rental units, of which 58% (127 out of 220 units) were designated at the very low income level. This data is shown in Table 2-50. Two projects account for virtually all of the very low income rental units produced during the cycle -- Avalon Senior Apartments (with 66 very low income units) and the Windsor Apartments at Bay Street (formerly called Metropolitan Apartments at Bay Street) with 57 very low income units. A majority of the moderate income rental units (62 units) are included in the Courtyards Apartment project. These figures illustrate how the production of rental apartments in Emeryville is concentrated in large-scale projects between 200 and 350 units. There is no similar concentration of ownership BMR units. BMR ownership units are distributed amongst eleven different developments, with the largest concentrations (about 20 units each) in three projects: Emeryville Warehouse Lofts, Terraces at Emery Station, and the Andante. The majority of BMR ownership units designated during the previous cycle were designated as Moderate Income (61%), with 39% designated as Low Income. No very low income units were designated as for-sale units during the 1999-2006 RHNA period.

Table 2-50: Below Market Rate Unit Production January 1, 1999 – June 30, 2006 by Tenure

	BMR Units	Very Low Income	Low Income	Moderate Income
Total	370	124	63	183
Ownership	142	0	55	87
Rental	228	124	8	96

Economic Characteristics

Employment and Unemployment

Unemployment in Emeryville and in Alameda County has been on the increase since 2006, due to the downturn and recession in the economy. The unemployment rates for both the city and county are shown in Table 2-51. As of January 2009, the State of California calculated the unemployment rate of Emeryville residents at 4.5%, and Alameda County's rate was 6.2%. Historically, Emeryville has had a lower rate of unemployment than Alameda County as a whole, which could be a result of Emeryville's more highly educated population.

Table 2-51: Unemployment Rates 2000-2008

Year	Emeryville	Alameda County
2000	2.6%	3.6%
2001	3.5%	4.8%
2002	4.9%	6.7%
2003	5.0%	6.9%
2004	4.3%	5.9%
2005	3.7%	5.1%
2006	3.2%	4.5%
2007	3.5%	4.8%
2008	4.5%	6.2%

Source: California Employment Development Department, 2009

Industry Characteristics

Table 2-52 provides data on the number of jobs by job sector in Emeryville and Alameda County. Emeryville has a larger share of jobs in the Retail, Financial and Professional Services sectors than Alameda County. The city's proportional share of Health, Educational, and Recreational Service jobs is less than half of that in Alameda County, however, while Manufacturing and Wholesale is also somewhat lower. These differences are likely explained by Emeryville's large regional shopping centers found at and around Bay Street and the East BayBridge shopping center, large companies such as Novartis (formerly Chiron biotech company) and Pixar Animation Studio, and a concentration of professional office buildings on the city's peninsula.

Table 2-52: Jobs by Industry 2005			
		Emeryville % of Total	Alameda County % of Total
Total	19,670	100%	100%
Manufacturing and Wholesale	3,960	20%	24%
Retail	3,240	17%	11%
Financial and Professional Service Job	6,530	33%	20%
Health, Educational and Recreational Service	2,760	14%	30%
Other	3,180	16%	15%

Source: ABAG Projections 2007

Another way to view Emeryville's employment breakdown is by the change in the number of establishments in each industry type. By looking at a snapshot of how the number and distribution of businesses has changed over time, it is possible to make some inferences about Emeryville's housing needs. The US Census provides business pattern information at the zip code level; Emeryville's zip code, 94608, includes the entire city and a small portion of neighboring Oakland.

Between 1998 and 2005, the growth in establishments (individual businesses, not classified by size of payroll) was highest among typically high wage industries, Finance and Insurance, Information, Real Estate and Leasing, and Professional, Scientific, and Technical Services. Retail trade establishments, a typically low-wage industry, grew at the second fastest rate over the same period. As a proportion of total establishments, Professional, Scientific, and Technical Services increased from 16% to 18%. The only other industry to represent over 10% of the zip code's establishments in 2005 was Retail trade, which increased from 10% to 14%.

Generally, the changes in industry make-up in Emeryville appear to mirror those among the population. The growth of establishments in high-skill, high-wage industries is matched by the greater rate of growth in high income and highly educated households. For example establishments in the Finance and Insurance, Information, Real Estate and Leasing, and Professional, Scientific, and Technical Services industries increased from 27% of total establishments in 1998 to 32% in 2005, as shown in Table 2-53. In contrast, establishments in industries that have typically paid middle class wages, Transportation and Warehousing, Manufacturing, and Wholesale Trade declined in number and share of total establishments. Perhaps most important for affordable housing policy is the fact that Retail Trade and Accommodation and Food Services represent 22% of all establishments in the zip code area. Workers in these industries are likely to be on the lower end of pay scales are some of the most likely to qualify for affordable housing.

Table 2-53: Growth in Business Establishments in 94608 ZIP Code 1998-2005

Industry Code Description	1998	% of Total	2005	% of Total	% Change 1998-2005

Jobs-Housing Balance

In general, jobs/housing balance is an in indicator of how many vehicle miles workers must commute to their jobs. A highly skewed ratio often means workers must commute far from where they live. Compared to Alameda County, Emeryville has a very high number of jobs versus housing units, also known as jobs/housing balance. However, the large increase in housing units in Emeryville between 2000 and 2005 contributed to a sizable decline in that ratio, from 4.4 to 3.1. This data is shown in Table 2-54.

Table 2-54: Jobs-Housing Balance in 2000 and 2005

	Emeryville			Alameda County		
	2000	2005	% Change	2000	2005	% Change
Total Employed Residents	4,600	4,500	-2%	694,600	733,500	6%
Total Jobs	19,300	19,670	2%	750,160	730,270	-3%
Housing units	4,431	6,421	45%	531,166	562,479	6%
Jobs-Housing Balance	4.4	3.1	-30%	1.4	1.3	-5%

Source: CA EDD, ABAG Projections 2007, City of Emeryville, County of Alameda

Another perspective on Emeryville's jobs-housing balance is to look at how many Emeryville residents live and work in the city. The latest data available from the 2000 Census found that 22% of employed residents worked in Emeryville (920 of 4,214); the remaining employed residents commuted outside the city for work. Those who both lived *and* worked in Emeryville in 2000 represented about 5% of the total 18,000 people employed in the city. Emeryville's rapidly expanding housing supply provides a greater opportunity for those who work in Emeryville to move here. While current data is not available, it is not unreasonable to assume that the proportion of workers who also live in Emeryville has grown.

Note 1: This table includes those projects for which building permits were pulled or received Planning Approvals July 1, 2006 through December 31, 2009, and those projects for which building permits are anticipated to be pulled during the RHNA period through June 30, 2014.

Note 2: This development is partially in Oakland; units listed in the table are those located in Emeryville portion only. The development includes 101 total units.

Note 3: Status refers to whether project has been completed, is under construction, is "Approved" by Planning Commission, or has been "Proposed" to City but has not yet received Planning Commission approvals.

CHAPTER 3. RESOURCES AND CONSTRAINTS

This chapter analyzes the availability of sites suitable for housing and describes both governmental and non-governmental resources and constraints on the housing supply and affordability. Local land use controls, availability of sites, housing market conditions, and financial resources are also discussed in this chapter. The chapter starts with an analysis of previous housing production to establish a baseline for future production. Although Emeryville is a small, built-out city, with no opportunity for outward expansion, it has been successful at capitalizing on favorable market conditions to recycle older industrial and commercial properties into sites with new housing development. As indicated in Chapter 2, the citywide increase in housing units between 2000 and 2008 was 1,997 units, a 47% increase. Sufficient sites are identified to meet the RHNA housing goals for 2014. However, it is important to understand the constraints of a built out city of only 1.2 square miles. The housing growth rate experienced over the past 10 years will not be sustainable into the future.

Housing Production 1999 to 2006

Table 3-1 below lists projects that resulted in new housing from January, 1999 through June, 2006. The table demonstrates that Emeryville has been highly successful at developing housing units at a range of affordability levels on sites that were contaminated, on non-vacant sites, and on properties that are zoned for non-residential uses or mixed-use. Table 2-55 in Chapter 2 provides additional detail on the affordability levels within each of the projects shown. Of the 21 projects, 17 (80%) were contaminated and successfully remediated for residential use. Sixteen were on sites formerly used for industry, and the remaining five were commercially used sites or vacant property.

* Emeryville units in border projects

Inventory and Analysis of Sites and Facilities

On March 20, 2008 the Association of Bay Area Governments approved the Regional Housing Needs Allocation (RHNA) for jurisdictions in the nine-county Bay Area. Emeryville's share of the regional housing need is 1,137 units in the following affordability categories:

Very low income units:	186	(16.4% of total)
Low income units:	174	(15.3% of total)
Moderate income units:	219	(19.3% of total)
Above-moderate income units:	558	(49.0% of total)
TOTAL:	**1,137**	

As required under Government Code Sections 65583 and 65583.2, this section of the element provides a parcel-specific inventory of suitable and appropriately zoned sites for the provision of housing for all affordability ranges. The inventory was developed by compiling information from the City's Major Development Projects listing (which is updated monthly) and the Redevelopment Agency's project list This inventory includes a listing of sites for which housing is anticipated to be developed within the planning period and a second list of more tentative future housing sites. This inventory shows the sites which will provide housing to meet the RHNA goal of 1,137 units.

A new Emeryville General Plan, including the Land Use Element, became effective on November 12, 2009. New zoning regulations consistent with the new General Plan are being prepared and will be adopted in 2011. Interim zoning regulations are currently in place to insure that development coming forward prior to the adoption of new zoning is consistent with the General Plan, including this Housing Element. The housing sites inventories below and the section on zoning that follows reflect the interim zoning that is currently in place. Although the projects listed in Table 3-2 below were developed under the old General Plan and under previous zoning regulations they are generally consistent with the new General Plan and interim zoning.

Sites Appropriate for Residential Development within the Planning Period

Table 3-2 below lists the sites where building permits are anticipated to be pulled during the July 2006 through June 2014 RHNA period. Projects listed in Table 3-2 mirror those listed in Table 2-55 in Chapter 2, which provides greater detail on the affordability levels of Below Market Rate units and the mechanism for achieving affordability. The Sites found in Table 3-2 are mapped in Diagram 3-1. Table 3-2 includes, for the July 2006 through June 2014 period, completed housing projects, approved housing projects, and proposed housing projects.

As shown in Table 3-2, the City provides the appropriate zoning for the development of 1,144 units during the 2006-2014 RHNA period which is within the horizon of this Housing Element. This number exceeds the RHNA goal by 7 units. The sites where this housing will occur are detailed in Table 3-2 below.

Table 3-2: Inventory and Analysis of Housing Sites – Appropriate and Available for Residential Use in the Planning Period

Sites Where Building Permits are Anticipated through June 30, 2014 – Completed and Proposed Projects

Map #	APN	Project Name & Description	Status of Approvals & Construction Schedule	Units approved or proposed	Acres	Units per acre	Below Market Rate	General Plan Land Use*	GP Density - units per acre (base/bonus) *	Current Zone *	Existing or pre-existing use	Environmental Issues Site Remediation	Access to Services & Amenities: Distance in Miles: Grocery Store	Park	Schools: Secondary	Schools: Elementary	Transit
Note 1: Zoning information is based upon interim zoning regulations that were enacted on November 12, 2009. New permanent zoning regulations consistent with the 2009 General Plan will likely be completed in 2011.																	
Note 2: This development is partially in Oakland. Units listed are in the Emeryville portion only. The total unit count for the development is 101.																	

Housing Capacities - Table 3-2: The majority of the projects listed in Table 3-2 already have entitlements in place. Seven were recently completed and another eight projects totaling 456 units have received planning approvals. The unit capacities are based upon the actual number of completed project units, the approved number of units in projects that have received entitlements, or the proposed number of units for the site, which have been determined to be feasible in accordance with the General Plan land use and zoning. Therefore it is not instructive to provide an analysis of the impacts of development standards for each site. Current residential development standards are discussed in the section on Land Use and Zoning below. Examples of the impact of development standards on density are provided under the discussion of Government Constraints to Housing Development.

Like Table 3-1, Table 3-2 above, which correlates to the Regional Housing Need Allocation period of 2006-2014, demonstrates a successful housing production record for both completed projects as well as projects anticipated to be completed during the period. As noted in Table 2-55 in the previous Chapter 2, an additional 243 units are projected to be produced at the very low, low, and moderate income levels, representing 21% of the total 1,144 units projected.

For the projects list in Table 3-2 above the planning permits required and density capacities varied from project to project. Three examples are provided as follows:

> *Salem Manor (#2)* is a triplex in the R-M zone. This project involved demolition of an existing single family residence and construction of three units on a 6,418 square foot parcel. A conditional use permit (CUP) was required for multi-family residential development, which is defined as any residential development of 3 units or more, in the R-M district. The project also required Planning Commission approval to demolish a single family dwelling. The CEQA determination was Categorical Exemption for urban infill housing.

Adeline Place (#6) is a 36 unit mix-use project. Multi-family residential development is a conditionally permitted use in what was formerly the C-G zone so this project required a CUP. The maximum allowable height in this district is 40 feet, which can be increased to 55 feet with a Conditional Use Permit. The project height is 49 feet 4 inches with an additional two and a half foot parapet wall. The project therefore required a CUP for the proposed height. Design review was also required. As an urban infill housing project Adeline Place was deemed categorically exempt from CEQA.

The Papermill Mixed Use project (#12) will have 168 residential units, 5 live-work units, 3 flex space units, 10,222 square feet of retail space, and 299 parking spaces, and a new park. The project required design review and a conditional use permit. The project is considered a multi-family residential use with ground level commercial use. Live-work units are considered as a separate use. Flexible space can be live-work space or commercial space. All three use categories were allowed with a CUP in the former M-U district. The project required a conditional use permit for a building height of 55 feet but is in conformance with setback, parking and floor area ratio requirements. Additionally the project required a demolition permit for removing a commercial building. An Initial Study/Mitigated Negative Declaration was prepared.

All three of the examples listed above were entitled under the previous General Plan and zoning regulations.

Table 3-2 demonstrates an increasing density over the previous housing cycle with an average 72.4 units per acre and a median density of 71. This period will experience more infill development of underutilized commercial properties and surface parking areas. Four of the sites are former industrial properties. Six of the sites listed have completed soil remediation and another four sites need further clean up or study.

Infill Development: Table 3-2 also demonstrates the City's ability to produce housing in mixed use, commercial, and industrial zones, on non-vacant properties, and on sites where toxic remediation is required. Only a small percentage of the sites listed were in residentially zoned districts, in this case the R-M Medium Density Residential District. The mechanism for determining how these units have or will accommodate the very low, low and moderate income regional housing need is described in Table 2-55 in Chapter 2.

Variety of Housing Types: As the above table shows, Emeryville is able to attract a wide range of housing types, including rental and ownership housing; live/work; small-, medium-, and large-size units; and townhomes as well as higher density buildings in mixed use, urban environments. Emeryville does not have the land capacity for subdivision and construction of single-family homes. Projects on the lower end of the density scale include rehabilitation of existing single-family homes (Oak Walk #5), and replacement of single dwellings with small multi-plexes (Salem Manor #2) in the older neighborhoods. (Further discussion of housing types is included below in the Land Use and Zoning section and under Zoning Constraints in the Government Constraints section.)

Tentative Future Housing Sites

In addition to the sites inventoried in Table 3-2, there are other sites in Emeryville that are appropriate for future housing development. Because these additional sites are more tentative than those listed in Table 3-2, they are inventoried separately. Table 3-3 below evaluates six sites that have capacity to yield additional housing in the future.

Table 3-3: Inventory and Analysis of Tentative Future Housing Sites Appropriate for Residential Use

Map #	Project Name; Address	APN	Estimated Completion Year	Projected Tenure	Site Acres	GP Density	GP Land Use	Current Zone	Existing or pre-existing use	Environmental Issues	Access to Services and Amenities (Distance in Miles)
18	Golden Gate Site Redevelopment; 3706 San Pablo	**Three-parcel site under one ownership** (First Citizens Bank). Parcel 1: 049-0951-004-02 (23,560 sf); Parcel 2: 049-0951-005-01 (8,964 sf); Parcel 3: 049-0951-006-01 (5,133 sf); Total: 37,657 sf site.	2013	RENT	0.86	85/100	MU-Residential Neighborhood Retail Overlay Major Transit Hub	MUR	Commercial building; vacant	Some past automotive uses; soilt testing underway spring 2010; some remediation may be needed	Grocery Store: 0.1 ; Park: 0.7; Secondary School: 0.6; Elementary School: 0.3, Transit: 0
			Potential Units (General Plan units/acre x 80%)					***Potential Units (General Plan Units @ 80% with BONUS)***			***Affordability Assumptions:*** Affordability based on assumption that this would be a Redevelopment-Agency sponsored housing development where developer would obtain financial assistance through Agency and Agency funds would be leveraged with outside sources to achieve given affordability levels.
			Total units	*58*				*Total units*	*69*		
			Very low	*29*				*Very low*	*23*		
			Low	*28*				*Low*	*45*		
			Moderate	*0*				*Moderate*	*0*		
			Market Rate	*1*				*Market Rate*	*1*		
	Redevelopment Potential: This site is currently comprised of the vacant Golden Gate commercial buildings and surface lots overgrown with weeds; the site has become blighted with vandalism. The property went into foreclosure and is bank-owned. Site is located on major transit corridor (San Pablo Avenue) with access to retail and services. The Site is located on the San Pablo Avenue corridor with transit access north to Berkeley and south to downtown Oakland. Redevelopment of Site with mixed use residential and retail uses would be highly desirable for bringing about revitalization of the area and providing needed housing.										
19	MAZ Site Redevelopment; 3800 San Pablo	**One-parcel site under one ownership.** FCM Props San Pablo Avenue LLC. Parcel 1: 049-0952-007. Total: 38,768 sf site.	2013	RENT	0.89	85/100	MU-Residential Neighborhood Retail Overlay Major Transit Hub	MUR	Auto-related commercial	Soil Study Needed	Grocery Store: 0; Park: 0.6; Secondary School: 0.5; Elementary School: 0.5, Transit: 0
			Potential Units (General Plan units/acre x 80%)					***Potential Units (General Plan Units @ 80% with BONUS)***			***Affordability Assumptions***: Affordability based on rental inclusionary requirements of City's Affordable Housing Set Aside Ordinance -- 6% of units at Very Low and 9% at Moderate Income.
			Total units	*61*				*Total units*	*71*		
			Very low	*4*				*Very low*	*4*		
			Low	*0*				*Low*	*0*		
			Moderate	*5*				*Moderate*	*6*		
			Market Rate	*52*				*Market Rate*	*61*		
	Redevelopment Potential: The MAZ building is currently vacant. The Site is located on major transit corridor (San Pablo Avenue) with access to retail and services. The Site is located on the San Pablo Avenue corridor with transit access north to Berkeley and south to downtown Oakland. Redevelopment of this Site with mixed use residential and retail uses would be highly desirable for bringing about revitalization of the area and providing needed housing.										

20	Gateway/Equity Building Redevelopment (BRE Properties); NE corner Powell/Christie	**Three-parcel site. Each parcel has separate ownership**. Parcel 1: 049-1494-004-07 (27,000 sf); owned by Dennys Realty; Parcel 2: 049-1494-004-08 (91,475 sf) owned by BRE Properties; Parcel 3: 049-1494-004-10 (18,295 sf) owned by Delta Fair. Total: 136,770 sf site.	2013	RENT	3.14	115/170	MU-Residential Neighborhood Major Transit Hub	MUR	Office building, gas station, restaurant, surface parking	Remediation Needed	Grocery Store: 0.2; Park: 0.2; Secondary School: 1.1; Elementary School: 1.3, Transit: 0
			Potential Units (General Plan units/acre x 80%)					***Potential Units (General Plan Units @ 80% with BONUS)***			***Affordability Assumptions:*** Affordability based on assumption that developer would receive financial assistance through the Agency to achieve given affordability levels beyond the inclusionary level required by the City's Affordable Housing Set Aside Ordinance for rental projects.
			Total units	*423*				*Total units*	*626*		
			Very low	*25*				*Very low*	*38*		
			Low	*42*				*Low*	*42*		
			Moderate	*38*				*Moderate*	*56*		
			Market Rate	*318*				*Market Rate*	*490*		
	Redevelopment Potential: The Gateway/Equity Office Site is located at a major transportion access point in the City, with access to the Amtrak Station, Emery-Go-Round access to the MacArthur BART Station, the I-80/580 interchanges, and SF Bay Bridge. BRE Properties owns the major portion of the site occupied by the Gateway/Equity Office building, which is occupied by an office building with Wells Fargo Bank on its ground floor that would be included in the redevelopment of the site, and fronted with a large surface parking lot. Other portions of the site include a Dennys Restaurant surrounded by surface parking and a Chevron gas station. The Site is located close to retail services and a grocery store (Trader Joe's). The Site is zoned Mixed Use Residential in the updated General Plan, in an area allowing the City's highest densities, building heights, and floor area rations. Redevelopment of the Site would enable consolidation of these retail uses and structured parking at ground floor and residential uses above, providing a defined building edge and more pedestrian-friendly design.									
21	Black & White Mixed Use; NW corner San Pablo/40th	**Four-parcel site under two ownerships:** Three parcels owned by Oaks Corner Inc.: 049-0618-021, 049-0618-024-02, and 049-0618-033 (1 ac. combined); one parcel owned by Pavlatos &Tsakopoul: 049-0618-022 (.5 ac.); Total: 65,340 sf site.	2013	OWN	1.50	85/100	MU-Residential Neighborhood Retail Overlay Major Transit Hub	MUR	Single story commercial building	Soil Study Needed	Grocery Store: 0.1; Park: 0.6; Secondary School: 0.4; Elementary School: 0.1, Transit: 0
			Potential Units (General Plan units/acre x 80%)					***Potential Units (General Plan Units @ 80% with BONUS)***			***Affordability Assumptions:*** As ownership development, the City's Affordable Housing Set Aside Ordinance requires 20% of units to be set aside at Moderate Income Levels, as shown in total BMR unit count. Affordability based on assumption that some BMR units would be sold at Low Income levels through provision of Ownership Housing Assistance Program (OHAP) downpayment assistance program.
			Total units	*102*				*Total units*	*120*		
			Very low	*0*				*Very low*	*0*		
			Low	*10*				*Low*	*12*		
			Moderate	*10*				*Moderate*	*12*		
			Market Rate	*82*				*Market Rate*	*96*		
	Redevelopment Potential: The Black & White Site is occupied by a small grocery and liquor store within an older commercial building building and surface parking lots for the store and nearby Oaks Card Room. The building is older and not in prime condition; the liquor store has sometimes attracted less desirable activities. Redevelopment of the Site with mixed use retail and residential uses would allow creation of structured parking and elimination of the surface parking lots, create vibrant ground floor activity with the retail uses, and needed housing to activate the retail. The Site is located at the intersection of a transit corridor (San Pablo Avenue and 40th Street both have bus lines to Berkeley, downtown Oakland, and MacArthur BART station, respectively) and access to nearby retail and services. Redevelopment of this Site with mixed use residential and retail uses would be highly desirable for bringing about revitalization of the area and providing needed housing.									

22	Sherwin Williams Redevelopment; Horton Street	**One-parcel site under one ownership** (Sherwin Williams Company): Parcel 1: 049-1041-026-15.	2014	OWN	5.84	85/100	MU-Residential	MUR and Park Avenue Overlay District	Vacant	Currently under remediation	Grocery Store: 0.5; Park: 0.3; Secondary School: 0.5; Elementary School: 0.2, Transit: 0
			Potential Units (General Plan units/acre x 80%)					***Potential Units (General Plan Units @ 80% with BONUS)***			***Affordability Assumptions:*** As ownership development, the City's Affordable Housing Set Aside Ordinance requires 20% of units to be set aside at Moderate Income Levels, as shown in total BMR unit count. Affordability based on assumption that some BMR units would be sold at Low Income levels through provision of Ownership Housing Assistance Program (OHAP) downpayment assistance program.
			Total units	*397*				*Total units*	*467*		
			Very low	*0*				*Very low*	*0*		
			Low	*30*				*Low*	*30*		
			Moderate	*49*				*Moderate*	*63*		
			Market Rate	*318*				*Market Rate*	*374*		
	Redevelopment Potential: The Sherwin Williams site is occupied by a former paint factory that is now a vacant building. The site represents one of the few larger-scale properties in Emeryville and could include a large number of units based on allowed new densities for the MUR zone. The site is within one block of an identified new neighborhood center in the updated General Plan land use map and within one block of the Park Avenue District which includes a mix of residential, live/work, office and restaurant uses. Due to its past industrial use, the site has required remediation which is underway and when completed will contribute to the site's redevelopment potential.										
23	Oaks/Bank of America Site Redevelopment; NE corner San Pablo/41st	**Five-parcel site under three ownerships**. 1) 049-1026-21 (5,100 sf), owned by Kulka; 2) 049-1026-22 (3,337 sf), owned by Oaks Corner; 3) 049-1026-23 (10,000 sf), owned by Oaks Corner; 4) 049-1026-24 (10,853 sf), owned by Oaks Corner; 5) 049-1026-02 (34,999 sf), owned by Bank of America National Trust and Savings Association. Total: 64,289 sf site.	2014	OWN	1.48	20/35 50/60	MU-Residential Neighborhood Retail Overlay Major Transit Hub	MUR R-M	Single story commercial building/surface parking	Soil Study Needed	Grocery Store: 0.3; Park: 0.5; Secondary School: 0.3; Elementary School: 0.2, Transit: 0
			Potential Units (General Plan units/acre x 80%)					***Potential Units (General Plan Units @ 80% with BONUS)***			***Affordability Assumptions:*** As ownership development, the City's Affordable Housing Set Aside Ordinance requires 20% of units to be set aside at Moderate Income Levels, as shown in total BMR unit count. Affordability based on assumption that some BMR units would be sold at Low Income levels through provision of Ownership Housing Assistance Program (OHAP) downpayment assistance program.
			Total units	*46*				*Total units*	*59*		
			Very low	*0*				*Very low*	*0*		
			Low	*4*				*Low*	*6*		
			Moderate	*5*				*Moderate*	*6*		
			Market Rate	*37*				*Market Rate*	*47*		
	Redevelopment Potential: The Oaks/Bank of America Site is occupied by the Bank of America branch and surface parking lots for the bank and the nearby Oaks Card Room. Redevelopment of the Site with mixed use retail and residential uses would allow creation of structured parking and elimination of the surface parking lots, create vibrant ground floor activity with the retail uses, and needed housing to activate the retail. The Site is located along the San Pablo Avenue corridor with transit access to Berkeley and cities north, downtown Oakland, and MacArthur BART station, and access to nearby retail and services. Redevelopment of this Site with mixed use residential and retail uses would be highly desirable for bringing about revitalization of the area and providing needed housing.										

Housing Capacities - Table 3-3: The Land Use Element of the General Plan defines residential density maximums based upon dwelling units per acre. The General Plan and interim zoning also allow for bonuses to exceed the maximum density, building intensity (floor area ratio), and building height for developments that provide public benefits. (These public benefit bonuses are separate from density bonuses allowed under State law for affordable housing.) In Table 3-3, capacities are shown for both the maximum densities allowed on the site (base density) and the densities that could be achieved if a bonus is applied (bonus density).

When updating the Land Use Element, projections were made to determine the growth likely to occur under the updated densities and intensities. This was done by reducing the maximum densities by 20% to account for properties that would not develop over the life of the Element. For consistency, the unit capacities estimates for the sites in Table 3-3 are calculated at 80% of the densities allowed under the Land Use Element. The density calculation examples provided below (and those provided under Development Standards in the section on Governmental Constraints to Housing Development in this chapter) demonstrate that the cumulative impact of development controls upon a site do not normally reduce the density from what is allowed by the Land Use Element. Although the densities are achievable, they may result in small dwelling units. If larger units are desired the densities would be reduced. Also, there may be situations, such as locations adjacent to lower density development, where the density allowed by the Land Use diagram would be limited. Furthermore, future zoning regulations may result in new open space standards that could result in slightly lower density. Therefore, the capacity assumption of 80% of maximum density as shown in Table 3.3 provides a sufficient margin to demonstrate realistic capacities for the sites inventoried.

Density Calculation Examples. The following examples provide residential density estimates under what is allowed by the Land Use Element without bonus and current development standard. These examples are for illustrative purposes.

#19 MAZ Site: 75 units allowed without bonus.
This example assumes residential development with structured parking and commercial space on the ground floor.
This is a 38,764 square foot site in the MUR (mixed use with residential) in an area designated as a Neighborhood Retail Overly where ground floor commercial use is required, and within a Major Transit Hub where transit-oriented development is encouraged. The base density allowed is 85 units per acre (with out bonuses) which calculates to75 units for this site**.** The Floor Area Ratio (FAR) maximum is 2.0 (without bonus) so that floor area would be limited to 77,528 square feet. Building height is limited to 55 feet -- about 5 stories (without bonuses). There are no yard or setback requirements in the MUR zone unless abutting a residential zone which is not the case for this site. The ground floor commercial area is assumed at 15,000 square feet. To determine the residential parking requirement a mixture of unit types are assumed: 30 one-bedroom units, 45 two-bedroom units. Forty five spaces are required for the commercial use, resulting in total parking requirement of 161 spaces to be accommodated in approximately 56,000 square feet of structured parking on the first two floors, leaving three full floors for residential development. Parking is not included in calculation of FAR. The minimum dwelling size is 500 square feet.

Subtracting the 15,000 square feet of commercial space from the allowed floor area of 77,528 square feet results in 62,528 square feet for residential use. This is further reduced by 25% for corridors, mechanical and common areas resulting in approximately

46,896 square feet for dwelling space which can accommodate 75 units, with an average unit size of 625 square feet. The example shows that full allowable density may be achievable but would result in small units. The potential unit capacity (without bonuses) determined in Table 3-3 is 61 units (80% of allowed density). At this density larger units would be possible.

 # 22 Oaks/Bank of America Site: 57 units allowed without bonus
This example also assumes residential development over structured parking with commercial space on the first floor.
This is a 64,289 square foot site in both the RM (medium density) and the MUR (mixed use with residential) zones. As with the example above, the site is in a Neighborhood Retail Overlay area and within a Major Transit Hub. The densities permitted (without bonuses) are 20 units per acre for the smaller portion in the RM zone, and up to 50 units per acre for the larger portion of the site in the MUR zone. A total of 57 units are allowed. The limits on floor area (without bonuses) vary on the project site from 0.5 to 1.2, so that overall floor area would be limited to 58,292 square feet. Building height (without bonuses) is limited to 30 ft (2 to 3 stories). Setback requirements would reduce the building footprint to 56,659 square feet. The ground floor commercial space is assumed to be about 12,000 square feet. Assuming 35 one-bedroom units and 22 two-bedroom units the total parking requirement would be 120 spaces which can be accommodated in a ground level structure within the building footprint. Parking is not included in the calculation of floor area.

Subtracting the 12,000 square feet of commercial floor area from the allowed 58,292 square feet would leave 46,292 square feet for residential development on a second level. Reducing this by 25% to account for corridors, mechanical and common areas, results in 34,719 square feet for residential use. The minimum dwelling size is 500 square feet. The allowed density of 57 units on this site can be accommodated in this 34,919 square feet of floor area with an average unit size of 609 square feet. The unit capacity shown in Table 3-3 is 46 units (80% of 57) would enable larger units.

#21 Black and White Site: 127 units allowed without bonus
This example also assumes residential development over structured parking with commercial space on the first floor.
This is a 65,340 square foot site in the MUR (mixed use with residential) zone, also in a Neighborhood Retail Overlay within a Major Transit Hub. The density permitted without bonuses is 85 units per acre allowing 127 units The limits on floor area (without bonus) is 2.0 so that 130,680 square feet would be allowed. Building height (without bonus) is limited to 55 feet (about 5 stories). There are no yard or setback requirements. The minimum dwelling size is 500 square feet. The ground floor commercial area is assumed to be 13,000 square feet. Assuming 77 one-bedroom units, 50 two-bedroom units, and 42 parking spaces for commercial development, a total of 226 parking spaces are required. This would be accommodated in structured parking on two levels. Parking area is not included in the calculation of floor area. The commercial space of 13,000 square feet is subtracted from the total permitted floor area of 130,680 square feet, resulting in 117,680 square feet for residential use which can be accommodated in two floors. When further reduced by 25% for corridors, mechanical and common areas, approximately 88,209 square feet would be available for

residential space which can accommodate 127 units with an average unit size of 695 square feet. The unit capacity shown in Table 3-3, 102 units (80% of 127), would allow for larger units, as is the case with the other examples above.

Attainment of Regional Housing Need Allocation for 2006-2014

The chart below summarizes Emeryville's attainment of goals set forth for the 2006-2014 Regional Housing Need Allocation period, including completed, approved, and proposed housing projects found in Table 3-2, and tentative housing sites shown in Table 3-3. The chart breaks out the units produced within each income category (very low, low, moderate, and above moderate income), calculating the unit capacity at 80% of General Plan densities for both the maximum allowed on the site and the maximum achievable with a bonus. The chart shows that Emeryville has the housing site capacity to exceed the overall RHNA goal of 1,137 units, by 196% and 225%, respectively. Under capacities provided in the General Plan, at 80% (without the bonus), Emeryville meets between 87% and 97% of the RHNA goals in the very low, low, and moderate income categories. Inclusive of the bonus, Emeryville meets or exceeds the RHNA goals**.**

Housing Sites Analysis: Attainment of Regional Housing Need Allocation for 2006-2014

	Units @ 80% of General Plan Density					Units @ 80% of General Plan Density with BONUS				
	Total Units	Very Low	Low	Moderate	Market Rate	Total Units	Very Low	Low	Moderate	Market Rate

Tables 3-1, 3-2, and 3-3 combined substantiate Emeryville's successful track record for developing and having the site capacity to develop infill housing of a variety of types and affordability levels.

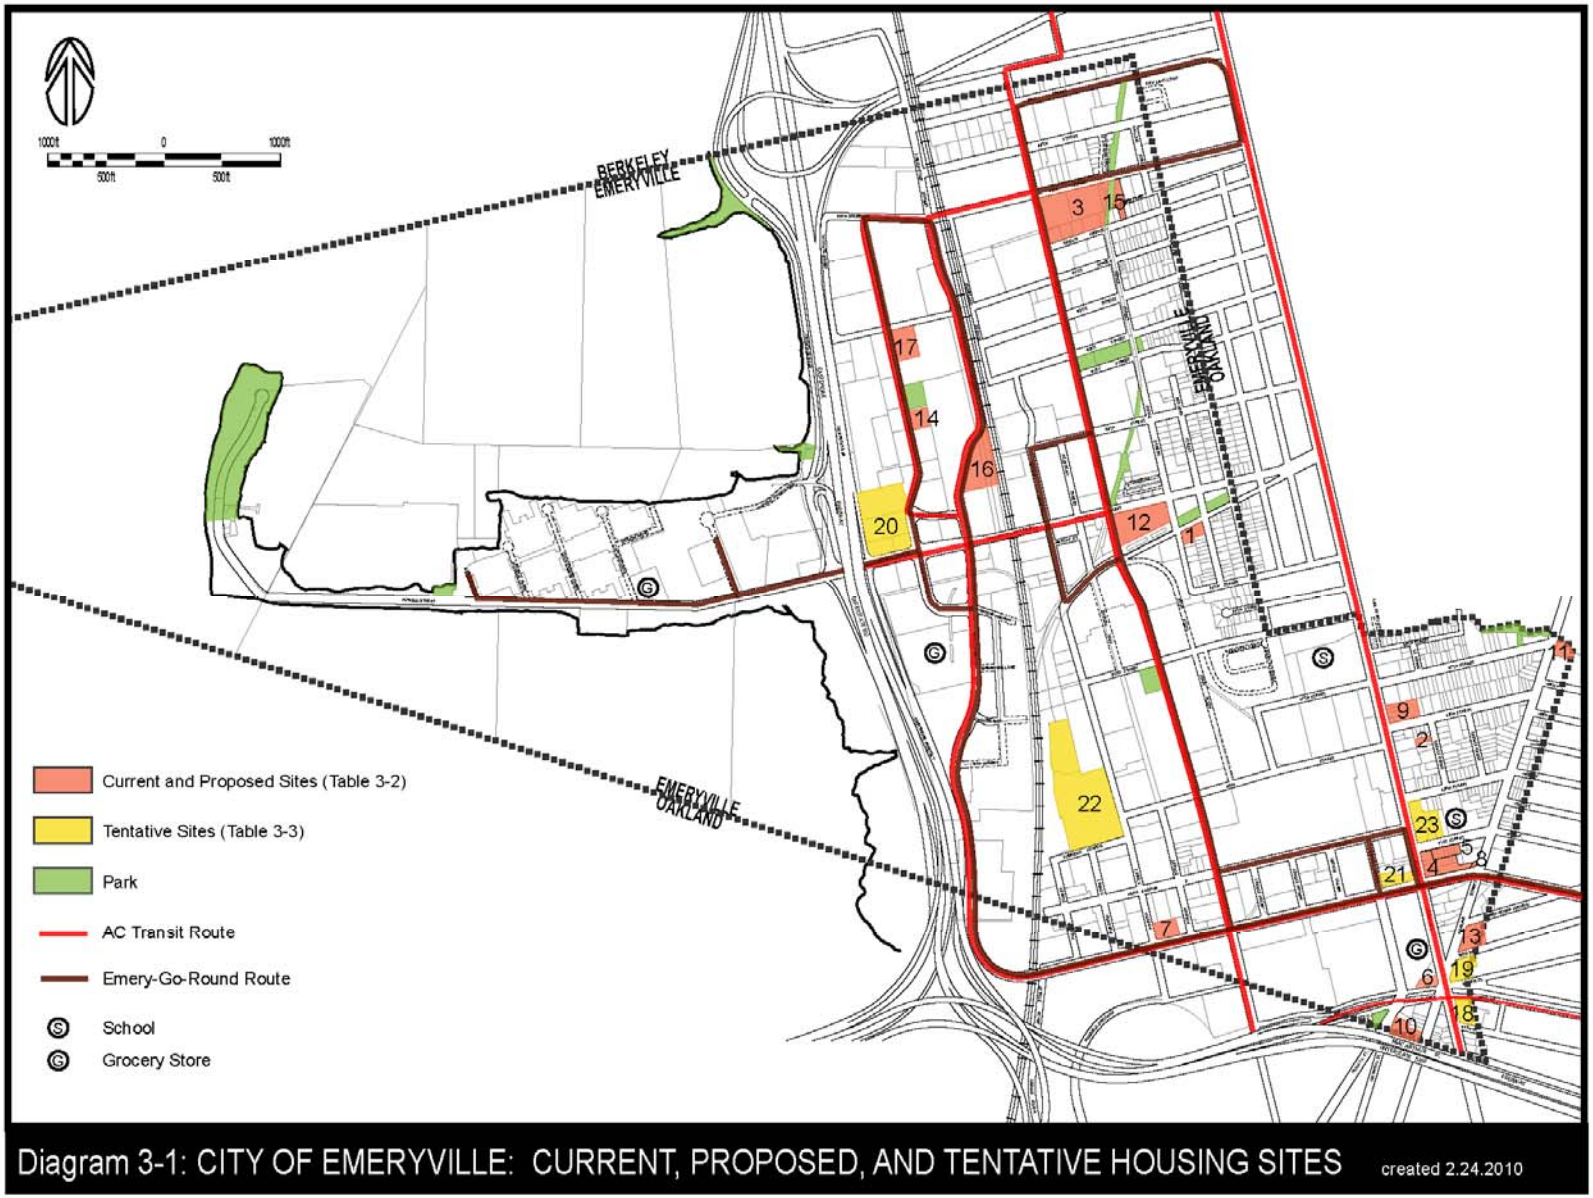

Diagram 3-1: CITY OF EMERYVILLE: CURRENT, PROPOSED, AND TENTATIVE HOUSING SITES created 2.24.2010

Facilities and Infrastructure. Public facilities and infrastructure have a direct influence on a city's ability to accommodate residential growth. This section provides information on schools, parks, grocery stores, and public transit, and summarizes other aspects of infrastructure, including water supply and wastewater treatment.

Schools. The Emery Unified School District operates two public schools in Emeryville: Anna Yates Elementary School and Emery Secondary School, which is a combined middle and high school. The total district enrollment is about 800 students. These schools are adequate to serve the population and have capacity for growth. The Emeryville community is very supportive of the School District and associated youth programs. Both the City Council and Planning Commission actively encourage the development of family housing to boost school enrollments. In 2003 city voters approved the community's first parcel tax for school funding. Again, on June 5, 2007 a remarkable 87% of the voters approved an extended and enhanced parcel tax to provide the district with $2.5 million per year for a ten year period. This will augment the schools' budget for smaller class sizes, counseling, tutoring, technical support, literacy, library facilities, arts, and music. Additionally, residential and commercial developers pay a school facilities fee based on projected future needs. As shown on Diagram 3-1 the public schools are in close proximity to housing throughout the City.

A private school, Pacific Rim School, is located on Doyle Street at Stanford Avenue. It includes grades kindergarten through eight. Other charter and private schools are located nearby. Schools providing higher education in Emeryville include Western Career College, Ex'pressions College for Digital Arts, and the National Holistic Institute.

Parks and Recreation. Today the city contains 13.74 acres of parkland. The majority of the City's developed parkland is concentrated to the west of the railroad tracks, with 8 acres on the peninsula and another 2.87 acres in the bayfront area. All of the City's recreation facilities (basketball courts, sports field, and play equipment) are located on the east side. The distribution of existing and planned parks leaves the extreme north and south portions of the city, east of the railroad, outside of a quarter-mile from a park.

There are 1.66 acres of parkland for every 1,000 residents, up from 1.54 in 1984. However, compared to neighboring cities, this ratio is low. Oakland has 2.94 acres of parkland per 1,000 residents and Berkeley's supply is 2.36 per 1,000 residents. The City is currently developing a new park in the North Hollis area which will add 1.25 acres to the supply. Plans for development of several other parks and expansion of the Emeryville Greenway are being considered, and other opportunity sites for new parks are identified in the Parks, Open Space and Public Services Element of the General Plan, including two large recreational parks, one on the north side of the City and one on the south. The City is also in the process of developing a parks and recreation strategic plan to determine needs and a funding strategy. Meanwhile, the City has been working with private developers to provide open space inside large residential and commercial projects, thereby offering a convenient, sheltered place for play and relaxation. In addition to public parks and private open space, the Emery Unified School District opens schoolyards to the public on weekends and allows public use of the sports field and swimming pool at Emery Secondary School when not being used by the school. Continued joint use of School District facilities is an important component of the City's recreation programs.

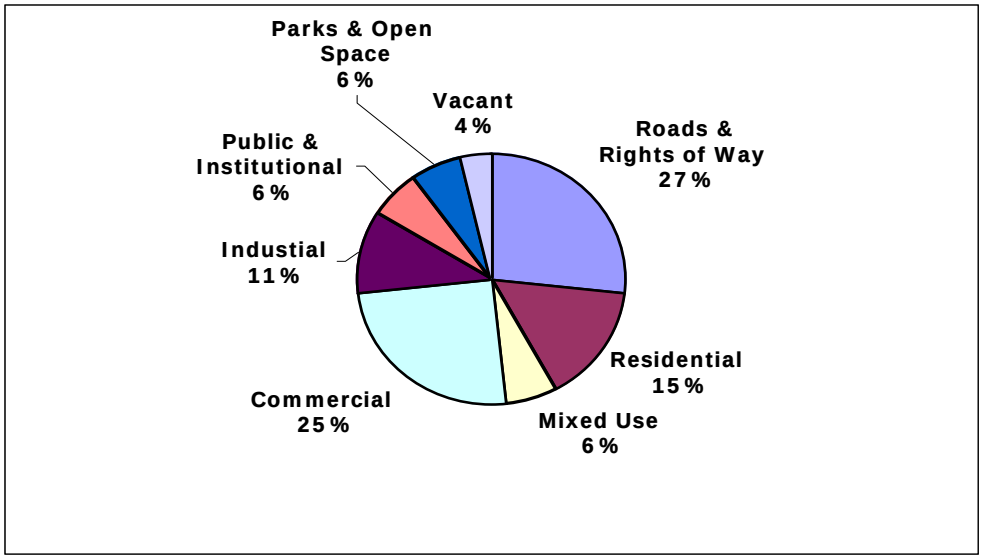
Grocery Stores. Four grocery stores are located in or on the border of Emeryville, as shown on the map in Diagram 3-4. These include the Watergate Market serving the peninsula, Trader Joe's which is centrally located at the Powell Street Plaza, a small corner grocery at 59th and Vallejo streets in Oakland, and Safeway in the south end of town. Safeway is a full supermarket serving the entire city and beyond. A new Berkeley Bowl grocery store is being constructed in southwest Berkeley less than a half mile from Emeryville's northern boundary.

Transit. Three organizations provide transit service into and out of Emeryville: the Emery Go-Round, AC Transit, and AMTRAK. The Emeryville Transportation Management Association, a consortium of employers, residential complexes and the City, funds the Emery Go-Round. The Emery Go-Round is a free shuttle connecting the city to the MacArthur BART station and Emeryville's Amtrak station. It runs within a quarter-mile of every property in the city. Buses run every ten to twelve minutes during peak commute times and every 15 to 20 minutes midday. Its two routes operate weekdays from 5:45 AM until 10:15 PM. On weekends it runs shopper shuttles from 9:25 AM to 9:50 PM on Saturday and 10:20 AM to 7:00 PM on Sundays.

AC Transit operates eleven routes in Emeryville: five local East Bay routes (26, 31, 57, 72 and 72M), one rapid bus line (72R), one "all-nighter" bus route (802) and four transbay bus lines (C, F, J and Z). Every property in Emeryville is within a quarter-mile of at least one AC Transit route. Emeryville's AMTRAK station provides national passenger rail service and is linked to San Francisco by bus service. Four AMTRAK routes serve this station, including the Capitol Corridor (between Sacramento and San Jose) and San Joaquin (between Oakland and Stockton) commuter service routes, and the long distance Coast Starlight (LA – Seattle) and California Zephyr (SF - Chicago). In 2008, Emeryville's station was the 20th busiest in the country. With 44 trains per day, over half a million passengers went through the Emeryville station during Amtrak's 2009 Fiscal Year. Diagram 3-4 shows that transit is available in close proximity to all areas of town. In addition the MacArthur BART station, located in Oakland, is approximately a half -mile from Emeryville's eastern border.

Water. East Bay Municipal Utility District (EBMUD) supplies water and provides wastewater treatment to areas of Alameda and Contra Costa counties, including Emeryville. Within the city EBMUD owns, operates and maintains the water distribution system that brings Sierra Nevada snowmelt and seasonal runoff through a distribution and treatment system to Emeryville. In 1993 EBMUD adopted its Water Supply Management Program (WSMP) that outlines projects to provide reliable sources of high-quality water through the year 2020. EBMUD is currently in the process of updating the WSMP to plan for resources out to 2040. In addition, every five years EBMUD prepares an Urban Water Management Plan (UWMP), as required by the California Urban Water Management Planning Act. The most recent UWMP was completed in 2005 and considers water resources through 2030. Water recycling and conservation programs are in place to reduce the future demand for water. Although the water supply is sufficient to meet demand during normal years, like most of California it is insufficient to meet customer demand in the case of multi-year drought despite aggressive conservation and recycling efforts. Additional supplemental supply projects are currently underway to reduce the severity and frequency of water rationing.

As an older city, Emeryville has had a water supply system in place for many years. The former industrial users demanded large quantities of water to serve their businesses so the system was built to accommodate large capacities. The system is regularly maintained and upgraded to serve densification. Currently the water supply system has capacity for growth. Where there is insufficient localized capacity to serve proposed development, upgrades or installations are required as conditions of project approval. For example, redevelopment of the Marketplace will necessitate installation of additional on site water and sewer lines to connect with the City's systems.



Wastewater The City of Emeryville operates a municipal sanitary sewer collection system that conveys wastewater from Emeryville and portions of the City of Oakland. Except for one pump station and a forced main at the Emeryville Marina, the City of Emeryville's collection system is generally a gravity-fed system, consisting of over 15 miles of sanitary sewer mains ranging in sizes from six to 30 inches. Additionally, the City of Emeryville's collection system carries wastewater from approximately 11 miles of sanitary sewer collection system owned and maintained by the City of Oakland. Emeryville's collection system is divided into five drainage basins, each of which connects to the East Bay Municipal Utility District's (EBMUD) North sanitary sewer interceptor, which is generally located along the east side of Interstate 80. The EBMUD interceptor carries sewer flows from the East Bay communities' collection systems to its Wastewater Treatment Plant. The plant provides secondary treatment for a maximum flow of 168 mgd. Primary treatment can be provided for up to a peak flow of 320 mgd. The average annual daily flow is approximately 80 mgd. In addition to the main wastewater treatment plant, EBMUD operates three wet weather treatment facilities. These facilities were constructed in the late 1980's to handle all the wet weather flows generated from Infiltration and Inflow (I&I) into the Satellite Agencies collection systems. The volume of wet weather flow is generally as high as 15 times the average dry weather flow. During periods of wet weather, the Wet Weather facilities are designed to provide primary treatment to the wet weather sewage flow prior to discharge into the Bay. (See additional discussion under the following section on governmental constraints.)

Land Use and Zoning

As noted previously, a new Land Use Element and interim zoning regulations were enacted in 2009. New permanent zoning regulations consistent with the General Plan are being prepared and will likely be adopted within a year of adoption of this Housing Element. The interim zoning measures insure that development projects under review prior to adoption of new zoning regulations, are consistent with all elements of the General Plan. The land use policy section below is based upon the Land Use Element and the zoning section describes the interim regulations which will be replaced once the new regulations are adopted.

Emeryville's land use history has been dominated by change. With the exception of small pockets with stable residential neighborhoods, most of the city's developed property has cycled through multiple land uses over time. By the middle of the twentieth century Emeryville was firmly established as an industrial and warehousing center with large properties flanking the railroad and Interstate 80. During the period of industrial decline in the latter part of the century, land use policies were set in place to transform the city into a vibrant mixed use city. These polices resulted in a remarkable transformation. As of 2003, housing and mixed use areas accounted for 29% of the city's developable land area – excluding roads and rights-of-way, with industrial areas reduced to only 14%. Since 2000, housing in mixed use developments has grown, accounting for two-thirds of approved residential construction. Typical mixed use projects are predominantly residential with a small amount of local-serving retail. For example, Icon at 1401 Park Avenue in Table 3-1 is a six story residential building with a small café space on the ground floor. Adeline Place (#6 in Table 3.2) has 36 residential units with only 2,400 square feet of commercial space. However, for the larger sites with a regional retail component such as Bay Street, the ratio of housing to commercial is more balanced.

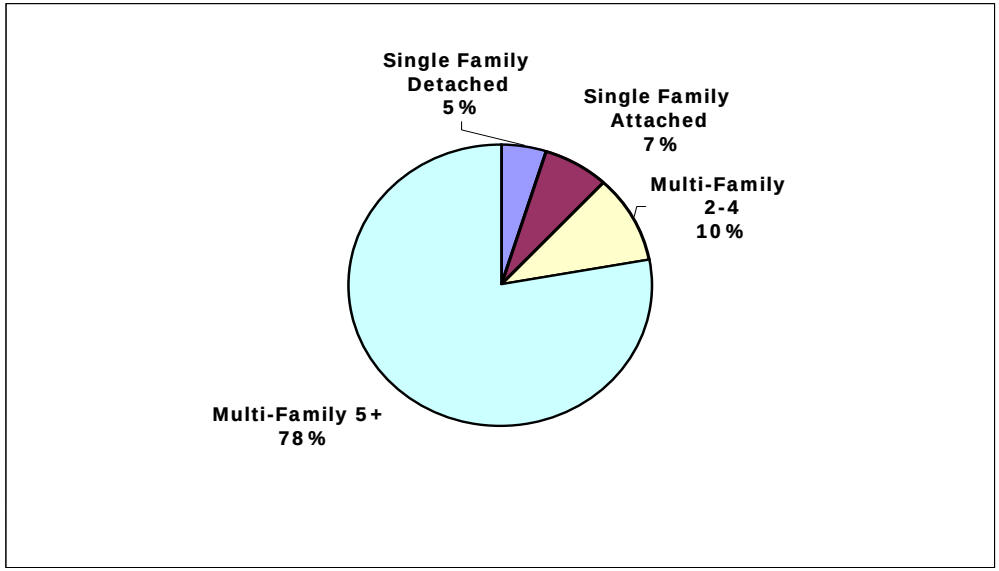


Diagram 3-2: Distribution of Land Uses

General Plan Opportunities and Challenges Report – January 2006

Given the city's small size, higher density projects have dominated the residential growth. The citywide distribution of housing by type is displayed in Diagram 3-3, showing that multi-family developments with five or more units far outnumber the lower density units. Seventy-eight percent (78%) of the City's housing units were in multi-family buildings with five or more units.

Diagram 3-3: Distribution of Housing Units by Type

General Plan Opportunities and Challenges Report –kJanuary 2006

General Plan Land Use Policy. Land uses, and standards for residential density, building intensity and building height are established by the Land Use Element and implemented by the zoning regulations. The land use goals of the 2009 General Plan call for a balance of uses within a predominantly mixed use city, preservation of older residential neighborhoods, and vibrant new mixed use centers where underutilized commercial centers now exist. The Plan can accommodate a capacity for an additional 3,800 dwelling units for a citywide total capacity of 9,800 units through 2030. This would represent a 64% increase in the housing supply. The areas where residential use is permitted constitute approximately 57% of the city, allowing for a continuation of residential expansion.

Residential Density: The Land Use Element provides for residential densities that range from 20 units per acre in the eastern neighborhood to 115 units per acre, and up to 170 units per acre with bonus, in the Powell Street/Christie Avenue core.

Building Height: Maximum building heights range from 30 feet to 100+ feet. Buildings heights gradually step up from the lowest in the east—reflecting the scale of the older residential neighborhoods—and the western edge of the Peninsula, to create a high-rise core in the Powell Street/Christie Avenue area.

Intensity: The General Plan establishes intensity standards for various parts of Emeryville. Intensity is measured as floor area ratio (FAR), obtained by dividing the gross floor area of a building by the lot area. In general, all floor area above grade is included, including residential uses, but excluding parking. The citywide distribution of FAR's are aligned with residential densities and building heights, with the most intense development targeted to the core area.

Density, intensity and building height maximums may be exceeded through bonuses for public benefit. (See General Plan diagrams in Appendix C.)

***Zoning*.** This section reviews how the City's interim zoning regulations apply to residential development. The interim zoning regulations establish zoning districts that apply to each of the land use designations established by the Land Use Diagram in the Land Use Element. In the RM (medium density residential), RMH (medium high density residential) and RH (high density residential) zones, single-family, townhouses, duplex units are allowed by right. Multi-family housing are also allowed by right except in the RM zone where a conditional use permit is required. Emeryville has no low-density residential zone because there are no neighborhoods with exclusively single family housing. In the MUR (mixed use with residential) zone multi-family housing is allowed by right, and other residential uses types are allowed with a conditional use permit. The zoning districts in which residential use is not permitted are MUN (mixed use with non-residential, OT (office technology), IND (industrial), PUB (public), MAR (marina) except for live-aboard boats, POS (parks/open space), and SM (shoreline management). Live work is permitted in the residential, commercial and industrial zones. For larger properties and/or phased development the PUD (planned unit development) zone may be used. Consistent with the Land Use Element, zones where residential use is permitted constitute approximately 57% of the city.

Table 3-4: Zones Where Residential Uses Are Permitted

Uses Permitted (P), Conditionally Permitted (C), and Prohibited (X).

Uses:	Base Zones:

Zoning for a Variety of Housing Types. Table 3-4 above shows the residential use types identified in the zoning regulations, the zones where they are permitted, and whether they are permitted by right or if a CUP is required. The Zoning Ordinance expressly treats factory-built homes the same as site-built homes, and allows mobile homes with a use permit in residential zones. Single room occupancy housing is considered Group Residential and allowed in RMH, RM and MUR zones with a CUP. The Zoning Ordinance was amended to list

emergency shelters and transitional housing in the definition of Group Residential as well, thereby permitting these types of housing where group housing is permitted. State law requires cities to permit these uses in their Zoning Ordinances if there is a need for these facilities. The homeless and transitional population in Emeryville is described in Chapter 2. (See additional discussion under Zoning Constraints below.) The Housing Action Plan includes Policy IV-A-4 to modify the zoning regulations to be in compliance with new State law regarding emergency shelters and transitional housing.

Residential Development Standards. Yard requirements are shown in Table 3-5 below and parking standards are shown in Table 3-6. In the MUR (mixed use with residential) the mix of uses must include residential development if the site is from one to five acres in size. Sites five acres or greater must be developed as a Planned Unit Development. As indicated previously, density, building intensity and building height prescribed by the Land Use Element. Density, intensity and height bonuses may be conditionally permitted for projects demonstrating a significant public benefit, such as public open space, family friendly housing, sustainable design, etc. Specific findings are required to approve a public benefit bonus.

Table 3-5: Residential Development Standards

	Zones					Unit Types	
	RH	**RMH**	**RM**	**MUR**	**MUR** if abutting other residential zones	Residential Second Units	Live/Work
	High Density Residential	Medium High Density Residential	Medium Density Residential	Mixed Use with Residential	Mixed Use with Residential		
Minimum Front Yard Setbacks							
If the two adjacent lots are developed:	Average of adjacent front yards	Average of adjacent front yards	Average of adjacent front yards	None.	Where street frontage abuts a lot in a residential zone, setback from street line shall be the same as required on the adjacent residential lot.	A detached dwelling unit shall be separated by a minimum of 10 feet	Set- backs are pursuant to the zone which the unit is located in.
If only one of the adjacent lots is developeda:	Same as front yard on developed lot but not less than 5 feet	Same as front yard on developed lot but not less than 5 feet	Same as front yard on developed lot but not less than 10 feet				
If neither of the adjacent lots are developed:	5 feet	5 feet	10 feet				
For all corner lots:	5 feet	5 feet	10 feet				
Other Minimum Setbacks							
Street Side:	3 feet	3 feet	3 feet	None.	Where street frontage abuts a lot in a residential zone, setback from street line shall be the same as required on the adjacent residential lot.	3 feet	Set- backs are pursuant to the zone which the unit is located in.
Interior Side:	3 feet	3 feet	3 feet		10 feet, plus an additional 2 feet for each 1 foot by which the height of the building on the nonresidential lot exceeds 30 feet.	3 feet	
Rear:	15 feet	15 feet	15 feet			10 feet

Open Space							
Usable Open Space Per Unit in Sq. Feet:	X	X	X	x	X	X	36

Table 3-6: Residential Parking Standards

Uses	Required Parking Spaces
RESIDENTIAL	
Single-family detached Single-family semiattached	2 covered per unit
Two-family Townhouse Multifamily	1 per studio unit 1 per one-bedroom unit 1.5 per two (or more) bedroom units All sites with 5 or more dwelling units must provide 1 guest parking space for every 4 dwelling units.
Group Residential Residential Second Unit Mobile Home Parks	Specific parking requirements are not listed for these uses. Per Emeryville Zoning Ordinance 9-4.55.9 "the Planning Commission, upon recommendation of City staff, shall determine the parking requirements for said use" on a case by case basis.
LIVE/WORK	
Light Heavy	1.5 per unit or 1.5 per 1000 sq. ft., whichever is greater. 1 loading space per 50,000 sq. ft

Governmental Constraints to Housing Development

This section evaluates land use controls and other government regulations and procedures that may impact the affordability and supply of housing.

Zoning Constraints.

Conditional Use Permits and Design Review. As discussed in the previous section, the currently adopted Zoning Ordinance provides for a variety of housing types, although conditional use permits and design review approvals are required in a number of circumstances. The City finds that conditional use permits and design review are necessary to address the many complex issues associated with infill development in such a small city, such as adjacent industrial and commercial uses, site irregularities, and environmental conditions created by the City's unique land use history. As part of the update of the zoning regulations the City will be reducing the level of review for some types of projects so that more permits may be processed administratively.

The fee for a CUP is $1,055 for a residential project of less than three units. For projects with 3 to 10 units the fee is $1,583. Larger projects are charged on a cost recovery basis with a $2,000 minimum. The processing time depending upon the size and complexity of the project and environmental review, can range from two months for simple projects up to the better part of a year for complex projects requiring redesign and an EIR. The Zoning Ordinance mandates that specific findings be made upon approval of a CUP. Emeryville's findings, listed below, are based upon standard findings provided by the State Office of Planning and Research:

a) That the location, size, and design and operating characteristics of the proposed use or uses will be compatible with and will not adversely affect or be materially detrimental to: neighborhood character, with consideration given to harmony in scale, bulk, coverage, and density of nearby uses, buildings and structures; the availability of civic facilities and utilities; the capacity and physical character of surrounding streets; the physical safety of the immediate area; and the amount of light falling on adjacent buildings and open spaces;
b) That the proposed use or uses are consistent with the capability of the circulation , water supply, wastewater disposal, fire, police and school systems to operate adequately and cons-effectively;
c) That the proposed use or uses with its impacts, as described in subsection a) of this section, and at its proposed location are consistent with the General Plan;
d) That the proposed use or uses at its proposed location will provide a service or facility which will contribute to the general well-being of the surrounding neighborhood or community;
e) That the proposed use or uses complies with all applicable standards and requirements of the Zoning Ordinance; and
f) That the environmental determination has been prepared in accordance with CEQA.

Design Review. The zoning regulations establish a design review procedure for development proposals that involve construction or exterior alterations. Smaller scale proposals are reviewed administratively. Design review applications are reviewed concurrently with any applicable use permit, variance or PUD application. For Minor Design Review the fee is $1,055, except projects involving less than three units have a fee of $422. Major Design Review is charged on a cost recovery basis with a $2,000 minimum. For Minor Design Review the processing times generally range between 14 to 30 days. With larger projects processing times are comparable to those of a CUP.

*Development Standards. S*pecific development standards required by zoning regulations may impose constraints on development so that the maximum density allowed under the General Plan and zoning may not be achievable. Three hypothetical examples of residential projects are provided below to illustrate the effect of Emeryville's development standards on densities permitted under the General Plan and zoning regulations. None of the examples illustrated result in lower densities as under normal development standards. (For the purpose of simplification the illustrations below do not factor increases in densities, height and floor area that may be achieved with bonuses.)

Effect of development standards on residential density:

Example #1: RM zone with 20 units per acre:
This example is based upon a 5,000 square foot lot
Density: 20 units per acre allowing **two units**
Intensity: FAR maximum is 0.5 so that total floor area would be limited to 2,500 square feet
Height: 30 feet, two stories
Minimum dwelling size: 500 square feet
Parking: Assuming two units with two or bedrooms each, the parking requirement would be three spaces, two of which can be tandem. (Parking is not included as floor area.)
Yard requirements plus a ten foot driveway would result in a building footprint of 2,775 square feet

In this example the development standards would not limit the density. The most limiting factor is the FAR of 2,500 square feet which can generously accommodate two units. A common constraint in the RM zone is designing on-site parking on narrow lots. Three units may be achieved through a conditional use permit in the RM zone. In that case the lot would need to be large enough to accommodate on site parking without it dominating the appearance from the street.

Example #2: MUR zone with 85 units per acre:
This example assumes a 20,000 square foot site
Density: 85 units per acre allowing **39 units**
Intensity: FAR maximum is 2.0 or 40,000 square feet
Height: 55 feet (four to five stories)
Minimum dwelling size: 500 square feet
Parking: Assuming 39 two bedroom units, 74 spaces in two-level structure – not included as floor area

Yard requirements: None

This example assumes residential development with two levels of structured parking. The floor area limitation of 40,000 square feet, which would occupy two full residential floors. When this floor area is reduced by 25% for corridors, mechanical and common areas, approximately 30,000 square feet would be available for living space. This area can accommodate 39 units averaging 770 square feet each.

Example #3: MUR zone with 115 units per acre:
This example is based upon a 40,000 square foot site in the core area
Density: 115 units per acre allowing **106 units**
Intensity: FAR maximum is 4.0 so that floor area would be limited to 160,000 square feet
Height: 100+ feet (over 8 stories)
Minimum dwelling size: 500 square feet
Parking: Assuming 106 two bedroom units, 199 spaces accommodated in two levels of structured parking – not included as floor area
Yard requirement: None

This example assumes residential development over structured parking. Floor area is limited to 160,000 square feet which when reduced by 25% for corridors, mechanical and common areas, would provide approximately 120,000 square feet for residential space which would accommodate 106 units averaging 1,132 square feet in size.

The above examples indicate that the development standards in Emeryville's zoning regulations do not normally constrain residential density. If larger units are desired the achievable number of units may decrease. There may be individual circumstance such as adjacent development or site characteristics where additional standards may be triggered,

Zoning Updates for Compliance with State Law. The City is currently updating its zoning regulations to be in compliance with State laws regarding permitting of secondary units, transitional housing and emergency shelters and other group residential uses, and with density bonus allowances, as described below.

Secondary Units. The zoning regulations will be updated to reflect State law that removed obstacles to the permitting of secondary dwelling units. Interim zoning regulations now allow them by right in all residential zones. A policy is included in this Element requiring revision of the zoning regulations to ensure that the requirements for secondary units conform to State law. (See Policy II-A-3.)

Group Residential Uses. As shown in Table 3-4 above, Group Residential uses are conditionally permitted in the RM and RMH zones. However, the State Health and Safety Code requires that group homes and residential care facilities for six or fewer residents

be treated as other single-family uses. Policy IV-A-5 requires that the zoning regulations be clarified to treat group homes and residential care facilities for six or fewer residents similarly to other single-family uses.

Emergency Shelters and Transitional Housing. Although the Zoning Ordinance was provisionally amended to provide for emergency housing and transitional shelters as Group Residential uses, these uses now require a conditional use permit in Emeryville. A policy is included in this Element calling for the revision of the Zoning Ordinance to be in compliance with Senate Bill 2. The policy requires establishment of a zoning district that allows emergency shelters by right and insures that transitional and supportive housing developments are considered as a residential use of property subject only to those same restrictions that apply to other residential uses of the same type in the same zone (See Policy IV-A-4.)

Two optional areas have been identified as appropriate places to apply by-right zoning for emergency shelters and supportive and transitional housing pursuant to Senate Bill 2 (SB2). These are identified on Diagram 3-4 as *SB2 Potential Zone #1* and *SB2 Potential Zone #2*. The City's zoning ordinance will be amended to accommodate these uses, in conformance with SB2 in one of these two areas.

Both areas have capacity for new uses and could easily accommodate at least one year-round emergency shelter. Potential Zone #1 is approximately 12 acres in size. Redevelopment is feasible on over half of the properties. There are at least six properties, comprising approximately two and a half acres, which are either vacant lots used for surface parking, or occupied by older low-rise buildings, some of which are vacant. Potential Zone #2 is about 24.5 acres, with about 2 acres of property that is vacant or underutilized.

Of the two areas, Potential Zone #2 is better suited for emergency shelters, and supportive and transitional housing. As shown in Table 3-7, basic services are more accessible to Potential Zone #2. From a land use perspective, Zone #2 the better area for emergency shelters and supportive and transitional housing because there is a balanced mix of residential and commercial properties, and it is in an area of the City that is experiencing residential growth. Conversely, Zone #1 has no residential development, and is targeted for industrial use with ancillary offices and the possibility of live/work. Zoning regulations, including performance standards for industrial uses, could provide for an emergency shelter and supportive and transitional housing in Potential Zone #1. However, since residential uses are not permitted in this area (other than live/work), and SB2 mandates that transitional and supportive housing be subject to the same permitting processes as other housing in the zone, transitional an supportive housing would be accommodated in another zoning district that permits residential use. Potential Zone #2 allows residential use and can accommodate both emergency shelters and transitional and supportive housing.

Both Potential Zones will be evaluated in more detail during Fiscal Year 2010/2011 as part of the City's Zoning Ordinance update, with the objective of meeting the requirements of SB2.

Density Bonus for Affordable Housing. Emeryville's density bonus for affordable housing regulations are contained in Section 9-4.62.9 of the City's Affordable Housing Set Aside Program (Article 62 of the Zoning Ordinance). In conformance with State law Emeryville offers a 25% density bonus incentive to allow developers to increase the amount of affordable housing being built. This is offered with other incentives, such as help in finding financial assistance, and in some cases redevelopment bond funding to help developers increase the amount of affordable housing in their projects. Since projects of 30 units or more are required to provide affordable housing, they are automatically eligible for the density bonus. Policy II-A-2 requires that the density bonus section be updated to reflect changes in State law to provide for greater bonuses and for the inclusion of more affordable units.

Constraints on Persons with Disabilities. Pursuant to Federal Fair Housing Amendments Act, the Americans with Disabilities Act and the California Fair Employment and Housing Act, Emeryville's Zoning Ordinance (Section 9-4-95.1-.80) provides for reasonable accommodation by modifying the application of its zoning and subdivision regulations for persons with disabilities. In determining whether a requested modification of zoning or subdivision regulations is reasonable, the City will consider, among other relevant factors, the extent to which the requested modification might be in conflict with the legitimate purposes of its existing zoning or subdivision regulations. The purpose of these provisions is to provide a process for making requests for reasonable accommodation to zoning and subdivision decisions and procedures regulating the siting, funding, development and use of housing for people with disabilities. Pursuant to the zoning regulations, requests for accommodation are referred to the Planning and Building Director, or designee, who must issue a decision within 45 days. There are provisions for appeal of the Director's decision. A packet of materials, including an information sheet and forms for application, decision, and appeal is provided in Appendix C.

The Magnolia Terrace project provides an example of a recent request for reasonable accommodation. In 2009 Housing Consortium of the East Bay (HCEB) received entitlements to restore a relocated building into five independent units for people with developmental disabilities. The project will offer long-term, affordable, accessible apartment units for adults and households with developmental disabilities, with leasing preferences for very low-income households. The relocated building met setback requirements except that a small portion of the front entry porch roof encroached into the 10-foot front setback. The applicant made a request for accommodation for the encroachment of the front entry into the setback to minimizing slippery conditions for a person in a wheelchair. The request was approved by the Planning and Building Director,

The Emeryville Zoning Ordinance includes few specific standards for the development of housing for persons with disabilities. It establishes the dimensions of accessible parking stalls and sets the parking requirement for convalescent facilities (sanitariums, asylums, residential care facilities, convalescent and nursing homes, homes for the aged, and rest homes) at 5-1/2 spaces per every 1,000 square feet of floor area. Residential parking requirements for housing for persons with disabilities are the same as for the non-disabled. The Zoning Ordinance defines *family* as one or more persons occupying a dwelling unit and living as a single housekeeping unit, as distinguished from a group occupying a hotel, club, or fraternity or sorority house. Title 24, the State Building Standards Code cover construction-related accessibility requirements for persons with disabilities. The City has a disabilities coordinator to facilitate ADA compliance.

Inclusionary Housing Ordinance

In 1990, the City of Emeryville adopted the Affordable Housing Set Aside (AHSA) Ordinance, an inclusionary housing ordinance, which is part of the Emeryville Municipal Code (EMC). As adopted in 1990, the AHSA Ordinance required that 20% of units in projects (both rental and ownership) which have 30 or more units must be set aside at affordable housing levels to moderate income households, which are households earning between 81 and 120% of the Area Median Income (AMI).

In June 2008, the Emeryville City Council approved a revision to the AHSA Ordinance to facilitate the production of units affordable to very low income households (households earning 50% or less of the AMI) by revising the inclusionary percentage requirement for rental developments. The revision was also made in response to the new Regional Housing Need Allocation (RHNA) for the 2006-2014 goal period that places greater emphasis on very low and low income housing. The AHSA Ordinance currently requires the following inclusionary levels in developments of 30 or more units:

- 20% of units in for-sale developments must be set aside for and affordable to moderate income households (no change from original Ordinance level).
- 9% of units in rental developments must be set aside for moderate income households, and 6% of units must be set aside for very low income households.

The inclusionary level for rental developments mirrors the "Housing Production" requirement set forth in the California Community Redevelopment Law for redevelopment agencies. Over the period of an Agency's Ten-Year Housing Compliance Plan, an agency must ensure that 15% of all privately-built housing in its project area be affordable to very low income households and moderate income households at these percentages, with 9% for moderate income and 6% for very low income. The inclusionary percentage level for rental developments was revised to encourage the production of very low income housing, a level not previously provided for in the AHSA Ordinance, but was reduced from 20% to 15% of the total units in the project to help offset the net cost of providing very low income instead of moderate income units. Prior to the revision of the rental inclusionary level, the City undertook feasibility analysis of the proposed income targeting mix and concluded that there was some loss of net revenue to the developer resulting from changing the inclusionary requirement to very low income, based on an average development size of 100 units (which is less than the average residential size for projects completed between 1999-2006 at 115 units). The potential impact of the inclusionary revision on the supply and cost of rental housing is, however, off-set by the incentives and concessions stipulated in the AHSA Ordinance, as well as the availability of financial assistance through the Redevelopment Agency to facilitate compliance with the AHSA Ordinance. The City did not reduce the 30-unit threshold unit level because developers indicated that imposing an inclusionary requirement for projects with fewer than 30 units would be economically infeasible and a constraint on the production of housing.

Production of Affordable Housing under the AHSA Ordinance

Although the AHSA Ordinance was adopted in 1990, during much of the 1990s, much of the residential development built in Emeryville was the result of public-private partnerships between developers and the City through its Redevelopment Agency. The Agency provided financial assistance through its Low and Moderate Income Housing Fund for several residential projects developed by private, for-profit and non-profit residential developers, and in one case, the Alameda County Housing Authority. Some of these developments did not exceed the 30-unit threshold of the AHSA Ordinance, while others provided a percentage of affordable units greater than the inclusionary requirement by leveraging Agency assistance with other federal, state and private sources. Between 1990 and 1999, 281 very low and low income units were added to the City's housing stock, including units within these major developments:

- Emery Villa, a 50-unit apartment development for very low income seniors.
- EmeryBay Club and Apartments Phase II, a 260-unit mixed market rate/affordable multi-family housing development with 104 very low and low income units.
- Triangle Court Apartments, a 100% affordable rental development with 20 affordable units for low and very low income families.
- Ocean Avenue Court, a 6-unit affordable project for physically disabled persons developed, owned and operated by the Alameda County Housing Authority.
- Bridgecourt Apartments, a 220-unit mixed market rate/affordable multi-family housing development with 88 very low and low income units.
- Baybridge Apartments, a 6-unit development for individuals living with AIDS-related illness.

The first private, ownership development proposed in the City that was subject to the requirements of the AHSA Ordinance was Emeryville Warehouse Lofts, a 140-unit live/work, residential unit condominium development completed in 2000. The project contains 24 moderate income and 2 low income-designated BMR units. This project ushered in a period of very strong residential growth undertaken by the private sector that continued throughout much of the decade, until housing starts declined rapidly beginning in 2008. Between 2000 and 2009, 413 units for very low, low, and moderate income households were completed in Emeryville within twenty separate developments, all but one of which were in developments subject to the AHSA Ordinance. About 53% of the BMR units were completed in rental developments (220 units) and 47% of the BMR units were completed in ownership developments (193 units).

The inclusionary units provided through the AHSA Ordinance have helped the City meet a substantial portion of the Regional Housing Need Allocation (RHNA) assigned to Emeryville during the 1999 through 2006 period, as shown in Table 2-55 in Chapter 2. The AHSA Ordinance has therefore not appeared to have had a constraining impact on the production of either rental or ownership housing or hindered the City from meeting its share of the overall regional housing need.

Developer Incentives

The City offers a number of incentives and financial mechanisms to encourage development of inclusionary units and to facilitate developers in their compliance with the AHSA Ordinance.

Incentives contained in the AHSA Ordinance:

- Below Market Rate ("BMR") units set aside through the AHSA Ordinance are to be proportional to the mix of unit sizes (e.g. studios, one-bedrooms, two-bedrooms, etc.) in the development but on the whole may be slightly smaller than the average square footage for that unit type because they do not include a development's "premium" units, such as top-floor units or penthouse units. (EMC 9-4.62.3(d))
- BMR units are required to include the same interior features and finishes as the "base level" of market rate units prior to purchaser-funded upgrades. The materials should be good quality and durable but do not need to reflect the highest level of finishes that a purchaser of a market-rate unit might select. (EMC 9-4.62.3(d))
- The developer has the ability to reduce the number of inclusionary units in a project if the developer agrees to provide more deeply affordable BMR units instead of the level required by the Ordinance. For example, a developer may agree to provide very low or low income units instead of moderate income units. In such cases, developers are able to reduce the interior amenity level and the unit square footages of these units, as well as seek Redevelopment Agency assistance for traffic impact fees, building fees, or other fees/exactions required. (EMC 9-4.62.3(i)(1 through 4))
- The developer has the ability to construct the BMR units off-site at sites either contiguous or non-contiguous with a development project if it is deemed the BMR units are not feasible or appropriate at that location. (EMC 9-4.62.3(f))
- In order to avoid any undue economic burden of the AHSA Ordinance, developers may seek a density bonus of 25% through the Ordinance that is exclusive of other density bonuses allowed. (EMC 9-4.62.9)
- Developers may claim an economic hardship resulting from imposition of the AHSA Ordinance, which provides ability for a developer to reduce the project interior amenity level or square footage of the BMR units (EMC 9-4.62.10).
- Developers may seek Redevelopment Agency financial assistance for the cost of traffic impact, building, and other fees imposed on the development if there is an undue burden or cost associated with imposition of the inclusionary requirement. (EMC 9-4.62.11)
- The Ordinance contains a process for appealing the requirements of the inclusionary requirement (EMC 9-4.62.14)

If a developer proceeds with an economic hardship claim, in practical terms that manner in which it is processed is the following: The developer is required to share their financial pro forma with City staff so that the City may review it to determine if the AHSA Ordinance makes the project financially unviable. The developer is able to present this case to the Council and the Council may take action to reduce the impacts of the Ordinance by one of the measures cited above. In terms of the appeal provision, of 20 residential development projects that were completed between 2000 and 2009 that were subject to the AHSA Ordinance, only one developer appealed the Ordinance requirement before the City Council while all others complied and completed their developments. The appeal was denied by the Council because the developer failed to provide supporting evidence that the Ordinance presented an economic hardship.

The City Council has approved projects where a lesser inclusionary percentage was required in exchange for deeper affordability. In these cases, City staff worked with the developer to determine a cost-neutral point at which the provision of units at low or very low income, in lieu of moderate income units (the inclusionary requirement for all projects up through mid-2008), would not negatively impact the development costs. The Avenue64 rental project, with 224 total units, was approved with a 10% inclusionary level instead of 20% (the project was approved prior to the June 2008 AHSA Ordinance revision). The development has 23 BMR units out of the total 223 project units; 8 are set aside at Low Income and 15 are set aside at Moderate Income units. The Icon at Park project has 54 rental units. The project has 3 very low income units (6% of the total units) and the remaining units are market rate, instead of the 20% inclusionary level that would have been required under the Ordinance (the project was approved prior to the June 2008 AHSA Ordinance revision).

Other Resources and Incentives for Compliance:

In addition to the incentives and concessions outlined in the AHSA Ordinance directly, the City commits staff time and Redevelopment Agency financial resources to facilitate implementation of the AHSA Ordinance, in the following ways:

- Staff participates actively with the marketing and sales/leasing teams of the developers in crafting marketing plans for the BMR units aimed at successfully leasing up or selling the BMR units.
- The City provides developers with its mailing list of over 2,500 people who have expressed interest in Emeryville housing, to assist in marketing outreach.
- The City participates in the open houses and information workshops for prospective tenants and purchasers of BMR units within the developments.
- The City actively markets new BMR units (including serving as a distribution point for BMR unit applications) at the City Hall information area, the City's website, through City-wide mailings, and notices to the Emeryville Chamber of Commerce, and neighborhood-based groups.
- The Redevelopment Agency provides Low and Moderate Income Housing Funds to support the City's First Time Homebuyer Programs for Low and Moderate Income Households purchasing inclusionary ownership unit. The Agency has also provided housing subsidies directly to developers to support the financial viability of residential developments. In a number of completed residential projects with BMR units, developers have been provided both land write-downs and financial subsidies to assist in the development costs of the BMR units. Further explanation of the resources provided to encourage affordable housing development is provided in the Government Resources section of this chapter.

Fees and Exactions.

Planning application fees range from $500 to $2,000, plus cost recovery for staff time, consultant fees and other expenses. For larger projects this can be over $50,000. The Building Permit Fee (BPF) is one of the largest fees and is 0.8% of the total valuation (replacement cost of the project once it is completed). Another major building fee is the Plan Review Fee which is 65% of the Building Permit Fee (50% for residential less than $100,000). Other major fees include the General Plan Maintenance Fee and the Art in Public Places fee. The former is a fee of 0.5% of valuation. The Art in Public Places fee applies to commercial projects of over $300,000 value and is an artwork or in-lieu fee of 1% of valuation. This fee also applies to residential projects of 20 units or greater and is .05% of valuation of these projects. Other fees include the Energy Conservation Fee (12.5% of BPF), the Electrical Permit Fee (20% of BPF), the Plumbing Permit Fee (18% of BPF) and the Mechanical Permit Fee (17% of BPF). Fire Department Fees and Traffic Impact Fees (calculation depends on type of building) can also add up to a large amount. The Emeryville Unified School Facilities Development Fee is based on the type of project and is calculated as a fee/sq. ft. This fee is $0.42/sq. ft. for residential projects, $1.53/sq.ft for live /work projects and $2.63/sq. ft. commercial projects. Planning application fees are due at the time of filing. For cost recovery, a deposit is required up front and billings will be made as costs incur. Building permit and impact fees are collected in three phases. Plan review fees and energy fees are due at plan check submittal. At the time the permits are issued the following fees are due: building, electrical, plumbing, and mechanical permit fees, Fire Department fees, sewer connection fees, schools, public art, and the general plan maintenance fee. The traffic impact fee and any business license fee, as well as any remaining planning fee, are due with the final inspection.

School Facilities Development Fees are waived for developments that provide affordable housing set-aside units. Additionally, to relieve any undue burden on developers who are required to provide moderate-income set-aside units under the Affordable Housing Set-aside Program, the Redevelopment Agency may subsidize the cost of any traffic fees, building fees and other City fees applicable to the set-aside units.

To illustrate the cumulative effect of fees on a project three examples are provided below:

Salem Manor (#2), new triplex
Conditional use permit $1, 031
Building fees and all other fees: $13,446
Total fees per unit: $4,825
Estimated development cost/unit $469,000
Proportion of fees to development costs: 1.0%

Elevation 22, 71 for sale townhouse units
Planning fees $28,245
Building fees and all other fees: $393,435
Total fees per unit $6,024
Estimated development cost/unit $375,000

Proportion of fees to development costs: 6.2%

Courtyards, 331 for-rent apartments

Planning fees	$87,274
Building fees and all other fees:	$1,725,296
Total fees per unit:	$5,476
Estimated development costs/unit	$375,000
Proportion of fees to development costs:	1.5%

As indicated in the above examples planning and building fees are a very small percentage of the total cost of developing housing in Emeryville.

Site Improvements.

Because many sites are small and being re-used, improvements consist of upgrading water and sewer lines if needed for intensification of use, providing parking and on-site circulation, and placing utility wires underground. The City uses standard conditions of approval that are applied to projects as warranted. Public improvements may also be required to improve the safety and livability of the city. These include curb, gutter, and sidewalks, street trees, street reconstruction, traffic signals, utility lines, and park and greenway improvements.

Permit Process. As a small city, Emeryville's zoning permit process is less time-consuming than that of many East Bay cities and staff is able to provide a higher level of customer service than seen in larger cities. Administrative planning approvals including staff-level (minor) design review, sign permits and other small projects, take about three days to three weeks to process. Planning Commission approvals (use permit, design review, variance, sign permit, subdivision) take about two months for simple projects, once the application is complete. Appeals to City Council or approval of a Redevelopment Agency agreement may add up to two months. A request for a planned unit development, an amendment to the Zoning Ordinance or a General Plan Amendment will likely take longer due to required hearings by the Planning Commission and City Council. For larger projects, the developer is asked to meet with neighbors prior to seeking approval from the Planning Commission. Informal study sessions with the Planning Commission, City Council, or both are also recommended for larger projects prior to filing of an application. Study sessions are beneficial to the applicant because any concerns by the Planning Commission and City Council can be aired prior to large investment into design. Likewise, applicants receive preliminary review by staff to determine conformance with zoning and the General Plan and to identify the permits required. By the time the project appears before the Planning Commission, significant issues are resolved. Emeryville's permit procedures are straightforward. Unlike neighboring cities and larger cities, there are no design or historical review boards. CEQA analysis can prolong project review but many projects are eligible for urban infill exemption. One of the objectives of the update of the zoning regulations is to expand the types of planning permits processed through administrative (staff) review, thereby simplifying the process for the developer and relieving the Planning Commission of long meetings with full agendas.

Building permits and the related reviews (plan, energy, electrical, plumbing, mechanical, fire) are processed together. For a mid-size, uncomplicated project with complete drawings and other submittal requirements, it generally takes about six weeks to produce first comments and two to three weeks to respond to the developer's response, for a total of two to three months. Larger, more complex projects can take several additional months to receive building permits.

To reduce staff time, the City is implementing a permit tracking system, allowing computerized access to files. Ultimately, this will result in limited public access to records online and will enable applicants to submit applications through the internet.

Overall the permit process in Emeryville is efficient and, as demonstrated by the City's success at developing housing (Tables 3-1 and 3-2) does not impeded housing production.

Building Code and Enforcement.

The mission of the Emeryville Building Division is to provide information and assistance to those planning a construction project in the City of Emeryville, as well as providing timely services for projects already under construction. Project design teams are encouraged to meet with the Building Official, the plan check engineer, and Fire Department staff in the early stages of the project in order to discuss significant code issues that will impact the project. By working out potential problems early, applicants can usually proceed more efficiently through the plan review stage of a project. On January 1, 2008 a new International Building Code came into effect in California. The City of Emeryville has transitioned to this new code.

The code enforcement program focuses on enforcing ordinances and laws that require abatement to properties that are dangerous to the public or are a public nuisance. Building inspectors respond to complaints, issuing notices of violations and informing property owners about rehabilitation programs. Building owners are given a reasonable period of time to correct code violations, and the buildings are re-inspected. If violations are not corrected, the owners can be cited or nuisance abatement proceedings can be initiated.

Environmental Issues.

Environmental review, in compliance with state and federal requirements, runs concurrent with other aspects of the local development approval process. Pursuant to the California Environmental Quality Act (CEQA), if a project has no significant impacts or the impacts can all be mitigated to a less-than-significant level, then an Initial Study and Mitigated Negative Declaration is adequate. This process usually takes two to three months. If the project has potentially unavoidable significant impacts, it requires an Environmental Impact Report, which can take four to six months, and sometimes longer. Use of an exemption for urban infill housing projects is often used to expedite environmental review if there are no identified impacts. The Environmental Impact Report prepared for the update of the other elements of the General Plan is a programmed EIR that will enable development projects in the near future to tier off the evaluation provided by the EIR. This means that future projects will require less evaluation under CEQA.

As a small city, Emeryville's environmental concerns are limited to a few areas. Landslides are not of concern because the entire city is on flat terrain. The City is not in a flood hazard zone and seismicity issues are addressed by building codes. Sensitive biologic resources are confined to bayshore areas that are designated and zoned for parks and open space. As indicated in the sites analysis section above, toxic contamination from previous industrial uses has been a key environmental concern. Noise is also a localized problem associated with the location of sensitive receptors relative to commercial and light industrial uses and the existence of freeways and a major rail line.

Toxic Cleanup. Site characterization, health risk assessment and site remediation in accordance with State mandates can present major development expenses. The Redevelopment Agency has implemented a grant to characterize sites and make information available, and administers a grant and loan program for assessment and cleanup work. The program is called Capital Incentives for Emeryville's Redevelopment and Remediation (CIERRA). It provides financial, technical and regulatory assistance and expertise for property owners and developers. This program has been instrumental in expediting the cleanup many sites.

Wastewater Facilities. In 2009, the Regional Water Quality Control Board adopted Order No. R2-2009-0004 reissuing a permit to EBMUD to operate its Wastewater Treatment Facilities but prohibiting any discharge from their three wet weather sanitary sewage treatment facilities. Shortly thereafter, the US Environmental Protection Agency, and the Regional and State Water Boards filed suit against EBMUD for discharges in violation of this prohibition and entered into a Stipulated Order. A provision of this Order requires EBMUD to pass a regional ordinance to implement a Regional Private Sanitary Sewer Lateral (PSL) Replacement Program in an effort to reduce the amount of wet weather sanitary sewage flows to their treatment facilities. It is believed that 50% of the wet weather flows originate from runoff entering the sanitary sewer collection systems through private sewer laterals.

On November 18, 2009 the US Environmental Protection Agency issued the City of Emeryville an order to reduce sanitary sewer overflows from its collection system and to control Infiltration and Inflow (I&I) into the collection system so as not to cause or contribute to overflows from the EBMUD wastewater facilities. This order includes a number of requirements for the City to implement immediately in order to improve on the current program for controlling overflows and reducing I&I. One of the requirements is to develop and implement a PSL Replacement Program or to coordinate with EBMUD in the implementation of the Regional PSL Replacement Program. The timeline to complete this requirement is within 90 days of the adoption of the Regional PSL Ordinance or by October 15, 2010, whichever is later. Emeryville will coordinate with EBMUD to fulfill the requirement.

In general, the proposed Regional Ordinance will require that the PSL be brought into compliance whenever the title of any private property is transferred associated with a sale of real property, whenever a property owner applies for any permit to remodel a structure where the cost of the work is projected to exceed $100,000, or whenever a property owner applies for any permit to increase or decrease the size of the property owner's water meter. The ordinance also requires that all PSLs belonging to Homeowners Associations for multi unit condominium developments comply with the Regional Ordinance within 10 years of the adoption of the Ordinance. When the PSL is replaced, a Certificate of Compliance will be issued by EBMUD that will be valid for 20 years.

The City has analyzed the capacity of its collection system to handle the dry weather flows generated from all the land use changes at full build out of the General Plan in conjunction with the wet weather I&I flow generated in Emeryville and the subbasins in Oakland draining into Emeryville. Various sewer mains within the system have been identified as needing capacity upgrades. The upgrades are primarily necessary to handle the I&I flow entering the system within the City of Oakland. The identified upgrades are funded and projects are underway. The Parks Open Space and Public Facilities Element of the Draft General Plan contains policies and actions to sewers.

Noise. The I-80 and I-580 freeways and the Union Pacific and Amtrak rail facilities will continue to be a major source of noise in the western and southern portions of Emeryville. With a growing residential population in a mixed use environment there is an increasing awareness of noise from non-residential uses, including newer high tech uses. The Emeryville Municipal Code prohibits excessive and annoying noises from all sources and limits the hours for construction and other noisy activities. However, some noises occur on an continual or continual but intermittent basis, such as freeway and train noise, and noise emitted by mechanical equipment such as heating and cooling facilities. The Conservation, Safety, and Noise Element of the Draft General Plan contains policies and actions to address noise.

Non-Governmental Constraints to Housing Development

This section evaluates non-governmental factors that may impact the affordability and supply of housing.

Local Geography. Perhaps the most obvious of Emeryville's constraints to housing development is its small size and inability to expand beyond its 1.2 square miles of land area. Infill densification has and will continue to occur but the rate will slow as the underutilized sites are redeveloped.

Residential Development Costs. The cost of developing residential housing escalated significantly during this decade due to the increasing cost of land, building materials such as lumber and steel, labor, remediation costs, and the need for construction defects liability insurance. During this decade, Emeryville has seen its land values increase dramatically, with many sites selling in the $85 to $120 per square foot range. This is a large increase from the land values reported in the 2001 Housing Element, which ranged from $20 to $60 per square foot.

Construction costs vary from site to site and may increase or decrease depending on project size, construction type (wood frame vs. steel), the number of funding sources involved, developer capacity, and the level of amenities or services being provided in the development. Emeryville's Affordable Housing Set Aside Ordinance requires that developers of residential units subject to the Ordinance provide the same base level of amenities and quality of unit finishes in the designated "below market rate" units as in the market rate units. Similarly, the City requires that regardless of whether a residential development is 100% market rate or 100% affordable, the architectural design and quality of the units must be of a very high standard. Therefore, the construction costs associated with affordable housing are likely to be as high as that of market rate housing. A sampling of recent residential developments that have been approved in Emeryville with Redevelopment Agency financial involvement have construction costs ranging from $360,000 to $450,000 per unit. Including land and soft costs, the City has reviewed development budgets for specific Agency-involved housing projects that have been in the range of $500,000 to $600,000 per unit. These high costs can be viewed as a constraint to affordable housing development because the cost of the units far exceeds the revenue potential from the affordable units. As described under the next section on Governmental Resources, the Emeryville Redevelopment Agency has often provided housing development subsidy to provide lower and very low income units, to off-set the cost of producing the housing and to ensure the provision of affordable units at these levels.

Affordable Sales Prices and Rents. The Bay Area has historically had higher market rate housing costs than much of the rest of the nation, and market rate housing prices and rent levels have exceeded that which is considered affordable by state housing law, particularly at the very low and low income levels. Each year, the City of Emeryville publishes a chart showing the maximum sales prices and rent levels that are considered affordable for very low, low, and moderate income households, pursuant to affordability definitions found in State of California redevelopment law. According to the law, total housing costs may not exceed the amounts shown in the formulas below:

Ownership Housing - For purchasers, housing costs include principal and interest on a mortgage, property taxes and assessments, fire and casualty insurance, property maintenance and repairs, allowance for utilities and homeowner associates fees.

- For moderate income households – 35% of 110% of the area median income
- For lower income households – 30% of 70% of the area median income
- For very low income households – 30% of 50% of the area median income

Rental Housing - For renters, housing costs include rent, allowance for utilities, fees or service charges assessed by the lessor and charged to all tenants, and any taxes or fees charged by a party other than the lessor.

- For moderate income households – 30% of 110% of the area median income
- For lower income households – 30% of 60% of the area median income
- For very low income households – 30% of 50% of the area median income

Using the formulas above, Table 3-7 shows the maximum affordable sales prices and gross rents that are based on the area median income for Alameda County in Year 2009.

Table 3-7: Year 2009 Affordable Housing Sales and Rental Chart

Unit Size	Studio	1-BR	2-BR	3-BR
Moderate Income Rent	**$1,719**	**$1,965**	**$2,210**	**$2,456**
Moderate Income Sales Price	$241,201	$276,083	$310,725	$349,364
Low Income Rent	**$938**	**$1,072**	**$1,205**	**$1,340**
Low Income Sales Price	$104,244	$119,514	$134,653	$153,680
Very Low Income Rent	**$781**	**$893**	**$1,004**	**$1,116**
Very Low Income Sales Price	$57,287	$65,739	$74,379	$86,588

Market Rate Ownership Housing. Using data collected for 2007 and 2008, Table 3-8 compares sales price averages between 2007 and 2008. While the data shows a drop in the median sales price for single family homes, from a median of $486,000 in 2007 to $399,000 in 2008, the 2008 median is still well above what would be considered an affordable sales price to low or very low income households, about

$133,000 and $75,000 respectively for a two-bedroom unit. The median single family home price of $399,000 is over what a moderate income household could afford in 2008, which was about $302,000.

The average condominium unit price increased 7% between 2007 and 2008, to $425,000. This level is significantly higher than the affordable Below Market Rate (BMR) level for moderate, low or very low income households.

Table 3-8: Sales Prices in 2007 and 2008

		12-month period 2007	12-month period 2008	% Change 2007-2008
Condominiums	High	$800,000	$925,000	16%
	Median	$396,500	$425,000	7%
	Low	$205,000	$230,000	12%
Single Family Homes	High	$539,500	$437,500	-19%
	Median	$486,000	$399,000	-18%
	Low	$380,000	$321,000	-16%

Market Rate Rental Housing. As shown in Table 2-45 in Chapter 2, average market rents from a February 2009 survey of existing larger apartment complexes in Emeryville show rental housing rates at high levels, despite the economic downturn. Rents for a studio ranged from $1,645 to $1,850 per month; one bedroom units ranged from $1,423 to $2,235; two bedroom units had rents ranging from $1,865 to $2,860; and three bedroom units (or two bedroom with loft) ranged from $1,945 to $3,795. The gap between what is considered an affordable rent and current market rents is very significant at the very low and low income levels. For example, the gross allowed affordable very low income rent for a two-bedroom unit is just $969 per month. For a low income two-bedroom unit, the rent is just $1,163 per month. Affordable rent levels for very low and low income households are about $800 less per month than what is available in the market. Low and very low income households have more difficulty obtaining affordable housing on the market, which is illustrated in the very high interest that the City receives from individuals looking for affordable rental opportunities in Emeryville and interest in new developments that contain a below market rate rental component. The City maintains a "Housing Interest Notification List" that it provides to developers when they are ready to begin marketing a new project with BMR units. The City's Housing Interest List has over 3,000 individuals on it who have shown interest in affordable housing opportunities. When new projects open that have low or very low income units, there is strong interest in the projects, and far more people apply for the units than there are units available. For example, over 450 applications were received for the 57 very low income designated units at the Windsor Apartments at Bay Street (formerly called Metropolitan Apartments at Bay Street), and over 80 applications were received for 8 low income units designated at the Avenue 64 rental development.

By contrast, currently the moderate income rents are not significantly different from what is available on the market at the lower end of the range; in fact, in some cases, market rents are less. With maximum allowed moderate income rents ranging from about $1,600 to $2,300 per month for studios up through three-bedrooms, on the market, as of early 2009 it was possible to obtain a studio unit for about the same amount, a one-bedroom unit for $1,423, a two-bedroom for $1,865, and a three-bedroom for $1,945.

The Non-Profit Housing Association of Northern California, an affordable housing advocacy organization, produced a resource and membership guide, "Opening New Doors," which contains analysis of Bay Area housing affordability conditions, looking at the nine Bay Area Counties as well as some metro-area data. This analysis may be found in Appendix B to this Housing Element. Included in the analysis are factors such as:

- In the third quarter of 2006, the annual income needed to purchase the median priced home in the Oakland Metro Area was $191,000 for the median price of $560,000.
- In Alameda County, a household must earn $50,000 to afford a two-bedroom unit at the Fair Market Rent (FMR) which is $1250 per month.
- In Alameda County, 142 minimum wage work-hours are required per week to afford a two-bedroom unit at the FMR.

Economic Recession and Budget Cuts: The provision of affordable housing in the market is contingent in part on governmental policies and programs that encourage the development of affordable units, as well as the availability and suitability of land for development, availability of financing from both public and private sources, and reasonable construction costs. The nationwide recession that began in late 2007, triggered by the housing foreclosure crisis and ensuing tightening of credit markets, has resulted in a significant downturn in the amount of residential housing and availability of financing for new residential development. Budget cuts at the state and federal levels have reduced the ability to leverage local public funds in affordable housing development which in practical terms reduces the number of affordable units that can be subsidized. Meeting the 579-unit goal for very low, low, and moderate income housing units specified for the 2006-2014 Regional Housing Need Allocation period (which represents 51% of the total 1,137-unit need allocation) will require significant levels of local public subsidy to underwrite the affordable units, as well as leveraging by other state and federal funding sources. As demonstrated in the Government Resources section of this chapter, the Emeryville Redevelopment Agency has a strong track record of supporting and funding very low, low, and moderate income housing through its Low and Moderate Income Housing Fund. However, the potential that redevelopment agencies will be required to shift local redevelopment funds to the State in May 2010 is certain to negatively impact the Agency's ability to fund as many affordable housing units in the coming years.

Government Resources

Emeryville Housing Policies, Programs, and Financing

The City of Emeryville and Emeryville Redevelopment Agency use a variety of mechanisms to encourage the production of affordable housing at the moderate, low, and very low income levels.

Emeryville Redevelopment Agency. The Emeryville Redevelopment Agency undertakes a variety of projects and programs for the purpose of revitalizing the community and fostering the production of affordable housing. The Agency has two Project Areas in which in focuses its activities – the 1976 Project Area and the Shellmound Project Area. Combined, these areas cover more than 95% of Emeryville's geographical area. The California Community Redevelopment Law (CRL) requires redevelopment agencies to set aside at least 20% of all tax increment revenues generated within their project areas into a separate Housing Set Aside Fund, or Low and Moderate Income Housing Fund (LMIHF). Funds in the LMIHF must be used for the purpose of increasing, improving or preserving the supply of low and moderate income units within the community. To meet these objectives, agencies may expend funds on land acquisition, building acquisition, construction of new units, on- and off-site improvements, rehabilitation of existing units, a portion of principal and interest payments on bonds, loans and subsidies to buyers or renters, and other programs that meet the stated objectives. In Emeryville, the major source of local public funding for affordable housing is the Emeryville Redevelopment Agency's LMIHF.

Agency Housing Production Requirements. The California Community Redevelopment Law (CRL) also requires that redevelopment agencies meet affordable housing production requirements, set forth in Section 33413 of the California Health and Safety Code, which covers Agency-built housing and Non-Agency-built housing. Because the Emeryville Redevelopment Agency has not directly produced affordable housing since undertaking the construction of new for-sale housing through the Vacant Housing Program in the 1990s, the Agency tracks its housing production against the requirement for Non-Agency-built housing. Specifically, the CRL requires that 9% of all housing constructed within the redevelopment project areas, regardless of Agency financing, must be designated for low or moderate income households, and 6% must be for very low income households (for 15% total). The CRL requires that redevelopment agencies prepare and update a Ten-Year Housing Compliance Plan every five years in conjunction with preparation of a "Redevelopment Implementation Plan" that describes the programs that will be undertaken by the agency to eliminate blight conditions in the redevelopment project areas. An Agency's housing production requirements must be met within the ten-year Housing Compliance Plan period. In December 2009, the Emeryville Redevelopment Agency adopted an update to the 2005-2014 Ten-Year Housing Compliance Plan in conjunction with adoption of the 2010-2014 Redevelopment Implementation Plan. The Implementation Plan and Housing Compliance Plan may be found in the Appendices to the Housing Element.

To ensure that the Housing Production Requirement is met over the ten-year Housing Compliance Plan period, the City regularly tracks affordable housing production to measure its achievement of both the redevelopment production requirement as well as attainment of the Regional Housing Need Allocation goals. The City's Affordable Housing Set Aside Ordinance, discussed previously in this Chapter, includes a requirement that 20% of ownership units be set aside for moderate income households; and within rental projects, 9% of units

must be set aside for moderate income households, and 6% for very low income units, mirroring the State redevelopment law production requirement.

Agency Financial Assistance. The Emeryville Redevelopment Agency implements its affordable housing objectives through a number of mechanisms. This includes: providing direct financial subsidy to private developers to achieve deeper affordability levels through land write-downs, low interest and/or deferred-payment loans, and/or housing grants to support the development of Below Market Rate (BMR) units; providing financial assistance through other Agency programs, such as the Emeryville Housing Rehabilitation Program, the Brownfields Loan and Grant Program which reduces remediation costs for the development; financing public right-of-way infrastructure improvements to support and facilitate the development of the housing; and providing subsidies directly to first-time homebuyers in the form of downpayment assistance loans that fill the gap between the sales price and the buyer's first mortgage.

Over the past decade, particularly during the very strong housing boom in the mid-decade, the gap between market rate housing prices and rents, and those of BMR units, was significant. To increase the financial feasibility of the BMR units, the Redevelopment Agency has provided subsidies from its LMIHF in both the form of developer subsidy as well as downpayment assistance loans. As documented in Table 8 of the 2005-2014 Ten-Year Housing Compliance Plan (see Appendix), between 2005 and 2009, the Agency extended $8.85 million in Agency housing funds to support the development of 57 new BMR units, an average of $155,000 per unit. Over the ten-year compliance plan period, the Agency anticipates making $56.7 million available through its LMIHF, projected bond sales, and leveraged State Programs for downpayment assistance to support the development of 565 BMR units. A fuller description of how the Agency has supported production of affordable housing between 2002 and 2008 through these mechanisms is found in Chapter 4 – Achievement of 2001 Housing Element Goals.

First Time Homebuyers Program. This program provides assistance through low-interest, deferred payment second mortgages to lower to moderate income home buyers purchasing a home in Emeryville. The program provides 1.5 times the buyer's amount, up to 15% of the cost of the home. The amount of the City's loans therefore varies between units. The Redevelopment Agency allocates $220,000 annually of new funds to the program, and loan repayments are put into a revolving fund to support new loans. The loans through this program are made to purchasers of BMR units created through the City's Affordable Housing Set-Aside Ordinance, and to purchasers of market-rate units. Within the First Time Homebuyers Program are sub-set programs that offer additional assistance to income-eligible teachers in the Emery Unified School District as well as City of Emeryville employees. The program offers loans up to 20% of the purchase price with no downpayment requirement. For Fire and Police Department personnel, due to the City's interest in encouraging them to live in Emeryville, above moderate income individuals may apply for the First Time Homebuyer Program loans.

Ownership Housing Assistance Program (OHAP). This program provides assistance through low-interest, deferred payment second mortgages to low and very low income households purchasing BMR units set aside through the City's Affordable Housing Set Aside Ordinance. Buyers make a 3% downpayment and obtain a first mortgage based on their household income. The Agency's loan fills the gap between the downpayment and the first mortgage loan. For low income buyers, the maximum loan amount is $110,000; for very low income buyers, the maximum loan amount is $220,000. Agency LMIHF funds have been supplemented with funds from the State CalHome and the

California Housing Finance Agency (CalHFA) Housing Enabled by Local Partnerships (HELP) Program to provide the Agency's assistance loans at these levels.

In 2004, the City applied for and was awarded a $1 million grant from the State CalHome Program to augment the Agency's LMIHF funds dedicated to OHAP being used in BMR units as well as for very low and low income buyers purchasing market rate units. In June 2008, the City applied for and was awarded an additional $900,000 in CalHome funds for these programs. The City was also awarded a $1.5 million deferred-payment, low interest-rate loan from the CalHFA HELP Program to leverage the Agency's funds in the OHAP Program. The final HELP loans were funded in October 2009; while the CalHome funds are still available as of the writing of this Housing Element.

At the end of each fiscal year, a report is compiled with detailed statistics on the First Time Homebuyer Programs for both market rate and below market rate units. During Fiscal Year 2008/2009, which ended on June 30, 2009, 28 households purchased homes in Emeryville through the Homebuyer Programs, and $2.2 million in loan funds were expended, of which $1.4 million was from the Agency LMIHF and $800,000 was from the HELP Program. The Program included these statistics:

- The average loan amount for all homebuyer loan programs combined was $83,873, a 37% increase over the prior fiscal year.
- The average household income for homebuyers assisted was $54,204.:
- 57% of the homebuyers assisted were households below median income.
- Loans made to minority households were 71% of the total loans.
- The average price of units purchased was down 10% from the prior year, to $295,732.
- The homebuyer programs continue to serve a young age group of homebuyers – 39% were in their 20s.
- Loan repayments contributed $536,516 to the Program's Revolving Loan Fund during the fiscal year. The City disbursed the balance of the previously awarded $1 million in CalHome funds and was awarded an addition $900,000 in CalHome.

City Foreclosure Prevention and Predatory Lending Prevention Strategy. Emeryville has historically had a very low foreclosure rate in its homebuyer programs. Up through Fiscal Year 2008/2009, there have been just two foreclosures on the first mortgage financing out of over 500 households assisted through the City's First Time Homebuyers Program, representing a 0.4% default rate. However, due to the increase in the incidence of foreclosures that began occurring in late 2007, in December of 2007, the City Council adopted an 8-point Predatory Lending Prevention and Foreclosure Prevention Strategy to take a proactive approach to addressing the foreclosure crisis. In implementing the strategy, the City has:

- provided information on its website and made brochures available throughout the City on predatory lending and foreclosure prevention;
- in December of 2007, began tracking properties in foreclosure in Emeryville through RealtyTrac and, as of October 2009, identified 262 properties in some phase foreclosure;

- entered into contracts with non-profit and U.S Department of Housing & Urban Development (HUD)-approved housing counseling agencies to participate in foreclosure workshops and provide free counseling to Emeryville loan program participants;
- contacted all Emeryville property owners who had received Notices of Default (NOD) to provide referral information and warn them of foreclosure scams;
- adopted in Summer 2009 a Declining Market Policy to enable short sales for certain homebuyer loans to avoid foreclosure;
- worked with sixteen Emeryville homeowner program participants who had received NOD's to assist them in avoiding foreclosure by helping them cure their defaults or take advantage of the City's Declining Market Policy, enabling the City to secure over $1 million in outstanding loan balances and retaining fourteen BMR units in the City's affordable housing stock; and
- organized foreclosure prevention workshop quarterly and coordinated with City of Oakland on two foreclosure workshops at the Oakland Housing Fair in June 2008.

The Strategy has been implemented through 2009 and will continue to be implemented by the City depending on the on-going nature of the foreclosure crisis.

Emeryville Housing Rehabilitation Program. This program offers owners low-interest or deferred payment loans for major rehabilitation and seismic retrofitting, and grants for minor home repairs, exterior painting and clean up. Loans are also made available to rental property owners through Rental Limitation Agreements assuring rental units remain affordable for fifteen years. The allocation of funding for the Emeryville Rehabilitation Program from the Low/Moderate Income Housing Fund was increased from $100,000 to $290,000 annually in 2007. The increase benefits both low and moderate-income households. The Program also uses an annual allocation of Community Development Block Grant (CDBG) funds through Emeryville's allocation of CDBG from the Alameda County Urban County. The annual allocation for this program is in the $40,000 to $45,000 range. The City also receives program income payments from loan pay-offs and monthly loan payments.

Federal and State Financing Sources

In addition to the Agency's LMIHF, there are funding sources available at the federal and state levels to assist in the development of affordable housing, although the demand for these resources often greatly outweighs the available supply. At the federal level, the U.S. Department of Housing and Urban Development (HUD) oversees many programs, including the Community Development Block Grant (CDBG), the HOME Investment Partnership Program, Section 811 for housing for disabled persons, Section 202 for senior housing, Housing Opportunities for People With Aids (HOPWA) and the McKinney Homeless Assistance Act's Supportive Housing Program and Shelter Plus Care Program. Alameda County Housing and Community Development Department (HCD) is the conduit for the CDBG, HOME and McKinney Programs on behalf of the City of Emeryville. In the past, Emeryville has been very successful in developing affordable housing by leveraging its Redevelopment Housing funds with federal funds.

A major source of affordable housing equity funding is the Low Income Housing Tax Credit. Federal tax credits are allocated through the State of California's Tax Credit Allocation Committee and State housing tax credits are allocated through the California Debt Limit Allocation Committee (CDLAC).

At the State level, there have been more funding resources available during the past decade than were available in the latter half of the 1990s. The State Housing and Community Development Department manages a number of programs using proceeds of the voter-approved housing bonds passed in November 2002 (Proposition 46, which authorized $2.1 billion in state bonds for housing investment) and most recently in November 2006 (Proposition 1C, which authorized $2.85 billion in General Obligation bonds to continue several important bond-funded housing assistance programs). With Proposition 1C, programs such as the Multifamily Housing Program (MHP), the CalHome Program, the Multifamily Supportive Housing Program, the Building Equity and Growth in Neighborhoods (BEGIN) Program, and CalHFA's Homebuyer Assistance Program, were funded. Substantial funding for infrastructure related to housing development is available through the State's Transit-Oriented Development Housing Program and Infill Incentive Grant Program, each of which provide funding for infrastructure and housing near transit stations. These programs were funded through Proposition IC.

The California Housing Finance Agency (CalHFA) administers a number of programs to further affordable housing efforts in the State, including multi-family acquisition and rehabilitation funding, single family development funding, tax exempt and mortgage revenue bonds, and assistance programs (the Housing Enabled by Local Partnerships (HELP) Program). CalHFA also provides a number of loan products for first time homebuyers with favorable interest rates and terms. The City's First Time Homebuyer Program may be used in conjunction with CalHFA's loans. Alameda County HCD administers the Mortgage Credit Certificate (MCC) Program for Alameda County, including Emeryville, which provides a tax credit to subsidize mortgage interest rates for low and moderate income first time home buyers. MCCs are allocated through CDLAC. The City of Emeryville has been successful in applying for and receiving funding awards from both State HCD's CalHome Program and CalHFA's HELP Program.

Priority Development Area Designation. On November 20, 2008, the ABAG Executive Board approved Emeryville's application for Priority Development Area (PDA) designation in conjunction with the FOCUS program to advance the region's Smart Growth Strategy/Regional Liveability Footprint. PDAs are areas that are already developed, near existing transit service, and are planned for more housing. Emeryville's PDA includes the entire city except for the existing lower density neighborhoods and the area west of Interstate 80. Local governments with PDA's will be eligible for technical assistance, planning grants, and capital funding.

Non-Governmental Resources

Developers. The City of Emeryville has worked with both private for-profit and non-profit developers to produce affordable very low, low, and moderate income housing in the city. For-profit and non-profit developers bring their expertise in the area of housing design, finance, site development, marketing, and operations to ensure that high quality housing is produced and maintained in the city. A list of housing developers and resources (non-profit developers, for-profit developers, advocacy organizations, and emergency housing resources) is included in Appendix F.

Lenders. On the private side, the Community Reinvestment Act requires banks to invest in local projects by providing favorable lending terms or programs geared toward investing in traditionally under-served communities. Some banks have established Community Lending

Divisions that have developed strong relationships with the affordable housing industry in the Bay Area. The Federal Home Loan Bank's Affordable Housing Program (AHP) provides grants and loans to subsidize affordability within rental and ownership housing developments. Non-profit lenders such as the Northern California Community Loan Fund, Local Initiatives Support Coalition (LISC), and the California Community Reinvestment Corporation have also provided funding to affordable housing development. Some affordable housing developments have received partial funding from philanthropic organizations and individuals in the community.

Advocacy Organizations. Other non-governmental resources are organizations dedicated to supporting and promoting affordable housing in the Bay Area and in California. The Non-Profit Housing Association of Northern California (NPH) is a nonprofit advocacy group that provides professional training, networking opportunities, and resources for housing policy analysts, advocates and activists. NPH was founded in 1979 with a mission of highlighting the successes of the non-profit housing section in developing affordable housing and to help guide affordable housing policy solutions. NPH's membership includes individuals, local governments, affordable housing development corporations, leading financial institutions, environmental non-profits, faith-based organizations and community development corporations. Another Bay Area organization is East Bay Housing Organizations (EBHO), which in 2009 celebrated its 25th year. EBHO is an affordable housing advocacy coalition that works with communities in Alameda and Contra Costa counties to preserve, protect and expand affordable housing opportunities through education and advocacy. EBHO's membership is made up of over 140 organizations and individuals, including non-profit housing developers, development consultants, fair housing agencies, tenant organizations, faith-based groups, housing counseling agencies, architects, homeless and tenant advocates and service providers, neighborhood organizations, municipal housing staff, financial institutions and elected officials.

Housing California (HCA) is a statewide non-profit affordable housing advocacy organization dedicated to promoting the housing needs of California by increasing the supply and variety of homes being built. Housing California runs the nation's largest annual statewide housing conference and monitors and sponsors statewide housing-related legislation. A second organization, the California Housing Consortium, was founded in 1997 as an umbrella organization for nonprofit and for-profit developers, lenders, representatives from State and local government agencies, housing professionals and specialists, investors, property managers and owners, residents and business leaders to address a broad range of housing and economic development community needs. Other organizations are also dedicated to a wide range of statewide issues that affect housing, community development, green building and redevelopment. Some of these include the California Redevelopment Association, and the League of California Cities.

CHAPTER 4. ACHIEVEMENT OF 2001 HOUSING ELEMENT GOALS

This chapter outlines the City's achievement with respect to goals, policies, and programs found in the 2001 Housing Element. The period covered in this chapter is January 1, 2002 through December 31, 2008. Each year, the City of Emeryville prepares an annual Progress Report on the Housing Element covering the prior calendar year. This report is approved by the Emeryville City Council and forwarded to the State Department of Housing and Community Development by its annual deadline of April 1st. This chapter represents a summary of the annual Progress Reports.

A. Progress in meeting Regional Housing Need Allocation

The Association of Bay Area Governments (ABAG) releases a Regional Housing Need Allocation (RHNA) for each jurisdiction in the Bay Area. The period that most closely corresponds to the period of this report is the previous RHNA cycle of January 1, 1999 to June 30, 2006. From January 1, 1999 to June 30, 2006, the City issued 1,822 building permits for housing units.

Building Permits Issued during ABAG RHNA Period by Income Level: Jan 1, 1999–June 30, 2006

	Income Level				
RHNA Period	Very Low	Low	Moderate	Market Rate	**Total Units Permitted**
Total ABAG RHNA Housing Goals	178	95	226	278	**777**
Building Permits Issued (units)	127	63	172	1460	**1,822**
Percentage of ABAG Goals Met	71%	66%	76%	525%	**234%**

The ABAG Executive Board adopted the final current cycle RHNA for Bay Area jurisdictions on March 20, 2008. The RHNA covers the period July 1, 2006 through June 30, 2014 and represents the number of housing units, by income level, for which cities and counties must plan through zoning and other regulatory and programmatic means. The table below shows progress towards the RHNA goals during the current cycle, by income level.

Progress Toward ABAG Housing Goals

	Income Level				
	Very Low	Low	Moderate	Market Rate	Total Units Permitted
Building Permits Issued: 7/1/06-12/31/06	5	6	18	95	124
Building Permits Issued: 1/1/07-12/31/07	0	4	18	123	145
Building Permits Issued: 1/1/08-12/31/08	0	0	0	127	127
Total Building Permits Issued 7/1/06-12/31/08	**5**	**10**	**36**	**345**	**396**
ABAG RHNA Housing Goals 7/1/06 – 6/30/2014	**186**	**174**	**219**	**558**	**1137**
Percentage of Housing Goals Met in 7/1/06-12/31/08 period as % of 7/1/06-6/30/14 Goal*	3%	6%	16%	62%	35%

** As of 12/31/08, 31.3% of RHNA Goal Period has elapsed.*

B. Attainment of housing goals and objectives

1. ACTIONS TAKEN

Goal I. Preserve existing housing stock.

Objective I-A. Promote preservation of existing housing through the Emeryville Housing Rehabilitation Program. Emeryville's Housing Rehabilitation Program will provide funding for 17 projects per year.

In 2002, the City took over administration of the Housing Rehabilitation Program from the Alameda County Housing and Community Development Department and created a new position, the Community Preservation Officer, to manage the program. This program

provides low interest loans and grants to low and moderate income homeowners and to rental property owners who provide a portion of units at affordable levels to low and moderate income households. The Housing Rehabilitation Program funded a total of 103 projects between 2002 and 2008, as follows: 0 in 2002, 11 in 2003, 21 in 2004, 34 in 2005, 13 in 2006, 15 in 2007, and 9 in 2008.

A table showing the types of grants and loans provided, by year, is below.

Housing Rehabilitation Projects by Grant/Loan Type: 2003-2008

	Year						
Grant/Loan	2003	2004	2005	2006	2007	2008	**Total**
Paint Grants	6	12	16	3	6	4	**47**
Security Bar Grants	1	1	2	0	0	0	**4**
Accessibility Grants	2	1	5	1	2	1	**12**
Rehab Loan	1	2	3	6	3	1	**16**
Minor Home Repair Grants	1	2	2	2	4	3	**14**
Exterior Clean-up Grants	0	3	6	1	0	0	**10**
Total	**11**	**21**	**34**	**13**	**15**	**9**	**103**

Housing Rehabilitation Projects by Grant/Loan Type: 2003-2008

	Year						
Grant/Loan	2003	2004	2005	2006	2007	2008	**Total**
Paint Grants	6	12	16	3	6	4	**47**
Security Bar Grants	1	1	2	0	0	0	**4**
Accessibility Grants	2	1	5	1	2	1	**12**
Rehab Loan	1	2	3	6	3	1	**16**
Minor Home Repair Grants	1	2	2	2	4	3	**14**
Exterior Clean-up Grants	0	3	6	1	0	0	**10**
Total	**11**	**21**	**34**	**13**	**15**	**9**	**103**

Program I-A-1. Increase funding for the Emeryville Housing Rehabilitation Program on a demand basis up to 50% through a combination of Redevelopment and Community Development Block Grant (CDBG) funds.

The allocation of funding for the Emeryville Rehabilitation Program from the Low/Moderate Income Housing Fund was the same from 2002 to 2006, at $100,000. In 2007, the Redevelopment Agency approved an increase in funding to the Housing Rehabilitation

Program to $290,000 annually. The increase benefits both low and moderate-income households, for whom funding is available. The Program also relies on an annual allocation of Community Development Block Grant (CDBG) funds through Emeryville's allocation of CDBG from the Alameda County Urban County. The annual allocation for this program is in the $40,000 to $45,000 range. The City does receive program income payments from loan pay-offs and monthly loan payments.

The Non-housing Redevelopment Tax Increment Fund has been used to add the following grant programs, which are available to all property owners regardless of income levels: concrete buyback, wrought iron fence, multi-family façade improvement and graffiti abatement. The graffiti program is also available for commercial properties. The multi-family façade improvement program will use housing funds if properties qualify. Though an interest has been shown in this program by two property owners, no applications have been received to date. An application was received last year (2007), but the property owner opted to withdraw from the program this year.

Program I-A-2. Make all types of rehabilitation loans and grants available to both homeowners and landlords. Make major accessibility grants available to homeowners, and make seismic retrofit loans and minor repair grants available to landlords.

Minor home repair and seismic retrofit grants are for low-income homeowners as they are funded with federal Community Development Block Grants (CDBG) funds, which may only be made available to households up to 80% of the area median income (AMI). The minor home repair grants are very small ($1,000) and are for repairs such as plumbing, electrical work, locks and broken windows. If more expensive repairs are necessary, the seismic retrofit grant program for owner-occupied units can be supplemented with the owner-occupied loan program.

All other programs (exterior paint grants, accessibility grants, and rehabilitation loans) are open to owners of low and moderate owner-occupied units and to rental property owners who own property occupied by low-to-moderate income tenants. These programs are funded with both CDBG and Redevelopment housing funds, the latter of which can be made available to households up to 120% of AMI.

Program I-A-3. Continue existing marketing and establish new marketing efforts for the Emeryville Housing Rehabilitation Program, directed to landlords and homeowners in the historic residential neighborhoods east of Hollis Street and east of San Pablo Avenue.

The City has marketed the rehabilitation program through Emeryville News (the Chamber's version is now called Emeryville Connection), which the City and Chamber of Commerce send to each resident and business in the city. Staff has marketed the

program at neighborhood meetings. Information on the Rehabilitation Program is also found on the City's website on the Economic Development and Housing Department webpage.

Objective I-B. Maintain and improve existing housing, especially the historic neighborhoods east of Hollis Street and east of San Pablo Avenue.

Policy I-B-1. Continue the Community Preservation Program to improve maintenance of residences in the historic neighborhoods. Provide rehabilitation program information and conduct code inspections on a case-by-case basis.

The City Council's Community Preservation Committee administers this program, assisted by the Community Preservation Officer and City Attorney. The program includes code inspections and cooperation with other city departments to resolve maintenance issues with property owners city-wide. In 2002, a Deputy City Attorney was hired to help with code enforcement. The Community Preservation Committee, supported by interdepartmental staff, meets monthly to track progress with all problem properties.

Program I-B-2. Continue the "Emeryville Is Proud" award program for well maintained residential and commercial properties.

Most properties are well-maintained, and thus, this program was discontinued due to changing conditions. The Program also required significant monitoring of properties to ensure they still met the award criteria, which is difficult with limited staff resources.

Objective I-C. Replace affordable housing that must be demolished as part of a City action.

Policy I-C-1. Continue to review aggregate housing demolition and construction in the City each year, and review the overall housing provision plan to confirm that there will be no net loss through demolition of very low, low and moderate income units.

There was no housing demolition by City action between 2002 and 2004. In 2005, one vacant bungalow was demolished at the corner of Adeline and 36th streets in Oakland by City action, and the Redevelopment Agency is involved in developer negotiations for a new affordable project, the 55-unit Ambassador Homes project (1168 36th Street), which is slated to include affordable units and be completed by 2010/11.

In October 2006, the City adopted an ordinance that requires City Council approval for the demolition of any residential unit. A residential demolition permit must be accompanied by entitlements for the replacement structure (i.e. use permits, design review, and any required variances), which must be approved by the City Council, and the replacement structure must provide at least as many units as are demolished.

A total of five residential units were demolished in 2007. Four houses were demolished as part of the Oak Walk project, and another house was demolished for the Salem Manor project (to be replaced by three units). At the Oak Walk project, nine Below Market Rate units will be designated and completed in 2009 – five single family homes being renovated for moderate income households, and four low income units within the new construction portion of the project. No residential units were demolished in 2008.

Goal II. Promote a variety of housing types and affordability levels.

Objective II-A. Support development of new housing for very low, low and moderate income households to meet Emeryville's fair share allocation of regional affordable housing need, as established by the Association of Bay Area Governments. Develop 104 very low income units and 73 low income units using the Redevelopment Agency's Low and Moderate Income Housing Fund and seeking funding for the remaining units

Emeryville's fair share allocation of regional affordable housing need established by ABAG was 178 very low income units, 95 low income units, and 226 moderate income units for the January 1, 1999 to the June 30, 2006 period. The production targets of the objective (104 very low income and 73 low income) were the projected number of units to be completed during the ABAG period, as listed in Table 11 of the 2001 Housing Element. As noted at the beginning of this chapter under Section A, through 12/31/08, the City issued building permits for 129 very low income units, 73 low income units, and 208 moderate income units. In terms of the goal of this objective, the City has exceeded its very low income goal by 25 units and has met its low income goal.

Policy II-A-1. Make very low and low income housing a priority for use of the Redevelopment Agency's Low and Moderate Income Housing Fund (LMIHF).

The Redevelopment Agency's Ownership Housing Assistance Program (OHAP) is a downpayment assistance program that provides low-interest, deferred payment second mortgages to low and very low income households purchasing units set aside through the City's Affordable Housing Set Aside Ordinance. In 2002, through OHAP, the Agency used $550,000 of the LMIHF to fund five low income units in Oliver Lofts and $990,000 of LMIHF to fund nine low income units in the Terraces project. In 2003, $550,000 was allocated to Liquid Sugar Town Homes for 5 low income units through OHAP. In 2005, $660,000 of OHAP funds were appropriated for 6 low income units within Christie Park Towers and $550,000 was appropriated for 5 low income units within 1401 Park Avenue Condominiums (this project was subsequently marketed as a rental project and a new Affordability Agreement was executed between the City and developer requiring three very low income rental units). During 2006, funds were appropriated from the LMIHF through OHAP for the following projects: Andante Phase II (5 low income units, $550,000), Green City Lofts ($300,000 for 3 low income

units), and Glashaus Lofts ($1.76 million for 5 very low income and 6 low income units). In 2007, $440,000 was allocated through OHAP to fund 4 low income units in the new construction portion of the Oak Walk Project. During 2008, $330,000 in OHAP funds was also allocated for 9 low and moderate income units in the Vue46 project.

Projects not funded through OHAP but which include a low or very low income affordability component include: Andante Phase I (completed in 2004), to which the Agency provided a $1 million land write-down to enable the provision of 10 units at below market rate prices affordable to low income households, Artisan Walk (1 low income unit), and the Windsor Apartments at Bay Street (formerly called the Metropolitan Apartments at Bay Street) (completed in 2006) in which 57 very low income units were financed through multi-family housing bonds leveraged by the Agency's LMIHF.

4001 Adeline Four-Plex Project: In December 2008, the Redevelopment Agency approved an Exclusive Right to Negotiate Agreement with Housing Consortium of the East Bay (HCEB) to renovate a four-plex for five studio units serving very low income households with developmental disabilities. It is contemplated that a Disposition and Development Agreement will be prepared for consideration by the Agency in 2009 to convey the four-plex property through a land write-down and additional housing subsidy to enable the project to commence construction.

Housing Compliance Plan: In October 2007, the Agency adopted a mid-cycle amendment to the Ten-Year Housing Compliance Plan covering the period 2005 through 2014. This document outlines the Agency's projected expenditures and programs for the Housing Compliance Plan period, and includes several projects to be implemented over the period that will contain low and very low income units. The Housing Compliance Plan also demonstrates, in compliance with the State Community Redevelopment Law, that the Agency will spend its Low and Moderate Income Housing Fund dollars for very low and low income households in at least the same proportion as the Regional Housing Need Allocation (RHNA) assigned for the City of Emeryville. The Agency's 2007-2014 RHNA for very low income category is 16% of the total allocation of 1,137 units – during the Agency's ten-year Housing Compliance Plan period, it is expected to spend 50% of its funding availability for this income level. The RHNA for the low income category is 15% of the total allocation; the Agency's projected ten-year expenditures for this income level are 22% of its total resources.

<u>Policy II-A-2. Include some low and very low income housing in Redevelopment Agency assisted development projects whenever feasible.</u>

Oliver Lofts and the Terraces at EmeryStation were built in 2002. Oliver Lofts includes 5 low income and 5 moderate income units. The Terraces include 9 low income and 11 moderate rate apartments.

In 2003, the Liquid Sugar Loft project was completed. This development includes 5 low income and 6 moderate income units.

The City Limits condominium project was completed in 2005 and included 4 low income units. The Agency appropriated down payment assistance in the amount of $440,000 to provide down payment assistance loans for the buyers of this project. In addition, this project included 5 units for sale to moderate income households.

Projects completed in 2006 with low or very low income units included: the Andante condominium development at 1121 40th Street (5 low income units), the Metropolitan Apartments at Bay Street (57 very low income units), the Artisan Walk condominium development at 6549 San Pablo Avenue (1 low income unit), and the Green City Lofts condominium development at 4050 Adeline Street (3 low income units).

In 2007, projects completed include Avenue 64, with 8 low income units; Vue 46 with 3 low income units; and Icon at Park Avenue with 3 low income units, located at 1401 Park Avenue.

Projects completed in 2008 with low or very low income units included: Glashaus Lofts, with 5 very low income ownership units and 2 low income ownership units. Projects considered under construction during 2008 include the Oak Walk Project, with 4 low income units; and Adeline Place, with 3 low income units.

Program II-A-3. Continue funding for the Vacant Housing Program, which provides first-time home buyer opportunities for low and moderate-income households.

The Vacant Housing Program (also known as the Infill program), which was a Redevelopment Agency-funded and developed first-time homebuyer housing program, has become obsolete as the private sector has taken the main initiative to renovate residential properties and construct infill housing. The last Vacant Housing Program units were developed in 1998.

Program II-A-4. Expand the First-Time Homebuyers Program to provide 1.5 times buyer's down payment up to 15% of purchase price for low and moderate-income households.

In January of 2001, the First Time Homebuyers Program guidelines were amended to include this program provision, and between 2002 and 2008, 148 loans were made.

In 2008, the City implemented its "Foreclosure Prevention and Predatory Lending Prevention Program", a program which is continuing to be implemented in 2009. This program was adopted by the Emeryville City Council in December 2007 in response to the growing incidence of foreclosures throughout the region in late 2007. The City's strategy includes providing information and referral information to property owners who are in default, tracking foreclosure data, convening workshops for homeowners on foreclosure prevention, providing free housing counseling to Emeryville residents who are participants in a City homebuyer or rehabilitation loan program who having difficulty making their mortgage payments or are in default on their first mortgages, updating the City's website to include relevant information and referrals to federally approved housing counseling agencies, distributing information throughout the City and at City Hall, and working with other local jurisdictions, the Emeryville Chamber of Commerce, and local mortgage lenders to do community outreach and education.

Program II-A-5. Leverage State and Federal funding programs to maximize the number of affordable units and/or the number of units available to low and very low income households, whenever possible.

The Windsor Apartments at Bay Street (originally called Metropolitan Apartments at Bay Street) were able to obtain an allocation of federal Low Income Housing Tax Credits and multi-family housing bonds to provide 57 very low income units in the 284 project.

The City applied for and received a $1 million grant from the State Housing and Community Development Department CalHome Program and a $1.5 million loan from the CalHFA HELP Program in 2005. These programs were used to provide $30,000 silent second, down payment assistance loans in combination with funding from the Agency's LMIHF ($80,000 for low income buyers, and $190,000 for very low income buyers) for combined loans of up to $110,000 for low income buyers, and $220,000 for very low income buyers. The CalHome funds were completed expended as the end of 2008. During 2007, the first HELP loans were funded: one within the Andante Phase II project, and one within Artisan Walk. There were five CalHome loans and two HELP Program loans funded in 2007. The City did not receive any new State or Federal funding in 2007.

In 2008, the City applied for and received a new $900,000 grant from the State Housing and Community Development Department CalHome Program. The CalHome and HELP programs are currently being used to provide $58,000 silent second, down payment assistance loans in combination with funding from the Agency's LMIHF ($52,000 for low income buyers and $162,000 for very low income buyers) for combined loans of up to $110,000 for low income buyers and $220,000 for very low income buyers. During 2008, eight HELP loans were funded: three in Vue 46, two in Glashaus phase II, two in the Terraces at EmeryStation, and one in Oliver Lofts. The CalHome 2008 award was not yet available in 2008. It is anticipated that the HELP loan will be completely expended by the end of 2009.

Program II-A-6. Encourage and facilitate the conversion of underutilized industrial sites to mixed-use or residential projects that

include low and very low-income units.

The City has used assessment loans, grants, and cleanup loans, along with a City consultant, to expedite hazardous material review and assist for-profit developers in developing residential projects on former industrial sites. The City has negotiated low-income units in several such conversion projects.

Projects completed in 2002 include Oliver Lofts, a former rubber plant, which contains 5 low-income ownership units, and Terraces at EmeryStation, a former Chevron above-ground tank facility, which includes 9 low-income ownership units. Liquid Sugar Lofts, on the site of a former molasses and syrup manufacturing facility, was built in 2003 and contains 5 low-income ownership units.

Built in 2004, the Courtyards, formerly Ryerson Steel, includes one very low income rental unit; Elevation 22, formerly Becker Construction Services and Industrial Gas, includes 7 low-income ownership units; and Andante Phase I, former King Midas card room and the site of a rail line, includes 10 low-income ownership units (Andante Phase II was completed in 2006 and contains 5 low-income ownership units).

City Limits, completed in 2005, was formerly Fabco, an automobile component manufacturer. This project contains 4 low-income ownership units.

Projects completed in 2006 included the Metropolitan Apartments at Bay Street, a former steel and paint pigment manufacturing site, which includes 57 very low-income rental units; Green City Lofts, a former paint manufacturing site, which includes 3 low-income ownership units; and Artisan Walk, a former drum recycling facility, which includes 1 low-income ownership unit.

In 2007, projects completed included Vue 46, a former Flecto paint factory, which includes 3 low income units; and the Avenue 64 project, a former PG&E site, which includes 8 low income units.

Projects completed in 2008 included Glashaus Lofts, a former machinery plant, with 5 very low and 2 low income units, built on a former brownfield site; and Icon at Park Avenue, with 3 very low income units. The remediation of the Icon at Park Avenue site, previously used as a plating facility, involved groundwater treatment and was capped with an impervious surface.

Set for completion in 2009 is the Oak Walk project, built on a former brownfield, which includes 4 low income units in the new

construction portion and five renovated single family homes along 41st Street.

Objective II-B. Amend the Zoning Ordinance to better facilitate the development of affordable housing, and retain existing affordable housing policies.

Policy II-B-1. Within a year after adoption of this Housing Element, change the regulations for multiple-use projects so that the Planning Commission may choose to exempt residential square footage from the floor area ratio (FAR, ratio of floor area to site area) calculations for a project, with a Conditional Use Permit. The revised regulation could include findings necessary to grant such an exemption, such as transit access or a mechanism to reduce the number of automobiles per unit.

This policy was implemented. In November of 2002, the Zoning Ordinance was amended to allow residential space exemption from the FAR in multiple use projects.

Policy II-B-2. Maintain the Affordable Housing Set-Aside Ordinance, requiring projects with 30 units or more to provide 20% of the units affordable to moderate, low or very low income households.

The Affordable Housing Set-Aside Ordinance has been maintained. It was revised in 2002 to reflect state legislation regarding increasing the term of income restrictions to 45 years for ownership units and to 55 years for rental units. In June 2008, the City Council approved a revision to the Ordinance that stipulates that rental projects of thirty or more units include six percent (6%) of the total project units as designated very low income BMR units, and nine percent (9%) of the total project units as designated moderate income BMR units. This represents a revision from the previous requirement that twenty percent (20%) of the total project units be designated at the moderate income level. Projects of thirty or more units that are approved by the Planning Commission have language included in the project Conditions of Approval requiring the applicant to comply with the Ordinance.

Policy II-B-3. Continue the affordable housing density bonus, and Group Residential and Group Care as conditionally permitted uses. Within a year after adoption of this Housing Element, list emergency shelter and transitional housing in the definition of Group Residential.

In November of 2002, the Zoning Ordinance was amended to list emergency shelter and transitional housing in the definition of Group Residential. In June of 2006, the Zoning Ordinance was amended to add Group Care as a conditionally permitted use in the I-L zone.

Objective II-C. Encourage a variety of housing types and settings, energy efficiency and water conservation.

Policy II-C-1. Encourage non-traditional group housing, live-work units and housing in multiple-use projects and mixed-use areas.

Projects Built 2002-2008

Live/Work Loft Projects

Project Name	Year Built	Total Number of Units	**Live/Work**
Oliver Lofts	2002	50	12
Key Route Lofts	2005	22	7
Icon Park Avenue	2007	54	11
Glashaus Lofts	2008	48	3

Since 2002, 33 live/work units have been constructed in Emeryville: 12 in Oliver Lofts (built in 2002), 7 in Key Route Lofts (built in 2005), 11 in Icon Park Avenue (built in 2007), and 3 in Glashaus Lofts (built in 2008).

Mixed-use projects completed between 2002 and 2008 include: Andante Phase I (102 units over retail), The Courtyards (331 units over commercial), Elevation 22 (70 units with ground floor commercial space), Bay Street Site A (95 condos and 284 rental apartments over retail), Andante Phase II (part of the Andante Phase I project which includes 125 units total over retail), Icon Park Avenue (54 units with a café on the ground floor), Vue 46 (45 dwelling units with approximately 3,000 sq. ft. of retail/commercial space at the 46th Street and Adeline Street), and Glashaus Lofts Townhouse Phase (live-work units and a café on the ground floor). Under construction in 2008 were Glashaus Lofts Podium Phase (live-work units with café on ground floor), Adeline Place (36 units over 2,400 sq. ft. of retail), and Oak Walk Mixed Use Project (residential/commercial mixed use development with 5,500 square feet of retail space).

Policy II-C-2. Encourage residential and live-work development in industrial areas where appropriate.

Between 2002 and 2008, all residential and live-work developments were built on former industrial sites, including Oliver Lofts, Terraces at EmeryStation, Liquid Sugar Town Homes, Courtyard Apartments, Elevation 22 Town Homes, City Limits Town Homes, Windsor Apartments at Bay Street (formerly called the Metropolitan), Bay Street One Condominiums, Green City Lofts, Artisan Walk, Avenue 64, Vue 46, Icon Park Avenue, and Glashaus Lofts.

Policy II-C-3. Encourage energy-efficient, water-conserving construction.

The City now requires project plans at the planning approval and building permit stage to show which of Build it Green's Greenpoint Rating Checklist items or the appropriate LEED checklist items the project follows. The City has adopted Bay-Friendly Landscaping and LEED for its own projects and landscapes. These would apply to private projects for landscaping in the public right of way, as well as projects involving the Redevelopment Agency.

Goal III. Promote housing for special needs groups.

Objective III-A. Support development of affordable housing for single-parent families in transition, people with AIDS, seniors, large families, disabled people, and artists who have very low, low and moderate incomes. Ways to support housing for special needs groups include providing funding and technical assistance for the development of housing and the establishment of cooperatives.

Program III-A-1. Support development of service-enriched transitional housing for single-parent families who have been displaced by economic problems or domestic violence.

No action has been taken.

Program III-A-2. Support the inclusion of Shelter-Plus-Care units (rent-assisted units for people with mental illness, substance abuse and/or AIDS-related illness) in some multi-unit projects. These units could be combined with other programs, and could be used to meet part of the 20% Affordable Housing Set-Aside requirement.

No action has been taken.

Program III-A-3. Support development of affordable 3- to 4-bedroom units for large families (families with five or more members) in appropriate projects.

The Courtyards, a 331 unit project with three affordable 3-bedroom units, was built in 2004. In 2006, Artisan Walk was constructed, which contained three affordable 3-bedroom units. Among projects currently under construction, the 53-unit Oak Walk Mixed Use

project includes seven 3-bedroom units. In 2008, permits were issued for a project on 1260 64th Street, comprised of two 3-bedroom units. The Ambassador Homes Project, which had been delayed to a billboard easement litigation matter, is beginning predevelopment work again since the billboard matter was settled. The developer is anticipating development of a 100% affordable, multi-family rental development with a significant portion of larger-sized units to accommodate large families. The City's Housing Committee and Planning Commission continue to support projects that contain larger units and encourage developers to include a greater percentage of larger sized units.

Projects Built 1999-2009
Housing Projects with Affordable and 3-bedroom Units

Project Name	Year Built or Anticipated Completion	Tenure	Total Number of Units	Total Number of Affordable Units	**Number of Affordable 3 bedrooms**
The Courtyards	2004	RENT	331	63	3
Artisan Walk	2006	OWN	6	6	3
Icon at Park Avenue	2007	RENT	54	3	1
Ambassador Homes	2009	OWN	55	TBD	TBD
Glasshaus Lofts Townhomes & Podium	2008	OWN	145	29	2
Oak Walk Mixed Use	2009	OWN	53	9	0
1260 64th Street	2009	OWN	2	0	0

Program III-A-4. Support development of affordable housing for disabled people in small households.

The Courtyards at 65th includes 63 units restricted through the City's Affordable Housing Set Aside Ordinance, of which 3 are reserved for developmentally disabled households. One unit was leased in 2005, and the last two were leased in 2006. In 2008, the Redevelopment Agency issued a Request for Qualifications and Proposals for an Agency-owned four-plex property at 4001 Adeline Street to solicit proposals for its redevelopment as affordable rental housing. In late 2008, the Agency entered into an exclusive Right to Negotiate Agreement with Housing Consortium of the East Bay to renovate the four-plex as five studio units serving single-person households with developmental disabilities. The ground floor units will be made fully accessible and targeted to developmentally disabled people who have physical disabilities. This project is located at a major bus hub.

Program III-A-5. Support the development of affordable housing including Shelter-Plus-Care units for people with AIDS-related illness.

No action has been taken.

Program III-A-6. Support development of affordable assisted-living and independent senior housing.

The City approved AgeSong Assisted Living project in 2006, which will include 121 assisted living units, 28 independent living units, a dining room, and publicly accessible café. None of the units are required to be classified as affordable under the provisions of the City's affordable Housing Set-Aside Ordinance.

Program III-A-7. Support development of transitional housing for veterans with physical disabilities, mental disorders and substance abuse problems.

No action has been taken.

Program III-A-8. Support development of affordable live-work space for artists.

Icon Park Avenue includes one live-work unit available for low income households; this project was completed in 2007.

Objective III-B. Support assistance for veterans, teachers and public safety employees in obtaining housing in Emeryville.

Program III-B-1. Support assistance for veterans with physical disabilities, mental disorders and substance abuse problems to live in residential treatment centers, supervised work settings, or transitional or permanent housing.

No action has been taken.

Program III-B-2. Offer additional home loan assistance to low and moderate income Emery Unified School District teachers, and moderate income Emeryville Police and Fire Department staff. Actively pursue funding to assist with this program.

The City offers favorable homebuyer loan terms for teachers in the Emery Unified School District and all city employees by waiving the down-payment requirement, offering deferred payment loans up to 20% of the purchase price, and waiving the first time homebuyers requirement. There have been a total of three loans to City of Emeryville staff, two in 2006 and one in 2007.

Goal IV. Promote equal opportunity in housing.

Objective IV-A. Prevent and redress discrimination based on race, color, ancestry, national origin, religion, familial status, sex, marital status, sexual orientation, age, disability or source of income.

Program IV-A-1. Continue to have a contract with Housing Rights or another fair housing counseling organization to provide fair housing counseling, tenant-landlord mediation, public education and legal referrals.

Through its participation as a member of the Alameda County Urban County, an entitlement jurisdiction for federal Community Development Block Grant funds, the City enters into a contract annually with Berkeley-based Housing Rights, Inc. to provide fair housing services to Emeryville residents.

Program IV-A-2. Effectively market the availability of the fair housing counseling service through a variety of means.

The counseling service is advertised on the public service television channel and in local periodicals. Information is also available in City Hall reception area and on the Economic Development and Housing Department's webpage under Community Resources.

2. EFFECTIVENESS AND OUTCOMES

Goal I. Preserve existing housing stock.

The City offers a wide range of grant and loan programs through the Housing Rehabilitation Program with the goal of preserving the City's older, existing housing stock. Between 2002 and 2008, the City assisted with improvements to 103 dwelling units.

One dwelling unit was demolished in 2005 on the Agency-owned parcel slated for development as the 55-unit Ambassador Homes project. In 2007, 5 residential units were demolished, including one house for the Salem Manor project, which will be replaced by three units, and five units were demolished for the Oak Walk project. Through an Owner Participation Agreement entered into between the Redevelopment Agency and the developer of the Oak Walk project in 2007, the developer is renovating five single family houses which will be sold as first time homebuyer housing to moderate income households. The developer was also required to relocate a four-plex building to an Agency-owned site at 4001 Adeline Street.

In October 2006, the City adopted an ordinance that requires City Council approval for the demolition of any residential unit. Under the ordinance, issuance of a residential demolition permit requires the concurrent approval of a replacement structure (i.e. use permits, design review, and any required variances). The replacement structure must provide at least as many units as are demolished.

Goal II. Promote a variety of housing types and affordability levels.

The City has a strong record of expanding its housing supply and will continue to support development of a wide range of housing types and affordability levels in the coming years. During the previous ABAG RHNA period (January 1, 1999 to June 30, 2006), 1,822 units were added to the City's housing stock, including townhouses, lofts, senior apartments, live/work units, and traditional condominiums. The individual projects are listed in Table 50 at the end of Chapter 2 of this Housing Element.
As described at the beginning of this chapter under Section A, from July 1, 2006 through December 31, 2008, 396 residential units have been produced in Emeryville. All projects of 30 or more units must comply with the City's Affordable Housing Set Aside Ordinance.

Goal III. Promote housing for special needs groups.

The Courtyards at 65th apartment project includes 3 units for developmentally disabled households. In 2006, the City approved AgeSong Assisted Living project, which will feature 121 assisted living units, 28 independent living units, a dining room, and publicly

accessible café. The City will consider any proposals that are made for special needs housing. The 2009-2014 Housing Element contains a number of new policies and programs specific to support of special needs housing.

Goal IV. Promote equal opportunity in housing.

Anti-discrimination clauses are standard in the City and Agency's agreements with housing developers, and failure to comply with fair housing laws is a violation of the City and Agency's agreements. The City, through its participation in the Urban County, contracts with Housing Rights, Inc. to provide fair housing counseling services to both tenants and landlords. Housing Rights, Inc.'s services include housing rights counseling, tenant/landlord mediation, attorney and small claims court referral, and housing discrimination investigation.

C. Progress toward mitigating governmental constraints identified in the housing element.

The Zoning Ordinance was amended in November 2002, changing the regulations for multiple-use projects to exempt residential square footage from the floor area ratio with a Conditional Use Permit and listing emergency shelter and transitional housing in the definition of Group Residential. It was further amended in June of 2006 to add Group Care as a conditionally permitted use in the I-L Zone.

CHAPTER 5. GOALS, OBJECTIVES, POLICIES AND PROGRAMS

This chapter presents the goals, objectives, policies and programs that will be implemented during the housing element period. The Housing Action Program outlined in Chapter 6 identifies the implementing department, implementation action, funding source, funding level, and measurable outcome for each of these policies and programs. These goals, objectives, policies and programs are consistent with the other elements of the General Plan.

Goal I. Preserve existing housing stock.

Objective I-A. Promote preservation of existing housing stock through the Emeryville Housing Rehabilitation Program.

Program I-A-1. Continue support of the Emeryville Housing Rehabilitation Program through Redevelopment Agency funding and allocation of a portion of Emeryville's annual federal Community Development Block Grant (CDBG) funds.

Program I-A-2. Conduct annual review of Emeryville Housing Rehabilitation Program and projected program demand for next fiscal year.

Program I-A-3. Continue existing marketing and establish new marketing efforts for the Emeryville Housing Rehabilitation Program through regular updates to the City's website, participation at community-wide events, and annual, targeted mailings to landlords and homeowners in the City's older residential neighborhoods.

Objective I-B. Maintain and improve existing older housing stock, especially the older residential housing located in the Triangle neighborhood east of San Pablo Avenue and the Doyle Street neighborhood located east of Hollis Street.

Program I-B-1. Continue administration of the Community Preservation Program and the Community Preservation Committee to encourage and improve maintenance of single and multi-family residences in the older residential neighborhoods. Provide rehabilitation program information and conduct code inspections on a case-by-case basis.

Policy I-B-2. Retain and continue implementing the Residential Preservation Ordinance, which requires Council approval for demolition of residential structures.

Objective I-C. Minimize the loss of affordable units and displacement of residents of lower and moderate income through implementation of State Community Redevelopment law provisions relating to replacement housing and relocation.

Policy I-C-1. Continue to review aggregate housing demolition and construction in the City each year through the annual Redevelopment Agency report submitted to the State Department of Housing and Community Development.

Policy I-C-2. Ensure that a replacement housing plan is implemented in connection with any loss of residential units housing lower or moderate income persons as a result of a specific Redevelopment Agency-sponsored or assisted project.

Policy I-C-3. Ensure that state relocation law is applied as required in connection with a specific Redevelopment Agency-sponsored or assisted project as required.

Goal II. Promote a range of affordability levels.

Objective II-A. Ensure that the Zoning Ordinance continues to facilitate the development of affordable housing.

Policy II-A-1. Ensure that sufficient sites are zoned in the City to allow for the development of the City's overall fair share allocation of regional affordable housing need.

Policy II-A-2. Incentivize the provision of extremely low, very low, low, and moderate income housing in conjunction with the revision to the Density Bonus Ordinance to ensure compliance with State Density Bonus law.

Policy II-A-3. Revise the City's Zoning Ordinance to ensure that the requirements for secondary units are consistent with State law.

Policy II-A-4. Continue implementation of the Affordable Housing Set-Aside Ordinance to ensure inclusion of Below Market Rate Units in residential projects of 30 or more units.

Objective II-B. Support new housing opportunities for extremely low, very low, low and moderate income households.

Policy II-B-1. Make extremely low, very low, and low income housing a priority for use of the Redevelopment Agency's Low and Moderate Income Housing Fund.

Policy II-B-2. Include extremely low, very low, and/or low income housing in Redevelopment Agency-assisted development projects whenever feasible.

Policy II-B-3. Where feasible, consider a reduction in the moderate income inclusionary percentage requirement on development projects subject to the City's Affordable Housing Set Aside Ordinance to support the inclusion of extremely low, very low, and/or low income units.

Program II-B-4. Continue funding of the City's First Time Homebuyer Program and Ownership Housing Assistance Program through Redevelopment funds to ensure that downpayment assistance can be provided to support homeownership opportunities for very low, low, and moderate income households purchasing homes in Emeryville.

Policy II-B-5. Leverage State and Federal funding programs to maximize the number of affordable units available to low and very low income households, whenever possible.

Program II-B-6. Coordinate with the Housing Authority of Alameda County to link Emeryville Section 8 Program participants in its Family Self-Sufficiency Program with homeownership opportunities in Emeryville.

Objective II-C. Sustain affordable housing availability for existing participants in the City's Below Market Rate and Market Rate First Time Homebuyers Program.

Program II-C-1. Continue implementation of the City Foreclosure Prevention and Predatory Lending Prevention Strategy so long as required during the Bay Area foreclosure crisis.

Goal III. Promote development of affordable housing for persons with special needs.

Objective III-A. Support development of affordable housing for disabled people, people living with HIV/AIDS, single-parent families, and seniors who are extremely low, very low, low or moderate income.

Policy III-A-1. Encourage the inclusion of extremely low and very low income affordable set-aside units for people living with physical and/or developmental disabilities in projects subject to the City's Affordable Housing Set Aside Ordinance. Ensure that support services are provided to tenants of these units.

Policy III-A-2. Encourage the inclusion of Shelter-Plus-Care units (rent-assisted units for dually-diagnosed people with mental illness, substance abuse and/or AIDS-related illness) in projects subject to the City's Affordable Housing Set Aside Ordinance or as set-aside within new Agency-sponsored affordable rental developments. Ensure that support services are provided to tenants of these units.

Policy III-A-3. Support the development of Residential Care Facilities for the Elderly (RCFE) and independent senior housing developments.

Policy III-A-4. Continue to support the County-wide long-range effort to prevent and end homelessness, the "EveryOne Home–Alameda Countywide Homeless and Special Needs Housing Plan", and monitor the Plan's progress through City participation in collaborative groups such as the EveryOne Home Leadership Board, the Alameda County Urban County Technical Advisory Committee, and the Alameda County HOME Consortium Technical Advisory Committee.

Goal IV. Ensure that the City has a variety of housing types to meet the diverse needs of its residents as well as attract new residents.

Objective IV-A. Ensure that the Zoning Ordinance facilitates the development of a variety of housing types.

Policy IV-A-1. Continue support of residential mixed use development through broader General Plan and update of zoning regulations.

Policy IV-A-2. Continue allowing development of live/work units as conditionally permitted in the light industrial and mixed use zones.

Policy IV-A-3. Encourage new developments to provide unit types for which there is an identifiable gap in Emeryville's housing stock.

Policy IV-A-4. Revise the Zoning Ordinance to be in compliance with Senate Bill 2, effective January 1, 2008, requiring establishment of a zoning district allowing emergency shelters without a conditional use permit or other discretionary approval and ensuring that transitional and supportive housing developments are considered as a residential use of property subject only to those same restrictions that apply to other residential uses of the same type in the same zone.

Policy IV-A-5. Revise the Zoning Ordinance to clarify that group homes and residential care facilities for six or fewer residents be subject only to those same restrictions that apply to other single family uses.

Policy IV-A-6. Revise the Zoning Ordinance to allow exemptions from design review for projects with a negligible visual impact, and to reduce the level of review to minor design review for one- and two-unit residential buildings and accessory dwelling units.

Policy IV-A-7. The City adopted an update of its General Plan including new General Plan Designations on October 13, 2009. The capacity assumptions for sites included in Table 3-3 are based on the newly established General Plan designations

and interim zoning classifications. To ensure sites in the inventory are adequate to accommodate the City's regional need, the City will amend zoning to adopt the interim densities as identified in the sites inventory.

Objective IV-B. Promote opportunities for affordable housing that serves locally identified target groups, including teachers of the Emery Unified School District, City personnel, families with children, and artists/craftspeople.

Program IV-B-1. Continue special homebuyer assistance terms through the City's First Time Homebuyer Program which provides zero-percent down, downpayment assistance loans up to 20% of the purchase price to very low income to moderate income teachers in the Emery Unified School District for both market rate and below market rate units.

Program IV-B-2. Continue special homebuyer assistance terms through the City's First Time Homebuyer Program which provides zero-percent down, downpayment assistance loans up to 20% of the purchase price to City of Emeryville employees who are any income for market rate units and very low to moderate income for below market rate units.

Policy IV-B-3. Encourage provision of set-aside below market rate units for teachers and employees of the Emery Unified School District where feasible in new residential development subject to the City's Affordable Housing Set Aside Ordinance.

Policy IV-B-4. Promote housing designs to attract families with children by encouraging developers to include larger unit sizes (two-, three-, and four-bedroom units) as well as other on-site amenities such as usable outdoor open space, play equipment for a variety of ages, community rooms, and multi-purpose rooms that can be utilized for after-school homework clubs, computer, art, or other resident activities.

Program IV-B-5. Consider development of affordable housing development specifically designed to attract families with children and collaboration between Redevelopment Agency and non-profit developer with expertise in this area of affordable housing development to implement such a development during the course of the housing element period.

Policy IV-B-6. Ensure that new residential developments that include a set-aside of below market rate live/work units conduct targeted marketing to artists and craftspeople to foster occupancy of these affordable below market rate live/work units by artists/craftspeople.

Program IV-B-7. Encourage development of affordable live-work space for artists and craftspeople.

Goal V. Maintain and expand activities designed to prevent those currently housed from becoming homeless and to assist those who are homeless.

Objective V-A: Support activities to assist Emeryville residents who are at-risk of homelessness or are homeless.

Program V-A-1. Continue providing funding through Emeryville's allocation of Community Development Block Grant funds to support the Berkeley Food and Housing Project's shelters, transitional housing, and Multi-Service Center to provide housing, meals and other support services to homeless individuals who have resided in Emeryville.

Program V-A-2. Continue providing information at City Hall and through City's website on resources available for emergency housing assistance.

Program V-A-3. Improve City departmental coordination to ensure that information on resources is made available to assist Emeryville families and households at-risk of homelessness.

Program V-A-4. Improve coordination between the City and Emery Unified School District to determine if there are families who may be at risk of homelessness to provide resource and housing referrals.

Program V-A-5. Assist in the development of affordable rental units serving extremely low income households within Redevelopment Agency-sponsored rental developments whenever feasible. Support projects that provide services to tenants of these units.

Goal VI. Promote equal opportunity in housing.

Objective VI-A. Prevent and redress discrimination based on race, color, ancestry, national origin, religion, familial status, sex, marital status, sexual orientation, age, disability or source of income.

Program VI-A-1. Through participation in the Alameda County Urban County Community Development Block Grant Entitlement jurisdiction, continue to contract with Housing Rights, Inc. or another fair housing counseling organization on an annual basis to provide fair housing counseling services, tenant-landlord mediation, public education and legal referrals for Emeryville resident tenants and landlords.

Program VI-A-2. Continue effective marketing of the fair housing counseling service provided through Housing Rights, Inc. or another fair housing counseling organization through a variety of means, including public information available at Emeryville City Hall, on the City's website, and at community-wide events.

Program VI-A-3. Require that developers include language stating that they provide equal opportunity in housing in their marketing materials for below-market-rate units provided through the City's Affordable Housing Set Aside Ordinance.

Program VI-A-4. Include appropriate equal opportunity and anti-discrimination language in all contractual agreements that the City and/or Emeryville Redevelopment Agency enter into with developers pertaining to housing, such as Agreements on Affordable Units, Resale Restriction Agreements, Disposition and Development Agreements, and Owner Participation Agreements.

Program VI-A-5. Continue Accessibility Grant Program through the Emeryville Housing Rehabilitation Program to provide grant assistance to lower income households with disabilities.

Goal VII. Promote environmental responsibility and long-term sustainability of City's housing development through remediation of brownfields and promotion of "green" and "healthy" housing development.

Objective VII-A. Encourage the remediation of former industrial sites through public-private partnerships and Redevelopment Agency assistance.

Program VII-A-1. Continue Agency grant and loan program, "Capital Incentives for Emeryville's Redevelopment and Remediation" (CIERRA) to provide financial, technical, and regulatory assistance to property owners and developers seeking to assess and remediate their housing development sites.

Program VII-A-2. Continue seeking outside funding opportunities to leverage the Agency's funding for site remediation at Agency-sponsored housing and mixed use developments, thereby increasing the financial feasibility of the projects.

Objective VII-B. Ensure that the City and Redevelopment Agency review and permitting process encourages "green" and "healthy" housing development, defined as clean indoor air and conservation of energy, water, and building materials.

Policy VII-B-1. Continue requirement that developers complete the appropriate GreenPoint Rated or LEED Checklist as part of their submittal to the Emeryville Planning and Building Department.

Policy VII-B-2. Include the appropriate GreenPoint or LEED Checklist in all Redevelopment Agency-led Request for Proposals (RFPs) for new housing developments and include the Checklist as a review criterion in the developer selection process.

Program VII-B-3. Ensure that public information materials are available at the City and through the website on green building resources and funding opportunities.

Program VII-B-4. Consider an ordinance requiring projects involving public funds to meet minimum green building thresholds.

Program VII-B-5. Consider an ordinance providing density, FAR, and height bonus for private projects that meet certain green building thresholds.

Objective VII-C. Encourage site and building design that includes social spaces, stormwater treatment, transit access, bicycle parking, and strong interface with the street.

Policy VII-C-1. Adopt open space requirements and design guidelines for multi-family housing projects.

Policy VII-C-2. Continue to require design and operation measures to protect stormwater quality, including site design, pollutant source control, and vegetative stormwater treatment.

Objective VII-D. Support property retrofits that reduce the City's carbon footprint through energy conservation, waste reduction, and transportation access measures.

Policy VII-D-1. Disseminate information on retrofit assistance programs such as youth energy services, solar energy rebates and alternative transportation facilities, such as bicycle parking and car sharing pods.

Program VII-D-2. Continue to provide assistance through the Emeryville Housing Rehabilitation Program for weatherization and energy efficiency repairs.

Policy VII-D-3. Encourage energy conservation measures and use of green building materials in residential remodel projects.

The Housing Action Plan is the implementation plan for the 2009-2014 Emeryville Housing Element. It consists of a comprehensive table that takes each of the goals, objectives, policies and programs described in Chapter 5, and for each policy and program identifies the responsible administrative department, the responsible review authority (such as the Planning Commission, City Council, or Redevelopment Agency), the funding source(s) for implementation of the policy or program, measurable outcomes, and action steps with completion dates.

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)
Goal I. Preserve existing housing stock					
Objective I-A. Promote preservation of existing housing stock through the Emeryville Housing Rehabilitation Program.					
Program I-A-1. Continue support of the Emeryville Housing Rehabilitation Program through Redevelopment Agency funding and allocation of a portion of Emeryville's annual federal Community Development Block Grant (CDBG) funds.	Economic Development & Housing (EDH)	Agency; Council	Agency Housing Set-Aside; CDBG	1 Ownership Rehab loans per FY; 1 Rental rehab loans per FY; 1 Paint grants per FY; 4 Accessibility grants per FY; 2 Clean-Up grants per FY; 1 Minor Home Repair Grants per FY; 5 Concrete buyback grants per FY; 6 Fence grants per FY.	1) Agency funding appropriation is made through budget process every 2 years in spring; next cycle is for FY10/11-FY11/12; 2) CDBG allocation to Program is done each spring for upcoming Fiscal Year through annual Community Development Block Grant (CDBG) application process through Urban County entitlement.
Program I-A-2. Conduct annual review of Emeryville's Housing Rehabilitation Program and projected program demand for next fiscal year.	EDH	Agency; Council	Agency Housing Set-Aside	Annual review of Program; determination if additional funding or resources are needed for subsequent fiscal year (July-June)	1) Conduct administrative annual review of completed and in-process projects and expenditures during first quarter of fiscal year (July-September); 2) submit funding request to Agency for program funding increase if needed as part of budget process.

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Program I-A-3. Continue existing marketing and establish new marketing efforts for the Emeryville Housing Rehabilitation Program through regular updates to the city's website, participation at community-wide events, and annual, targeted mailings to landlords and homeowners in the City's older residential neighborhoods.	EDH	Administrative	Agency Housing Set-Aside	Annual program updates to information materials; participation in community events; outreach to potential participants.	1) Update website and program materials (brochures, applications, guidelines) each spring after release of new income limits; 2) Develop new marketing outreach program to reach potential participants (FY09/10); 3) Participate in community events sponsored by Community Services Department (as scheduled); 4) submit articles for city-wide activity guide (twice yearly).	
Objective I-B. Maintain and improve existing older housing stock, especially the older residential housing located in the Triangle neighborhood east of San Pablo Avenue and the Doyle Street neighborhood located east of Hollis Street.						
Program I-B-1. Continue administration of the Community Preservation Program and the Community Preservation Committee to encourage and improve maintenance of single and multi-family residences in the older residential neighborhoods. Provide rehabilitation program information and conduct code inspections on a case-by-case basis.	EDH (lead department); Police, Fire, City Attorney Office, Planning & Building; Public Works.	Planning Commission for code violations; Agency for any action taken related to providing Rehab Program funding or property acquisition.	General Fund for staffing	Reduction in number of dilapidated properties; increased level of property maintenance; resolution of code violations.	1) Hold quarterly meetings of CPC; 2) hold monthly progress meeting with City Attorney's Office and Planning; 3) monitor property condition on identified properties (on-going); 4) work with City Attorney Office to process code violations (on-going as required); 5) provide Emeryville Rehabilitation Program information to neighborhoods through targeted mailings (twice yearly).	
Policy-I-B-2. Retain and continue implementing the Residential Preservation Ordinance, which requires Council approval for demolition of residential structures.	Planning and Building	Council	Developers	No demolition without Council approval	Take applications for residential demolition to Planning Commission and Council when developers apply (on-going as required).	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Objective I-C. Minimize the loss of affordable units and displacement of residents of lower and moderate income through implementation of State Community Redevelopment law provisions relating to relocation and replacement housing.						
Policy I-C-1. Continue to review aggregate housing demolition and construction in the City each year through the annual Redevelopment Agency report submitted to the State Department of Housing and Community Development.	Building; EDH	Agency	General Fund for staffing	Timely submittal of annual report to State HCD on Agency housing activity and submittal of demolition and construction completion reports to State Dept of Finance.	1) Annually review demolition and construction permits in preparation for State HCD Report due no later than 12/31; 2) Monthly submit reports to DOF.	
Policy 1-C-2. Ensure that a replacement housing plan is implemented in connection with any loss of affordable residential units housing lower or moderate income persons as a result of a specific Redevelopment Agency-sponsored or assisted project action.	EDH; City Attorney Office	Agency	Agency Housing Set-Aside	Replacement Housing Plan adopted for any identified project; units replaced as required.	As part of review of new Agency-sponsored development, review potential impact on units occupied by lower or moderate income households. Adopt replacement housing plan as required by state redevelopment law. (As projects proposed to Agency)	
Policy 1-C-3. Ensure that state relocation law is applied as required in connection with a specific Redevelopment Agency-sponsored or assisted project as required.	EDH; City Attorney Office	Agency	Agency Housing Set-Aside	Relocation Plan adopted as required for any identified project; households relocated as required.	As part of review of new Agency-sponsored development, review potential relocation impacts and adopt relocation plan as required by state redevelopment law. (As projects proposed to Agency)	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Goal II. Promote a range of affordability levels						
Objective II-A. Ensure that the Zoning Ordinance continues to facilitate the development of affordable housing.						
Policy II-A-1. Ensure that sufficient sites are zoned in the City to allow for the development of the City's overall fair share allocation of regional affordable housing need.	Planning and Building	Planning Commission; Council	General Plan Maintenance Fund	23 acres must be zoned to allow residential assuming 50 units per acre with use permit.	Include in General Plan and Zoning Ordinance update to be completed by end of FY09/10. FY10/11.	
Policy II-A-2. Incentivize the provision of extremely low, very low, low, and moderate income housing in conjunction with the revision to the Density Bonus Ordinance to ensure compliance with State Density Bonus Law.	Planning and Building	Planning Commission; Council	General Plan Maintenance Fund	Revised Density Bonus Ordinance	Adopt Density Bonus Ordinance Revision as part of Zoning Ordinance update to be completed by end of FY09/10. FY10/11.	
Policy II-A-3. Revise the City's Zoning Ordinance to ensure that the requirements for secondary units are consistent with State law.	Planning and Building	Planning Commission; Council	General Plan Maintenance Fund	Review of secondary units requirements as part of Zoning Ordinance update.	Revise Zoning Ordinance by end of FY09/10 FY10/11 and ensure secondary units requirements are not onerous.	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy II-A-4. Continue implementation of the Affordable Housing Set Aside Ordinance to ensure inclusion of Below Market Rate Units in residential projects of 30 or more units.	EDH	Planning Commission; Council	General fund for staffing	Enforce the ordinance for all applicable projects.	1) Review applicability of AHSA Ordinance for each new residential project and include as required in Planning Conditions of Approval (as residential applications submitted); 2) For projects subject to Ordinance, negotiate and prepare Affordability Agreements for Council approval (after Conditions of Approval are approved, EDH begins Affordability Agreement preparations); 3) To ensure the City's Inclusionary requirements do not pose a significant constraint of the provision of housing, the City shall annually monitor the Ordinance to consider the costs and benefits and any impact of the Ordinance on the production of housing due to changing market conditions and amend the ordinance as necessary in order to provide more flexibility to developers.	
Objective II-B. Support housing opportunities for extremely low, very low, low and moderate income households.						
Policy II-B-1. Make extremely low, very low and low income housing a priority for use of the Redevelopment Agency's Low and Moderate Income Housing Fund.	EDH	Agency	Agency Housing Set-Aside	Provision of extremely low, very low or low income units in housing projects.	1) Annually review housing production against goals of 10-year Agency Housing Compliance Plan (spring of each year); 2) negotiate additional affordable units for low and very low income in inclusionary housing developments (as Affordability Agmts negotiated); 3) Identify opportunities for extremely low, very low, and low units in Agency-sponsored projects and incorporate need into Agency-issued RFPs (as RFPs issued).	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy II-B-2. Include extremely low, very low, and/or low income housing in Redevelopment Agency-assisted development projects whenever feasible.	EDH	Agency	Agency Housing Set-Aside	Provision of extremely low, very low and low income units in Agency-sponsored housing projects.	For Agency-sponsored or assisted housing developments, negotiate the inclusion of extremely low, very low, and low income housing where feasible. Include language in each RFP issued for affordable rental housing a goal to encourage developers to include extremely low, very low, and low income housing (as RFPs drafted).	
Policy II-B-3. Where feasible, consider a reduction in the moderate income inclusionary percentage requirement on development projects subject to the City's Affordable Housing Set Aside Ordinance to support the inclusion of extremely low, very low, and/or low income units.	EDH	Council; Agency if funding appropriation needed.	Agency Housing Set-Aside if Agency funds required to write down affordability.	Approval of Affordability Agreements for inclusionary projects with low and/or very low income units where not initially required by Ordinance.	1) Review potential for inclusion of extremely low, very low, and/or low income units in projects subject to the Ordinance that only have moderate income requirement and negotiate affordability agreement with developers for this inclusion (as Affordable Agmts being negotiated); 2) appropriate funds through the Ownership Housing Assistance Program for for-sale projects which include low income or very low income BMRs (as projects negotiated to include BMRs at these levels).	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy II-B-4. Continue funding of the City's First Time Homebuyer Program and Ownership Housing Assistance Program through Redevelopment funds to ensure that downpayment assistance can be provided to support homeownership opportunities for very low, low, and moderate income houshold purchasing homes in Emeryville.	EDH	Agency	Agency Housing Set-Aside	Provision of downpayment assistance loans for first-time homebuyers.	1) Appropriate funds for FTHB program through two-year budget process; 2) conduct annual review after close of program year and give annual report on FTHB activities to Agency in the first quarter of subsequent year.	
Policy II-B-5. Leverage State and Federal funding programs to maximize the number of affordable units available to low and very low income households, whenever possible.	EDH	Council	To be identified	Obtain and utilize outside funding to leverage Agency funds for affordable housing.	1) Keep apprised of outside funding opportunities and identify potential projects or programs to use funding; apply for these funding sources as appropriate (on-going); 2) utilize outside funding in projects (on-going).	
Policy II-B-6. Coordinate with the Housing Authority of Alameda County to link Emeryville Section 8 Program participants in its Family Self-Sufficiency Program with homeownership opportunities in Emeryville.	EDH	Administrative	General Fund for staffing.	Work with Housing Authority to place participants into Emeryville homeownership opportunities.	1) Establish coordination with FSS program coordinator (FY09/10); 2) identify potential projects for placement of FSS program participants (through on-going coordination).	
Objective II-C. Sustain affordable housing availability for existing participants in the City's Below Market Rate and Market Rate Homebuyers Program.						
Program II-C-1. Continue implementation of the City Foreclosure Prevention and Predatory Lending Prevention Strategy so long as required during the Bay Area foreclosure crisis.	EDH	Administrative	Agency Housing Set-Aside	Assistance to homeowner participants facing foreclosure to help them avoid foreclosure.	1) Prepare bi-monthly updates on Strategy Implementation for review by the Housing Committee (bi-monthly); 2) work with individual homeowners facing foreclosure (on-going)	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Goal III. Promote development of affordable housing for persons with special needs.						
Objective III-A. Support development of affordable housing for disabled people, people living with HIV/AIDS, single families, and seniors who are extremely low, very low, low or moderate income.						
Policy III-A-1. Support inclusion of extremely low and very low income affordable set-aside units for people living with physical and/or developmental disabilities in projects subject to the City's Affordable Housing Set Aside Ordinance. Ensure that support services are provided to tenants of these units.	EDH	Council	General Fund for staffing	Additional units in housing stock for extremely low and very low income people living with physical and/or developmental disabilities.	1) Identify projects for inclusion of accessible set-aside units for people with physical and/or developmental disabilities (as project Affordability Agmts are negotiated); 2) work with service providers for these special needs groups to identify opportunity projects and to ensure services are provided to support these tenants (after projects approved with these set-aside units); 3) promote universal design in projects containing set-aside units for people living with disabilities.	
Policy III-A-2. Support inclusion of Shelter-Plus-Care units (rent-assisted units for dually-diagnosed people with mental illness, substance abuse and/or AIDs-related illness) in projects subject to the City's Affordable Housing Set Aside Ordinance or as set-aside within Agency-sponsored rental affordable developments. Ensure that support services are provided to tenants of these units.	EDH	Council	Shelter Plus Care - federal	Additional units in housing stock serving individuals who qualify for Shelter Plus Care housing assistance.	1) Identify availability of Shelter Plus Care vouchers through coordination with countywide EveryOne Home Homeless and Special Needs Plan collaborative and opportunity developments (on-going); 2) work with developers to negotiate inclusion of set-aside of some SPC units within inclusionary projects (as project Affordability Agmts are negotiated); 3) consider inclusion of set-aside of SPC units within new Agency-sponsored affordable rental projects (as projects are developed).	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy III-A-3. Support development of Residential Care Facilities for the Elderly (RCFE) projects and independent senior housing developments.	Planning and Building	Planning Commission/ Council	General Fund for staffing	Additional units in housing stock that are either RCFE units or independent senior units.	1) Support projects that provide assisted living (Residential Care Facilities for the Elderly) or independent senior units; 2) establish mechanism through Zoning Ordinance to provide bonus (FAR, density, height, etc.) to developers who provide a certain percentage of the RCFE units to those with incomes at SSI levels through draft of Ordinance for review by Planning Commission and City Council by end of FY09/10 FY10/11.	
Policy III-A-4. Continue to support the County-wide long-range effort to prevent and end homelessness, the "EveryOne Home - Alameda Countywide Homeless and Special Needs housing Plan", and monitor the Plan's progress through City participation in the collorative groups such as the EveryOne Home Leadership Board, the Alameda County Urban County Technical Advisory Committee and the Alameda County HOME Consortium Technical Advisory Committee.	EDH	Council; administrative	General Fund for staffing	Participation in collaborative planning; continued financial support of agencies that serve homeless in Emeryville; creation of supportive housing units that serve extremely low income special needs groups that are identified in the EveryOne Home Plan.	1) staff-level participation on the Urban County and HOME Consortium TACs and EveryOne Home Board (on-going); 2) seek opportunities to encourage development of supportive housing within new Agency-sponsored rental developments.	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Goal IV. Ensure that the City has a variety of housing types to meet the diverse needs of its residents as well as attract new residents.						
Objective IV-A. Ensure that the Zoning Ordinance facilitates the development of a variety of housing types.						
Policy IV-A-1. Continue support of residential mixed use development through broader General Plan and update of zoning regulations.	Planning and Building	Planning Commission	General Plan Maintenance Fund	At least half of City to be zoned for mixed use with where residential use is permitted through General Plan update.	Include in Zoning Ordinance update to be completed by end of FY09/10 FY10/11.	
Policy IV-A-2. Continue allowing development of live/work units as conditionally permitted use in light industrial zones and mixed use zones.	Planning and Building	Planning Commission	General Plan Maintenance Fund	Update ordinance to define heavy live/work and allow it with use permit in IG (general industrial)	Include in Zoning Ordinance update to be completed by end of FY09/10 FY10/11.	
Policy IV-A-3. Encourage new developments to provide unit types for which there is an identifiable gap in Emeryville's housing stock.	Planning and Building	Planning Commission	General Fund for staffing	Production of a variety of housing types, particularly unit types for which there is an identifiable gap, including family-oriented projects with larger unit sizes, over Housing Element period,	Include in Zoning Ordinance update to be completed by end of FY09/10 FY10/11; Planning Commission to encourage creation of larger units as part of unit mix in proposed new residential multi-family development (on-going).	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy IV-A-4. Revise the Zoning Ordinance to be in compliance with Senate Bill 2, effective January 1, 2008, requiring establishment of a zoning district allowing emergency shelters without a conditional use permit or other discretionary approval and ensuring that transitional and supportive housing developments are considered as a residential use of property subject only to those restrictions that apply to other residential uses of the same type in the same zone.	Planning and Building	Planning Commission	General Fund for staffing	Zoning Ordinance updated to be in compliance with SB2.	1) Conduct an information session on requirements of SB2 with the Housing Committee and Planning Commission (fall 2009) as part of the Zoning Ordinance update in FY09/10; 2) Include in Zoning Ordinance update to be completed by end of FY09/10 FY10/11.	
Policy IV-A-5. Revise the Zoning Ordinance to clarify that group homes and residential care facilities for six or fewer residents be subject only to those same restrictions that apply to other single family uses.	Planning and Building	Planning Commission	General Fund for staffing	Zoning Ordinance revised to meet policy objective.	1) Include in Zoning Ordinance update to be completed by end of FY09/10 FY10/11.	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy IV-A-6. Revise the Zoning Ordinance to allow exemptions from design review for projects with a negligible visual impact, and to reduce the level of review to minor design review for one- and two-unit residential buildings and accessory dwelling units.	Planning and Building	Planning Commission	General Plan Maintenance Fund	Zoning Ordinance revised to meet policy objective.	1) Include in Zoning Ordinance update to be completed by end of FY10/11.	
Policy IV-A-7. The City adopted an update of its General Plan including new General Plan Designations on October 13, 2009. The capacity assumptions for sites included in Table 3-3 are based on the newly-established General Plan designations and interim zoning classifications. To ensure sites in the inventory are adequate to accommodate the City's regional need, the City will amend zoning to adopt the interim densities as identified in the sites inventory.	Planning and Building	Planning Commission	General Plan Maintenance Fund	Zoning Ordinance revised to meet policy objective.	1) Include in Zoning Ordinance update to be completed by end of FY10/11.	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Objective IV-B. Promote opportunities for affordable housing that serves locally identified target groups, including teachers of the Emery Unified School District, City personnel, families with children, and artists/craftspeople.						
Program IV-B-1. Continue special homebuyers assistance terms through the city's First Time Homebuyer Program which provides zero-percent down, downpayment assistance loans up to 20% of the purchase price to very low income to moderate income teachers in the Emery Unified School District for both market rate and below market rate units.	EDH	Agency	Agency Housing Set-Aside	Provision of downpayment assistance loans for this group.	1) Continue marketing efforts to this group to encourage participation in the FTHB Program through City website and flyers, and through distribution of program materials to each of the school sites and the EUSD district office (website updates on-going; distribution of materials to EUSD is annual); 2) Annually review number of participants who fall into this category and report to Agency as part of annual report on City's Homebuyer Programs (annually in first quarter of City's fiscal year).	
Program IV-B-2. Continue Special homebuyer assistance terms through the City's First Time Homebuyer Program which provides zero-percent down, downpayment assistance up to 20% of the purchase price to city of Emeryville employees who are any income for market units and very low moderate income for below market rate units.	EDH	Agency	Agency Housing Set-Aside	Provision of downpayment assistance loans for this group.	1) Continue marketing efforts to this group to encourage participation in the FTHB Program (on-going); 2) Annually review number of participants who fall into this category and report to Agency as part of annual report on City's Homebuyer Programs (annually in first quarter of City's fiscal year).	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy IV-B-3. Encourage provision of set-aside below market rate units for teachers and employees of the Emery Unified School District where feasible in new residential development subject to the City's Affordable Housing Set Aside Ordinance.	EDH	Council	General Fund for staffing	Provision of set-aside units for low to moderate income EUSD employees.	1) Identify appropriate projects for inclusion of set-aside units for EUSD employees and negotiate developer agreements for inclusion of these units (as projects Affordability Agmts negotiated).	
Policy IV-B-4. Promote housing designed to attract families with children by encouraging developers to include larger unit sizes (two-, three-, and four-bedroom units) as well as other on-site amenities such as usable outdoor open space, play equipment for a variety of ages, community rooms, and multi-purpose rooms that can be utilized for after-school homework clubs, computer, art, or other resident activities.	Planning and Building; EDH	Planning Commission/ City Council	General Fund for staffing	Completion of developer manual; New residential developments built that include larger units plus other on-site and nearby amenities that will attract households with children.	1) Encourage developers applying for planning permits to include not only larger units but other on-site, family-oriented amenities that will attract households with children (on-going); 2) Draft ordinance that provides a density, FAR, and/or height bonus if developer provides three-bedroom units and additional on-site family-oriented amenities (include in Zoning Code update for completion by end of FY09/10); 3) create developer manual or other distribution materials for Building Department counter with examples of well-designed family-oriented housing developments (by end of FY09/10).	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy IV-B-5. Consider development of affordable housing development specifically designed to attract families with children and collaboration between Redevelopment Agency and non-profit developer with expertise in this area of affordable housing development to implement such a development during the course of the housing element period.	EDH	Agency	General Fund for staffing; Agency Housing Set Aside	Agency-sponsored development(s) completed that are specifically designed to attract households with children.	1) Identify opportunity affordable housing development(s) for Agency-non-profit developer partnership that will be designed to attract households with children (during FY09/10); 2) evaluate opportunity as project proposals are submitted by private developers (as needed when proposals submitted to Agency); 3) consider inclusion of multi-family affordable housing development as part of update to Agency Housing Compliance Plan for 2010-2014 Implementation Plan period.	
Policy IV-B-6. Ensure that new residential developments that include a set-aside of below market rate live/work units conduct targeted marketing to artists and craftspeople to foster occupancy of these affordable below market rate live/work units by artists/craftspeople.	EDH	Administrative	General Fund for staffing	Occupancy of live/work units by artists or craftspeople.	1) Ensure that marketing plans submitted for city approval in projects with BMR live/work units include targeted marketing to artists/craftspeople (City will review and approve the plans as submitted; timing of submittal varies and is dependent on completion schedule of projects); 2) City assists in marketing of BMR units by including application materials at City Hall, presenting at project information workshops; including information on its website (varies in accordance with BMR marketing schedule for a particular project).	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy IV-B-7. Encourage development of affordable live-work space for artists and craftspeople.	Planning and Building	Planning Commission/ Council	General Fund for staffing	Development of affordable live/work space for artists and craftspeople	1) Process applications expeditiously as submitted for artist housing (as project applications submitted).	
Goal V. Maintain and expand activities designed to prevent those currently housed from becoming homeless and to assist those who are homeless.						
Objective V-A: Support activities to assist Emeryville residents who are at-risk of homelessness or are homeless.						
Program V-A-1. Continue providing funding through Emeryville's allocation of Community Development Block Grant funds to support the Berkeley Food and Housing Project's shelters, transitional housing, and Multi-Service Center to provide housing, meals and other support services to homeless individuals who have resided in Emeryville.	EDH	Council	CDBG	Support of homeless who have lived in Emeryville with needed services and shelter.	1) Undertake annual CDBG application process with County HCD and enter contract with Berkeley Food and Housing Project for fiscal year (January - June of each year); 2) review quarterly reports submitted by Agency and submit data to County HCD (quarterly)	
Program V-A-2. Continue providing information at City Hall and through City's website on resources available for emergency housing assistance.	EDH	Administrative	General Fund for staffing	Updated information available at City Hall and website.	1) Do quarterly update of public information materials and provide at City Hall and on-line.	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Program V-A-3. Improve City departmental coordination to ensure that information is made available on resources available to assist Emeryville families and households at-risk of homelessness.	EDH	Administrative	General Fund for staffing	Dissemination of information to City departments who interface with those at-risk of homelessness; dissemination of information to those individuals.	1) Convene annual meetings of City departments including Economic Development & Housing, Police, Fire, Recreation, Senior Center, and Child Development Center to discuss available resources, share information (first quarter of City's fiscal year); 2) establish lines of communication to improve dissemination of information to at-risk households (on-going)	
Program V-A-4. Improve coordination between the City and Emery Unified School District to determine if there are families who may be at risk of homelessness to provide resource and housing referrals.	EDH	Administrative	General Fund for staffing	Dissemination of information to EUSD on housing and services available; increased coordination between entities.	1) Convene annual meeting between EDH staff and EUSD to discuss housing resources, coordination needs to determine families at risk of homelessness, and dissemination of information to assist those households (first quarter of City's fiscal year); 2) Establish coordination efforts with City-Schools Committee (on-going)	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Program V-A-5. Support inclusion Assist in the development of affordable rental units serving extremely low income households as 30% of the area median income within future Redevelopment Agency-sponsored rental developments whenever feasible. Ensure that support services are provided to tenants of these units.	EDH	Agency	Housing Set-Aside; other outside funding	Provision of rental units that serve very low income households at 30% of the AMI.	1) Identify opportunities for development of units that support households at this income level and negotiate development agreements that include these affordability covenants and services requirements as needed; 2) Provide Agency financial assistance to support development at housing affordable at this income level if required for financial viability of project; 3) Require supportive services plan as submittal requirement in Agency-sponsored RFPs.	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Goal VI. Promote equal opportunity in housing.						
Objective VI-A. Prevent and redress discrimination based on race, color, ancestry, national origin, religion, familial status, sex, marital status, sexual orientation, age, disability, or source of income.						
Program VI-A-1. Through participation in the Alameda County Urban County Community Development Block Grant Entitlement jurisdiction, continue to contract with Housing Rights, Inc. or another fair housing counseling organization on an annual basis to provide fair housing counseling services, tenant-landlord mediation, public education and legal referrals for Emeryville resident tenants and landlords.	EDH	Council	CDBG	Provision of fair housing counseling services to Emeryville residents and landlords.	1) Enter into annual City-County CDBG agreement to continue participation in Urban County CDBG Program (annually in spring); 2) through staff participation on Urban County Technical Advisory Committee, review and approve quarterly reports of fair housing organization to ensure that Emeryville residents and landlords are being provided fair housing services. (on-going)	
Program VI-A-2. Continue effective marketing of the fair housing counseling service provided through Housing Rights, Inc. or another fair housing counseling organizaton through a variety of means, including public information available at Emeryville City Hall, on the City's website, and community-wide events.	EDH	Administrative	General Fund for staffing	Provision of updated fair housing information at City Hall and on web-site; information available at Emeryville community events	1) Communicate with fair housing organization to ensure that updated information is provided at City Hall (quarterly); 2) identify community-wide events as opportunities for dissemination of fair housing information (participate in annual community fair sponsored by Community Services Department)	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Program VI-A-3. Require that developers include language stating that they provide equal opportunity in housing in their marketing materials for below-market-rate units provided through the City's Affordable Housing Set Aside Ordinance.	EDH	Administrative	General Fund for staffing	Inclusion of equal opportunity language in marketing materials for BMR units.	1) Review marketing plans submitted by developers pursuant to affordability agreements and ensure that equal opportunity language is included (varies as project marketing plans are submitted)	
Program VI-A-4. Include appropriate equal opportunity and anti-discrimination language in all contractual agreements that the City and/or Emeryville Redevelopment Agency enter into with developers pertaining to housing, such as Agreements on Affordable Units, Resale Restriction Agreements, Disposition and Development Agreements, and Owner Participation Agreements.	City Attorney's Office	Council/ Agency	General Fund for staffing	Inclusion of equal opportunity and anti-discrimination language in City and Agency housing agreements.	1) Ensure inclusion of equal opportunity and anti-discrimination language in housing-related contracts and agreements with developers (varies, as Agency and City enter into agreements these clauses are reviewed by City Attorney's Office)	
Program VI-A-5. Continue Accessibility Grant Program through the Emeryville Housing Rehabilitation Program to provide grant assistance to lower income households with disabilities.	EDH	Agency	Agency Housing Set-Aside	Provision of grants to disabled households for accessibility improvements.	1) Continue marketing of Accessibility Grant Program through City Hall, website, and community events (annual update to website and program materials; participation in annual community fair); 2) expediting grant process as applications received (on-going)	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Goal VII. Promote environmental responsibility and long-term sustainability of City's housing development through remediation of brownfields and promotion of "green" and "healthy" housing development.						
Objective VII-A. Encourage the remediation of former industrial sites through public-private partnerships and Redevelopment Agency assistance.						
Program VII-A-1. Continue Agency grant and loan program, "Capital Incentives for Emeryville's Redevelopment and Remediation" (CIERRA) to provide financial, technical, and regulatory assistance to property owners and developers seeking to assess and remediate their housing development sites.	EDH	Agency	EPA/Agency funds for match	Provision of loans and grants to property owners that result in remediation of sites.	1) Continue implementation of CIERRA Program and direct program repayments back into new remediation assistance (on-going); 2) research new possible funding sources to enable continuation of program during housing element period (on-going)	
Program VII-A-2. Continue seeking outside funding opportunities to leverage the Agency's funding for site remediation at Agency-sponsored housing and mixed use developments, thereby increasing the financial feasibility of the projects.	EDH	Agency	To be determined.	Attainment of additional outside funding to support Agency's site remediation goals.	1) At staff level, continue to identify funding opportunities and seek authority to apply for these funding sources (on-going)	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Objective VII-B. Ensure that the City and Redevelopment Agency review and permitting process encourages "green" and "healthy" housing development, defined as clean, indoor air and conservation of energy, water, and building materials.						
Policy VII-B-1. Continue requirement that developers complete the appropriate GreenPoint Rated or LEED Checklist as part of their submittals to the Emeryville Planning and Building Department.	Planning and Building	Planning Commission for entitlements; Administrative for plan check.	General Fund for staffing	Developers' inclusion of checklist in planning application submittal, inspiring them to consider green design features.	1) Review applications as submitted by developers and ensure one of the checklists has been submitted (on-going); 2) ensure the conditions of approval require compliance with submitted green building measures (on-going); 3) review plans at plan check in accordance with checklist (on--going)	
Policy VII-B-2. Include the appropriate GreenPoint Rated or LEED Checklist in all Redevelopment Agency-led Request for Proposals (RFPs) for residential and/or live/work projects and include the Checklist as a review criterion in the developer selection process.	EDH	Agency	General Fund for staffing	Inclusion of GreenPoint Rated or LEED Checklist in all Agency-led RFPs for new housing; incorporation of green building measures in Agency-sponsored housing developments.	1) Include GreenPoint Rated or LEED Checklist in Agency housing RFPs for Agency approval prior to issuance (on-going as RFPs issued); 2) require developers to incorporate green building measures in Agency-sponsored housing developments (on-going as RFPs issued)	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy VII-B-3. Ensure that public information materials are available at the City and through the website on green building resources and funding opportunities.	Public Works	Administrative	General Fund for staffing	Provision of information materials at Planning and Building Counter.	1) Ensure that updated public information materials are available at Planning and Building Counter (quarterly); 2) Develop information for website with referrals and information on green building resources and funding opportunities (incorporate with new City website update in 2009)	
Policy VII-B-4 Consider an ordinance requiring projects involving public funds to meet minimum green building thresholds.	Public Works	Planning Commission and City Council	General Fund for staffing, project costs	Public-private projects meeting higher green building thresholds, helping to meet City's climate change goal.	1) Survey previous projects to set threshold (FY09/10); 2) Draft ordinance and present draft to Planning Commission and City Council (FY10/11)	
Policy VII-B-5 Consider an ordinance providing density, FAR, and height bonus for private projects that meet certain green building thresholds.	Public Works	Planning Commission and City Council	General Fund for staffing	Private projects meeting higher green building thresholds, helping to meet City's greenhouse gas reduction goal.	1) Survey previous projects to set threshold; 2) Recommend density and height bonus level; 3)Draft ordinance and present draft to Planning Commission and City Council. (complete action steps by end of FY09/10)	
Objective VII-C. Encourage site and building design that includes social spaces, stormwater treatment, transit access, bicycle parking, and strong interface with the street.						
Policy VII-C-1. Adopt open space requirements and design guidelines for multi-family housing projects.	Planning and Building	Planning Commission	General Plan Fund	Requirements in Zoning Ordinance, leading to more open space and better design.	Include in General Plan and Zoning Ordinance update to be completed by end of FY09/10.	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Policy VII-C-2. Continue to require design and operation measures to protect stormwater quality, including site design, pollutant source control, and vegetative stormwater treatment.	Public Works	Administrative	General Fund for staffing	Inclusion of design and operation measures to protect stormwater quality.	1) Public Works to review and approve stormwater treatment measures in connection with development projects (on-going)	

Policy or Program	Responsible Department	Responsible Review Authority	Funding Source(s)	Measurable Outcomes	Action Steps/ (Completion Dates)	
Objective VII-D. Support property retrofits that reduce the City's carbon footprint through energy conservation, waste reduction, and transportation access measures.						
Policy VII-D-1. Disseminate information on retrofit assistance programs such as youth energy services, solar energy rebates and alternative transportation facilities, such as bicycle parking and car-sharing pods.	Planning and Building / Economic Development and Housing	Administrative	General Fund for staffing	Retrofit of existing residential buildings to be more energy efficient, less wasteful and better oriented to non-auto travel.	1) Provide information on retrofit resource programs at the Planning and Building Counter and through the Community Preservation program (on-going)	
Program VII-D-2. Continue to provide assistance through the Emeryville Housing Rehabilitation Program for weatherization and energy efficiency repairs.	Economic Development and Housing	Administrative	Agency Housing Set Aside Fund	Property retrofits that would not occur without Agency funding.	1) Continue use of program for weatherization repairs and other energy-efficiency retrofits (on-going)	
Policy VII-D-3. Encourage energy conservation measures and use of green building materials in residential remodel projects.	Planning and Building	Administrative	General Fund for Staffing	Green remodel features in property improvement and maintenance projects	1) Include checklist in planning and building applications (complete by end of FY09/10)	

Quantified Objectives by Unit Type and Income Level

Projects Completed 2009 through 2014*

	New Construction	Rehabilitation	Conservation**	Total
Extremely Low Income***	28	5	0	33
Very Low Income	83	0	0	83
Low Income	33	0	0	33
Moderate Income	60	5	0	65
Above Moderate Income	755	0	0	755
Total	**959**	**10**	**0**	**969**

Extremely Low Income - households at or less 30% Area Median Income (AMI); Very Low Income - households 31-50% AMI; Low Income - households 51-80% AMI; Moderate Income - households 81-120% AMI; Above Moderate Income - households above 120% AMI.

* Projects included are a sub-set of projects listed in Table 2-55; Table 2-55 includes projects completed 2007 and 2008, which are not included here. This list does not contain Icon at Doyle (27 market rate); Salem Manor (3 market rate); Glashaus Lofts (5 very low, 6 low, 18 moderate, 116 market rate)

** No projects will have expiring Project Based Section 8 contracts during this time period.

*** Extremely low income unit assumptions: REHABILITATION: 5 rehabiliation units in Magnolia Terrace project. NEW CONSTRUCTION: 8 units within the Ambassador Apartments Project for FY09/10; 20 units as set-aside units within Agency-sponsored projects and/or inclusionary projects with negotiated set-aside at this level for four fiscal years remaining in Housing Element period of FY10/11 through FY13/14 (5 units per year)

INTRODUCTION

I-1. Background on the City's Sanitary Sewer System and Regional Issues Facing the Operations of the Collection System

The City of Emeryville is located between the Cities of Berkeley (to the north) and Oakland (to the south and east), with San Francisco Bay to the west. Emeryville is a small community, covering about 670 acres, with a population of about 10,000. Originally, Emeryville was an industrial community with meat packing plants, steel works, manufacturing, and a rail yard. In the 1960's, heavy industries began leaving the City, making way for the current mix of housing, commercial and retail properties, biotech research, and computer and graphic film industries.

The City of Emeryville's sanitary sewer service area is shown on Figure 1 and a schematic of Emeryville's 15 miles of sanitary sewer system is shown on Figure 2. The collection system serves the entire City. In addition, approximately 11 miles of sanitary sewer mains from 370 acres of primarily residential property in the City of Oakland and 0.25 acres of residential property in the City of Berkeley drain into Emeryville's sanitary sewer system.

The first sewers in Emeryville were constructed in the mid-1880s. They were generally small diameter pipes carrying sanitary flows to larger pipes that carried a combination of sanitary sewage and storm water to local creeks and San Francisco Bay. Over the ensuing 50 years, the system was extended and enlarged to handle increasing flow from the growing community. Many of the early sewers were installed by private developers and were not subject to uniform standards and inspection. Because the drainage system was a combined sanitary/storm water system, roof, basement, and area drains were connected to the system. Emeryville's early development was heavily industrialized, with canneries, paint production, wood processing, and steel manufacturing contributing to the wastewater load. In addition, much of the system was below the groundwater table for all or part of the year. The combination of these factors resulted in a sewer system that had inadequate capacity, was subject to frequent overflows during wet weather, and contributed heavy pollution loads to the receiving streams and ultimately the San Francisco Bay.

In the late-1930's, construction of the San Francisco Bay Bridge first brought public awareness to the odors and pollution caused by untreated sewage discharges directly to San Francisco Bay. In 1944, Special Sewer District No. 1 was formed by the East Bay Municipal Utility District (EBMUD) to construct interceptor sewers through the communities bordering San Francisco Bay (from El Cerrito to the Oakland/San Leandro border) and provide primary wastewater treatment at a centralized location near the eastern side of the Bay Bridge. These new regional facilities were brought online in 1951. Persistent overflows within the communities during wet weather prompted EBMUD to undertake a program to separate the storm sewers from the sanitary sewers. This program, begun in the 1940's, was essentially complete by 1975, three years before EBMUD upgraded its treatment plant to include a secondary facility with land-based sludge disposal.

High wet weather flows and associated overflows continued to plague the East Bay communities through the 1970's. Federal and State requirements calling for the reduction and eventual

May, 2011

elimination of sewer overflows prompted EBMUD and its service communities to undertake a systematic, system-wide capacity and condition assessment of the local sewer systems. At the same time, EBMUD undertook an assessment of its interceptor and treatment facilities.

In 1980, the City of Emeryville, the East Bay Communities, and EBMUD, coordinated their efforts and initiated a 6-year infiltration/inflow study (I/I Study) to develop a program to address sanitary sewer overflows that were occurring on City streets and in the Bay during periods of wet weather. The completed 1985 I/I Study was used to develop the East Bay I/I Correction Program (I/ICP), which outlined the long-range sanitary sewer improvements that were necessary to correct overflows occurring within the collection system of each community and along the EBMUD Interceptor. The I/I Study also specified schedules, called Compliance Plans, to complete various sewer rehabilitation projects specified in the I/ICP.

In 1986, the Regional Board issued Cease and Desist Orders (CDOs) to the City of Emeryville, the East Bay Communities, and EBMUD to eliminate all sanitary sewer overflows and to reduce the overall I/I. The immediate objective of the CDOs was to eliminate the public health impacts caused by the overflows. In this enforcement order, the Regional Board accepted the proposed improvements outlined in the I/ICP. The Compliance Plans for each Community were incorporated into the CDOs. The City of Emeryville's Compliance Plan specified a 20-year program to correct the overflows and to reduce the overall I/I. There were eight known overflow locations within the City of Emeryville at the time the CDOs were issued.

In concurrence with the I/ICP, EBMUD underwent its own Wet Weather Program for the treatment plant. The objective of the Wet Weather Program was to equip EBMUD's treatment plant and facilities with the capacity to convey peak flows from the East Bay Communities trunk sewers by the end of the I/ICP implementing period.

Since it was cost-prohibitive to eliminate all I/I into the sanitary sewer collection system as part of the I/I Study, the East Bay Communities performed a cost analysis to determine the most cost-effective level of rehabilitation. The study concluded that the most cost-effective solution was to design the treatment plant and collection system to accommodate peak I/I flows generated during a 5-year design storm. For a storm that was larger than the 5-year design storm, overflows would be permitted to occur.

As a part of EBMUD's Wet Weather Program, each connection to EBMUD's interceptor was allotted a peak wet weather design flow as stated in the I/I Study. The total of these design flows from all the connections in the East Bay communities was the basis for sizing the capacity at the EBMUD treatment plant. The wet weather design flows include three components: a 3-hour peak base flow, a groundwater infiltration flow, and a rain dependent I/I flow. Emeryville has 5 connections to the interceptor. The total peak wet weather flow contribution from Emeryville's system to EBMUD's overall design flow was 25.59 mgd as stated in the 1985 I/I Study. This design flow was about half from Emeryville and half from Oakland. Of the total wet weather flow, only 4.36 mgd or 17% was attributable to dry weather base flow. The dry weather base flows defined in the I/I Study were developed from flow metering in the early 1980's and included a growth factor projected at that time.

In 2006, the City of Emeryville reached the end of the I/ICP implementation period specified in the Compliance Plan. To date, the City spent approximately $11,000,000 on the program and reconstructed approximately 75% of its sanitary sewer infrastructure. The City successfully performed projects as necessary to correct overflows at the previously identified locations. In addition, EBMUD spent more that $310 million on its wet weather facilities in order to accommodate the wet weather flows as defined in the Wet Weather Program. These facilities are working as intended and as were permitted by the Regulators.

The City of Emeryville initiated a Sewer System Capacity Analysis and Master Plan in 2005. This study was triggered by an update to the City's General Plan and was completed in 2010. A model of the sanitary sewer system was developed based on upgrades to the sanitary sewer system as a result of the I/ICP. The analysis was performed using the same general approach to system analysis that was used in 1986 and was calibrated with wet weather flow data collected in 2005/06. It was estimated that under design storm conditions with an allowance for an increase in flow from future land use modifications, the design wet weather flow is now 20.4 mgd (versus 25.59 mgd in 1985, or a reduction of 5.19 mgd). The flow contribution from Emeryville was determined to be 7.9 mgd, with the remaining flow of 12.5 mgd from Oakland.

In 2009, the California Regional Water Quality Control Board, San Francisco Bay Region, adopted Order No. R2-2009-0004 reissuing an NPDES permit to EBMUD to operate its Wastewater Treatment Facilities. However, the new NPDES permit prohibited any discharge from its three wet weather sanitary sewage treatment facilities. The reason for prohibiting discharge from the wet weather facilities had to do with a change by the US Environmental Protection Agency (USEPA) in the interpretation of provisions of the Clean Water Act dealing with heavy metals in the effluent of sanitary sewage treatment facilities. Given that the EBMUD wet weather facilities only provide primary treatment to the wet weather wastewater flow, the wet weather facilities do not treat the heavy metals as needed to meet the revised requirements. In order to eliminate discharge from these facilities, further reduction of wet weather flows from the East Bay Communities is needed as well as an expansion of EBMUD's storage capacity.

Shortly after EBMUD received its reissued NPDES permit in 2009, the USEPA and the Regional and State Water Boards filed suit against EBMUD for discharges in violation of this prohibition and entered into a Stipulated Order (SO). One provision of the EBMUD SO required them to pass an ordinance to implement a Regional Private Sanitary Sewer Lateral (PSL) Program http://www.ebmud.com/psl. The purpose of the PSL program was to reduce the amount of wet weather sanitary sewage flow to their treatment facilities from old leaky private sewer laterals. Another product of the EBMUD SO was the preparation of a Flow Modeling and Limits Report that could be used in the future by the USEPA as a basis for imposing flow limits on each of the East Bay collection system agencies.

In November 2009, the California Regional Water Quality Control Board issued the City of Emeryville NPDES Permit No. CA0038792 for the operation of the City's sanitary sewer system. The most notable difference in this renewed NPDES permit was a discharge prohibition stating "The Discharger shall not cause or contribute to discharges from EBMUD's Wet Weather Facilities that occur during wet weather or that are associated with wet weather."

On November 18, 2009, the USEPA issued the City of Emeryville and all the other Collection System Agencies that are part of the service area of EBMUD treatment facilities, an Administrative Order (AO) to reduce Sanitary Sewer Overflows (SSOs) from its collection system and to control I/I into the collection system so as not to cause or contribute to overflows from the EBMUD wastewater facilities. The AO included a number of requirements for the City to implement immediately in order to improve on the current program for controlling SSOs and to reduce I/I.

Then, on September 6, 2011, the United States District Court Northern District of California issued Stipulated Order for Preliminary Relief (SO). The requirements contained in this SO are similar to those in the 2009 AO, with the addition of penalties for failure to comply with the timeline and reporting requirements. The terms of the SO identify the following work to be performed by the City of Emeryville:

- Maintaining its current program for controlling SSOs and reducing I/I set forth in this SSMP (this document)
- Implementing improvements in its current programs
- Preparing an Asset Management Implementation Plan (AMIP) by July 15, 2012
- Participating in EBMUD's Regional PSL program
- Cooperating with EBMUD in the development of the Regional Flow Monitoring Data Assessment Program
- Formulating a program for inflow identification and reduction
- Providing SSO response, recordkeeping, notification, and reporting
- Implementing a Maintenance Management System by October 15, 2011
- Submitting a Sewer Pipe and Maintenance Hole Inspection plan
- Providing EPA with copies of annual SSO reports now provided to the Regional Water Board

I-2. Requirement from Regulators for Preparing Sanitary Sewer Management Plans

In a statewide effort to reduce the amount of pollution caused by poor management of sanitary sewer collection systems, the Regional and State Water Boards have developed very strict policies in recent years dealing with Sanitary Sewer Overflows (SSO). Some of the major causes of SSO's include grease blockages, root blockages, manhole structure failures, vandalism, pump station mechanical failures, power outages, excessive storm or ground water inflow/infiltration, debris blockages, sanitary sewer system material failures, lack of proper operation and maintenance, insufficient capacity and contractor-caused damages. Many SSOs are preventable with adequate and appropriate facilities, source control measures and operation and maintenance of the sanitary sewer system.

In July 2005, in order to facilitate proper funding and management of sanitary sewer systems, the Regional Water Quality Board issued "New Requirements for Preparing Sewer System Management Plans (SSMP)" to all the sewer collection agencies in the San Francisco Bay Area. These requirements provided for a three-year phased compliance schedule and included exemptions from certain requirements for communities with populations less than 10,000. To be effective, the SSMP's were required to include provisions to provide proper and efficient

management, operation, and maintenance of sanitary sewer systems, while taking into consideration risk management and cost benefit analysis. Additionally, the SSMP had to contain a spill response plan that establishes standard procedures for immediate response to an SSO in a manner designed to minimize water quality impacts and potential nuisance conditions.

On May 2, 2006, the State Water Resources Control Board issued order No. 2006-0003 Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (WDR). The WDR mirrors the Regional Board's SSSP requirements, but includes some additional provisions, one of which is that the City Council must approve the SSMP at a public meeting and it must be made available to the Public in the City's office or on the internet. Also, the SSMP must be updated every five years and the City Council must reapprove the document if significant updates are made.

SECTION 1. GOALS

The goals for the City's SSMP include the following five items:

- To properly manage, operate, and maintain all parts of the wastewater collection system.
- To use a GIS-based system for daily management and operation of all parts of the wastewater collection system.
- To work closely with EBMUD on the FOG program to reduce the amount of fats, oils, and grease in the wastewater collection system in order to prevent SSOs.
- To provide adequate capacity in the collection system to convey the peak wet weather flows to minimize the frequency of SSOs.
- To reduce wet weather I/I by working with EBMUD in the implementation of the Regional PSL Program and by eliminating I/I from pipe defects identified through field work.
- To provide routine training for all personnel involved with the management, reporting, and cleanup of SSOs.

SECTION 2. ORGANIZATION

Figure 3 illustrates the City's organization chart in relationship to the SSMP requirements. The roles and responsibilities of the positions included in this chart are described below. The individuals currently holding key positions are listed in Table 1.

- City Manager - Implements policy, plans strategy, leads staff, allocates resources, delegates responsibility, authorizes outside contractors to perform services, recommends required budget to City Council, and arranges for emergency meetings of City Council if necessary.

- Public Works Director/City Engineer - Provides information updates to the City Council, prepares wastewater collection system planning documents with the help of consultants, oversees preparation of budget for SSMP, coordinates development and implementation of SSMP, oversees the Maintenance Supervisor, Sr. Civil Engineer, and Environmental Programs Administrative Analyst, and is the City's authorized representative for the SSMP.

- Engineering Consultant - Provides technical support to the Public Works Director/City Engineer on issues associated with the sanitary sewer system.

- Sr. Civil Engineer - Assists the City Engineer in the development and implementation of the Capital Improvement Program (CIP), manages the design and oversees construction of CIP projects, manages consulting Public Works Inspectors, and ensures that the new and rehabilitated assets meet the agency standards.

- Public Works Inspector (Consultant) - Inspects construction of City sanitary sewer capital improvement projects and construction of private sewer laterals.

- Environmental Programs Administrative Analyst - Prepares monthly report of SSOs in CIWQS database, submits SSO reports as stated in overflow response plan, prepares written and electronic reports as required, including the annual SSO report.

- Public Works Superintendent - Manages field operations and maintenance activities, manages annual contract for routine and emergency sewer cleaning and closed circuit television (CCTV) inspection, prepares and implements contingency plans, leads emergency response, investigates and reports SSOs, and trains field crew.

- Public Works Administrative Secretary - Directly assists the Public Works Director/City Engineer and Public Works Superintendent with day-to-day efforts of the department, receives and responds to calls from the public.

- Sewer Cleaning/CCTV Contractor - Provides field services for routine and emergency sewer cleaning and CCTV inspection, and structure inspection.

- Public Works Crew Chief - Staffs preventive maintenance activities, mobilizes and responds to notification of stoppages and SSOs, (mobilizes sewer cleaning equipment, by-pass pumping

equipment, and portable generators as needed when contract sewer cleaning firm is not able to respond), rotates on stand-by mode to respond to emergency call-outs during off hours.

- Public Works Maintenance Worker - Works under the direction of the Public Works Crew Chief responding to notification of stoppages and SSOs, rotates on stand-by mode to respond to emergency call-outs during off hours.

As outlined in the "Overflow Response and Reporting Procedure," in the event of an SSO, the Fire Department is generally the initial responder to the scene and the Fire Department Incident Commander is responsible for reporting the SSO to the Regional Water Board and other applicable agencies.

FIGURE 3
CITY OF EMERYVILLE ORGANIZATION CHART
FOR SSMP

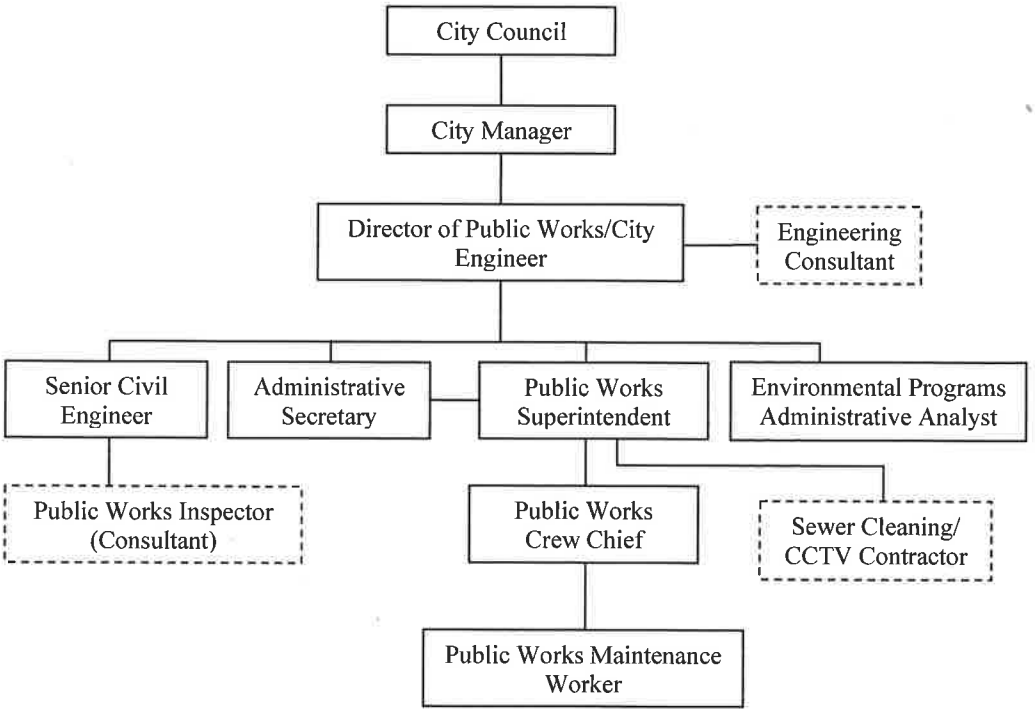

TABLE 1
CITY OF EMERYVILLE CONTACT INFORMATION

Position	Individual	Contact Phone No.	Email Address
City Manager	Patrick O'Keeffe	510-596-4370	pokeeffe@ci.emeryville.ca.us
Assistant City Manager	Delores Turner	510-5964391	dturner@ci.emeryville.ca.us
Director of Public Works, Legally Responsible Individual	Maurice Kaufman	510-596-4334	mkaufman@ci.emeryville.ca.us
Senior Civil Engineer	Michael Roberts	510-596-4333	mroberts@ci.emeryville.ca.us
Public Works Superintendent	Michael Mahoney	510-596-4341	mmahoney@ci.emeryville.ca.us
Environmental Program Administrative Analyst*	Peter Schultze-Allen	510-596-4728	pschultze-allen@ci.emeryville.ca.us
Mayor	Jennifer West	510-596-4376	jwest@ci.emeryville.ca.us
Vice Mayor	Kurt Brinkman	510-596-4376	kbrinkman@emeryville.org
City Council Member	Jac Asher	510-596-4376	jacasher@ci.emeryville.ca.us
City Council Member	Ruth Atkin	510-596-4376	ratkin@ci.emeryville.ca.us
City Council Member	Nora Davis	510-596-4376	ndavis@ci.emeryville.ca.us

* The Fire Department is responsible for the initial communication of SSOs to CIWQS; the Environmental Program Administrative Analyst is responsible for compiling the annual SSO reports.

SECTION 3. LEGAL AUTHORITY

The City's legal authority over the sanitary sewers is contained in the City of Emeryville Municipal Code, Chapter 8 of Title 7, Wastewater Collection System. This code was updated and adopted by the City Council on May 3, 2011.
http://www.codepublishing.com/ca/emeryville/?Emeryville07/Emeryville078.html

3-1. Illicit Discharges (Control I/I, FOG)

Article 4. of Chapter 8 of Title 7, "Sewer Use Regulations," addresses illicit discharges into the City's wastewater collection system. This article includes among other items, prohibited uses, requirements for food service establishments (FSEs) to control FOG discharges, the conditions for discharge of radioactive wastes into the City's collection system, and the permitting of industrial waste discharges.

3-2. Proper Design and Construction

Article 2. of Chapter 8 of Title 7, "Building Sewer Lateral," addresses the requirements for and design of privately-owned building sewer laterals or PSLs. The City has streamlined the permit process for the Public Works Encroachment and the Building Department into a single Sewer Lateral Permit that must be obtained before construction of a new building sewer lateral or the repair, replacement, or abandonment of an existing building sewer lateral. This section of the City's municipal code also adopts the EBMUD Regional PSL ordinance http://www.ebmud.com/sites/default/files/pdfs/071211%20-%20Ordinance%20No.%20355-11%20-%20WW%20Control%20Ordinance.pdf by reference (Municipal Code 7-8.211)

3-3. Installation, Testing, and Inspection

The requirements for installation, testing and inspection of Building Sewer Laterals are defined in Article 2. of Chapter 8 of Title 7. "Building Sewer Lateral," of the Municipal Code..

3-4. Enforcement of Sewer Ordinance

Enforcement of the Wastewater Collection system ordinance is described in Article 6 of Chapter 8 of Title 7.

SECTION 4. OPERATION AND MAINTENANCE PROGRAM

4-1. Resources and Budget

The Sewer Fund is an Enterprise Fund that supports operation and maintenance of the City's sanitary sewer system. The fund is supported by Sewer User Charges collected by EBMUD via water bills. The rates were last increased in January, 1995. Capital funds for sewer improvements are also generated by the Sewer Connection Fee Fund when new development occurs. Emeryville's Sewer User Charge is the lowest in the East Bay region at $8 per month per single family service or $1.25 per month for each 100 cubic feet of water use for multiple family connections. The new sewer connection fee is in the amount of $746 for a single family dwelling equivalent. At this time, there is sufficient revenue generated by the current charges and fees to operate the sanitary sewer system. There is also a sufficient fund balance of assets available to pay for up coming known capital improvements that are needed on the system.

Both the Sewer Rehabilitation Fund and the Sewer Connection Fee Fund are addressed in the City's Operating Budget and Capital Improvement Program. Table 2 outlines the City's sewer operations funds, including the actual budget for FY 2010/2011 and projected budgets for F2011/2012 and FY 2012/2013.

TABLE 2
SEWER OPERATIONS FUNDS

	FY 2010/11 Actual	FY 2011/2012 Budgeted	FY 2012/2013 Proposed Budget
Revenue Estimates			
Investment Earnings	$7,348	$15,816	$7,000
Sewer Service Charges	$812,756	$800,000	$800,000
Total Revenues	**$820,104**	**$815,816**	**$807,000**
Proposed Expenses			
Public Works/Sewer Division	$183,500	$187,134	$190,000
Professional Services	$60,000	$135,000	$130,000
FOG	$8,028	$10,669	$12,000
Maintenance Management Services	$25,000	$25,000	$25,000
Cleaning	$40,661	$136,000	$40,000
Video Inspection	$11,724	$120,000	$10,000
Emergency Repair	-	$25,000	$25,000
Smoke Testing	$11,388	$25,000	$10,000
Pump Station Maintenance	$12,820	$15,000	$15,000
Debt Service	$2,082	$25,000	$25,000
Interfund Transfer	$81,500	$81,500	$81,500
Total O & M Expenses	**$436,703**	**$785,303**	**$563,500**
Capital Improvement Program	$998,776	-	$1,000,000
Total Expenses	**$1,435,479**	**$785,303**	**$1,563,500**

Total Current Assets as reported in the Comprehensive Annual Financial Report Year Ended June 30, 2011 were $4,718,238.

4-2. Collection System Mapping

The City of Emeryville contracts with the firm of Redzone to host a comprehensive web-based maintenance management system for the sanitary sewer system called ICOMMM. The system incorporates GIS database files and mapping and is used to manage CCTV inspection and smoke testing data for the collection system. Given that there have been issues with developing accurate data on the system, the older hard copy plans are still used at times when questions arise. It is expected that a complete transition to the web-based system will be during the 2011/2012 fiscal year. The ICOMMM database includes asset information for sewers, manholes, and the one pump station operated by the City. The City also working on the developing a layer of information on private sewer laterals which should be completed in 2012.

4-3. Routine Preventive Operation and Maintenance Activities

In 2011, the City started a system-wide cleaning and CCTV inspection program of the public sanitary sewer system. The project is anticipated to be complete in early 2012. With the use of the ICOMMM system to manage the CCTV inspection data, a prioritization of preventive maintenance activities will be established.

Given that Emeryville's sanitary sewer system is so small, the system historically used for prioritizing preventative maintenance has been to clean the lines that are known to collect grease and debris. The most frequently cleaned main in Emeryville is the Powell Street main west of I-80. This main is cleaned every three months due to the large grease buildup in the line coupled with the irregular grade of the pipe. This issue is an on-going enforcement issue for the FOG program as the City deals with the various restaurants contributing to the grease problem.

There are no mains in Emeryville that have serious root control problems; however recent CCTV inspection has uncovered a limited number of pipes with root intrusion. As the system-wide CCTV inspection is completed, additional pipes with root intrusion may be identified. Odor control has not been an historical issue in the City.

The City's only pump station was reconstructed during fiscal year 2006/2007 and has weekly inspections.

4-4. Scheduled Inspections and Condition Assessment

Beginning in FY 2010/2011, the City began a system-wide smoke testing, CCTV inspection, and structure inspection program. The system used for identifying pipe condition with the CCTV work is the NASSCO PACP version 4.2-4.4 defect codes. The information is stored and accessed on the ICOMMM system.

Smoke testing for inflow sources has been completed in Basin 20, 21E, 22, and 23. The remaining smoke testing is scheduled for completion in FY 2012/2013. City-wide sewer cleaning, CCTV inspection and structure inspection are expected to be completed in FY 2011/2012. Once the entire system is inspected, smoke testing, CCTV inspection, and structure inspections will be conducted every 10 to 15 years. However, certain line segments may require more frequent CCTV inspection to monitor the rate of buildup of sediment and possible deterioration of non-acute defects.

4-5. Rehabilitation and Replacement Plan

The CCTV inspection data capture technology includes an automated rating system to identify condition-based rehabilitation and replacement needs within the sewer system. As a result of the condition inspections, capital, and operation and maintenance projects can be identified and prioritized via the ICOMMM system. Structures with "poor" or "deteriorated" ratings can also be screened via the ICOMMM system. Once the CCTV inspections are completed, a capital improvement plan, including estimated costs, budgets and schedules, will be formulated. This plan will also incorporate capacity deficiency projects identified in the Sewer System Capacity Analysis.

4-6. Training

Emeryville's training program for the public works crew includes annual training by the Public Works Superintendent on the use and operations of sanitary sewer maintenance equipment. The entire crew was recently trained through a special class on SSO response by an outside consultant and also participated in a seminar by the Alameda County Clean Water Program for hazardous waste spills, including SSOs.

As new crew members are hired, each member is required to complete the SSO response training.

4-7. Outreach to Plumbers and Building Contractors

The City's municipal code is posted in its entirety on the City's website (www.emeryville.org). The Municipal Code includes information on installation, repair and maintenance of privately-owned sewers within the city limits. Information on the PSL Program is also available on the City's website. http://www.ebmud.com/psl

4-8. Contingency Equipment and Replacement Inventories

The City maintains the following contingency equipment and replacement parts for its sanitary sewer system.

- Vactor cleaning truck
- Bypass pump with suction and discharge hose
- Trash pump with suction and discharge hose
- Water trailer
- Portable hydrant meter

- Fire hose and nozzle
- Sand bags and rope
- Plastic sheeting
- Wattles
- Hand tools (shovels, rakes, brooms)
- Plastic bags
- Cones/Barricades/Caution Tape/Signage
- Digital camera

In addition to in-house staff, the City contracts with private sewer service contractors to clean and inspect the collection system and to assist in emergency response to system blockages and SSOs.

SECTION 5. DESIGN AND PERFORMANCE STANDARDS

5-1. Standards for Installation, Rehabilitation, and Repair

The City of Emeryville uses the latest edition of the APWA Green Book for the design and construction standards for sanitary sewers.

5-2. Standards for Inspection and Testing of New and Rehabilitated Facilities

Emeryville Public Works uses the APWA Green Book standards for inspection and testing of new and rehabilitated facilities. The testing is performed by the contractors and the City Public Works Inspector ensures that the proper testing procedure is followed and that the results are adequate prior to approval. Testing methods generally include air testing, video inspection, smoke testing, and dye testing.

In addition to the City's requirements for testing new and rehabilitated sewer facilities, the EBMUD Regional PSL ordinance requires that an EBMUD inspector witness a verification test (air or water pressure test) on all rehabilitated or repaired PSLs that are subject to the Regional PSL program requirements. Upon passing a verification test, EBMUD issues the property owner a certificate of compliance that is effective for 20 years if the entire lateral has been rehabilitated and seven years if the existing lateral has been repaired.

SECTION 6. OVERFLOW EMERGENCY RESPONSE PLAN

6-1. Procedures

The City's overflow emergency response plan is a stand-alone document that was approved by the USEPA on July 15, 2010 as part of the requirements of the Administrative Order. A revised and updated plan dated October 1, 2011, is now in use by the City. This document, entitled "Overflow Response and Reporting Procedure",
http://emeryville.org/DocumentView.aspx?DID=1694
contains instructions for:

- Incident Notification
- Incident Operations
- Incident Reporting
- Staffing Resources
- Equipment List

6-2. Description of Procedure Elements

The following elements are incorporated in the City's "Overflow Response and Reporting Procedure:"

- Notification - This document outlines the procedures for internal notification of a spill including to the Public Works Superintendent and the Fire Department as well as external notification to the Regulatory Agencies.

- Response - This document outlines how the City staff and contracted support staff are to follow the "Overflow Response and Reporting Procedure" when mitigating an overflow, correcting a sewer deficiency, warning the public, and cleaning up during the spill and after it has been stopped.

- Emergency Operations - This document includes instructions on isolating the spill site with barricades and caution tape, and posting warning signs as appropriate. Traffic control may be as required depending on the size and location of the spill.

- Reporting - This document outlines the timeline and responsibility for incident reporting to local, regional, and state agencies.

- Mitigation - This document outlines the procedures for identifying the cause of the spill, the actions necessary to stop and contain the spill, the follow-up activities to prevent similar spills in the future, and necessary clean-up activities.

SECTION 7. FATS, OILS, AND GREASE (FOG) CONTROL PROGRAM

7-1. Purpose

The purpose of having a FOG control program is to eliminate or minimize the discharge of fats, oils, and grease into the sanitary sewer system, thereby reducing the formation of blockages that could result in SSOs. The City's legal authority and requirements for FOG control are included in Article 4 of Chapter 8 of Title 7 of the Municipal Code. In addition, the City participates in the EBMUD Regional FOG Control Program.

7-2. EBMUD Regional FOG Control Program

The EBMUD Regional FOG Control Program consists of permitting, inspections, and multiple-language outreach to food service establishments (FSEs) in the service area. http://emeryville.org/DocumentView.aspx?DID=1695
The program requires the installation of a grease interceptor under defined circumstances, maintenance of all grease removal devices at a facility, and maintenance record keeping. This program includes the following elements http://www.ebmud.com/fog

- Source identification
- Legal authority
- Program structure/requirements
- Grease removal device technology for FSEs
- Inspections and monitoring for FSEs
- Enforcement for FSEs
- FOG disposal
- Public Education and Outreach

SECTION 8. CAPACITY MANAGEMENT

8-1. Capacity Assessment

In June 2010, the City completed its "Sewer System Capacity Analysis and Master Plan." This plan includes a hydraulic capacity model of the City's sanitary sewer system and identifies line segments with existing and projected future capacity deficiencies under design wet weather flow conditions (5-year storm). Since the City has fixed boundaries, additional future flows in the system will stem from land use changes in Emeryville and upstream in Oakland, rather than expansion of the service area.

8-2. System Evaluation and Capacity Assurance Plan

The Sewer System Capacity Analysis and Master Plan identified 18 reaches of pipe within the City of Emeryville that have deficient capacity. Of these, fourteen were replaced by the City in 2011. The remaining deficient pipe segments within the City are four reaches of pipe at the east end of Powell Street near the Oakland City limits. These pipes carry flow primarily from the City of Oakland. The upsizing of these pipes will be addressed in the near future when the Capital Improvement Program is developed.

8-3. Capacity Improvement Projects

The City has addressed its sewer capacity deficiencies along with its sewer rehabilitation projects. At this time there are only four reaches of pipe on Powell Street with modeled deficiencies under design storm conditions. The need for a capacity improvement project for these pipes will be addressed after the condition assessment has been completed.

SECTION 9. MONITORING, MEASUREMENT, AND PROGRAM MODIFICATIONS

In general, Emeryville's sanitary sewer system performs very well since it is mostly new. The City is small geographically and communication is good between departments so various staff can work together to report overflows quickly for rapid response times. During the 2010 and 2011 calendar years there were no overflows in the City. The City reports to the State CIWQS website on a monthly basis to report SSOs should they occur.

The ICOMMM system is being used to track maintenance activities on the collection system and can also be used to measure the level of effort placed on the program. This tool can be used to determine if SSMP program modifications are necessary.

SECTION 10. SSMP AUDITS

Beginning in 2012, the City will conduct an annual audit of its SSMP and report the findings of the audit to the Regional Water Quality Control Board and the State Water Resources Control Board as part of its annual Sanitary Sewer Overflow report, which is due by March 15 each year.

The audit report will identify the results of implementing the SSMP elements, necessary improvements to the SSMP, sewer system improvements undertaken during the reporting year, and planned improvements for the coming year.

Approximately every five years or if significant system changes warrant it, the SSMP will undergo a formal review and revision, which will be taken to the City Council for approval.

SECTION 11. COMMUNICATIONS

The City maintains a website (www.emeryville.org) to inform the public about all aspects of city government. As a member of the East Bay Technical Advisory Board (TAB) and the East Bay Collections Systems Advisory Committee (EBCSAC), the City communicates and works with other East Bay collection agencies on a regular basis.

DESIRABLE

Housing should meet the needs of various ages and groups. The Bayside Park development in Emeryville offers independent and assisted living for seniors, in an attractive design and transit accessible location.

DESIRABLE

High-rises are fronted by townhomes with entrances at the street level in this San Diego development, providing more access points and increasing safety and security, since residents can look directly onto the street.

DESIRABLE

Landscaped walkways add charm to residential projects.

DESIRABLE

Balconies created through building stepbacks, and windows create textured buildings for both the residents and passersby in this Emeryville example.

RESIDENTIAL

SITE & BUILDING DESIGN

J-21 Design housing to support a range of household types, incomes, and sizes.

J-22 Landscape pedestrian walkways to provide attractive spaces, as well as privacy.

J-23 Provide visual privacy between units. Where units face each other across a narrow distance, windows should be offset.

J-24 Place the mailboxes on the path to units from the main pedestrian entrance.

J-25 Arrange parking, pedestrian circulation, and building entrances so that residents and visitors are encouraged to access residential units from a street or greenway.

J-26 Consider additional lighting, changes in plane, and other security measures to ensure safety and security. Avoid using bars or security grills on windows and doors.

J-27 For all multifamily residential development, promote identity and street safety.

- Design a portion of the ground level frontage of all multifamily residential developments (including high-rises) to be residential units or other active uses, with individual or paired entrances from the street edged with landscaping. Alternatively, articulate ground-floor residential building façades to differentiate individual residential units

Exhibit A

from each other and from the overall massing of the building, in order to express a rhythm of individual units along the street.

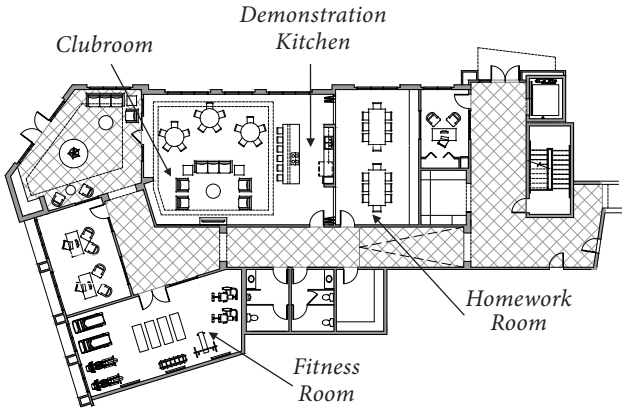
- Design ground floor units to include windows that face onto the street. At the same time, ensure the privacy of residents by considering the interior floor height, window height and other design factors. Maximize views of the street from the interiors of units while minimizing views into units from the street.

J-28 In projects with 30 or more units, provide a community multipurpose room with at least 500 square feet of space, internet access, kitchen facilities and a rest room, for parties, meetings, homework clubs, computer access, art, or other resident activities.

DESIRABLE

This Emeryville affordable housing project at 3706 San Pablo features an interior courtyard with designated circulation paths and play areas for different age groups.

J-29 In corridors serving six units or more, define entries and break up walls by using lighting and articulation of walls and ceiling.



J-30 Provide efficient access from units to exterior common open space, and visual connections from interior hallways and stairs to exterior space.

UNIT DESIGN

J-31 Maximize ventilation and sunlight by providing multiple exposures and shallow unit depths as much as possible. Place living areas along exterior walls and place bath and storage areas along interior walls.

J-32 Take advantage of views and natural light, particularly for living areas, by providing large areas of glazing looking onto streets, yards, or other exterior spaces. Provide shading on south and west exposures.

DESIRABLE

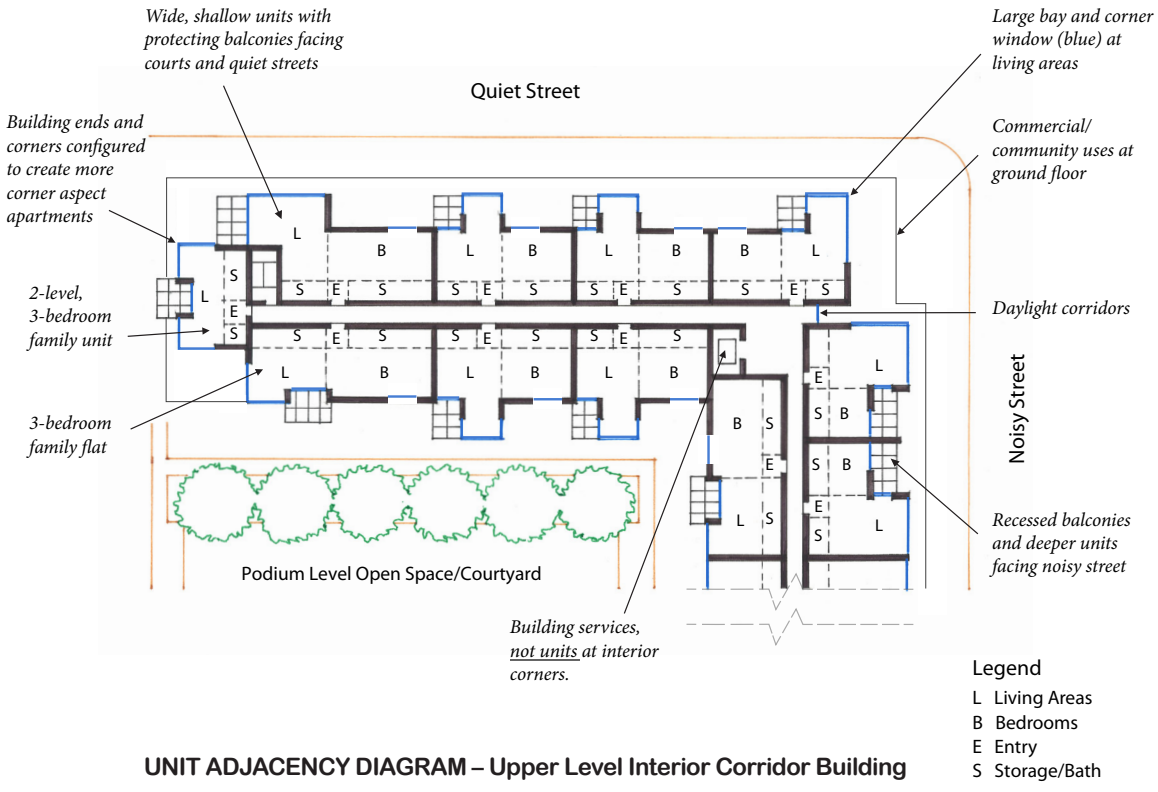
The 3706 San Pablo project offers a variety of amenities to the residents, including a clubroom, a homework room, a demonstration kitchen and a fitness room.

J-33 Maintain a sense of privacy from within housing units, while allowing views onto streets and interior courtyards.

J-34 Provide visual interest and improve quality of life for inhabitants through the use of stoops, porches, recessed windows, bay windows, and balconies.

J-35 Incorporate architectural features and materials that assure high-quality, human-scale, distinctive design that is comfortable and attractive to residents. Consider vaulted ceilings; arches; corner treatments; window, ceiling, and roof proportions; and the proportional relationship between the façade and the roof, where roof height is less than or equal to floor height, above the first floor.

J-36 For units that are adjacent to common open space, provide access through transition spaces between the units and the common space.



J-37 Kitchens should be well ventilated with windows providing cross ventilation or a quiet, powerful fan venting to the outside.

J-38 In units with two or more bedrooms, include an entry coat closet, a pantry, and a linen closet or cabinet.

J-39 In multi-level units, provide closed stair risers.

J-40 Show furniture in unit plans submitted for planning approvals.

DESIRABLE

UNIT ADJACENCY DIAGRAM – Upper Level Interior Corridor Building

The relation of units to each other, the type of streets and open space is important for successful family-friendly design.

FAMILY-FRIENDLY RESIDENTIAL

SITE & BUILDING DESIGN

J-41 Provide units with two, three or more bedrooms.

J-42 In high density housing, include a variety of unit types. Multi-story units can be included in a larger building with single-story units for greater diversity.

J-43 Place and configure units to relate well to quiet and noisy streets, on-site open space and each other, as shown in the Unit Adjacency Diagram.

J-44 Situate as many family-oriented units as possible adjacent to open spaces designed and landscaped to create active play areas and opportunities for gathering and quiet respite.

J-45 Provide ample exterior play areas that are safe and visible from major spaces in homes, with a variety of age-appropriate equipment.

J-46 Design visible places where pre-teens and teens will want to gather.

J-47 In larger projects (e.g. over a hundred units), consider dividing the project into sections where residents have exclusive access to their common and circulation areas.

J-48 Designate parking for family-friendly units near hallways and elevators. If parking lifts are used for family units, they should not require backing one car out to get to another car.

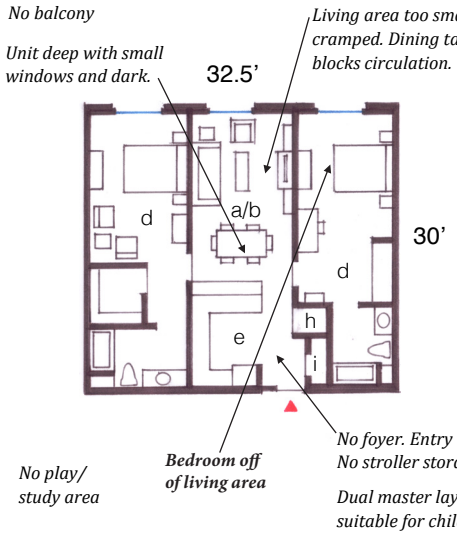
J-49 Provide more bicycle parking than the code requires, with space for longer family bicycles and trailers.

J-50 Provide ample in-unit or common laundry areas. Common laundry areas should have convenient access, and be located on each floor, or near common gathering space. In-unit laundry facilities are preferred in units with three or more bedrooms.

UNIT DESIGN

J-51 Front doors should not enter directly into a room, but rather should enter into a transitional space, which could be an enclosed foyer.

J-52 Provide indoor space near the entry for tricycles, strollers, outdoor toys, etc., where parked items will not obstruct circulation.

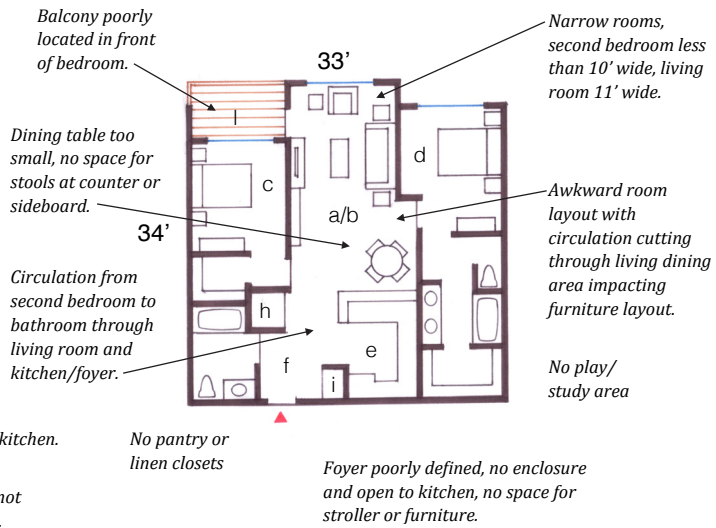


J-53 Provide only one master suite. Other bedrooms should have access to a common bathroom. In three-bedroom units provide at least two full bathrooms.

J-54 Separate sleeping areas from living areas. In two-level units, place bedrooms on a separate floor from living areas.

J-55 Provide each bedroom with access to a full bathroom without going through the living room, dining room or kitchen. Provide a bathtub in the unit. In multi-level units, provide at least a half bath on the floor with the living room, dining room and kitchen.

UNDESIRABLE

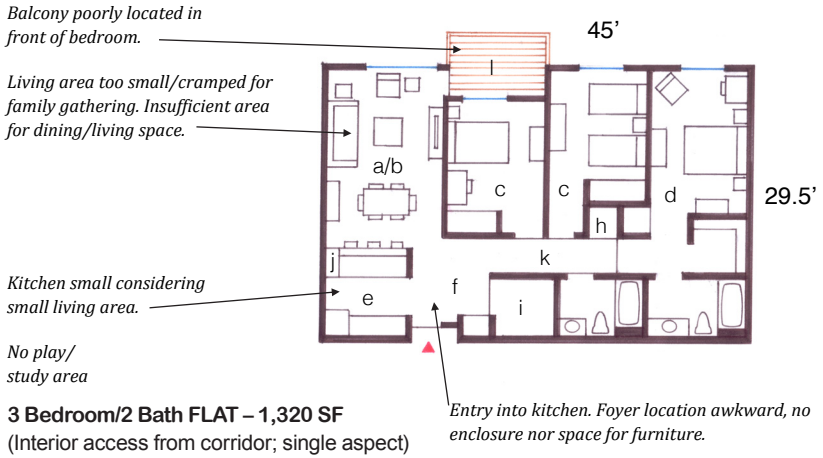


All rooms narrow, minimal space for circulation around furniture.

2 Bedroom/2 Bath Dual Master FLAT – 975 SF
(Interior access from corridor; single aspect)

UNDESIRABLE

Deep unit requires more floor area than shallow unit to fit rooms, but is cramped and has poor daylight potential.



2 Bedroom/2 Bath FLAT – 1,035 SF
(Interior access from corridor; single aspect)

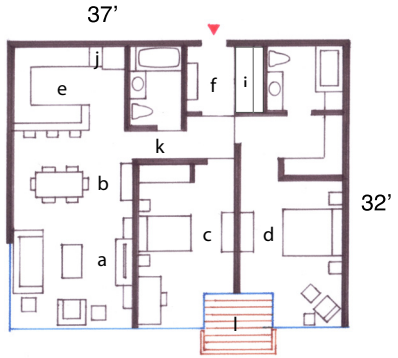
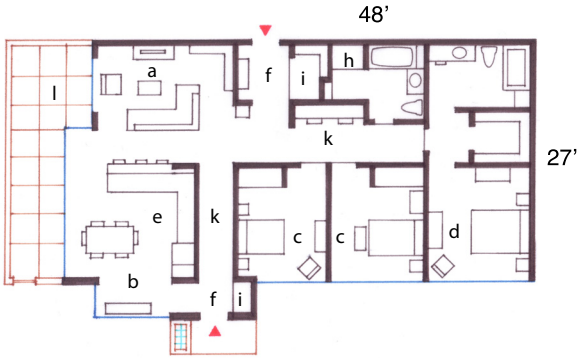
(Interior access from corridor; single aspect)



DESIRABLE



EXAMPLE A
2 Bedroom/2 Bath FLAT – 1,100 SF
(Interior access from corridor; large bay form)

EXAMPLE C
3 Bedroom/2 Bath FLAT – 1,300 SF
(Interior access from corridor; single aspect)

EXAMPLE B
2 Bedroom/2 Bath FLAT – 1,152 SF
(Interior access from corridor; deep unit; adjacent unit set back or shallow to improve daylight)

EXAMPLE D
3 Bedroom/2 Bath FLAT – 1,419 SF
(Exterior access from courtyard/mew; private patio; building corner/end location)

The examples above illustrate ways to arrange one-story family friendly two- and three-bedroom units.

J-56 The dining area should have enough room for a family-sized dining table with all household members seated around it, plus circulation. The living area should also have enough room for seating for all household members plus other furniture and circulation.

J-57 In units near play areas, provide windows that allow for supervision of children outdoors.

J-58 Hallways in units should be well lighted and wide enough for children to play in.

J-59 Provide space that can change use as children grow, such as from toddler play to homework to music making to gathering.

1.0 Executive Summary

- Environmental noise measurements were conducted at the project site. The noise environment is dominated by trains on the Union Pacific Railroad (UPRR) line and traffic on Shellmound Street, the I-80 offramps, and I-80. Measured noise levels range from DNL[1] 68 to 86 dB which is considered "Conditionally Acceptable" to "Clearly Unacceptable" per the City's noise and land-use compatibility guidelines.

- Measurements of ground-borne vibration were conducted at the closest project setbacks to the UPRR rail line. Vibration levels were within the Federal Transit Administration (FTA) guidelines; however, we recommend that a disclosure to future residents be made notifying them of vibration from train passbys.

- In order to meet the interior noise criterion of DNL 45 dB in the residences, sound-rated windows, exterior (patio) doors, and upgraded exterior walls are necessary. The following summarizes the required STC[2] ratings:
  - Windows: STC 35 to 50
  - Exterior Doors: STC 32 to 42
  - Exterior Walls: STC 40 to 60

2.0 Project Description

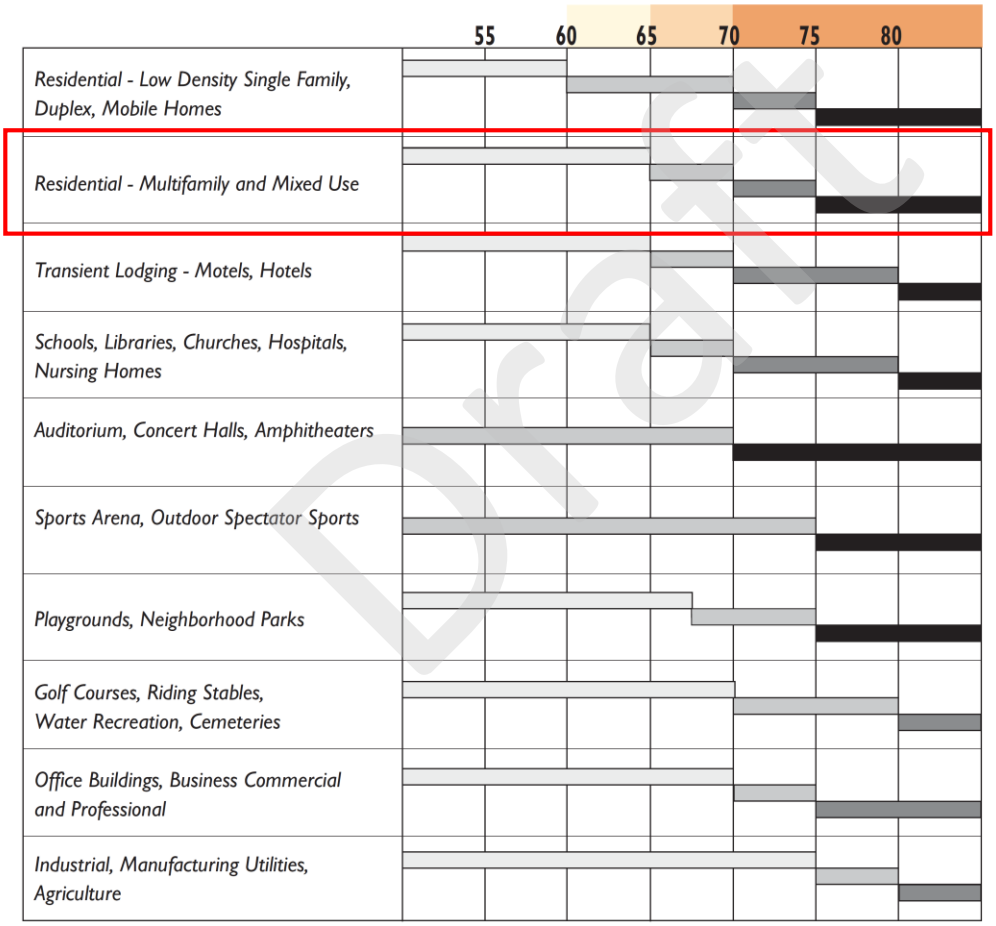
The project consists of a mixed-use, seven-story building with residences, retail, and amenity spaces. A total of 211 residential units are planned. The project site is located in Emeryville, east of Interstate 80, south of the Ashby/Shellmound offramps, and west of Shellmound Street. There is an active rail line east of the site, just past Shellmound Street; the rail line consists of three active tracks and one siding and is used by both freight and passenger trains.

CSDA conducted an environmental noise and vibration study to quantify the existing environmental noise and vibration levels at the site and provide mitigation recommendations to meet the applicable project criteria. This report summarizes our findings and recommendations.

Draft

[1] Day/Night Average Sound Level (L_{dn} or DNL): A descriptor established by the U.S. Environmental Protection Agency to describe the average day-night level with a 10 dB penalty applied to noise occurring during the nighttime hours (10 pm to 7 am) to account for the increased sensitivity of people during sleeping hours. A 10 dB increase in sound level is perceived by people to be twice as loud.

[2] Sound Transmission Class (STC): A single number used to rate how well a building partition (wall, floor/ceiling assembly, door) attenuates airborne sound.



3.0 Acoustical Criteria

The project is located in Emeryville and is subject to the City's General Plan Noise Element acoustical criteria and the acoustical criteria contained in the State Building Code. In addition, the Federal Transit Administration stipulates rail vibration criteria. The following summarizes the relevant project criteria:

3.1 Emeryville General Plan

The Land Use and Conservation, Safety, and Noise Elements from the City's 2009 General Plan stipulates the following:

- Policy CSN-P-50: The community noise compatibility standards (reproduced below) shall be used as review criteria for new land uses.

Draft

- Policy LU-P-25: If new residential buildings are proposed adjacent to freeways and railroad tracks impacts of these corridors, including noise, vibration, and air pollution, should be considered during site planning. Noise, vibration, and air pollution shall be mitigated to the extent possible.

- Policy CSN-P-52: Occupants of existing and new buildings should be protected from exposure to excessive noise, particularly adjacent to Interstate-80 and the railroad.

- Policy CSN-P-53: A noise study and mitigation measures shall be required for all projects that have noise exposure levels greater than "normally acceptable" levels.

- Policy CSN-P-54: Developers shall reduce the noise impacts of new development through appropriate means (e.g., double-paned or soundproof windows, setbacks, berming, and screening). This noise attenuation method should avoid the use of visible sound walls.

3.2 California Building Code

The 2010 California Building Code (CBC), Section 1207, stipulated an interior noise level requirement of DNL 45 dB for multi-family residences; however, the new 2013 California Building Code no longer stipulates this criterion. However, we understand Emeryville's General Plan EIR stipulates the DNL 45 dB criterion, and, regardless, we recommend that noise levels in the multi-family residences be DNL 45 dB or less.

The 2013 California Green Building Code, Section 5.507, stipulates an hourly L_{eq} limit of 50 dB in occupied, non-residential spaces (e.g., the retail spaces, leasing office) for projects with noise exposure above DNL 65 dB.

3.3 Federal Transit Administration

The Federal Transit Administration stipulates vibration criteria for rail activity.[3] Table 1 summarizes the criteria:

Table 1 – FTA Rail Vibration Criteria, RMS (VdB re 1 micro-inch/sec)

Land Use Category	Frequent Events [1]	Occasional Events [2]	Infrequent Events [3]
Residences and buildings where people normally sleep	72	75	80
Institutional Land uses with primarily daytime use	75	78	83

[1] "Frequent Events" is defined as more than 70 vibration events of the same source per day.
[2] "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
[3] "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day.

Per the Fehr and Peers Transportation Assessment dated March 28, 2014, there are up to 63 train passbys per day. Since the guidelines above were designed for light rail rather than freight, we are applying the "Frequent Events" criteria to all train passbys since there is a mixture of freight and passenger trains. However, per the FTA, we are applying the criteria for "infrequent events" to freight locomotive vibration levels since the duration of the actual locomotive passby is short.[4]

[3] Federal Transit Administration, 2006. Transit Noise and Vibration Impact Assessment (DTA-VA-90-1003-06).
[4] Ibid. Section 8.1.3, Page 8-5.

4.0 Noise Measurement Results

In order to quantify the noise environment at the site, long-term (i.e., 48 hour) noise measurements were conducted at three locations from April 29 to May 2, 2014. Short-term (i.e., 10 to 60 minute) measurements were conducted at four locations to supplement the long-term measurements and quantify noise levels at the upper floors of the project.

The noise environment at the project site is dominated by noise from the UPRR line, especially train horns as they approach the grade crossings from the south. We measured train horn noise levels between 100 and 110 dB. Noise from traffic on Shellmound Street, the I-80 off ramps, and I-80 also contribute to the noise environment.

Figure 1 shows the noise measurement locations; Table 2 summarizes the noise measurement results.

Table 2 – Noise Measurement Results

Location	Description	Height (feet)	Measured DNL (dB)
LT-1	Shellmound Street, dominated by UPRR noise	12	86
ST-1	Shellmound Street, at project setback	25	85
ST-2	Shellmound Street, at project setback	6	82
LT-2	I-80 off ramps, north portion of site	12	71
ST-3	I-80 off ramps, north portion of site	25	68
LT-3	West end of site facing I-80	6	69
ST-4	West end of site facing I-80	25	70

In order to calculate the noise level at the outdoor-use areas and interior (courtyard) facades, we created a three-dimensional computer model. The results of our noise modeling are shown in Figures 2 through 5.

Noise levels at the facade facing Shellmound Street and the UPRR lines are considered "Clearly Unacceptable" for residential uses per the City's noise and land-use compatibility standards. However, we understand this incompatibility was addressed in the General Plan EIR. The noise level at the other building facades is considered "Conditionally Acceptable" to "Normally Unacceptable." Noise levels at the courtyards and roof deck (DNL 67 to 70 dB) are considered "Conditionally Acceptable."

Draft

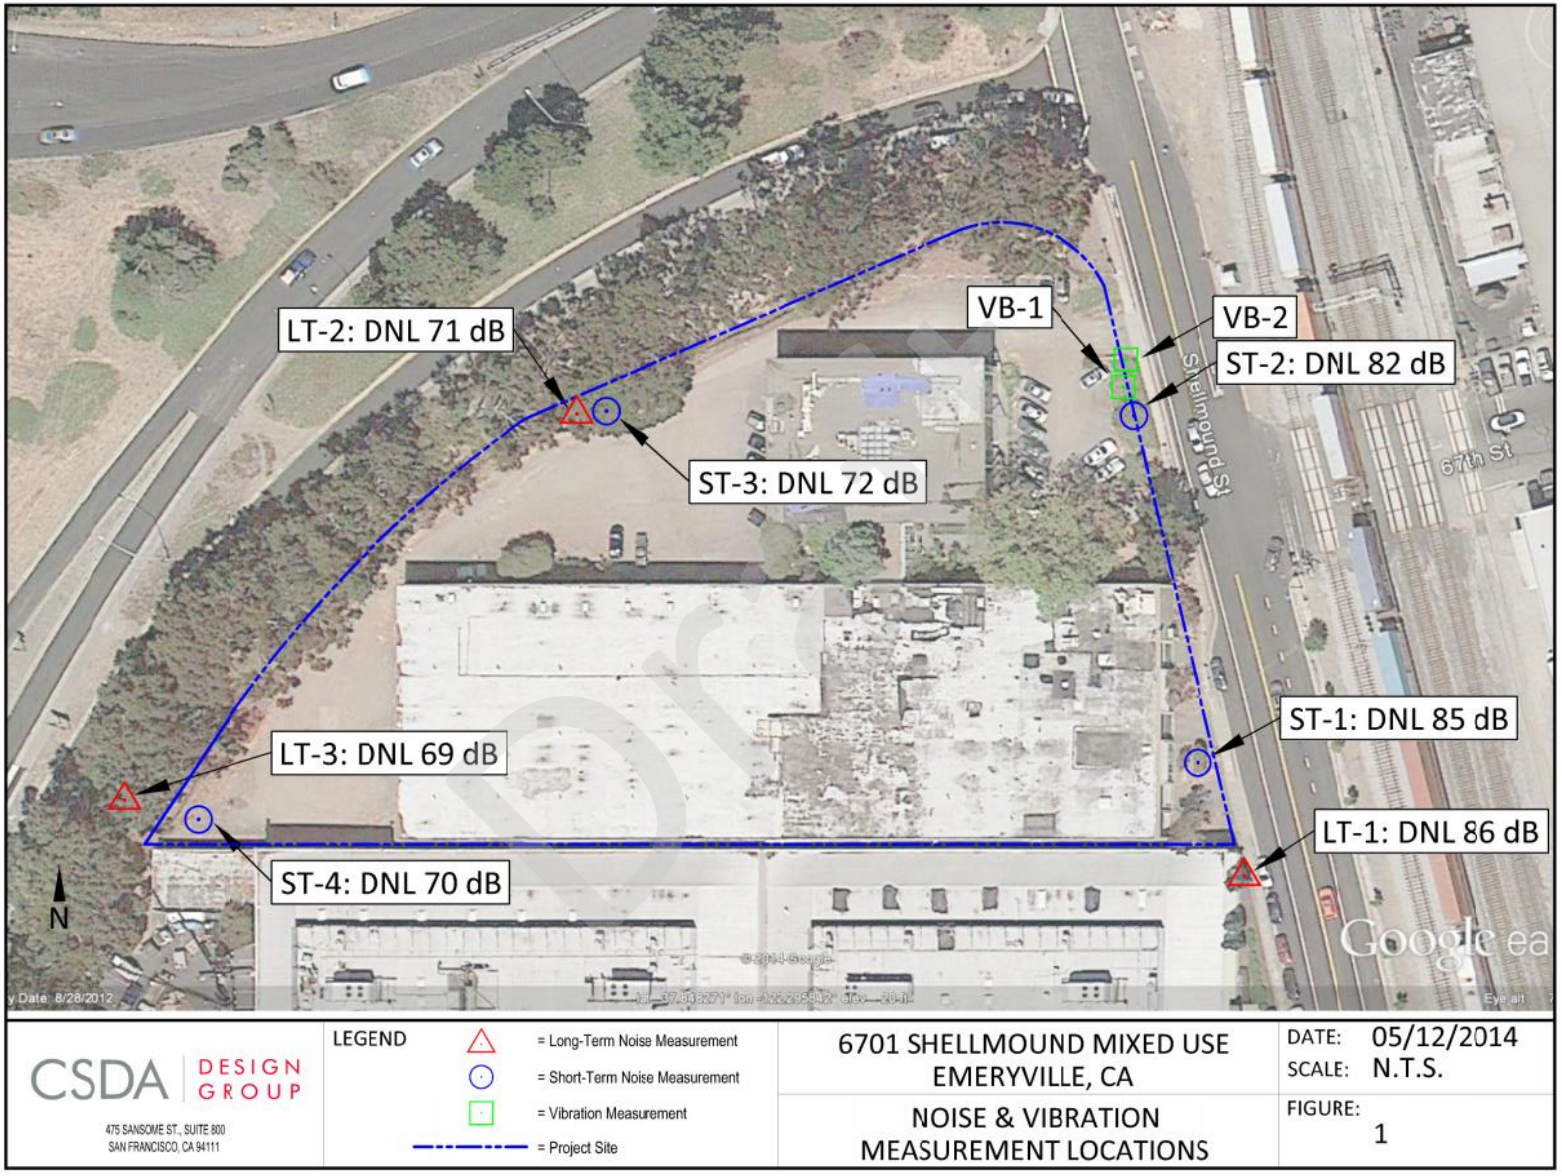


Figure 1 – Measurement Locations and Measured DNL

Figure 2 – DNL Noise Levels, Plan View

Figure 3 – DNL Noise Levels, View from Northeast

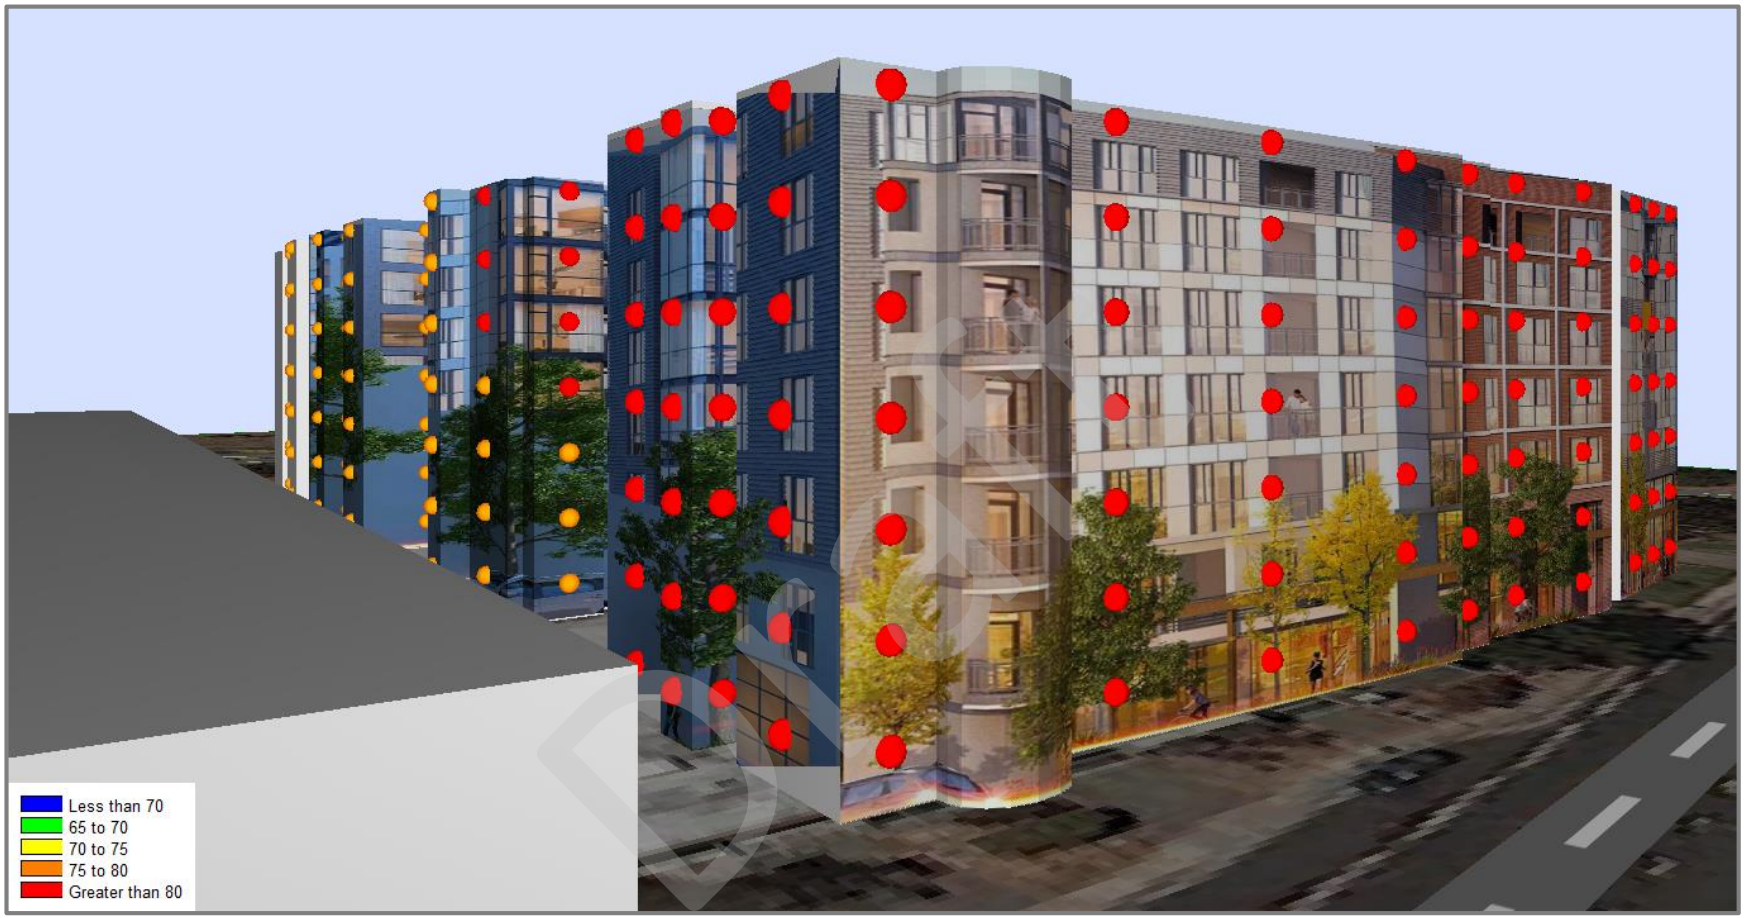

Figure 4 – DNL Noise Levels, View from Southeast

5.0 Rail Vibration

We measured ground-borne train vibration levels at two locations along the future west facade of the project building; see Figure 1 for the measurement locations. Both measurement locations were approximately 90 feet from the closest active rail line. We measured multiple freight and passenger train passbys at varying speeds on all three active tracks. Table 4 presents the results of our train vibration measurements.

Table 3 – Measured Train Vibration Levels, (VdB re 1 micro-inch/sec)

Event	Measurement Location	Measured Vibration Level	FTA Criteria
Freight Train Locomotive	VB-1	76	80 (Infrequent)
Freight Train Locomotive	VB-2	75	80 (Infrequent)
Freight Train Cars	VB-1	69	72 (Frequent)
Freight Train Cars	VB-2	68	72 (Frequent)
Passenger Trains	VB-1	63	72 (Frequent)
Passenger Trains	VB-2	63	72 (Frequent)

The measured train vibration levels meet the FTA criteria.

Draft

6.0 Recommendations

6.1 Interior Noise Calculation

In order to meet the DNL 45 dB criterion inside of the residences and the L_{eq} 50 dB criterion in the non-residential spaces, sound-rated windows and exterior doors are required. Our calculations are based upon the March 7, 2014 Planning Study Session drawings and, where information was not shown on the drawings, we used typical window sizes. These calculations will need to be refined as the project design progresses. We incorporated future increases in traffic noise levels into our calculations; these were based upon traffic volume increases contained in the Fehr and Peers traffic study and a 2% increase in traffic volume per year on I-80.[5]

Where sound-rated windows are required to meet the interior noise requirement, fresh air ventilation should be provided. The ventilation system should meet applicable Code requirements and should not compromise the noise reduction provided by the exterior facade assembly.

The STC ratings provided are for the entire window assembly, including frame and seals. Table 4 summarizes the required STC ratings; we have organized the ratings by building zone. Figure 5 shows the zones and required ratings on the project plan.

Table 4 – Summary of Exterior Noise Levels and Preliminary Facade STC Ratings

Zone/Facade	Future Exterior Noise Level, DNL (dB)	Windows	Balcony Doors	Exterior Walls*	Interior Noise Level, DNL (dB)	Meets Criteria?
A - East	82-84	STC 50	STC 42	STC 60	45	Yes
B – Southeast/Northeast	82	STC 45	STC 42	STC 55	45	Yes
C – South	80	STC 45	STC 42	STC 50	45	Yes
D – South/North	74-79	STC 40	STC 35	STC 45	45	Yes
E – West/Courtyards	66-73	STC 35	STC 32	STC 40	45	Yes
Non-Residential Spaces	L_{eq} 82	STC 41	NA	NA	L_{eq} 50	Yes

Note: We assumed the standard exterior wall assembly meets STC 40 unless otherwise noted; this will need to be confirmed during detailed design. Exterior wall ratings above STC 40 will require additional layers of gypsum board, resilient channels, and/or double-stud construction.

6.2 Vibration

Although the train vibration levels meet the FTA criteria, we recommend a disclosure be made to residents advising them of vibration from train passbys.

[5] The 2% traffic volume growth is based upon the 2007-2012 average traffic volume growth summarized in the 2012 Traffic Volumes on the California State Highway System book published by Caltrans.

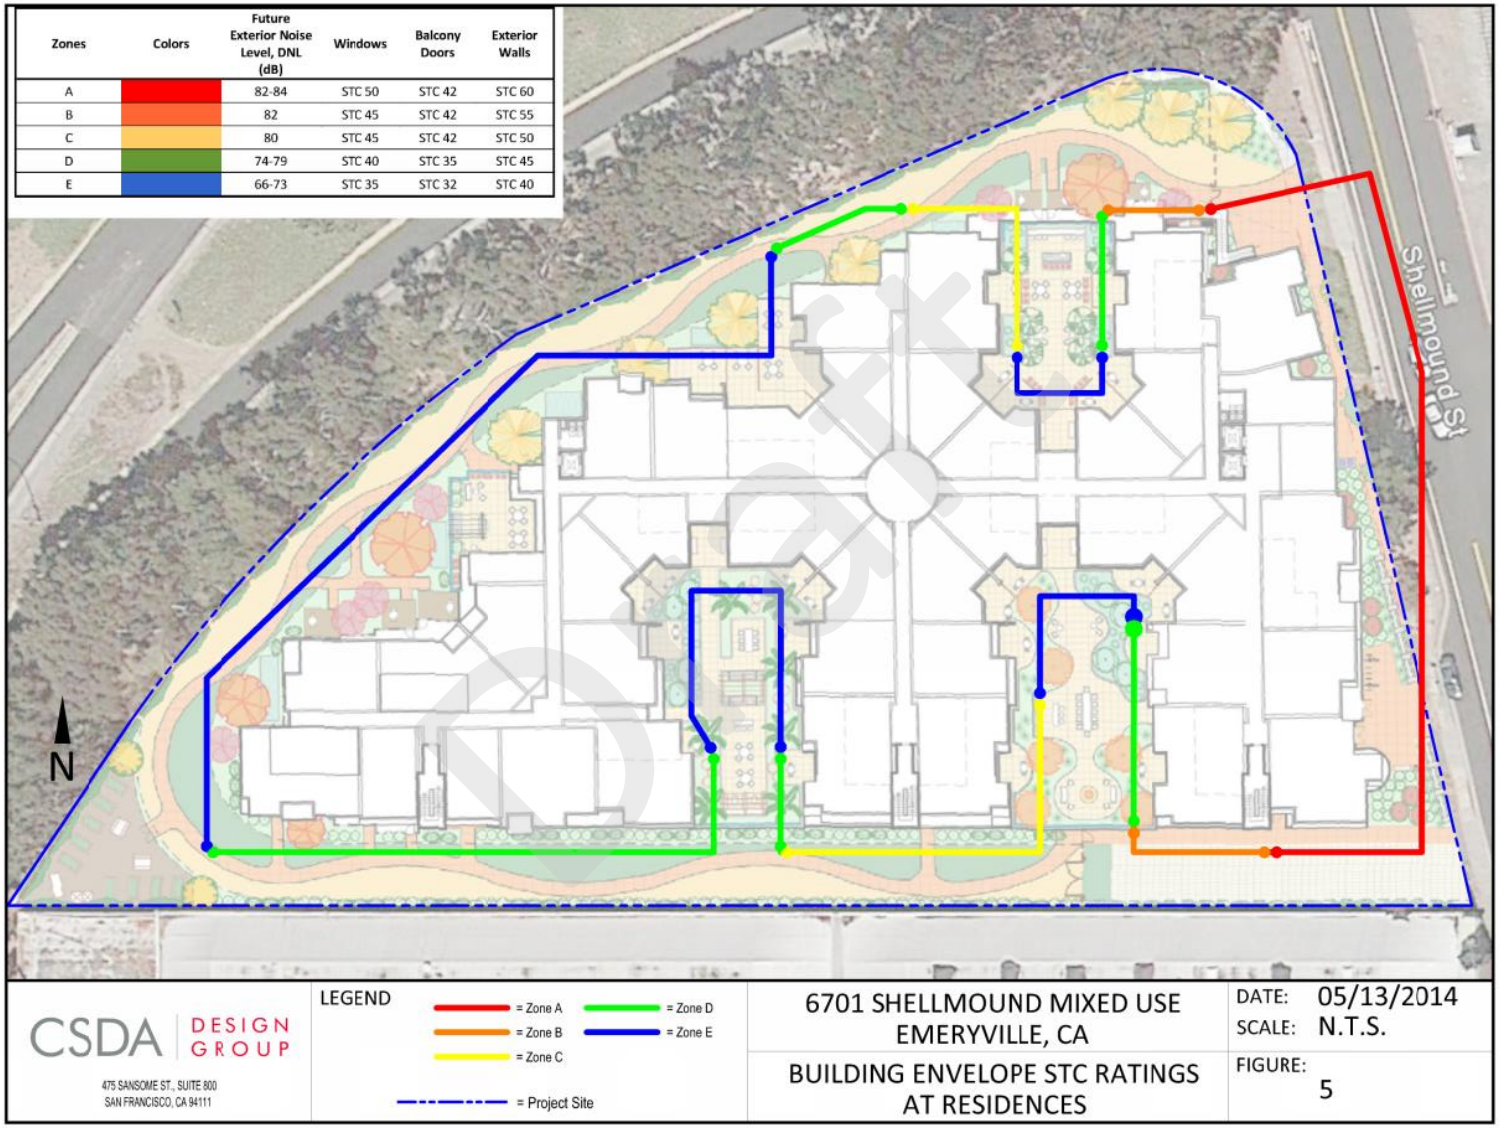

Figure 5 – Building Envelope STC Ratings at Residences

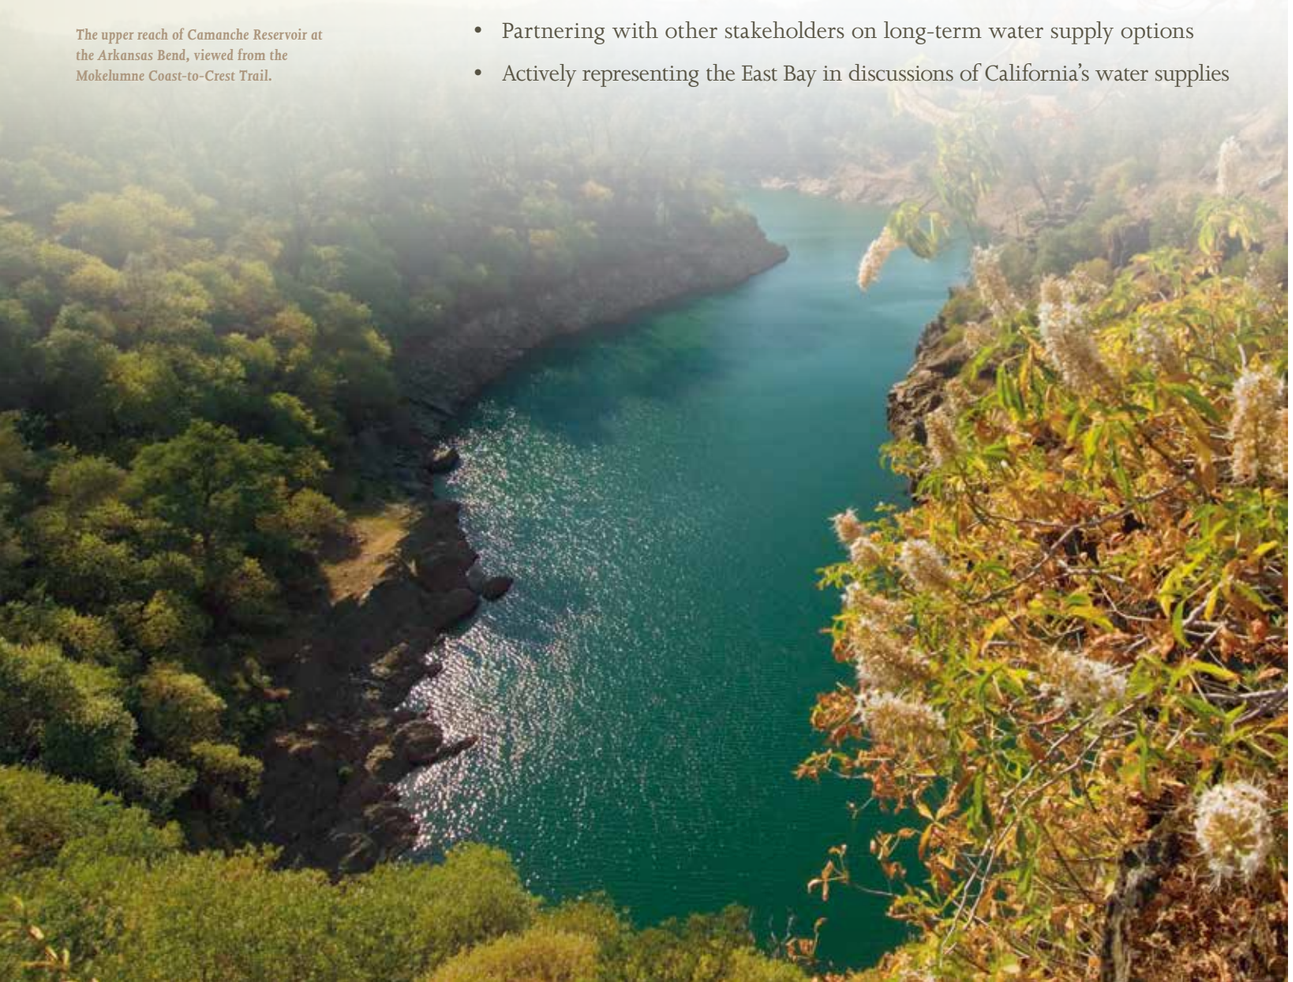
East Bay Water

A Status Report on Local Water Use & Water Supplies

EBMUD

Introduction



This report describes the water supplies currently used by East Bay communities and plans for ensuring reliable supplies for the future.

The East Bay Municipal Utility District provides drinking water supplies essential to the quality of life we enjoy in the East Bay. Our ability to reliably provide water depends on many partnerships. Local residents and businesses use water efficiently and help us stretch the available supplies. We coordinate infrastructure work with local communities to cost-effectively maintain the water supply and delivery system that stretches across 4,100 miles of pipes. Throughout northern California, a host of agencies work with us to find and store water supplies and protect watersheds for future generations.

As a public agency, EBMUD ensures delivery of supplies to meet today's needs and plans for tomorrow's water needs with guidance from an elected Board of Directors. Adopted Board policies give priority to:

- Improving water efficiency through conservation and recycling
- Promoting environmental sustainability
- Preserving the existing boundaries of the area that receives water service
- Requiring new customers in the service area to be water-efficient from the start
- Partnering with other stakeholders on long-term water supply options
- Actively representing the East Bay in discussions of California's water supplies

The upper reach of Camanche Reservoir at the Arkansas Bend, viewed from the Mokelumne Coast-to-Crest Trail.

Inside

Current Water Supply 2

Conservation Water 5

Recycling Water 9

Future Water Supply 11

EBMUD and the Delta 16

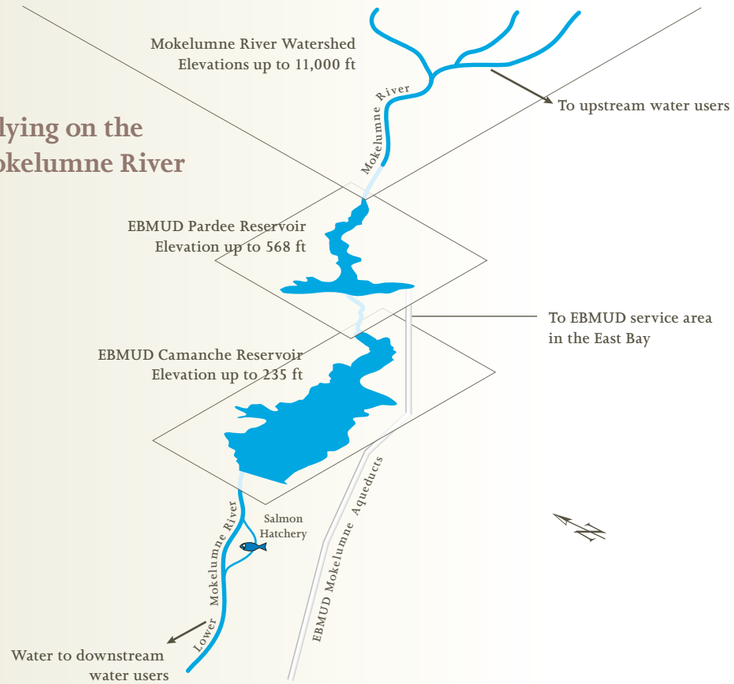
Pardee Reservoir holds most of EBMUD's water supplies. Its depth enables EBMUD to retain cold water and release it through Pardee Dam to the lower Mokelumne River in the fall, providing cooler water to support a healthy fishery.

Current Water Supply

EBMUD's 1.3 million customers used an average of 161 million gallons per day of water in calendar year 2011 and a similar amount in 2012. To meet the daily water needs of businesses and residents in the East Bay, EBMUD relies on water stored in two large Sierra reservoirs and a network of more than 160 local reservoirs and neighborhood tanks. We reduce water demand by supporting customer efforts to use water efficiently and by providing recycled water for industrial and irrigation uses. In dry years when water supplies are short, EBMUD can activate a contract for additional water supplies from the Sacramento River and can draw some water from underground storage in a local groundwater basin. (The map on pages 14–15 shows available and future water supplies.)

EBMUD evaluates the water supply throughout each rainy season. Each April we forecast one of four scenarios for the following October: normal conditions, moderate shortage, severe shortage or critical shortage. Moderate and severe shortages, respectively, occurred in 2008 and 2009 and customers rationed their water use. In 2010, 2011 and 2012, EBMUD's supply was normal. Under normal water supply conditions, EBMUD asks that customers use water wisely.

Water for Daily Use

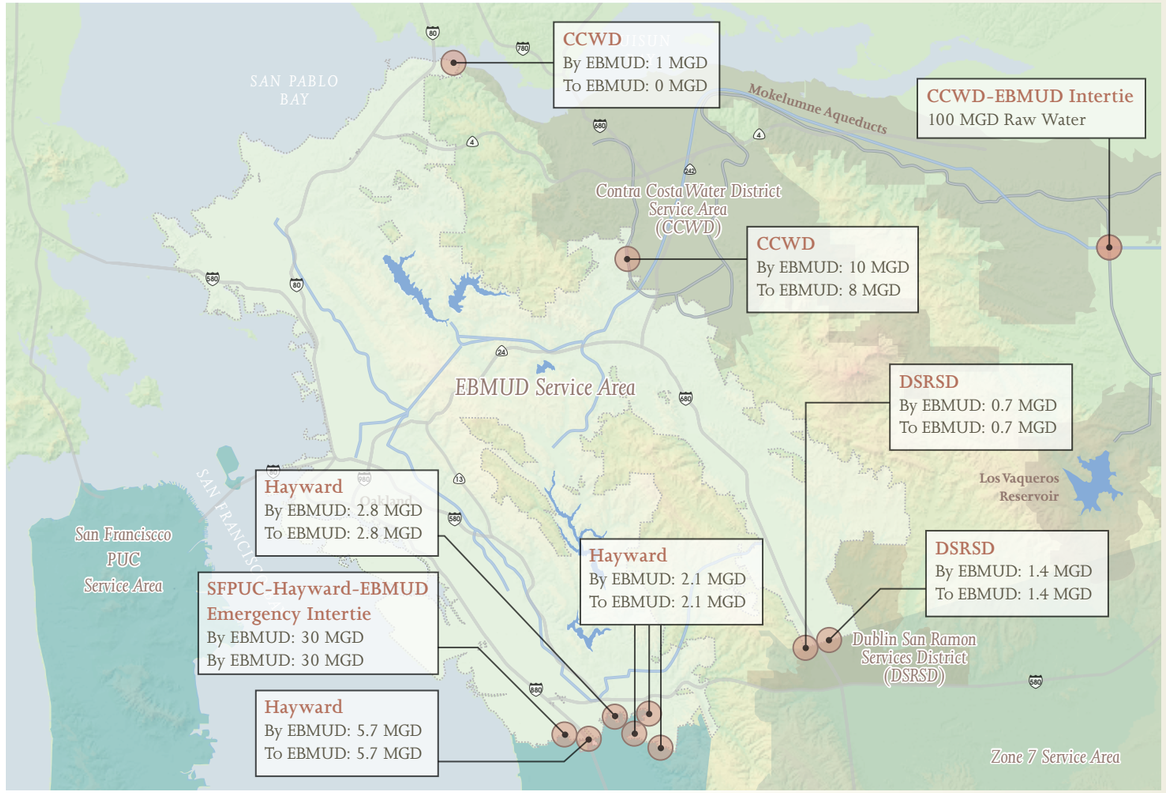


Protecting the East Bay's existing water rights is one of EBMUD's most important responsibilities. Mokelumne River water rights are vital to the East Bay's water supply, since most of our daily water supplies originate from the Sierra-fed Mokelumne. EBMUD is working on updating one of the key water rights permits that secure those supplies.

Like other California rivers, the Mokelumne supports many water supply needs while providing respite and recreation for residents along its course. EBMUD operates its two reservoirs on the river to provide a high-quality water supply for 1.3 million East Bay customers while meeting all regulatory requirements and downstream release obligations.

Yet, the amount of water the East Bay can rely on from that central Sierra source is declining. The central Sierra foothill region has more senior rights to Mokelumne River water, and as that region grows, its residents and businesses are using more water. In addition, EBMUD has a long-standing commitment to protect the river environment and maintain fishery conditions on the lower Mokelumne.

To meet the needs of lower Mokelumne fisheries, EBMUD releases up to 148 million gallons a day on average during normal condition water years. EBMUD also releases water to meet the needs of other Mokelumne water rights holders downstream of EBMUD reservoirs.

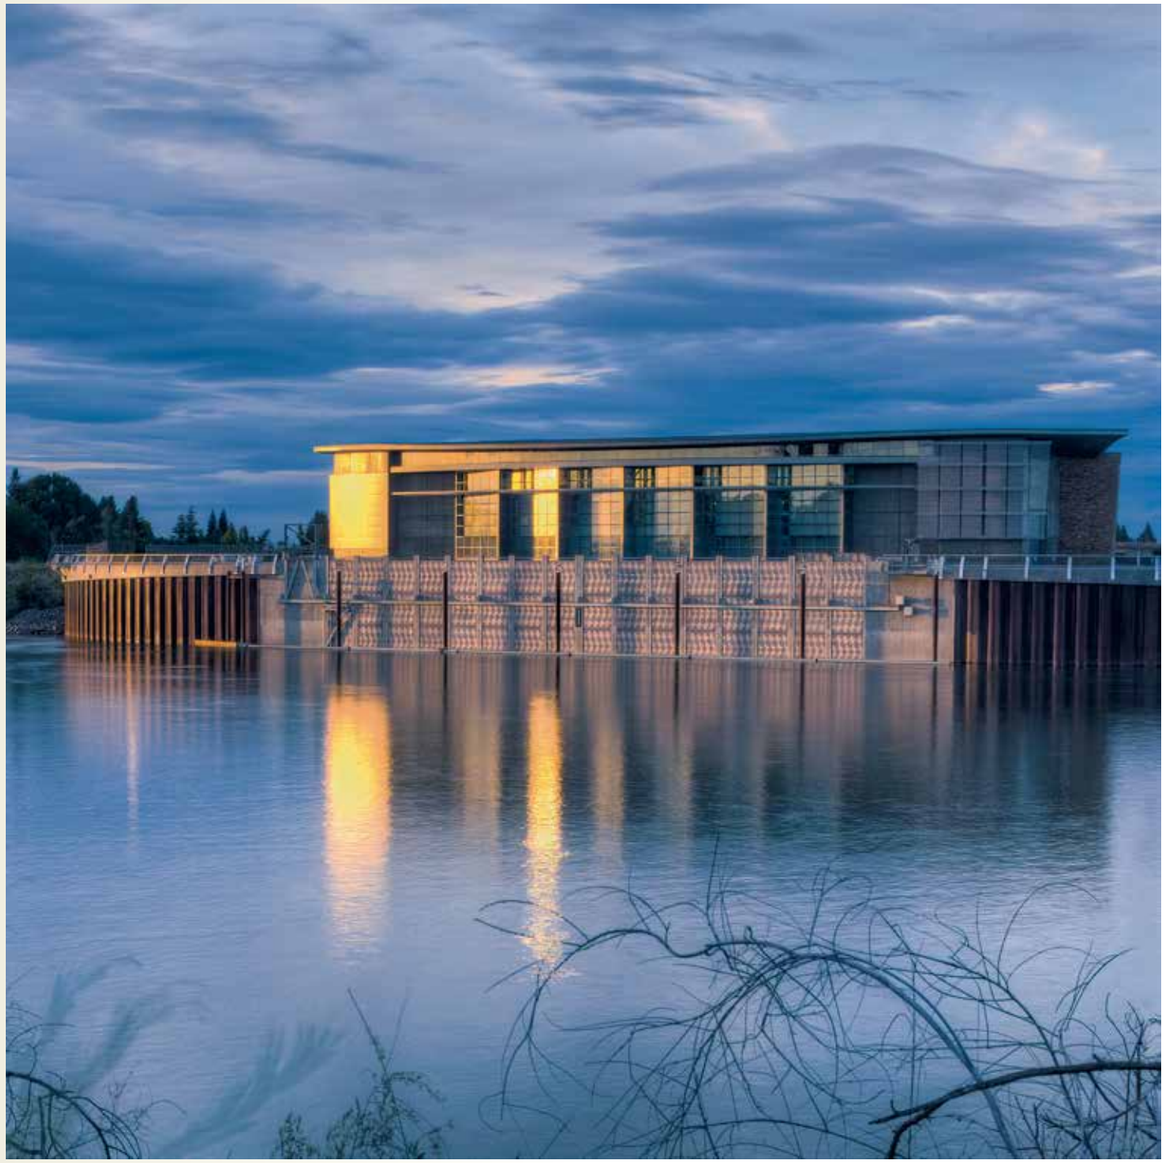


Relying on the Mokelumne River

Water for Emergencies

Emergencies can disrupt the storage and delivery of current water supplies. EBMUD is ready to receive as well as to provide mutual assistance during emergencies to restore water service as quickly as possible. Pipeline connections that intertie EBMUD to other systems in the Bay Area are in place that will allow partner agencies to share water during emergencies, as well as to make repairs on critical facilities.

EBMUD also works with customers to encourage personal preparedness. Customers should store enough tap water or bottled water to last at least three to seven days during an emergency. That is about one to two gallons per person per day.



Bay Area agencies have water rights to a range of supply sources that have different short-term and long-term vulnerabilities. Interties make it easier for Bay Area agencies to respond to emergencies and keep vital water supplies flowing.

Water for Dry Years

In years with little Sierra snowfall, the amount of Mokelumne River water held in EBMUD's two Sierra reservoirs can be well below the target levels of storage (the target is set based on the next two years' expected water needs in the East Bay). When the Sierra reservoirs' storage falls below target levels, EBMUD can use a contract for water from the Sacramento River to draw up to 100 million gallons per day of additional water supplies.

EBMUD's strategy for meeting the region's need for water begins with demand management. EBMUD is currently achieving the 2020 goal for reducing water use that the State of California set for each water service provider. East Bay customers conserve supplies year-round through wise water use. During times of severe drought, EBMUD policy calls for customers to save even more—up to 15 percent of overall supplies.

When needed, EBMUD can draw water from the Sacramento River via the Freeport Regional Water Facility, completed in 2011.

Conserving Water

The typical East Bay residence uses approximately one-third less water today than in the 1970s. EBMUD supports efforts to conserve water by advising residential, commercial and industrial customers on water-efficient fixtures, appliances and equipment, and by demonstrating how outdoor landscaping can be both water-efficient and beautiful.

EBMUD's 4,100-mile water distribution system receives constant attention. On average, water pipes in the ground are more than fifty years old. Some are nearly a century old. Hard-wired and hand-held leak detectors, coupled with customer reports of leaks, help EBMUD dispatch crews to investigate potential leaks.

Recent Water Conservation Savings

Since the 2008 drought ended, customers have continued to use water wisely and EBMUD has developed a new water conservation master plan to support continued customer conservation.

WaterSmart Practices at Home Residential water use keeps getting more efficient. Outdoors, more households are controlling water use by using efficient irrigation systems and selecting plants that thrive in our summer-dry climate zone. Inside, a growing percentage of customers use water-efficient practices, appliances and fixtures, and repair leaks.

High-efficiency toilet rebates are popular with customers. Toilets installed with EBMUD rebates in 2011/2012 are saving an estimated 85,460 gallons of water or more every day. Clothes washer rebates also are popular, and in fiscal years 2011 and 2012 18,269 EBMUD residential customers participated in a joint water and energy rebate program implemented by Bay Area water utilities and PG&E. By completing one rebate application, East Bay residents who purchased qualifying clothes washers saved an estimated combined 345,280 gallons of water daily.

Berkeley students participating in California Youth Energy Services (CYES) retrofit plumbing fixtures for EBMUD customers with water and energy conserving devices. This program, run by the non-profit Rising Sun Energy Center and sponsored by EBMUD, educates teachers, students and the community about water and energy conservation and available utility services.

The David Brower Center in Berkeley has received certification from EBMUD as a WaterSmart Business. The 50,000 square foot facility uses recirculating cooling, radiant heat and rain water catchment along with high-efficiency water fixtures. A similar building with traditional plumbing would consume 3–5 times as much water.

WaterSmart Businesses

Saving water is a good business practice and improves the bottom line for East Bay businesses. The EBMUD Board of Directors recognizes businesses and institutions for outstanding water use efficiency when they work with EBMUD to assess their water use, implement water saving measures at their facilities, and make ongoing water management a priority. Businesses that participate in the WaterSmart Business Certification program receive expert assistance in evaluating water use. In some cases, they qualify for rebates on water conserving technology. Businesses implementing water-efficient best practices can publicly display their EBMUD WaterSmart certificate for up to three years. In fiscal years 2011 and 2012, EBMUD recognized 27 businesses for their WaterSmart practices. To date, WaterSmart businesses have reduced their annual water use by more than 18 million gallons since 2010—that's enough water to serve approximately 200 households for an entire year.

Shut-off nozzles save water when hand-irrigating.

Conservation in the Community

State law requires EBMUD to serve water for all development approved by land-use planning agencies within its service area. EBMUD tries to reduce the impact of new users on the water supply we all share. To be eligible for water service, new EBMUD customers must meet rigorous indoor and outdoor water efficiency standards for appliances, landscaping, plumbing fixtures and for commercial processes that use water. EBMUD encourages sustainable development and landscape design and works with local land-use planning agencies to make it happen by providing free landscape plan and code review to support water-efficient landscape choices and building designs.

To help existing residents and businesses use only the water they need, EBMUD conservation experts talk with thousands of customers at community fairs, festivals and events sponsored by neighborhoods, cities, towns, businesses and civic groups. Demonstration gardens in Alameda, Oakland and Walnut Creek help local residents better understand low water use approaches to beautifying local property. EBMUD's award-winning book, *Plants and Landscapes for Summer-Dry Climates*, is a useful resource for gardeners that describes water efficiency and sustainable design principles.

Water Conservation Program FY11 and FY12

Program Description	Activity or Accounts	Incentives ($)	Water Savings (gpd)
Residential Services			
Single-Family Surveys	215	–	14,210

Finding Leaks in Underground Pipes

It's expensive to repair damage that can occur when there are leaks on large pipes that serve thousands if not hundreds of thousands of customers. Finding the leak early reduces the cost of repairs and the amount of disruption to our customers' daily life resulting from the repair work, while saving the valuable water supply. EBMUD regularly deploys acoustic pipeline leak detection equipment designed to listen for running water and to report findings via a computer uplink. EBMUD leak detection efforts have located leaks not only on EBMUD pipelines in the streets but also on homeowner pipes in neighboring yards.

The average age of the 4,100 miles of pipes in our system is more than 50 years. As our pipes age they can be more susceptible to cracking, corroding and even bursting. As infrastructure ages, it takes more work to keep it in good working condition so dependable water supplies arrive at customer taps round-the-clock, every day of the year. Maintenance and replacement work planning focuses on ensuring public, worker and environmental safety and considers the financial burden to customers and the potential disruption to daily life that results when crews are at work near homes and businesses.

The median strip near El Cerrito City Hall demonstrates low-water-use landscaping.

Conservation for Tomorrow

Over the past two decades, EBMUD-sponsored conservation programs have saved an estimated additional 26 million gallons per day of water in the service area. By 2040, EBMUD is committed to saving an additional 36 million gallons per day through residential and commercial indoor and outdoor water use surveys; technical assistance; leak detection services; incentives including distribution of water-saving showerheads, aerators and other devices; water-efficient technology research; and on-going customer education and outreach. All told, EBMUD water conservation efforts for the period 1995-2040 are projected to save nearly 23 billion gallons of water annually by the year 2040.

EBMUD's Water Conservation Master Plan was updated in 2011. It reviews water demand, water savings, and future conservation and drought response plans. Its ten-year implementation schedule is consistent with water demand reduction targets established by the Urban Water Management Planning Act, the Water Conservation Act of 2009, and the Statewide Memorandum of Understanding for Urban Water Conservation. The plan is available on EBMUD's website.

Recycling Water

Recycling Today

EBMUD currently can produce an average of nine million gallons per day of recycled water. Plans are in place to construct more pipelines and pumping plants so additional customer sites using recycled water can be built or retrofitted. EBMUD's Recycling Master Plan calls for recycling up to 20 million gallons per day by 2040, reducing the overall need for drinking water by approximately six percent.

EBMUD customers use recycled water for irrigating landscapes, including parks, greenbelts, community and school sports fields, business parks, and private and public golf courses. Recycled water also is used for industrial applications, construction dust control and flushing toilets. Recycled water has protected Bay Area investments in landscaping and parks from episodic droughts for nearly a century. EBMUD has used recycled water for more than 40 years for industrial processes and irrigation at the wastewater treatment plant located at the foot of the Bay Bridge in west Oakland.

EBMUD's East Bayshore Recycled Water Project supplies recycled water for irrigation in portions of Oakland and Emeryville. EBMUD plans to expand the recycled water distribution system in Emeryville and into Albany, Berkeley and Alameda. In 2011, customers in Oakland and Emeryville used about 80,000 gallons per day and EBMUD used another 2.3 million gallons a day at its wastewater treatment plant.

EBMUD also provides recycled water in partnership with other public agencies: the West County Wastewater District for service in Richmond, the City of San Leandro for service in Alameda and the Dublin San Ramon Services District for multiple EBMUD customer sites in the San Ramon Valley.

EBMUD delivers recycled water to parks, greenbelts, schools, common area landscapes and a golf course in the San Ramon Valley. In 2011, that use offset the need for more than 500,000 gallons per day of drinking water.

EBMUD works closely with local businesses that use large volumes of water for industrial processing to evaluate opportunities to replace drinking water with recycled water. One example is the Chevron refinery in Richmond. It has been using recycled water in its industrial cooling towers since 1996. In 2011, Chevron used an average of almost 4 million gallons per day in three cooling towers and 3.1 million gallons per day in its boilers.

EBMUD's East Bayshore Recycled Water Project provides recycled water to portions of Oakland for landscaping at places like Lake Merritt.

Recycling in the Future

EBMUD's goal is to be reusing 20 million gallons per day of recycled water by 2040. During water shortages, recycling will reduce the overall system demand by about six percent.

One area of future growth is West Contra Costa County, the northwestern part of EBMUD's service area. Hercules, Pinole, and West County Wastewater District are all potential sources of effluent that could be used for recycled water. EBMUD's long-range water supply plans identify several potential recycled water projects, including projects in West County, which could use effluent from these agencies for primarily industrial processes (see map).

In 2012, the EBMUD Board of Directors adopted a new long-term water supply plan to meet customer needs through the year 2040. The plan is a partnership-oriented approach to cope with changing demand for water locally and statewide, and relies on the latest knowledge from technical research into how climate change can affect local water supplies over the long term.

The 2040 plan has three fundamental assumptions:

1. **Water-efficient hardware and wise water use habits are ingrained and will make it harder for East Bay customers to cut back in droughts.** Each increment of future savings will be more difficult to achieve.
2. **Growth in the Central Sierra will affect EBMUD's daily supply source, the Mokelumne River.** The Central Sierra foothill communities located near EBMUD's water supplies face growth pressures. EBMUD is working with the foothill region to promote land management programs that will protect water quality as land is developed, to protect the Mokelumne and to meet the needs of the many Californians that rely on it.
3. **Global climate change will add uncertainty over time.** The long-term impacts of climate change on water supplies are complex (see below). The best strategy is a robust, flexible water supply program that can adapt to a variety of future conditions.

With guidance from previous long-term water supply plans, EBMUD promoted conservation and recycling, developed emergency pipeline connections with adjacent water service providers, improved drought supplies and launched pilot studies of groundwater and desalination. The Water Supply Management Program 2040 (WSMP 2040) is a strategy to meet future water supply needs by working with stakeholder groups and customers. WSMP 2040 will rely on the most cost-effective measures for reducing water demand to build on decades of aggressive conservation and water recycling in the East Bay. WSMP 2040 recognizes California's conservation savings goal to achieve a 20 percent statewide reduction in water use by the year 2020.

Above and beyond the aggressive water conservation goals established in WSMP 2040, EBMUD relies on an additional 15 percent reduction in water use by all customers in multi-year droughts. Reaching this target could require as much as a 19 percent reduction by single family residential customers in dry years.

EBMUD will simultaneously investigate several ways to close the anticipated gap between long-term water supplies and projected water needs. The options to be explored include groundwater banking/conjunctive use, water transfers, regional desalination and water storage. Parallel study provides the best possibility of timely success in the face of statewide water challenges, a complex regulatory environment, and the threat of climate change.

Climate Change

Despite the uncertainties with global climate models, climate change is almost sure to pose new challenges for providing safe and reliable water supplies. EBMUD has identified how changes in temperature and precipitation may affect the water system, and routinely assesses its ability to respond to those vulnerabilities.

Increasing Outdoor Water Use

A warming climate could extend the growing season, reduce natural soil moisture content and result in more heat waves.

Decreasing Water Supplies

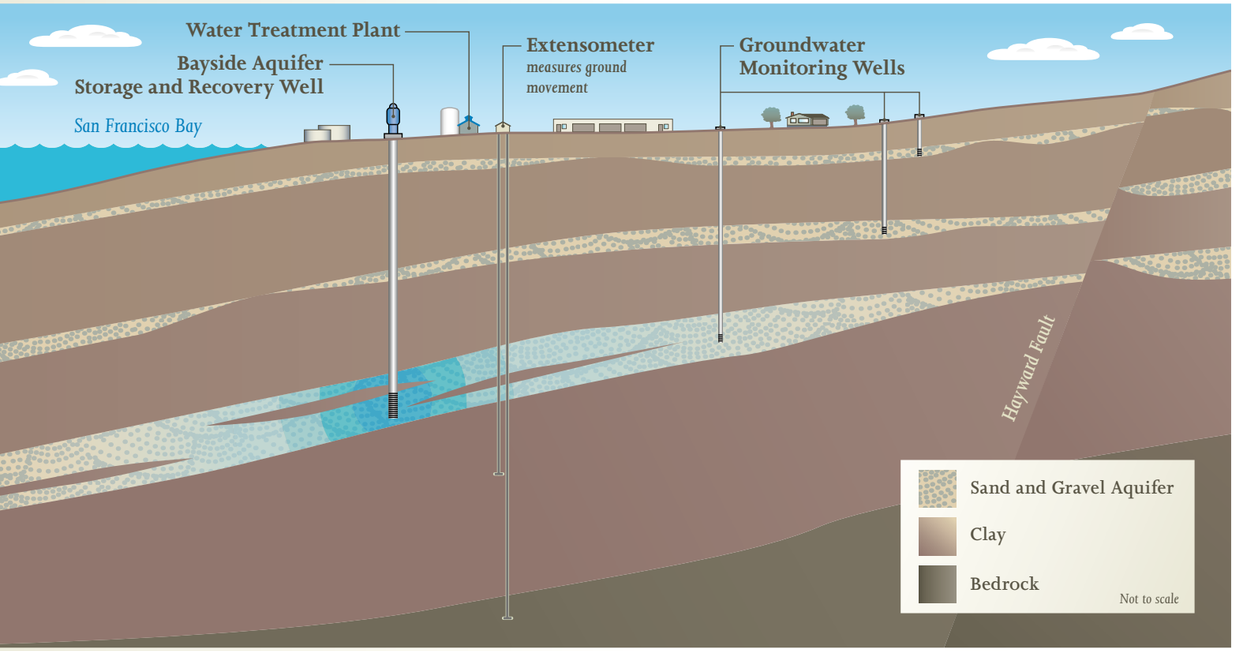
A warming climate could decrease precipitation and the snow pack and change the timing of spring runoff.

Warmer Waters

Warmer river temperatures could hurt salmon eggs that need cool water to survive. Warmer ocean temperatures could stress migrating fish by disrupting the oceanic food chain. EBMUD supports aquatic habitats by managing its Sierra reservoirs to release cold water to the lower Mokelumne River; warming waters would make this more difficult.

Increasing Flood Risks

A rise in sea level could increase flooding risks to communities along San Francisco Bay and to Delta levees that protect EBMUD's aqueducts across the Delta.



Greenhouse Gas Emissions

EBMUD monitors and mitigates its greenhouse gas emissions and produces renewable energy. In an average year, EBMUD hydropower generation exceeds the amount of power needed to treat and deliver water to our 1.3 million customers. EBMUD also generates solar power at several facilities and is a net energy generator at its wastewater treatment plant. EBMUD is an active participant in national efforts by EPA and by industry groups to assess the vulnerabilities to water supplies that could result from a changing climate.

New Water Storage in the Greater East Bay

The fragile state of the Delta is a concern for EBMUD because our aqueducts cross the Delta. One option now being explored that could help mitigate that concern is to store some EBMUD water in Contra Costa Water District's (CCWD) Los Vaqueros Reservoir, which is located to the west of the Delta. CCWD has expanded that reservoir and EBMUD could partner with CCWD for a portion of the storage that was created.

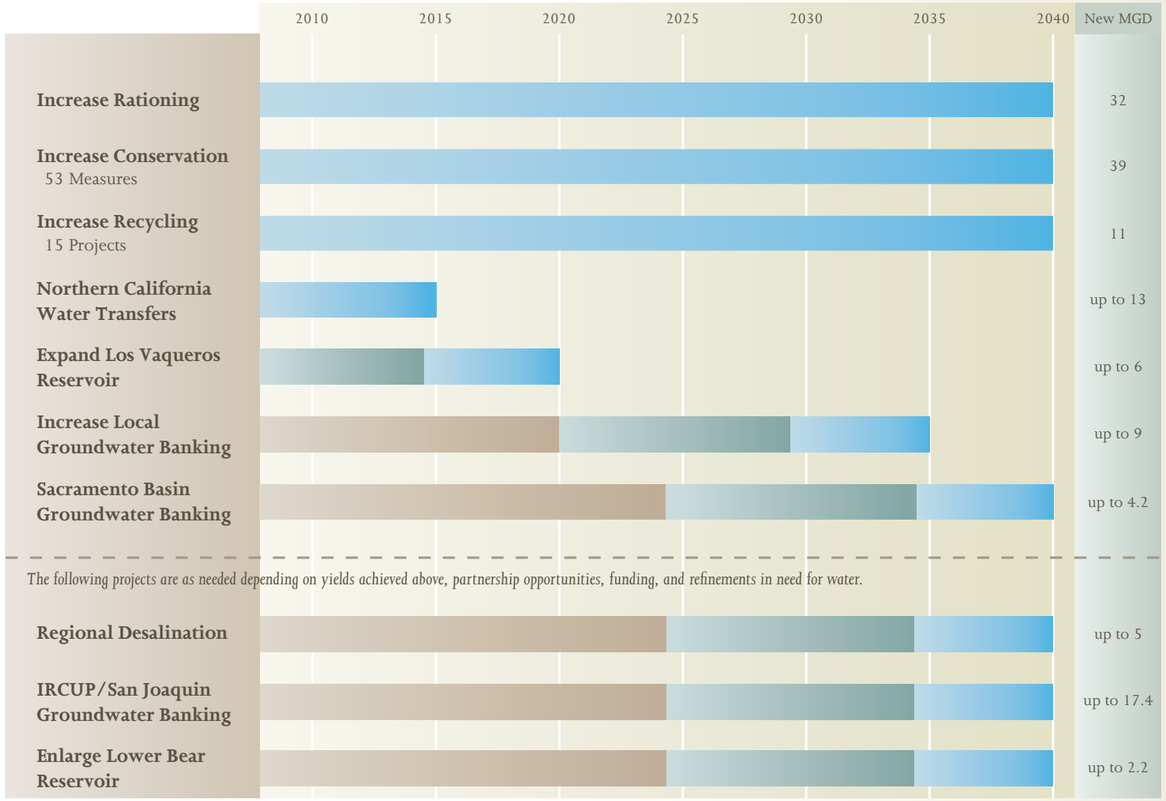
EBMUD also can store some water locally in a deep underground aquifer. (See below)

The Bayside Groundwater Facility is a state-of-the-art groundwater injection well that can move some water into a deep underground aquifer more than 500 feet below ground. During shortages, EBMUD can draw the water from storage into the treatment facility and then distribute the treated water to customers. The well can provide a supply of up to one million gallons of water per day on average.

Water Transfers and New Water Storage

The EBMUD-Sacramento County jointly-owned pumping facilities on the Sacramento River offer another way to move water to places where it is needed. Conjunctive use projects designed to replenish groundwater basins in wet years and also store some water underground for use during future dry times are being investigated in Sacramento County and San Joaquin County. EBMUD is exploring water transfer and exchange possibilities throughout Northern California that would make use of the Sacramento River pumping facilities at Freeport.

An additional option being explored is a regional project that would include conjunctive use opportunities in San Joaquin County (one or more groundwater storage projects located in the county).



EBMUD is committed to a partnership-driven approach for any water supply and/or storage plan. Before moving to project-level planning, stakeholder support, regional benefits and a confirmed need for water will need to be in place.

Regional Desalination

Taking the salt out of brackish or salty water has been possible for many years, but prohibitively expensive. EBMUD is working with other Bay Area water agencies (Contra Costa Water District, San Francisco Public Utilities Commission, Santa Clara Valley Water District and Zone 7 Water Agency) to explore adding desalinated water to the local water supply. Today, the costs of desalination are lower, but questions remain about the environmental impacts of the process.

A pilot test showed it would be feasible to desalinate up to 20 million gallons per day of water at a location in eastern Contra Costa County. Desalination costs are still high, and environmental impacts must be analyzed and addressed. But over time, with advancements in technologies, desalination may prove to be a viable supplemental supply source for the Bay Area. Investigation into this supply option continues to assess the pros and cons of moving forward into an actual operation.

EBMUD's 30-Year Plan to Meet the East Bay's Water Needs*

**Assumes that when needed, an average of 32 million gallons per day (MGD) will be saved through rationing to stretch supplies. Project MGD by project as estimated in WSMP 2040; actual yields to EBMUD and project partners will vary.*

Exploratory Phase · Determine Project Feasibility · Implementation of Feasible Projects

WSMP 2040:

Diverse Regional Partnerships Seeking a Secure Water Future

Conservation and Recycling

Water conservation and recycling are critical elements of EBMUD water supplies for today and tomorrow. Water Supply Management Program 2040 calls for conserving 62 million gallons a day by 2040 and for recycling 20 million gallons a day by that same year. Additionally, customers will be asked to cut use up to 15 percent in dry years.

- Existing water supply
- Dry-year water transfer options
- Regional interties
- Future supply options

Supply Transfers

Potential partnership agreements with other water agencies. Water transfer agreements allow agencies to share their supplies to best meet their collective water needs.

Desalination in Partnership with Multiple Bay Area Water Agencies

Continuing study and investigation of how desalination could one day serve as a supplemental water source.

Sacramento County Groundwater

Potential partnerships with water agencies and interests in Sacramento County.

Water would be stored ("banked") in the underlying groundwater basin in wet years. The banked groundwater would be extracted during dry years and delivered to EBMUD via the Freeport intake and Mokelumne conveyance facilities.

Lower Bear Reservoir

Continued partnership with Amador Water Agency, PG&E and other foothill water interests to study the option to expand the water storage volume of Lower Bear Reservoir.

San Joaquin Groundwater

Potential partnership(s) with Upper Mokelumne River Water Authority (UMRWA) and Northeastern San Joaquin County Groundwater Banking Authority (GBA) member agencies as well as environmental interest groups.

UMRWA in partnership with the GBA has secured grant monies through the California Department of Water Resources to implement the Mokelumne Watershed Interregional Sustainability Evaluation (Moke WISE) Program. The goal of the work effort is to identify comprehensive and sustainable approaches to water resources management in the Mokelumne watershed. A wide array of water sources and strategies to balance water supplies and demands while minimizing environmental impacts will be investigated.

As the concept moves forward, partnership arrangements will become clearer, as will possible program elements such as expanded use of recycled water, groundwater storage/conjunctive use, increased water conservation, etc.

Expand Los Vaqueros

Potential partnership with Contra Costa Water District (CCWD).

In mid 2012, CCWD completed the expansion of their Los Vaqueros Reservoir, increasing the total storage from a total of 100,000 acre feet to 160,000 acre feet. CCWD has indicated that a portion of the storage capacity created could be made available to EBMUD and that CCWD's existing conveyance facilities could be used to move water to and from the reservoir. EBMUD is working with CCWD to develop plans to move the concept forward.

EBMUD and the Delta

The Sacramento-San Joaquin Delta provides habitat for more than 500 species. It provides water to roughly two-thirds of California's population, is a vital recreation resource and is critical to commercial fisheries, agriculture and an extensive network of infrastructure including EBMUD's Mokelumne Aqueducts. State legislation passed in 2009 calls for investing billions in restoring the ecosystem, protecting levees and potentially building a canal or tunnel to take water south of the Delta.

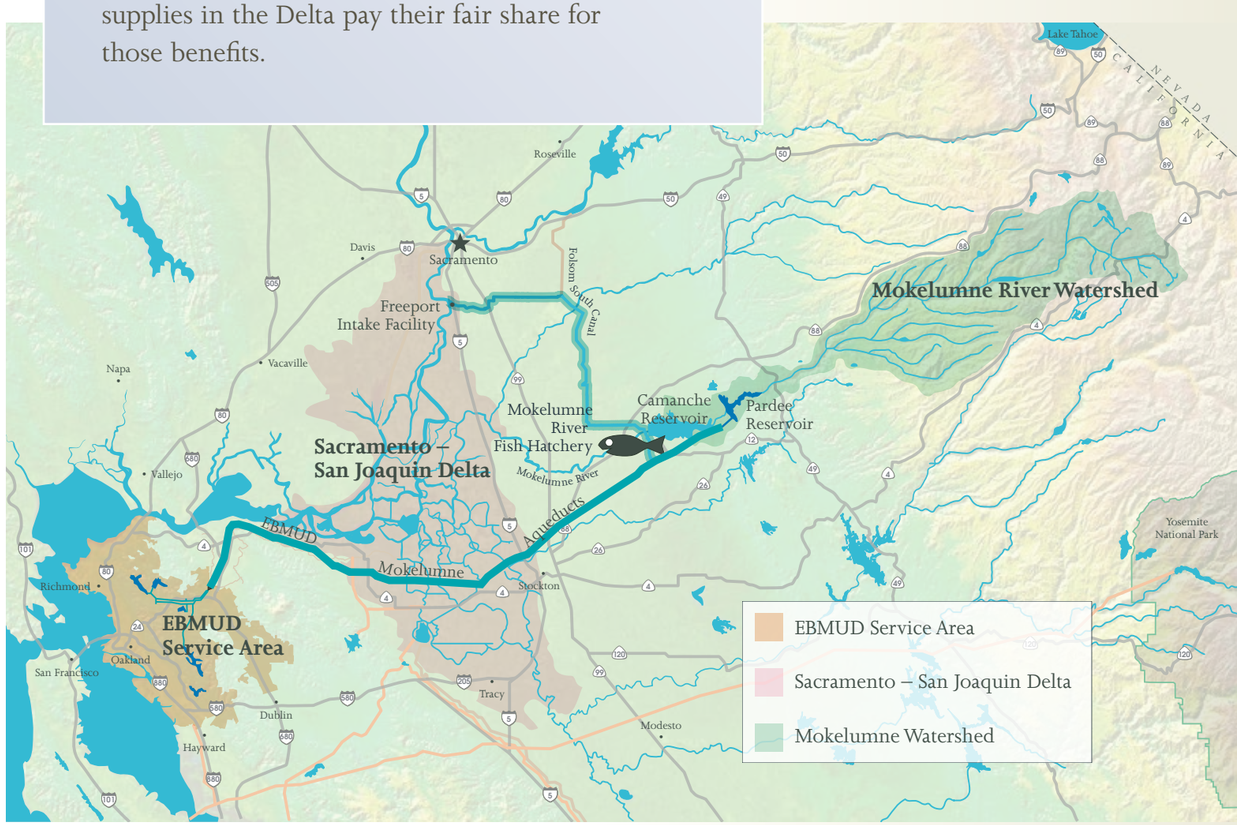
EBMUD does not deliver Delta water to the East Bay, but 60 percent of water for the Bay Area comes from the larger Delta watershed. Over the past two decades, EBMUD investments in Delta-related projects have totaled almost $100 million to protect and maintain aqueducts and levees and effectively manage the Mokelumne River fishery.

Pressures to increase freshwater inflows to the Delta may lead to new limits on upstream water diversions, including EBMUD's water diversions from the Mokelumne River (which represent about 1.5 percent of all Delta watershed diversions). Projects to improve the conveyance of water to the Delta export pumps may disrupt the migration of the steelhead and salmon that EBMUD has invested so heavily to restore. And funding that now helps maintain levees that protect EBMUD's aqueducts could be diverted to other purposes.

EBMUD has an exemplary record in water use efficiency and stewardship of natural resources. Average fall-run Mokelumne River salmon returns over the past ten years have surpassed the long-term historic average, an indicator that the stewardship program is working. Any Delta restoration plan must provide that EBMUD's resource management plan can continue to ensure the river's health.

In addition to the potential effects a new Delta plan could have on water supplies, it also could affect water costs. Some options would make the East Bay responsible for a share of the costs for new water facilities it doesn't want or need. Other options would increase EBMUD's financial obligation to protect Delta levees.

EBMUD is working to ensure the interests of its customers are protected while actively participating to help balance the many competing needs in the Delta.



Decisions about the Delta could affect the cost of the East Bay's water and the reliability of its water supply.

EBMUD Goals for the Delta

- Ensure that any additional Delta flows needed to mitigate impacts from a new tunnel or canal are provided by the direct beneficiaries of that project
- Strengthen the levees surrounding islands that protect critical infrastructure, including EBMUD's Mokelumne Aqueducts
- Protect the Mokelumne fishery and its migratory routes through the Delta
- Minimize impacts on water supplies from the Freeport facility on the Sacramento River
- Ensure that those who benefit from new water supplies in the Delta pay their fair share for those benefits.

EBMUD has invested millions in the lower Mokelumne River salmon fishery, and Delta operations affect the migration of fish from the Mokelumne.

EBMUD provides high-quality drinking water for 1.3 million customers in Alameda and Contra Costa counties.

EBMUD's award-winning wastewater treatment plant generates renewable energy from waste and protects San Francisco Bay; it serves 650,000 customers.

EAST BAYSHORE RECYCLED WATER PROJECT

PROJECT PURPOSE

EBMUD's East Bayshore Recycled Water Project currently supplies recycled water for landscape irrigation in areas of Oakland and Emeryville where recycled water pipelines have been installed. EBMUD plans to expand the distribution system into Alameda, Albany and Berkeley. In addition to irrigating landscapes, recycled water uses may include restoring wetlands, flushing toilets in dual-plumbed buildings, and industrial processes.

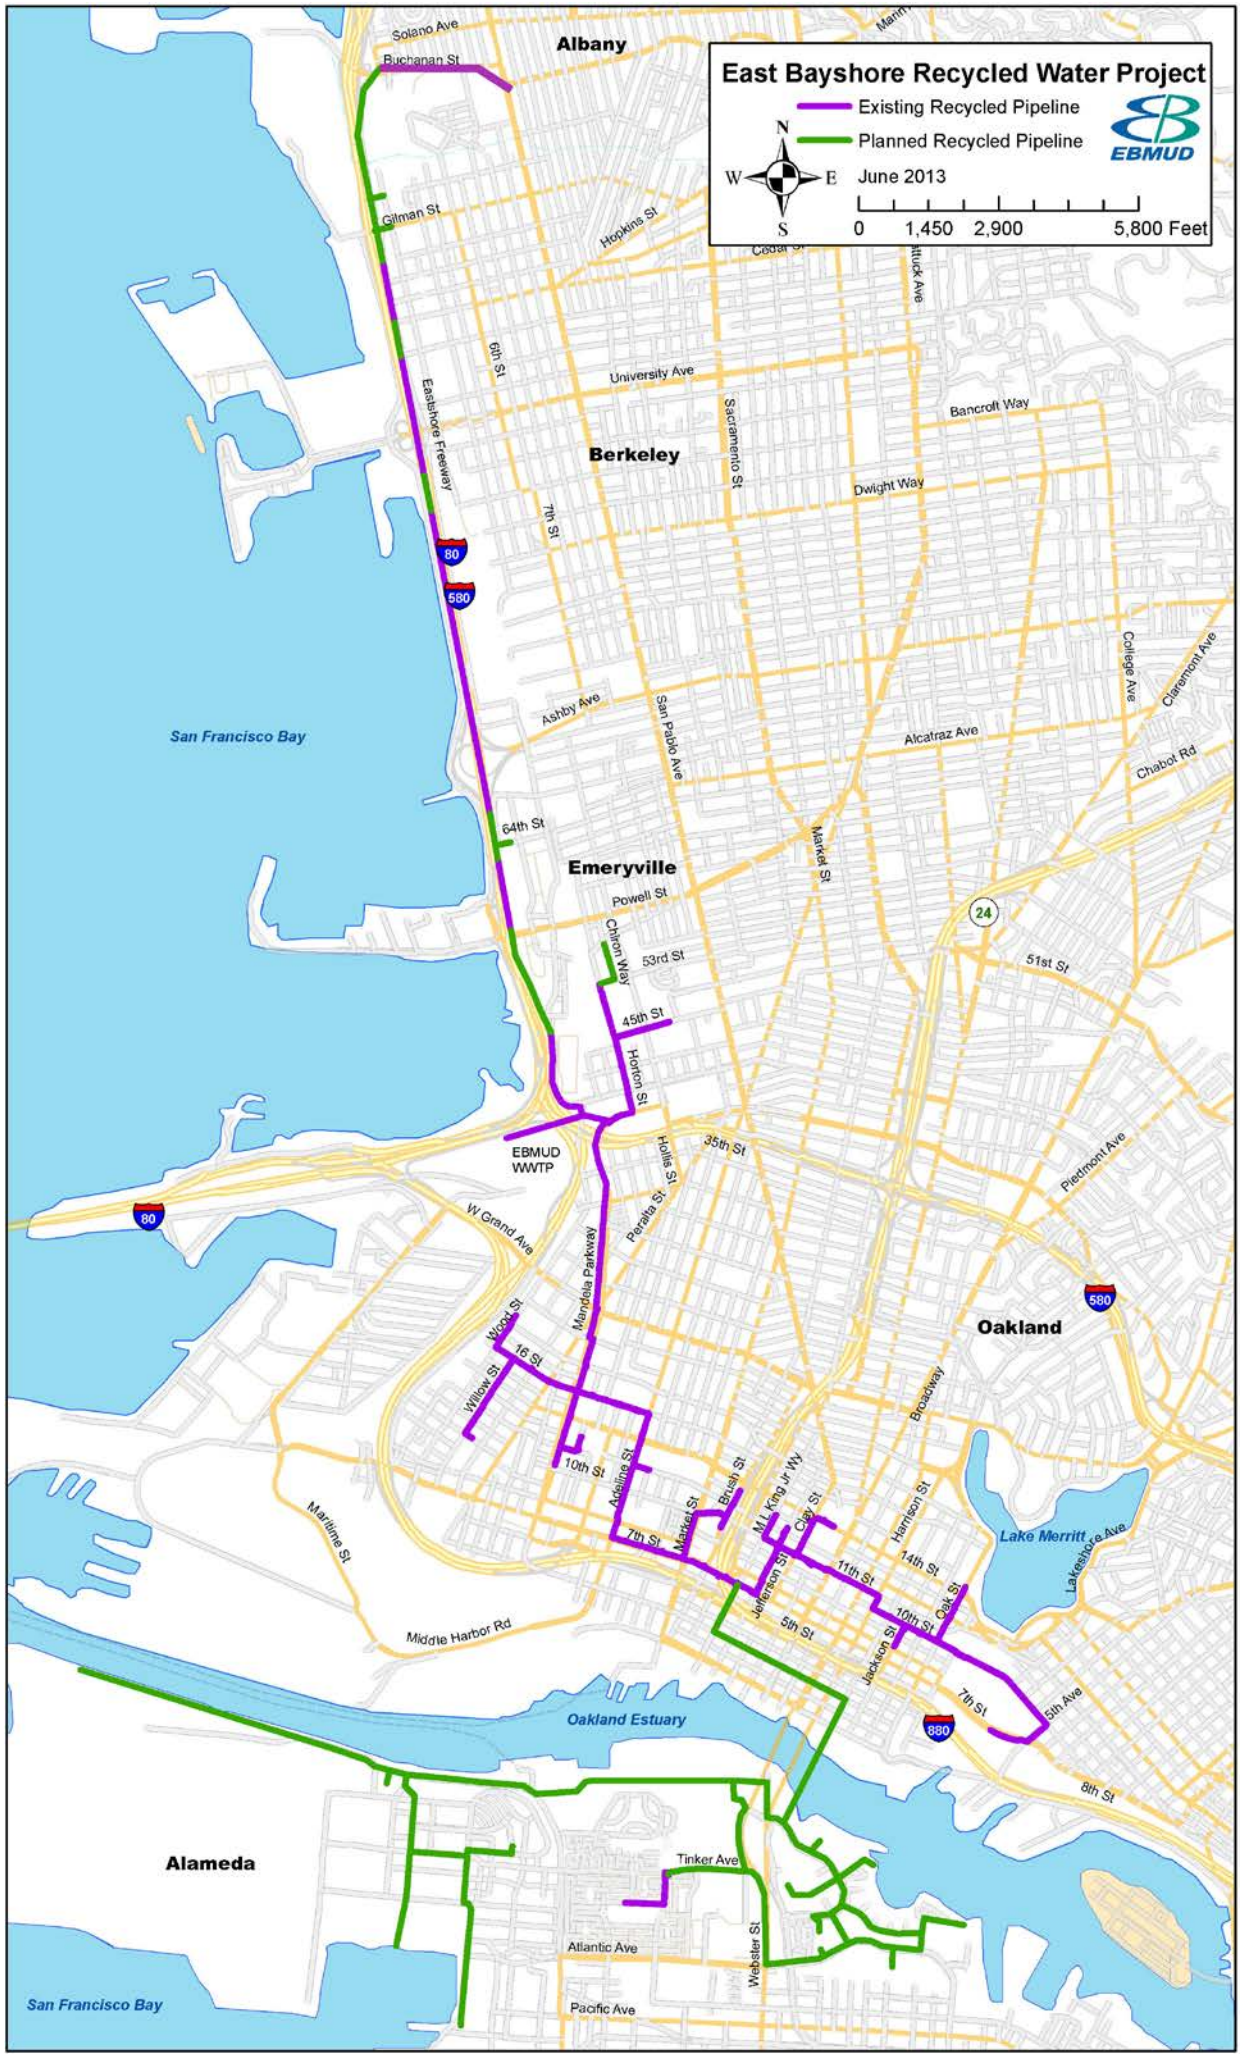
RECYCLED WATER BENEFITS

- Stretches our limited drinking water supply, especially in droughts
- Safeguards community and private investments in parks and landscaping
- Makes drinking water supplies more reliable, helping to sustain our economy
- Protects San Francisco Bay

PROJECT STATUS

Recycled water treatment facilities were constructed at EBMUD's wastewater treatment plant, located at the foot of the Bay Bridge. Using microfiltration and extra disinfection, EBMUD produces recycled water that meets or surpasses California Department of Public Health standards for unrestricted use. EBMUD stores the recycled water in a 1.5 million gallon storage tank on the site. A recycled water transmission pipeline along 4.4 miles of the Eastshore Freeway is largely complete, and 2 miles of transmission pipeline have been installed Oakland.

The East Bayshore Recycled Water Project began deliveries to customers in 2008. In 2012 the project delivered recycled water to offset the need for a total of more than 25 million gallons of EBMUD drinking water. EBMUD itself used another 2.6 million gallons a day at the wastewater treatment plant for various industrial processes and for landscape irrigation.



When complete, up to 24 miles of distribution pipelines will be in place and up to 2.2 million gallons per day of recycled water will be available to East Bayshore Recycled Water Project customers. (See map on page 2.)

NEXT STEPS

- Retrofit customer sites in areas of Oakland, Emeryville, Berkeley, Albany, and Alameda
- Complete construction of transmission pipeline along the Eastshore Freeway
- Design and construct pipeline to reach customer sites in northern Emeryville, Albany, Berkeley, and western Alameda, including pipeline under the Oakland Estuary

UCERF3: A New Earthquake Forecast for California's Complex Fault System

With innovations, fresh data, and lessons learned from recent earthquakes, scientists have developed a new earthquake forecast model for California, a region under constant threat from potentially damaging events. The new model, referred to as the third Uniform California Earthquake Rupture Forecast, or "UCERF3" (http://www.WGCEP.org/UCERF3), provides authoritative estimates of the magnitude, location, and likelihood of earthquake fault rupture throughout the state. Overall the results confirm previous findings, but with some significant changes because of model improvements. For example, compared to the previous forecast (UCERF2), the likelihood of moderate-sized earthquakes (magnitude 6.5 to 7.5) is lower, whereas that of larger events is higher. This is because of the inclusion of multifault ruptures, where earthquakes are no longer confined to separate, individual faults, but can occasionally rupture multiple faults simultaneously. The public-safety implications of this and other model improvements depend on several factors, including site location and type of structure (for example, family dwelling compared to a long-span bridge). Building codes, earthquake insurance products, emergency plans, and other risk-mitigation efforts will be updated accordingly. This model also serves as a reminder that damaging earthquakes are inevitable for California. Fortunately, there are many simple steps residents can take to protect lives and property.

What is UCERF3?

California is sandwiched between the Pacific and North American tectonic plates, with the former migrating northwest about two inches per year compared to the latter. The plate boundary is far from smooth, reflecting more of a fragmented zone locked in a tectonic battle over which areas will give way, producing some of the steepest mountain ranges in the world. The sliding between plates is also not steady, but rather plays out in fits and starts with periods of rest interrupted by sudden slip along cracks in the Earth. These "fault ruptures" in turn cause the ground to shake, much like the ripples that radiate from a pebble tossed in a pond, and it is this shaking that causes the most damage in earthquakes.

Two kinds of scientific models are used to help safeguard against earthquake losses: an Earthquake Rupture Forecast, which tells us where and when the Earth might slip along the state's many faults, and a Ground Motion Prediction model, which estimates the subsequent shaking given one of the fault ruptures. UCERF3 is the first type of model, representing the latest earthquake-rupture forecast for California. It was developed and reviewed by dozens of leading scientific experts from the fields of seismology, geology, geodesy, paleoseismology, earthquake physics, and earthquake engineering. As such, it represents the best available science with respect to authoritative estimates of the magnitude, location, and likelihood of potentially damaging earthquakes throughout the state (further background on these models, especially with respect to ingredients, can be found in U.S. Geological Survey Fact Sheet 2008–3027, http://pubs.usgs.gov/fs/2008/3027/).

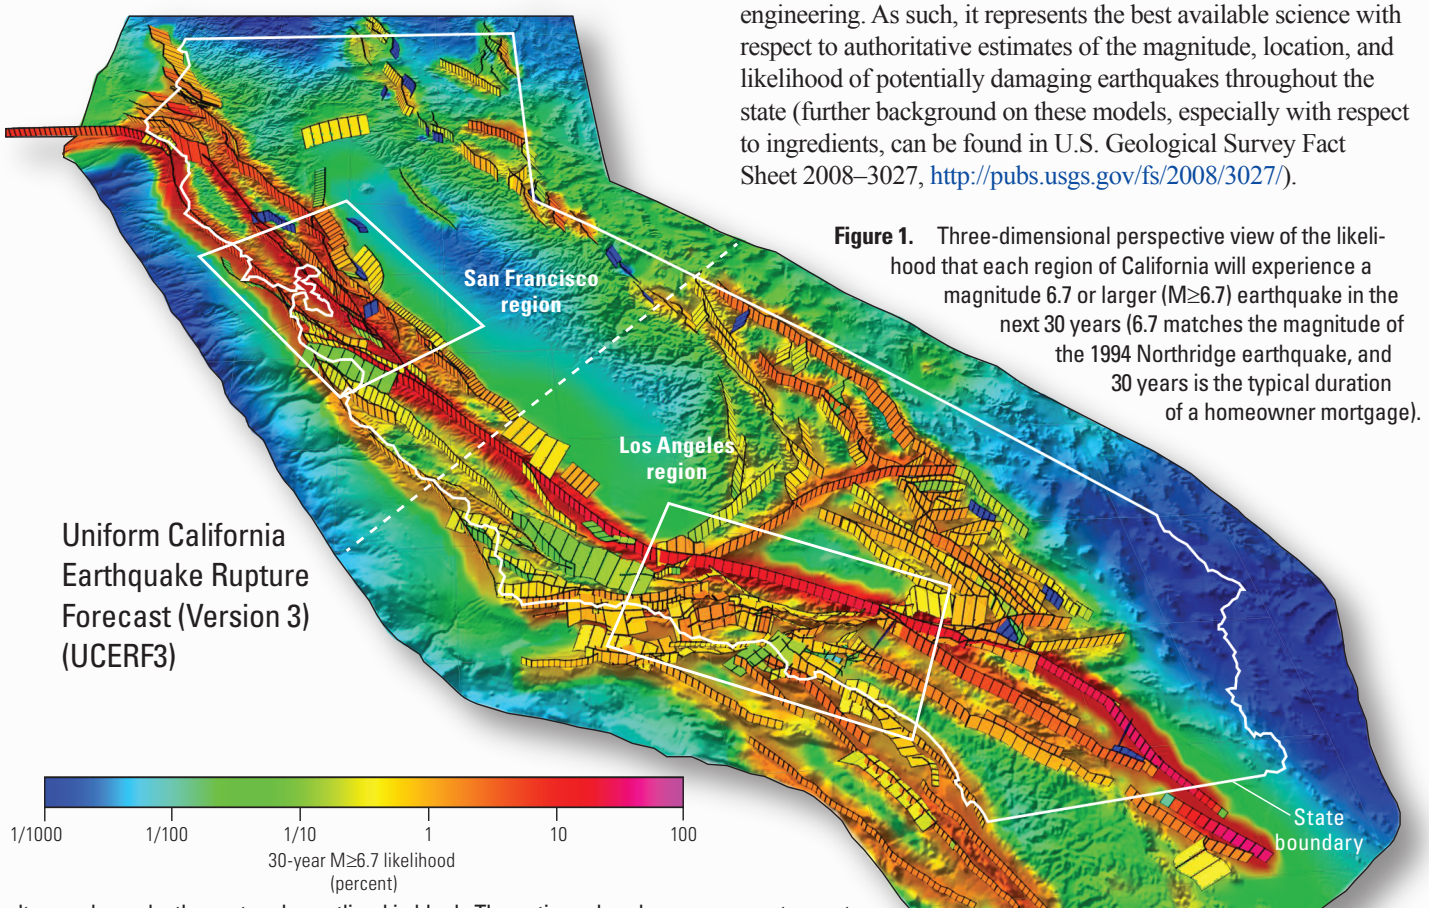

Figure 1. Three-dimensional perspective view of the likelihood that each region of California will experience a magnitude 6.7 or larger (M≥6.7) earthquake in the next 30 years (6.7 matches the magnitude of the 1994 Northridge earthquake, and 30 years is the typical duration of a homeowner mortgage). Faults are shown by the rectangles outlined in black. The entire colored area represents greater California, and the white line across the middle defines northern versus southern California. Results do not include earthquakes on the Cascadia Subduction Zone, a 750-mile offshore fault that extends about 150 miles into California from Oregon and Washington to the north.

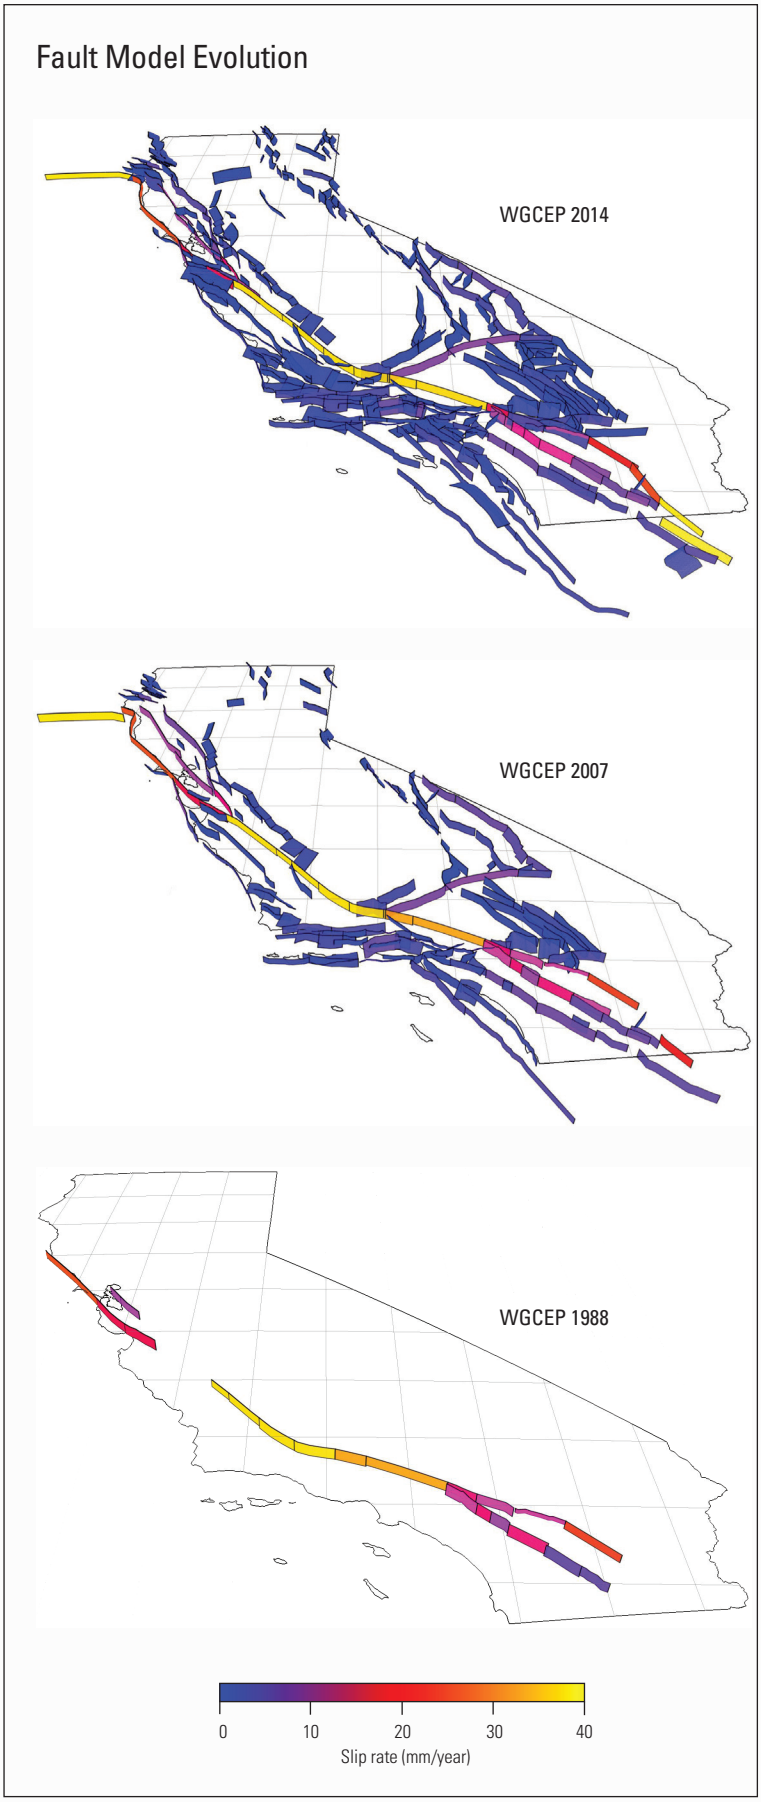

Figure 2. Changes with time of the inventory of faults used in California earthquake forecast models (WGCEP, Working Group on California Earthquake Probabilities).

Why a New Earthquake Forecast Model?

All scientific models, including earthquake rupture forecasts, are an approximation of the physical system they represent, in the same way that "the map is not the actual territory" (Korzbski, 1931). UCERF3 represents the latest model from the Working Group on California Earthquake Probabilities (WGCEP) (WGCEP, 2014), which also released forecasts in 1988, 1990, 1995, 2003, and 2007. This historical progression of models reflects increasingly accurate, detailed, and sophisticated representations of a particularly complex natural system.

A puzzling feature of previous models has been a forecasted rate of moderate-sized earthquakes (between magnitude 6.5 and 7.0) that is up to a factor of two higher than that observed historically. The first discovery of this discrepancy, by the 1995 WGCEP, was particularly disturbing in that one such event, the magnitude 6.7 1994 Northridge earthquake, had just surprised many as the costliest earthquake in U.S. history. In fact, the prospect of such events becoming more frequent contributed to an ensuing homeowner-insurance-availability crisis, as most insurance providers opted to pull out of the market altogether, rather than comply with a state law requiring they offer an earthquake option with each policy. This insurance availability crisis was ultimately solved in 1996 with the legislative creation of the California Earthquake Authority (http://www.earthquakeauthority.com), which has since become the largest earthquake insurance provider in the state. However, the discrepancy between the forecast rate and the observed rate at moderate magnitudes has remained through the most recent previous study (WGCEP, 2007), and scientists have hotly debated whether this is real or a result of some model limitation.

Recent earthquakes have fortunately provided clues. For example, the Northridge earthquake occurred on a previously unrecognized fault, which motivated scientists to search for other faults and quantify those that might be capable of producing damaging earthquakes. The effort has paid off. Whereas the 1988 WGCEP considered only 16 different faults, albeit the main ones, by the time of the WGCEP 2007 effort there were about 200. With UCERF3, there are now more than 350 fault sections in the model, thanks in part to using space-based geodesy where geologic data are limited. This historical progression is shown in the fault model evolution figure at left.

Another clue with respect to the moderate-magnitude rate discrepancy is that many recent earthquakes have plowed past previously inferred fault-rupture boundaries. That is, past models have generally assumed that earthquakes are either confined to separate faults, or that long faults like the San Andreas can be divided into different segments that only rupture separately. However, all three of the most-recent, largest earthquakes in California ruptured right past such boundaries, jumping from one fault to another as multifault ruptures. These were the 1992 magnitude 7.3 Landers, the 1999 magnitude 7.2 Hector Mine, and the 2010 magnitude 7.2 El Mayor–Cucapah earthquakes. The 2011 magnitude 9.0 Tohoku, Japan earthquake also violated previously defined fault-segment boundaries, resulting in a much larger fault-rupture area and magnitude than expected, and contributing to the deadly tsunami and Fukushima nuclear disaster.

Given these observations, the possibility of multifault ruptures clearly needed to be considered in our new model. In fact, as the inventory of California faults has grown over the years, it

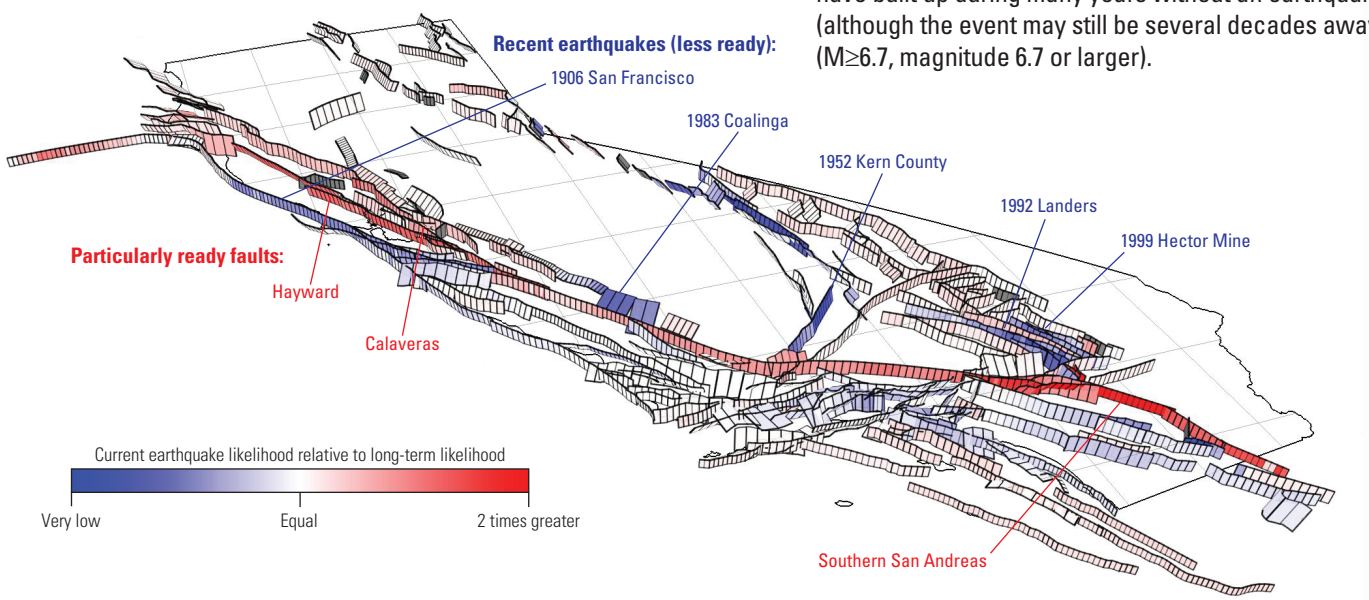

Figure 3. California earthquake likelihood in UCERF3 incorporates the concept that earthquake probabilities change with time according to elastic-rebound theory. Faults are less likely to rupture (less ready) when and where there has been a recent earthquake, and are more likely to rupture (more ready) where tectonic forces have built up during many years without an earthquake (although the event may still be several decades away) (M≥6.7, magnitude 6.7 or larger).

has become increasingly apparent that we are not dealing with a few well-separate faults, but with a vast interconnected fault system. In fact, it has become difficult to identify where some faults end and others begin, implying many more opportunities for multifault ruptures. As a consequence, UCERF3 now considers more than 250,000 different fault-based earthquakes, including multifault ruptures, whereas UCERF2 had about 10,000, and previous models had far fewer. Because we still lack a complete inventory of faults, UCERF3 (and UCERF2 before it) also includes the possibility of earthquakes on unrecognized faults elsewhere in the region.

Solving for the rate of all possible ruptures in the interconnected fault system represented a significant challenge. The UCERF3 methodological breakthrough, referred to as the "grand inversion," allowed us to not only solve for the rate of each earthquake rupture, but to also draw upon a broader range of observations in doing so. For example, the previous rate discrepancy at moderate-magnitudes was turned into part of the solution. That is, because the total plate-tectonic deformation is generally well known, any increase in the rate of larger, multifault ruptures must come with a consequent reduction in rates at lower magnitudes. The grand inversion manages the overall plate-tectonic, fault-system budget mathematically, adding whatever multifault ruptures are needed to eliminate the rate discrepancy at moderate magnitudes. So, not only does UCERF3 include the types of multifault ruptures seen in nature, but doing so has also eliminated the overprediction of moderate-sized events, implying the latter was simply a manifestation of the isolation and segmentation of faults in the previous models.

UCERF3 also includes the notion of fault "readiness," where earthquake likelihoods go down on faults that have recently ruptured, and build back up with time as tectonic stresses reaccumulate. Although this concept, known formally as Reid's elastic rebound theory (Reid, 1911), has been around for more than a century, applying it in a model that includes multifault ruptures also proved challenging. A new methodology was therefore developed, which also relaxes the requirement that the date-of-last event be known where applied. That is, we may not know when the most recent event occurred on many California faults, but we do know that it had to have been prior to 1875 (the year when reliable recordkeeping began). Being able to account for this "historic open interval" for events that precede 1875 allowed us to quantify fault readiness throughout the entire fault system (fig. 3), rather than being limited to only a subset of faults as in previous studies.

There are many uncertainties in both the data and scientific theories that go into UCERF3, and alternative values for each element can lead to a different forecast. Consequently, UCERF3 is not a single model, but rather a collection of 5,760 different viable models. The results presented in the next section represent an average of these forecasts. Calculating grand-inversion results for all the models required the use of super computers, as they would have taken more than 8 years on a single desktop computer.

What Are the Results, and How Do They Differ from Previous Estimates?

UCERF3 results for various regions and faults of interest are shown in the figures and tables here. How have expected earthquake rates changed from the previous model? Overall, the results confirm earlier findings (California is earthquake country), but with some important refinements in certain areas. Considering the entire region, the average time between magnitude 6.7 and larger earthquakes has gone from 1 every 4.8 years in UCERF2, to 1 about every 6.3 years in UCERF3, representing a 30 percent decrease in the new forecasted

Table 1. Average time between earthquakes in the various regions together with the likelihood of having one or more such earthquakes in the next 30 years (starting from 2014). Values listed in parentheses indicate the factor by which the rates and likelihoods have increased, or decreased, since the previous model (UCERF2). "Readiness" indicates the factor by which likelihoods are currently elevated, or lower, because of the length of time since the most recent large earthquakes (see text). These values include aftershocks. It is important to note that actual repeat times will exhibit a high degree of variability, and will almost never exactly equal the average listed here.

Greater California region

Magnitude (greater than or equal to)	Average repeat time (years)		30-year likelihood of one or more events		Readiness
5	0.12	(0.7)	100%	(1.0)	1.0
6	1.2	(0.9)	100%	(1.0)	1.0

rate (and note that most of these events occur in remote areas of the state). For magnitude 8 and larger, on the other hand, the rate has increased by 20 percent in UCERF3, with an expected repeat time of 494 years for UCERF3, down from 1 every 617 years in UCERF2. These changes are a direct and expected manifestation of including multifault ruptures in UCERF3. A more careful analysis of historical seismicity has also produced an increased rate for magnitude 5 and greater earthquakes, going from about 5.8 per year in UCERF2 to 8.3 per year in UCERF3. All of these trends are similar to those seen in various subregions of the state, with differences being slightly more dramatic for the Los Angeles area because that region has a large number of faults that can now host multifault ruptures.

Results are also expressed in terms of the likelihood of experiencing one or more earthquakes in the next 30 years, the duration of a typical home mortgage, and these values also take fault readiness into consideration (how long it has been since the most recent event). As in UCERF2, the likelihood for magnitude 6.7 and larger earthquakes somewhere in the entire region remains near certainty (greater than 99 percent). The likelihood is 7 percent for magnitude 8 and greater, a 50 percent increase over UCERF2, resulting from both the inclusion of multifault ruptures and the particular readiness of some large faults.

One particularly ready fault is the Southern San Andreas, which contributes to its continued status of being the most likely to host a large earthquake. Specifically, it has a 19 percent chance of having one or more events larger than magnitude 6.7 in the next 30 years near Mojave, Calif. The comparably low values for the Northern San Andreas, such as 6.4 percent near San Francisco, are partly because of the relatively recent 1906 earthquake on that fault. In fact, probabilities on two other Bay Area faults, the Hayward–Rodgers Creek and the Calaveras, currently rival or exceed those on the Northern San Andreas, in part because they are both relatively ready.

Compared to the previous model, UCERF2, the San Jacinto fault has a three-fold decrease in the likelihood of magnitude 6.7 or larger earthquakes. Much of this decrease is because of the inclusion of more multifault ruptures, as indicated by the factor of 57 increase in the likelihood of magnitude 8 and larger earthquakes. In other words, the fault has traded some moderate-sized events for rare larger ones.

The Calveras fault, on the other hand, has a three-fold increase in the likelihood of magnitude 6.7 or larger earthquakes. In UCERF2 most Calaveras events were well below magnitude 6.7, so the inclusion of multifault ruptures in UCERF3 has increased the frequency of earthquakes above magnitude 6.7.

We have only touched on a few of the more important changes between UCERF2 and UCERF3, and have highlighted only some of the influential factors. Many more are currently understood, and scientists will be further analyzing results and testing assumptions for years to come.

So what do these changes imply with respect to seismic hazard, the likelihood of ground shaking, as well as for seismic risk, the threat to the built environment with respect to fatalities and economic losses? The answer turns out to be entirely dependent on what you are concerned about. For example, increasing the likelihood of large multifault earthquakes, which consequently reduces the likelihood of moderate-sized events, may increase the risk to tall buildings or large bridges, but actually lower the risk to residential homes.

As a consequence, it is difficult to make generalizations about the hazard or risk implications of UCERF3 without first specifying both asset types and their locations. Conclusions will vary depending on whether you are designing a single family dwelling in Sacramento, retrofitting the San Francisco–Oakland Bay Bridge, considering the location of a nuclear power plant, laying pipeline across the San Andreas Fault, or considering aggregate losses over a large insurance portfolio. The practical implications will need to be considered on a case-by-case basis.

What Next?

UCERF3 can now be used to evaluate seismic hazard and risk in California. In fact, it has already been used for the 2014 update of the U.S. Geological Survey National Seismic Hazard Maps (http://earthquake.usgs.gov/hazards/), which in turn are used in building codes. The California Earthquake Authority, which is required by law to use the best available science, will use UCERF3 to evaluate insurance premiums charged to customers, as well as their own level of reinsurance. UCERF3 will be used in many other risk mitigation

Tabulated values represent the likelihood of having one or more earthquakes in the next 30 years (starting from 2014).

[At the points on the fault indicated by white circles. M≥6.7 means magnitude greater than or equal to 6.7, and likewise for the other two magnitude thresholds. %, percent. Values listed in parentheses indicate the factor by which the likelihoods have increased, or decreased, relative to the previous model (UCERF2), where "--" means the previous value was zero. "Readiness" indicates the factor by which probabilities are currently elevated, or lower, because of the length of time since the previous large earthquake]

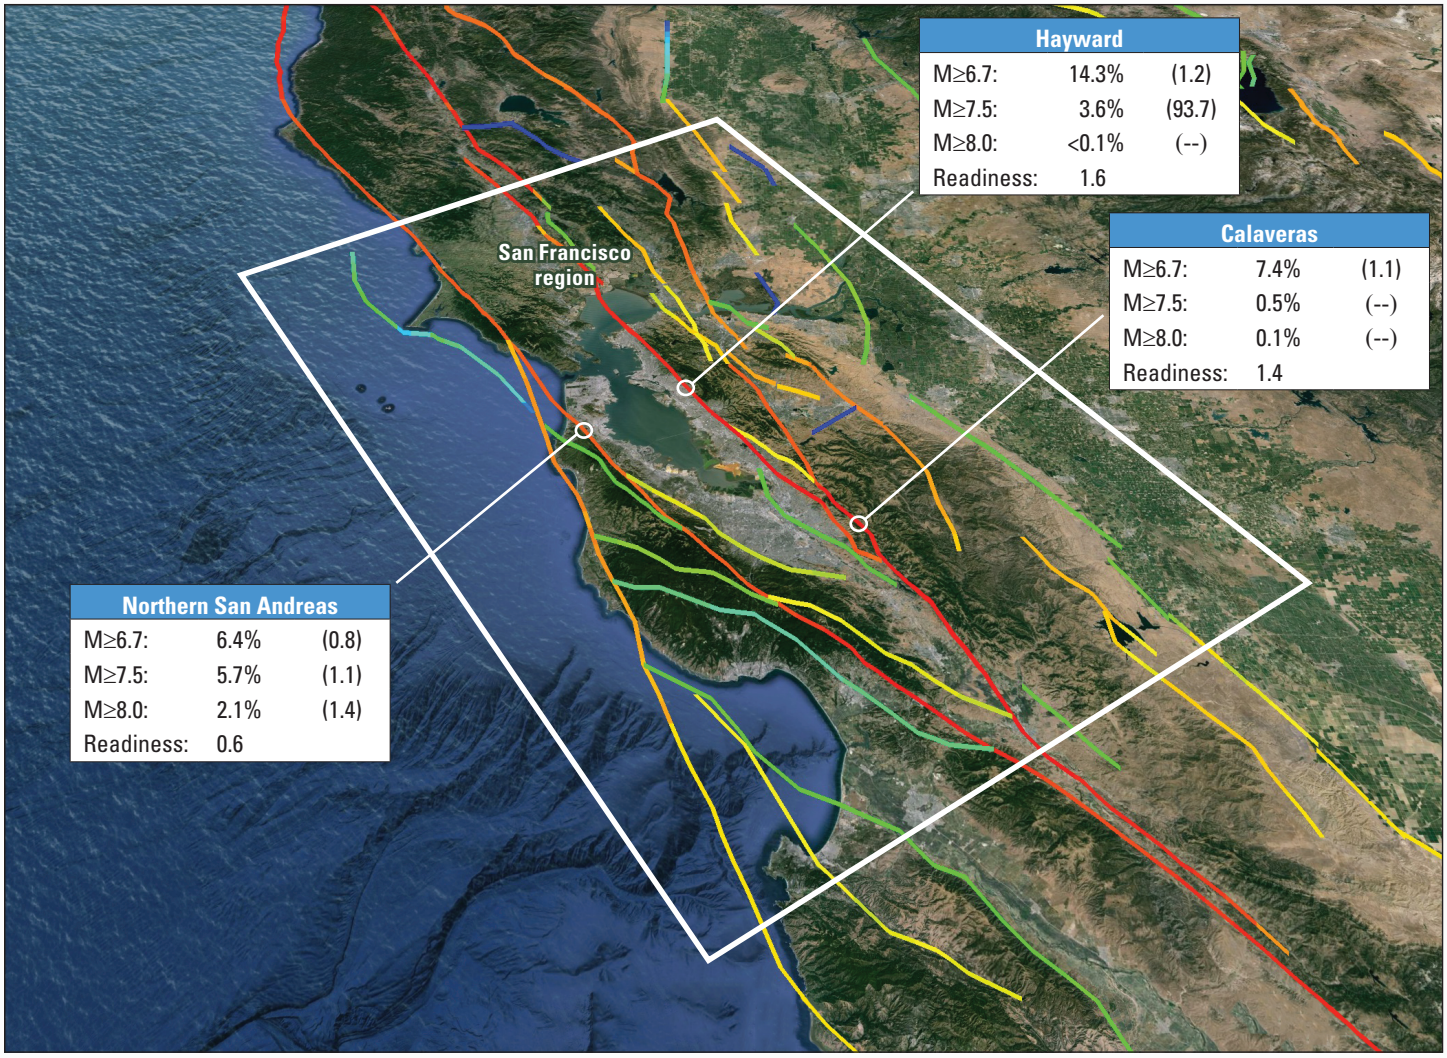

Figure 4. Likelihood of magnitude 6.7 or greater earthquakes in the next 30 years, from 2014, on the faults near San Francisco, Calif.

efforts in the years to come, including engineering design of buildings and lifelines, loss estimation for catastrophic bonds and other risk-linked securities, and emergency preparedness, all of which have the ultimate goal of increasing public safety and community resilience.

UCERF3 should also serve as a reminder that California is earthquake country, and residents should always be prepared. Simple safeguards include practicing "drop, cover, and hold on," securing items in your home and workplace that could fall during an earthquake, and storing seven-days worth of food and water. Homeowners can also consider structural retrofits, such as bolting the house to its foundation, as well as earthquake insurance options. For further guidance on how to prepare for, survive, and recover after big earthquakes, follow the Seven Steps to Earthquake Safety (http://www.earthquakecountry.org/sevensteps).

Although UCERF3 is a clear improvement over the previous model (UCERF2), it is still an approximation of the natural system. For example, it does not model the earthquake-triggering process that produces aftershocks, even though we know such events can be large and damaging. Through the National Earthquake Hazard Reduction Program (http://www.nehrp.gov), the U.S. Geological Survey and its partners will continue to conduct research aimed at improving our understanding of fault behavior and estimates of earthquake hazard in the future.

Subject:	Progress Report Nady Property Development 6701 Shellmound Street Emeryville, California	Copies to:	Duane Carlson, AvalonBay Bryan Moore, AvalonBay

This memorandum presents our preliminary findings and recommendations resulting from our preliminary geotechnical study being performed for the Nady property located at 6701 Shellmound Street in Berkeley, California (Figure 1). The work was performed in accordance with our proposal dated October 9, 2012 and Addendum No. 1 dated April 16, 2013.

FIELD EXPLORATION PROGRAM

Three rotary wash borings were drilled on April 18 and 19, 2013 to depths of 60 (B-1), 40 (B-2) and 45 (B-3) feet at the approximate locations indicated on Figure 2. Boring logs are attached. Drill fluids and excess soil cuttings were stored in 55-gallon drums, and initial representative soil samples were tested for environmental contaminants. Drums awaiting removal following completion of additional landfill requested soil and liquid characterization testing and receipt of landfill acceptance for receiving spoils and drilling product (offhaul and acceptance by landfill handled by drilling subcontractor Woodward Drilling).

SUBSURFACE SOIL CONDITIONS

The general subsurface conditions encountered across the site in our test borings consisted of approximately 18' of non-engineered variable soil (primarily clayey gravel with some sand) and debris fill (placed in the late 1940s) overlying about 3 feet or less of overconsolidated, stiff Bay Mud. Some hydrocarbon or oil products were encountered within the fill zone and mixed into the drill fluid. Debris materials encountered within the fill included concrete, glass, metal, rubber and wood fragments. Native materials encountered below the Bay Mud below a depth of about 20 to 21 feet consisted of medium dense silty sand and/or stiff to very stiff lean clays to a depth of 30 feet, underlain by dense sands or stiff to very stiff lean clays to the depth explored of about 60 feet. Two of three borings encountered a dense silty sand layer between depths of about 30 feet and 37 feet (B-1) and 43 feet (B-3).

Older URS borings and Cone Penetration Tests (CPTs) encountered generally consistent soil conditions as encountered during the present field exploration. CPTs indicate a discontinuous dense sand layer may be present between 30 and 45 feet bgs, and that soils may be very dense below a depth of 60 – 70 feet at the eastern portion of the site.

GROUNDWATER CONDITIONS

Groundwater was encountered during Geosphere's current field exploration in the three borings at depths ranging between about 8 and 11 feet below ground surface (bgs). We understand that during concurrent environmental field exploration conducted at the site by Environ, the shallowest groundwater encountered in their borings was measured at 10.4 feet bgs.

Available recorded groundwater depth levels from groundwater well measurements taken by various investigators between 1989 and 1996 in relation to previous environmental studies conducted on in the vicinity of the subject property were reviewed. Measured groundwater depths taken from onsite wells installed by Subsurface Consultants between 1989 and 1993 ranged between 7.1 and 12.9 feet bgs. Two old wells (designated in the data as PES MW-5 and MW-7) at unknown locations believed to be somewhere within the nearby property to the south (1650 65th Street) showed shallowest GW levels at 5.2 and 5.4 feet bgs in measurements taken in May 1995.

GEOTECHNICAL DEVELOPMENT CONSIDERATIONS

1. Near-surface fill materials are not suitable for heavy foundation support without modification; heavy debris presence presents uncertainty in suitability and effectiveness of certain ground modification techniques of near-surface soils such as dynamic compaction, vibro-compaction, and grouting. The likely contaminated nature of the fill soils and desire to limit contaminated soil offhaul likely limits the use of non-displacement type improvement methods such as stone columns and Geopiers. However, use of displacement-type auger concrete or soil-cement columns to dissipate as well as transfer shallow foundation loads through the fill materials to stiffer underlying materials appear to be feasible options for further evaluation.

2. A significant thickness of compressible Bay Mud was not encountered below the fill layer. The mud layer encountered was up to about 3 feet thick. This site is just outside the edge of the pre-1940s bay shoreline and within the tidal zone; the thickness of overlying fill indicates the pre-development site elevation was on the order of +0 (sea level) or slightly lower.

3. Isolated liquefiable zones may be present in portions of the fill layer that are more granular in nature (difficult to assess due to the heterogeneity of the fill). No granular layers within the underlying native alluvial soils were encountered that would be considered to be significantly susceptible to liquefaction to an extent resulting in significant seismic surface settlement. A more complete evaluation can and would be made as a result of future CPTs needed to be performed for a design-level geotechnical study.

FOUNDATION FEASIBILITY EVALUATION

Shallow Foundations

1. Shallow, relatively heavily loaded footing foundations appear to be a feasible option for further study assuming footing loads can be dissipated and transferred below the fill and mud zones by use of "soil improvement" techniques below the footings. Augered displacement columns (e.g., Farrell Drill Displacement Columns) extending to stiff competent materials below the fill and Bay Mud layers have been locally used at similar projects, and are the subject of further cost evaluation. Using augered displacement columns, some spoils would be generated through excavations required for footing construction. Due to the desire to limit the volume of soil cuttings due to offhaul costs of environmentally-impacted material as well as aquifer cross contamination concerns, use of a non-displacement-type drilled pier foundation type such as Geopiers is not favored for this site.
2. Structural mat foundations are geotechnically feasible at this site, but would require some combination of reworking of the upper portion of the existing soils as engineered fill and constructing an imported engineered fill layer in order to provide a suitable subgrade for the foundation (typically three feet total thickness of engineered fill would be required). Mat foundations are typically more advantageous when a below or partially below-grade level is used for the project. Possible construction and design constraints to the use of below-grade mat foundations include the presence of a relatively shallow groundwater table and the desire to limit offhaul of existing potentially contaminated fill materials excavated to reach a below-grade subgrade level. For evaluation and preliminary design purposes, given the existing GW data discussed herein, a highest (shallow) groundwater depth could be assumed to be on the order of 5 to 6 feet below existing ground surface, pending revision if more site-specific measurements are eventually generated.

Deep Foundations

1. Precast, pre-stressed concrete displacement piles are suitable for this site from a geotechnical standpoint. Supporting capacity would be derived by frictional resistance between the sides of the pile and the surrounding soils primarily below a depth of 25 feet. Suitable capacities can be derived by using 14-inch square piles driven to a depth of at least 60 feet (calculated preliminary allowable load [FS=2] of 170 kips for a 60-foot long pile). Use of such piles will minimize the amount of construction spoils except for pile cap excavation. Noise and vibration considerations could be an issue with driven piles.
2. Drilled pier foundations are also suitable for this site from a geotechnical standpoint. Supporting capacity would also be derived by frictional resistance between the sides of the pier and the surrounding soils primarily below a depth of 25 feet. *Non-displacement* drilled piers are judged not to be feasible at this site due to the significant amount of soil spoils

generated as well as the potential for cross contamination of groundwater aquifers. Use of *displacement* type drilled piers such as APGD (Berkel) and Omega (Malcolm) would significantly decrease the amount of spoil generation as well as reduce the potential for aquifer cross contamination. Subsurface geotechnical data available and generated to date indicate that auger displacement piles (ADPs) are feasible at the site. Typical ADP diameters are 18, 24 and 30 inches. Based on preliminary engineering evaluation, use of an 18-inch diameter, 60-foot long ADP would derive on the order of 140 kips allowable load. Per foot cost of an 18" ADP ($40-60/lf installed) may be a little higher than cost of a 14" square pile. This option will also necessitate excavating for pile caps that would generate spoils. The greatest advantage of an ADP over comparable pre-stressed concrete pile is the minimization of noise and vibration concerns.

The results of our preliminary evaluation of foundation options have been previously discussed with AvalonBay personnel in conjunction with the development of preliminary comparative cost estimates for various foundation system options for the project. If you have any other questions regarding the contents of this memorandum, please contact me at (925) 314-7123, or by e-mail at cdare@geosphereinc.net.

Trammell Crow • Proposed Emeryville Residential Development

Statement of Hammett & Edison, Inc., Consulting Engineers

The firm of Hammett & Edison, Inc., Consulting Engineers, has been retained by Trammell Crow Residential to evaluate the impact on Radio Stations KFRC, 610 kHz, San Francisco, and KVTO, 1400 kHz, Berkeley, California from a new residential high-rise building proposed to be constructed near the intersection of Bay Street and Ashby Avenue in Emeryville, California.

Background

Trammell Crow Residential has proposed to construct a new high-rise residential building to be located on the southwest corner of the intersection of Ashby Avenue and Bay Street in Emeryville. The structure would be located about 150 meters south of the KFRC/KVTO tower from which both stations operate non-directionally at nominal powers of 5.0 kW and 1.0 kW, respectively. Trammell Crow has requested an analysis to determine the recommended maximum height of the building in order to minimize the impact on KFRC and KVTO. In addition, Trammell Crow has requested that the proposed construction be evaluated relative to radio frequency interference/radio frequency exposure and that mitigation measures, if required, be recommended.

Maximum Building Height

Figure 1 shows two building areas being considered for construction of the new residential structure. The northern area is the primary site under consideration, with the southern area being considered as an alternate or possibly an addition to the primary site. The effect of the proposed building was evaluated using the Numerical Electromagnetics Code (NEC), a program developed by Lawrence Livermore National Laboratory. Distances from the proposed building to the KFRC/KVTO tower were determined using aerial photographs and a building frame model was constructed in NEC. Building heights from one to twelve stories were modeled, assuming a height of 10 feet per story, and evaluated versus the 1400 kHz frequency of KVTO. KVTO is far more susceptible to interference from surrounding structures than KFRC due to the fact that the wavelength at 1400 kHz is less than half that at 610 kHz (703 feet versus 1613 feet). Therefore, and the effect of the proposed building on KVTO is the deciding factor in determining the recommended height of the residential high-rise.

Figure 2 provides a graph of the height of a building constructed covering all of Area 1 (from Figure 1), in stories, versus the maximum perturbation of the KVTO electromagnetic field signal. The percentage perturbation is given as absolute values, but in all cases represents the maximum null depth created by the introduction of the residential building, as compared to the desired circular azimuth pattern. As can be seen, the effects increase dramatically between seven and twelve stories. Several variations on this model were run with similar results. Two other models were also run assuming that

the new building would be located entirely on Area 2 and that the new building would cover all of Areas 1 and 2. The results for Area 2 are very close to those shown in Figure 2 for Area 1. When assuming a building encompassing both areas, however, the calculated perturbation of the KVTO pattern increases somewhat, with maximum value similar to what would be seen from either Area 1 or 2 from a building one more story in height.

Based upon this analysis, it is our recommendation that the proposed residential high-rise be built no higher than nine stories if the building is to be built to encompass *either* Areas 1 or 2. If the building is to be constructed on both Areas 1 and 2, however, it is recommended that the height be limited to eight stories.

Radio Frequency Exposure

The NEC model was also used to determine if electric or magnetic fields in excess of the FCC exposure limit applicable at AM frequencies were predicted to occur within the finished residential structure. The limits at the 610 kHz frequency of KFRC are 614 V/m for electric fields and 1.63 A/m for magnetic fields, with limits at the 1400 kHz frequency of KVTO of 588 V/m and 1.56 A/m. A summary of the FCC's exposure limits is shown in Figure 3. These limits apply for continuous exposures and are intended to provide a prudent margin of safety for all persons, regardless of age, gender, size, or health.

Based upon a grid model near field analysis, the maximum electric field due to the operation of both stations is calculated to be 254 V/m, occurring within four inches of several of the framing beams used in the model. The maximum cumulative magnetic field is calculated to be 1.5 A/m, again occurring within four inches of certain framing beams. It should be noted that good bonding practices, as well as the presence of other metallic materials in the vicinity of the beam, likely will serve to further reduce localized electromagnetic field levels.

Radio Frequency Interference

Throughout the proposed structure, even assuming attenuation due to the metal construction of the building, typical field levels may still range from 4 V/m, caused by the direct signal from the two stations, to 200 V/m, in extremely localized cases of re-radiation. As a result, interference to telephones, consumer electronics, and other electronic devices may occur, with residents along the north side of the building likely to experience the greatest effects. There are several techniques that can be employed to mitigate the interference. First, metal interfaces in the building frame construction, whether steel beams or rebar, should be well bonded to electrically "shorten" the individual elements. The building frame should also be grounded, though the use of ground rods, along the entire perimeter of the building, spaced at intervals not greater than 40 feet. Telephone and

power service feeds to the building should be undergrounded, with a well-bonded grounding system connected to the building ground. Building phone and power lines should be run in metal conduit, where practical, with phone lines consisting of shielded, twisted-pair wires. The shielding should be grounded only at the service end to prevent ground loops.

A further measure to reduce interference would be to screen the roof and north side of the building. Copper mesh or a similar material could be laid along the roof and the interior or exterior of the north wall and bonded to the building's steel structure. While this approach would not completely shield the structure from interference, it should provide for significant attenuation of the radio signals, and, therefore, significant reduction of interference within the building.

It is typically not possible to eliminate all cases of interference through mitigation measures during construction. Ongoing interference after the building is occupied can be dealt with on a case-by-case basis by the installation of filters or the replacement of susceptible devices.

Construction Issues

New construction in the vicinity of AM radio stations can present several problems not seen at typical construction sites that, nevertheless, are usually mitigable. In particular, cranes and concrete boom trucks can create very long re-radiating elements that present an RF shock hazard to workers on site. It is recommended that an occupational exposure guide be developed prior to the start of constructed that can be configured to address construction techniques planned for the site. Such a guide should include, but not be limited to, the following:

- Require the use non-conductive cable or hooks for cranes utilized at the site.
- Require ground straps at the working end of all concrete booms employed at the site.
- Require that protective, non-conductive gloves, such as lineman's gloves, protective glasses, and boots be utilized by workers when working with cranes, boom trucks, pile drivers, or any equipment of sufficient size to present an RF shock hazard.
- Require that all steel elements being raised by crane be grounded to the building structure prior to being contacted and placed by workers.

Conclusion

Provided that the high-rise residential structure proposed by Trammel Crow is limited to nine stories on Areas 1 or 2, or eight stories over both areas, it should not have a significant impact on the operation of Radio Stations KFRC and KVTO. Provided that bonding and grounding recommendations are followed, calculations indicate that the proposed structure will not present field

levels in excess of the FCC exposure limits applicable at AM frequencies in any accessible area. Re-radiation of the AM signals may present worker safety issues during construction and an occupation exposure guide is recommended to address potential site problems. Radio frequency interference is likely to be an issue within the proposed building, however mitigation measures during and after construction can be used to minimize this effect and solve most, if not all, cases of interference to within the structure.

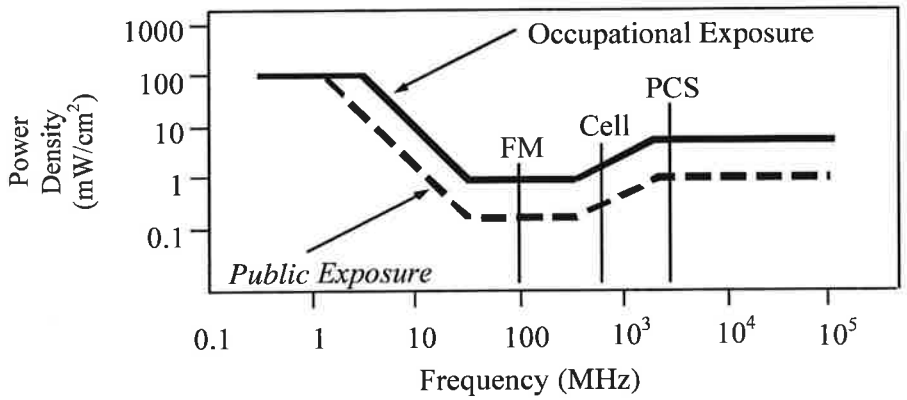
Figure 1

Trammell Crow • Proposed Emeryville Residential Development

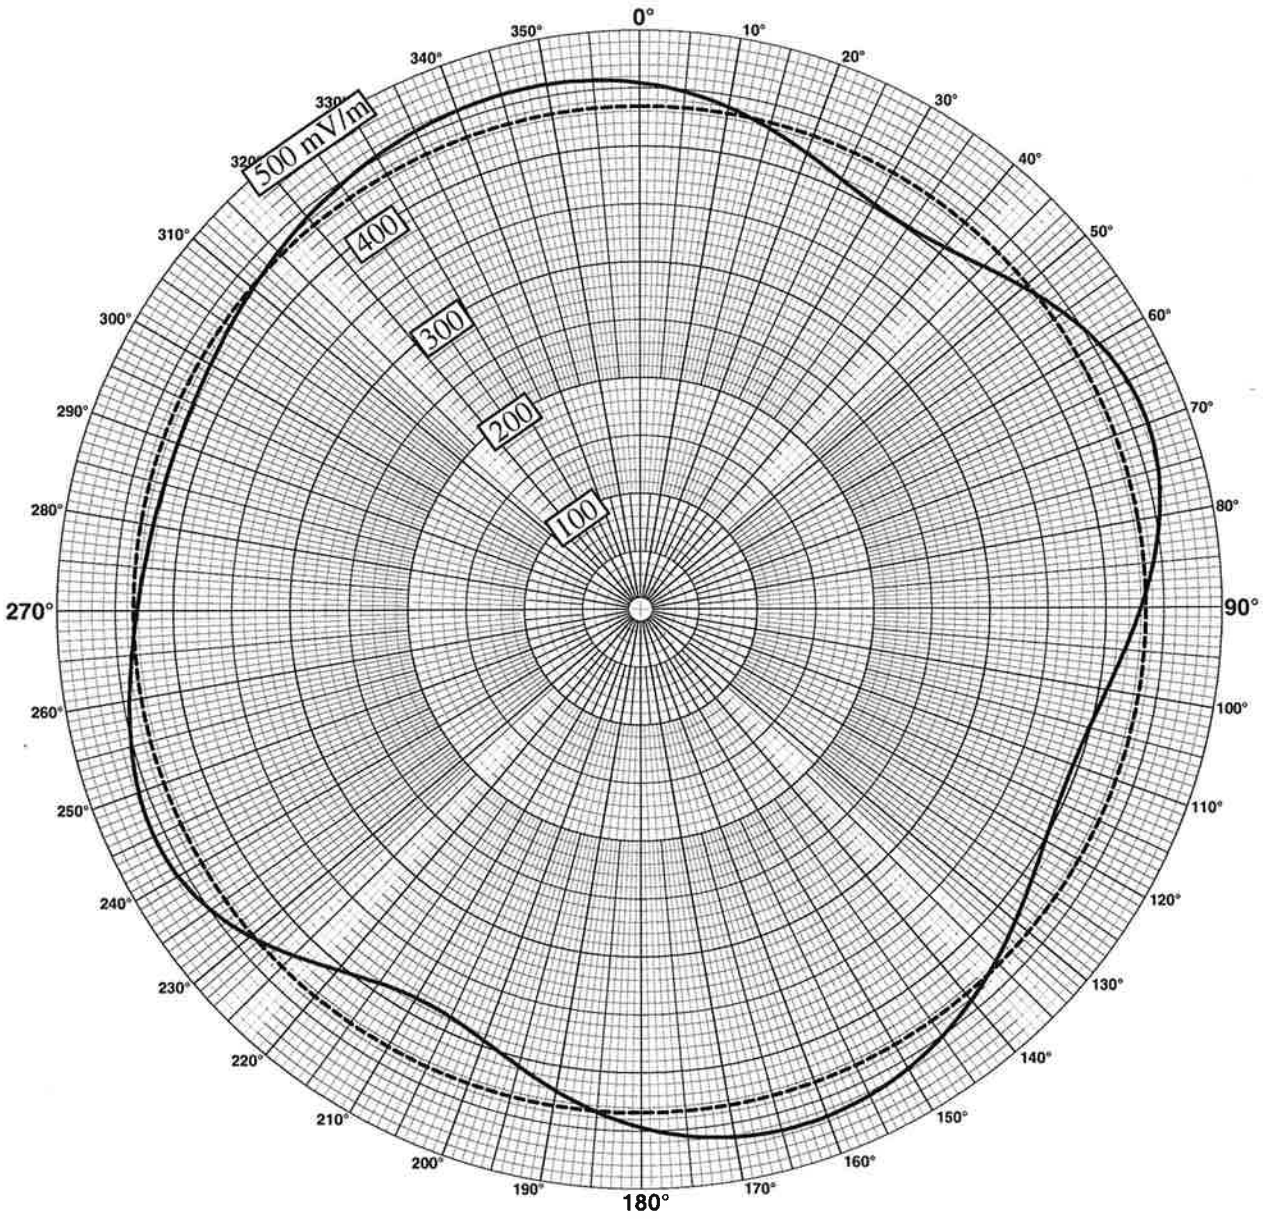
Maximum Perturbation of Signal for
Radio Station KVTO, 1400 kHz, Berkeley, California
Versus Height of Proposed Building 1



FCC Radio Frequency Protection Guide

The U.S. Congress required (1996 Telecom Act) the Federal Communications Commission ("FCC") to adopt a nationwide human exposure standard to ensure that its licensees do not, cumulatively, have a significant impact on the environment. The FCC adopted the limits from Report No. 86, "Biological Effects and Exposure Criteria for Radiofrequency Electromagnetic Fields," published in 1986 by the Congressionally chartered National Council on Radiation Protection and Measurements, which are nearly identical to the more recent Institute of Electrical and Electronics Engineers Standard C95.1-1999, "Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz." These limits apply for continuous exposures from all sources and are intended to provide a prudent margin of safety for all persons, regardless of age, gender, size, or health.

As shown in the table and chart below, separate limits apply for occupational and public exposure conditions, with the latter limits (in *italics* and/or dashed) up to five times more restrictive:



Frequency	Electromagnetic Fields (f is frequency of emission in MHz)					
Applicable Range (MHz)	Electric Field Strength (V/m)		Magnetic Field Strength (A/m)		Equivalent Far-Field Power Density (mW/cm^2)	
0.3 – 1.34	614	*614*	1.63	*1.63*	100	*100*
1.34 – 3.0	614	*823.8/f*	1.63	*2.19/f*	100	*180/f^2*
3.0 – 30	1842/ f	*823.8/f*	4.89/ f	*2.19/f*	900/ f^2	*180/f^2*
30 – 300	61.4	*27.5*	0.163	*0.0729*	1.0	*0.2*
300 – 1,500	$3.54\sqrt{f}$	*$1.59\sqrt{f}$*	$\sqrt{f}/106$	*$\sqrt{f}/238$*	f/300	*f/1500*
1,500 – 100,000	137	*61.4*	0.364	*0.163*	5.0	*1.0*

Higher levels are allowed for short periods of time, such that total exposure levels averaged over six or thirty minutes, for occupational or public settings, respectively, do not exceed the limits, and higher levels also are allowed for exposures to small areas, such that the spatially averaged levels do not exceed the limits. However, neither of these allowances is incorporated in the conservative calculation formulas in the FCC Office of Engineering and Technology Bulletin No. 65 (August 1997) for projecting field levels. Hammett & Edison has built those formulas into a proprietary program that calculates, at each location on an arbitrary rectangular grid, the total expected power density from any number of individual radio sources. The program allows for the description of buildings and uneven terrain, if required to obtain more accurate projections.

2.2 Air Quality

This section evaluates the regional air quality impacts of implementing the proposed Plan. The analysis focuses on the following criteria pollutants: (1) ground-level ozone precursor emissions, for which the Bay Area is currently designated as a non-attainment area under the national and state standards, (2) particulate matter (PM) emissions, for which the Bay Area is currently designated as non-attainment under the national and state standards; and (3) carbon monoxide emissions, for which the Bay Area is designated as attainment under the national standard. It also evaluates criteria pollutants and Toxic Air Contaminants (TACs) from construction activity and local and regional emissions of TACs and fine particulate matter ($PM_{2.5}$).

This EIR examines these at a regional level. However, for TACs and $PM_{2.5}$ a localized analysis is provided to identify potential public health impacts from locating new sensitive receptors within Transit Priority Project (TPPs) areas. The EIR does not examine the effects on local or regional air quality from specific land use and transportation improvements in the proposed Plan.

The related issues of greenhouse gas emissions and potential climate change effects are addressed separately in *Chapter 2.5: Climate Change and Greenhouse Gases* of this EIR.

Environmental Setting

PHYSICAL SETTING

Air quality is affected by the rate, amount, and location of pollutant emissions, and the associated meteorological conditions that influence pollutant movement and dispersal. Atmospheric conditions, including wind speed, wind direction, and air temperature, in combination with local surface topography (i.e., geographic features such as mountains and valleys), determine the effect of air pollutant emissions on local and regional air quality.

Climate, Meteorology, and Topography

The Bay Area region has a Mediterranean climate characterized by wet winters and dry summers. Rainfall totals can vary widely over a short distance, with windward coastal mountain areas receiving over 40 inches of rain, while leeward areas receive about 15 inches. During rainy periods, horizontal and vertical air movement ensures rapid pollutant dispersal. Rain also washes out particulate and other pollutants.

Normally, air temperatures decrease with increasing elevations. Sometimes this normal pattern is inverted, with warmer air aloft, and cool air trapped near the earth's surface. This phenomenon occurs in all seasons. In summer, especially when wind speeds are very low, a strong inversion will trap air

emissions and high levels of ozone smog can occur. In winter, a strong inversion can trap emissions of particulate and carbon monoxide near the surface, resulting in unhealthful air quality.

The Bay Area topography is complex, consisting of coastal mountain ranges, inland valleys, and bays, which distort normal wind flow patterns. The Pacific Ocean bounds the area to the west with warmer inland valleys to the south and east. The only major break in California's Coast Range occurs at San Francisco Bay. The gap on the western side is called the Golden Gate, and on the eastern side, it is called the Carquinez Strait. These gaps allow air to pass between the Central Valley and the Pacific Ocean. The general region lies in the semi-permanent high-pressure zone of the eastern Pacific, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. The usually mild climatological pattern is interrupted occasionally by periods of extremely hot weather, winter storms, and offshore winds.

Regional wind patterns vary from season to season. During the summer, winds flowing from the northwest are drawn inland through the Golden Gate and over the lower portions of the San Francisco Peninsula. Wind speeds may be strong locally in areas where air is channeled through a narrow opening, such as the Carquinez Strait, Golden Gate or the San Bruno Gap. In the winter, the region frequently experiences stormy conditions with moderate to strong winds, as well as periods of stagnation with very light winds. Winter stagnation episodes are characterized by nighttime drainage flows in coastal valleys. Drainage refers to the reversal of the usual daytime air-flow patterns; air moves from the Central Valley toward the coast.

Wind tends to move from areas of high-pressure to areas of low-pressure. In warmer months, this means that air currents move on-shore from the Pacific Ocean to inland areas. Pacific Ocean air receives emissions from numerous sources (anthropogenic and biogenic) as it comes onshore, and will then carry these pollutants to areas many miles away. Mountains and valleys often affect on-shore winds. This means that a wind pattern that started as northwesterly will often swing 90 degrees or more when it encounters topographic features.

The climatological pollution potential of an area is largely dependent on winds, atmospheric stability, solar radiation, and terrain. The combination of low wind speeds and a strong inversion produces the greatest concentration of air pollutants. On days without inversions, or on days of winds averaging over 15 miles per hour (mph), smog potential is greatly reduced. Because of wind patterns, and, to a lesser degree, the geographic location of emission sources, high ozone levels usually occur in inland valleys, such as the Livermore area. High particulate matter levels can occur in areas of intense motor vehicle use, such as freeways, ports, etc., and in most valley areas where residential wood smoke and other pollutants are trapped by inversions and stagnant air.

Existing Air Quality and Attainment Status Summary

The federal Clean Air Act requires the U.S. Environmental Protection Agency (EPA) to set National Ambient Air Quality Standards (NAAQS) (40 CFR part 5) for six pollutants considered harmful to public health and the environment. These six pollutants are ground-level ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter (PM), and lead (Pb). EPA calls these pollutants "criteria" air pollutants because it regulates them by developing human health-based and/or environmentally-based criteria (science-based guidelines) for setting permissible levels.

Under amendments to the federal Clean Air Act, EPA has classified air basins or portions thereof, as either "attainment" or "nonattainment" for each criteria pollutant, based on whether or not the national standards have been achieved. The California Clean Air Act, patterned after the federal Clean Air Act, also designates areas as "attainment" or "nonattainment" for State standards. Thus, California has two sets of attainment/nonattainment designations: one with respect to national standards and one with respect to State standards.

Table 2.2-1 identifies the ambient air quality standards and attainment status for all criteria pollutants. The Bay Area is currently designated as a nonattainment area for State and federal ozone standards, the federal 24 hour $PM_{2.5}$ standard, and State PM_{10} standards. Based on the nonattainment status of these pollutants, this analysis is focused on ground-level ozone, particulate matter, and carbon monoxide.[1] **Table 2.2-2** presents a ten-year Bay Area air quality summary for days over the national and California standards for ozone, carbon monoxide, and particulate matter. Each of these criteria pollutants is discussed in more detail in the following pages.

[1] In April 1998, the Bay Area was re-designated to attainment for the national 8-hour carbon monoxide standard. However, the Bay Area must continue to demonstrate attainment of that standard. Because of this, the EIR evaluates the carbon monoxide impacts of the proposed Plan.

TABLE 2.2-1: BAY AREA AMBIENT AIR QUALITY STANDARDS AND ATTAINMENT STATUS AS OF 2012

Pollutant	*Averaging Time*	*California Standard[1,2]*	*Attainment Status for California Standard*	*Federal Primary Standard[1,3]*	*Attainment Status for Federal Standard*	*Major Pollutant Sources*
Ozone	8 hour	0.070 ppm	Non-Attainment	0.075 ppm	Non-Attainment	Motor vehicles, other mobile sources, combustion, industrial and commercial processes
	1 hour	0.09 ppm	Non-Attainment			
Carbon Monoxide (CO)	8 hour	9.0 ppm	Attainment	9 ppm	Attainment	Internal combustion engines, primarily gasoline-powered motor vehicles
	1 hour	20 ppm	Attainment	35 ppm	Attainment	
Nitrogen Dioxide (NO_2)	1 hour	0.18 ppm	Attainment	0.100 ppm	Unclassified	Emissions from cars, trucks, and buses
	Annual Arithmetic Mean	0.030 ppm	---	0.053 ppm	Attainment	
Sulfur Dioxide (SO_2)	24 Hour	0.04 ppm	Attainment	0.14 ppm	Attainment	Fossil fuel combustion at power plants and other industrial facilities, and burning of high sulfur containing fuels by locomotives, large ships, and non-road equipment
	1 Hour	0.25 ppm	Attainment	0.075 ppm	Attainment	
	Annual Arithmetic Mean	---	---	0.030 ppm	Attainment	
Particulate Matter (PM_{10})	24 Hour	50 µg/m^3	Non-Attainment	150 µg/m^3	Unclassified	Dust- and fume-producing industrial and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays)
	Annual Arithmetic Mean	20 µg/m^3	Non-Attainment	---	---	
Particulate Matter – Fine ($PM_{2.5}$)	24 Hour	---	---	35 µg/m^3	Non-Attainment	Same as above
	Annual Arithmetic Mean	12 µg/m^3	Non-Attainment	15 µg/m^3	Attainment	

TABLE 2.2-1: BAY AREA AMBIENT AIR QUALITY STANDARDS AND ATTAINMENT STATUS AS OF 2012

Pollutant	*Averaging Time*	*California Standard[1,2]*	*Attainment Status for California Standard*	*Federal Primary Standard[1,3]*	*Attainment Status for Federal Standard*	*Major Pollutant Sources*
Lead[4]	30 day Average	1.5 µg/m^3	---	---	Attainment	Fuels in on-road motor vehicles and industrial sources
	Calendar Quarter	---	---	1.5 µg/m^3	Attainment	
	Rolling 3 Month Average[5]	---	---	0.15 µg/m^3		

Notes:

1. PPM=parts per million; mg/m^3=milligrams per cubic meter; and µg/m^3=micrograms per cubic meter
2. California standards for ozone, CO (except Lake Tahoe), NO_2, SO_2, PM_{10}, $PM_{2.5}$, and visibility reducing particles are values not to be exceeded. All other are not to be equaled or exceeded.
3. National standards (other than ozone, PM, and those based on annual averages or annual arithmetic means) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest eight-hour concentration in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
4. The California Air Resources Board has identified lead and vinyl chloride as "toxic air contaminants" with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
5. National lead standard, rolling 3-month average: final rule signed October 15, 2008.

TABLE 2.2-2: TEN-YEAR BAY AREA AIR QUALITY SUMMARY (2002-2011)

Days Over Standard for Ozone, Carbon Monoxide and Particulate Matter (PM)

	Ozone			*Carbon Monoxide*			*PM_{10}*		*$PM_{2.5}$*
	1-Hr	*8-Hr*		*1-Hr*	*8-Hr*		*24-Hr*		*24-Hr[2]*
Year	*Cal*	*Nat[1]*	*Cal*	*Nat*	*Cal*	*Nat/Cal*	*Nat*	*Cal*	*Nat*
2002	16	7	-	0	0	0	0	6	7
2003	19	7	-	0	0	0	0	6	0
2004	7	0	-	0	0	0	0	7	1
2005	9	1	9	0	0	0	0	6	0
2006	18	12	22	0	0	0	0	15	10
2007	4	1	9	0	0	0	0	4	14
2008	9	12	20	0	0	0	0	5	12
2009	11	8	13	0	0	0	0	1	11
2010	8	9	11	0	0	0	0	2	6
2011	-	4	10	0	0	0	0	4	8

Notes:

1. On May 17, 2008, the U.S. EPA implemented a more stringent national 8-hour ozone standard, revising it from 0.08 ppm to 0.075 ppm. Ozone exceedance days for 2008 reflect the new standard.
2. On December 17, 2006, the U.S. EPA implemented a more stringent national 24-hour $PM_{2.5}$ standard—revising it from 65 µg/m^3 to 35 µg/m^3. Starting in 2006, $PM_{2.5}$ exceedance days reflect the new standard.

Ozone

Ozone is a reactive pollutant, which is not emitted directly into the atmosphere, but is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG) and oxides of nitrogen (NO_x). ROG and NO_x are known as precursor compounds of ozone. Motor vehicle exhaust and industrial emissions, gasoline vapors, and chemical solvents are some of the major sources of ROG and NO_x that help to form ozone. Ozone is a regional air pollutant because it is formed downwind of sources of ROG and NO_x under the influence of wind and sunlight. During summertime (particularly on hot, sunny days with little or no wind), ozone levels are at their highest.

Short-term exposure to elevated concentrations of ozone is linked to such health effects as eye irritation and breathing difficulties. Repeated exposure to ozone can make people more susceptible to respiratory infections and aggravate pre-existing respiratory diseases. Long-term exposures to ozone can cause more serious respiratory illnesses. Ozone also damages trees and other natural vegetation, reduces agricultural productivity, and causes deterioration of building materials, surface coatings, rubber, plastic products and textiles.

Tables 2.2-3 and **2.2-4** show exceedances of the State one-hour ozone standard and national eight-hour ozone standard, respectively. The number of days the region experiences unhealthy ozone levels has fallen overall. This improvement is due to the California Air Resources Board (ARB) regulations affecting motor vehicle emissions and Bay Area Air Quality Management District (BAAQMD) regulations to reduce emissions from industrial and commercial sources.

Carbon Monoxide

Carbon monoxide (CO) is an odorless and invisible gas. It is a non-reactive pollutant that is a product of incomplete combustion of gasoline in automobile engines. Carbon monoxide is a localized pollutant, and the highest concentrations are found near the source. Ambient carbon monoxide concentrations generally follow the spatial and temporal distributions of vehicular traffic and are influenced by wind speed and atmospheric mixing. Carbon monoxide concentrations are highest in flat areas on still winter nights, when temperature inversions trap the carbon monoxide near the ground. When inhaled at high

concentrations, carbon monoxide reduces the oxygen-carrying capacity of the blood, which, in turn, results in reduced oxygen reaching parts of the body. Most of the Bay Area's carbon monoxide comes from on-road motor vehicles, although a substantial amount also comes from burning wood in fireplaces. Over the past 10 years, the Bay Area has not experienced any exceedances of either the national or state carbon monoxide standard.

Particulate Matter

Particulate matter includes dirt, dust, soot, smoke and liquid droplets found in the air. Coarse particulate matter, or PM_{10}, refers to particles less than or equal to 10 microns in diameter (about one-seventh the diameter of a human hair). PM_{10} is primarily composed of large particles from sources such as road dust, residential wood burning, construction/demolition activities, and emissions from on- and off-road engines. Some sources of particulate matter, such as demolition and construction activities, are more local in nature, while others, such as vehicular traffic, have a more regional effect. Fine particulate matter, or $PM_{2.5}$, refers to particles less than or equal to 2.5 microns in diameter, and contains particles formed in the air from primary gaseous emissions. Examples include sulfates formed from SO_2 emissions from power plants and industrial facilities, nitrates formed from NO_x emissions from power plants, automobiles, and other combustion sources, and carbon formed from organic gas emissions from automobiles and industrial facilities.

The Bay Area experiences its highest particulate matter concentrations in the winter, especially during evening and night hours, due to the cool temperatures, low-wind speeds, low inversion layers, and high humidity. Specifically, $PM_{2.5}$ is viewed as a significant component of the region's total particulate matter problem because the $PM_{2.5}$ fraction of total particulate matter accounts for approximately 60 percent of the PM_{10} during the winter and approximately 45 percent during the rest of the year. On days when the PM standards are exceeded, $PM_{2.5}$ can account for as much as 90 percent of PM_{10}.

Coarse and fine particulate matters are small enough to get into the lungs and can cause numerous health problems, including respiratory conditions such as asthma and bronchitis, and heart and lung disease. People with heart or lung disease, the elderly, and children are at highest risk from exposure to particulate matter.

Toxic Air Contaminants

The California Health and Safety Code defines toxic air contaminants (TACs) as air pollutants that may cause or contribute to an increase in mortality or in serious illness, or that may pose a present or potential hazard to human health. TACs are less pervasive in the urban atmosphere than criteria air pollutants, but are linked to short-term (acute) or long-term (chronic and/or carcinogenic) adverse human health effects. For evaluation purposes, TACs are separated into carcinogens and non-carcinogens based on the nature of the physiological effects associated with exposure to TACs. Carcinogens are assumed to have no safe threshold below which health impacts would not occur. Cancer risk from carcinogens is expressed as excess cancer cases per one million exposed individuals, typically over a lifetime of exposure. Non-carcinogens differ in that there is a safe level in which it is generally assumed that no negative health impacts would occur. These levels are determined on a pollutant-by-pollutant basis.

There are many different types of TACs with varying degrees of toxicity. TACs may also exist as particulate matter or as vapors or gases. Sources of TACs include industrial processes, commercial operations (e.g., gasoline stations and dry cleaners), and motor vehicle exhaust—particularly diesel-

powered vehicles. Compared to other air toxics that ARB has identified and controlled, diesel particulate matter (diesel PM) emissions are estimated to be responsible for about 70 percent of the total ambient air toxics risk statewide.

The three most potent carcinogens come primarily from motor vehicles—diesel PM overall, and 1,3-butadiene and benzene as specific components of diesel PM. Cleaner motor vehicles and fuels are reducing the risks from these three priority toxic air pollutants. The remaining toxic air pollutants, such as hexavalent chromium and perchloroethylene, while not appearing to contribute as much to the overall risks, can present high risks to people living close to a source due to the highly localized concentration of TACs. ARB has control measures for motor vehicles, consumer products, and industrial source programs either already on the books, in development, or under evaluation for most TACs.

Health risks from diesel PM are highest in areas of concentrated emissions, such as near ports, rail yards, freeways, or warehouse distribution centers. According to the ARB, diesel engine emissions are responsible for the majority of California's known cancer risk from outdoor air pollutants. Those most vulnerable are children whose lungs are still developing and the elderly who may have other serious health problems. Based on numerous studies, ARB has also stated that diesel PM is a contributing factor for premature death from heart and/or lung diseases. In addition, diesel PM reduces visibility and is a strong absorber of solar radiation that contributes to global warming.[2]

According to the ARB, levels of toxic air pollutants have decreased significantly with the adoption of airborne toxic control measures, stringent vehicle standards, requirements for low emission vehicles, and cleaner fuels. Since 1980, there has been a statewide reduction of 98 percent in lead, and since 1990, there has been a statewide reduction of 85 percent in benzene 80 percent in 1,3-butadiene, 75 percent in hexavalent chromium, and 50 percent in diesel PM. The estimated cancer risk from TACs, measured statewide, has been reduced by 60 percent since 1990.[3]

To address community risk from air toxics, BAAQMD initiated the Community Air Risk Evaluation (CARE) program in 2004 to evaluate and reduce health risks associated with exposure to outdoor TACs. The program examines TAC emissions from point sources, area sources and on-road and off-road mobile sources co-located with sensitive populations to help focus mitigation strategies. In fiscal year 2012 alone, the BAAQMD allocated over $60 million to fund diesel emission reduction projects in CARE communities. Some of the projects funded included replacing or retrofitting on and off road heavy duty trucks; installation of shore side electric power at 11 berths at the Port of Oakland to reduce ship emissions; and to replace a locomotive operating at the rail yard in Richmond.

Based on annual emissions inventory of TACs prepared through the CARE program, TAC emissions from all sources in the Bay Area region were estimated to be 115 tons per day for 2005. The largest single source of daily average TAC emissions was on-road mobile sources, accounting for 38 percent. Diesel PM emissions constitute about 86 percent of cancer toxicity-weighted pollutants emitted in the region.

---

[3] ARB, The California Almanac of Emissions and Air Quality, 2009 Edition.

The largest single sources of diesel PM in the Bay Area region include the Port of Oakland, refineries, and rail yards.

REGULATORY SETTING

Air quality is regulated at the federal, state, and regional levels. The following subsection summarizes the applicable air quality regulations and regulatory agencies.

Federal Regulations

Federal Clean Air Act

The federal Clean Air Act (CAA) of 1970, amended in 1977 and 1990 (42 USC 7506(c)), was enacted for the purposes of protecting and enhancing the nation's air resources to benefit public health. In 1971, the CAA required the EPA to set NAAQS to achieve the purposes of Section 109 of the act. The NAAQS require that certain pollutants should not exceed specified levels; areas that exceed the standard for specified pollutants are designated as "nonattainment" areas. In promulgating the NAAQs, the EPA allowed some states the option to develop stricter state standards. As such, California has adopted its own set of stricter standards under the California Clean Air Act (CCAA) of 1988 (described under State Regulations).

The federal CAA requires states to develop State Implementation Plans (SIPs) that outline how each state will control air pollution under the CAA. A SIP includes the regulations, programs and policies that a state will use to clean up polluted areas. States must hold public hearings and provide opportunities for the public and industries to be involved and comment on the development of each state plan. The Bay Area's latest SIP is the *2001 Ozone Attainment Plan*, which demonstrates how the region is addressing the national 1-hour ozone standard.

1990 Amendments to Clean Air Act

The 1990 Amendments to the CAA included a provision to address air toxics. Under Title III of the CAA, EPA establishes and enforces National Emission Standards for Hazardous Air Pollutants (NESHAPs), which are nationally uniform standards oriented towards controlling particular hazardous air pollutants (HAPs). Section 112(b) of the CAA identifies 189 "Air Toxics" (hazardous air pollutants), directs EPA to identify sources of the 189 pollutants, and establishes a 10-year time period for EPA to issue technology-based emissions standards for each source category. Title III of the CAA provides for a second phase under which EPA is to assess residual risk after the implementation of the first phase of standards and impose new standards, when appropriate, to protect public health.

Federal Transportation Conformity Requirements

Transportation conformity is required under the CAA section 176(c) to ensure that federally supported highway and transportation project activities are consistent with ("conform to") the purpose and requirements of the SIP. Conformity currently applies to areas that are designated nonattainment, and those re-designated to attainment after 1990 ("maintenance areas") for the following transportation-related criteria pollutants: ozone, $PM_{2.5}$ and PM_{10}, CO, and NO_x. Conformity, to the purpose of the SIP, means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. Conformity is demonstrated by showing that the total

air pollutant emissions projected for a RTP/SCS are within the emissions limits ("budgets") established by the SIP.

Conformity requires demonstration that transportation control measures (TCMs) in ozone nonattainment areas are implemented in a timely fashion. TCMs are expected to be given funding priority and to be implemented on schedule and, in the case of any delays, any obstacles to implementation have been or are being overcome. A total of 33 TCMs have been fully implemented since the 1982 Bay Area Air Quality Plan; 12 TCMs were originally listed in the 1982 Bay Area Air Quality Plan, 16 additional TCMs were adopted by MTC in February 1990 in response to a 1990 lawsuit in the federal District Court to bring the region back on the "Reasonable Further Progress" track, and five TCMs were adopted as part of the 2001 1-Hour Ozone Attainment Plan. These TCMs include strategies such as improved transit service and transit coordination, ridesharing services and new carpool lanes, signal timing, freeway incident management, and increased gas taxes and bridge tolls to encourage use of alternatives modes.

MTC must make a determination that the proposed Plan conforms to the SIP and is consistent with the applicable air quality attainment plans. The transportation conformity analysis and findings prepared by MTC for the proposed Plan are addressed in a separate process from the Plan Bay Area environmental review process, and are included as a Supplemental Report to Plan Bay Area that is available for review at www.onebayarea.org.

State Regulations

California Clean Air Act

The California Clean Air Act (CCAA) of 1988 requires nonattainment areas to achieve and maintain the state ambient air quality standards by the earliest practicable date and local air districts to develop plans for attaining the state ozone, carbon monoxide, sulfur dioxide, and nitrogen dioxide standards. The ARB sets the state ambient air quality standards.

Under the CCAA, areas not in compliance with the standard must prepare plans to reduce ozone. Non-compliance with the state ozone standard does not impact the ability to proceed with any transportation plan, program, or project. The first Bay Area Clean Air Plan (CAP) was adopted in 1991, and updates to the CAP have occurred since then, with the most recent being the *Bay Area 2010 Clean Air Plan*. The Bay Area 2010 CAP provides "all feasible measures" to reduce ozone in the Bay Area.

Senate Bill 656 (Chapter 738, Statues of 2003)

In 2003, the Legislature enacted Senate Bill (SB) 656 (Chapter 738, Statutes of 2003), codified as Health and Safety Code Section 39614, to reduce public exposure to PM_{10} and $PM_{2.5}$. SB 656 requires ARB, in consultation with local air pollution control and air quality management districts (air districts), to develop and adopt, by January 1, 2005, a list of the most readily available, feasible, and cost-effective control measures that could be employed by ARB and the air districts to reduce PM_{10} and $PM_{2.5}$ (collectively referred to as PM). The legislation establishes a process for achieving near-term reductions in PM throughout California ahead of federally required deadlines for $PM_{2.5}$, and provides new direction on PM reductions in those areas not subject to federal requirements for PM. Measures adopted as part of SB 656 will complement and support those required for federal $PM_{2.5}$ attainment plans, as well as for State ozone plans. This will ensure continuing focus on PM reduction and progress towards attaining California's more health protective standards. This list of air district control measures was adopted by the ARB on

November 18, 2004. ARB also developed a list of State PM control measures for mobile and stationary sources, including measures planned for adoption as part of ARB's Diesel Risk Reduction Plan. The lists are at the following web site: http://www.arb.ca.gov/pm/pmmeasures/pmmeasures.htm.

To comply with SB 656, BAAQMD reviewed the list of 103 potential PM control measures prepared by ARB and developed a Particulate Matter Implementation Schedule which was adopted by BAAQMD in November 2005.[4] As a result, the BAAQMD adopted or amended existing rules to reduce particulate matter from internal combustion engines, chain driven commercial broiling, and residential woodburning and expanded its public awareness program.

Toxic Air Contaminant Identification and Control Act of 1983

Under the Toxic Air Contaminant Identification and Control Act of 1983 (Assembly Bill (AB) 1807, Chapter 1047, Statues of 1983), the California Legislature created a two-step identification and risk management program to reduce the risk of health effects from air toxic substances. During the first step (identification), the ARB and the Office of Environmental Health Hazard Assessment (OEHHA) determines if a substance should be formally identified as a toxic air contaminant (TAC) in California. During the second step (risk management), the ARB reviews the emission sources of an identified TAC to determine if any regulatory action is necessary to reduce the risk. The analysis includes a review of controls already in place, the available technologies and associated costs for reducing emissions, and the associated risk. Conducting public outreach is essential during the development of a control plan and any control measure to ensure that the ARB efforts are cost-effective and appropriately balance public health protection and economic growth.

In 1993, AB 1807 was amended to include the identification and control of additional TACs. Specifically, AB 2728 required the ARB to identify the 189 federal hazardous air pollutants as TACs. For substances that have not previously been identified under AB 1807, but were subsequently identified under AB 2728, health effects values will need to be developed.

Assembly Bill 2588 Air Toxics "Hot Spots" Information and Assessment Act of 1987

In September 1987, the California Legislature established the Air Toxics "Hot Spots" Information and Assessment Act of 1987, Assembly Bill (AB) 2588 (Health and Safety Code Sections 44300-44394). It requires facilities to report their air toxics emissions, ascertain health risks, and to notify nearby residents of significant risks. The emissions inventory and risk assessment information from this program has been incorporated into this report. In September 1992, the "Hot Spots" Act was amended by Senate Bill 1731 which required facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

Diesel Risk Reduction Plan

In August 1998, the ARB identified particulate emissions from diesel-fueled engines (diesel PM) as toxic air contaminants, based on data linking diesel PM emissions to increased risks of lung cancer and respiratory disease. Following the identification process, the ARB was required by law to determine if

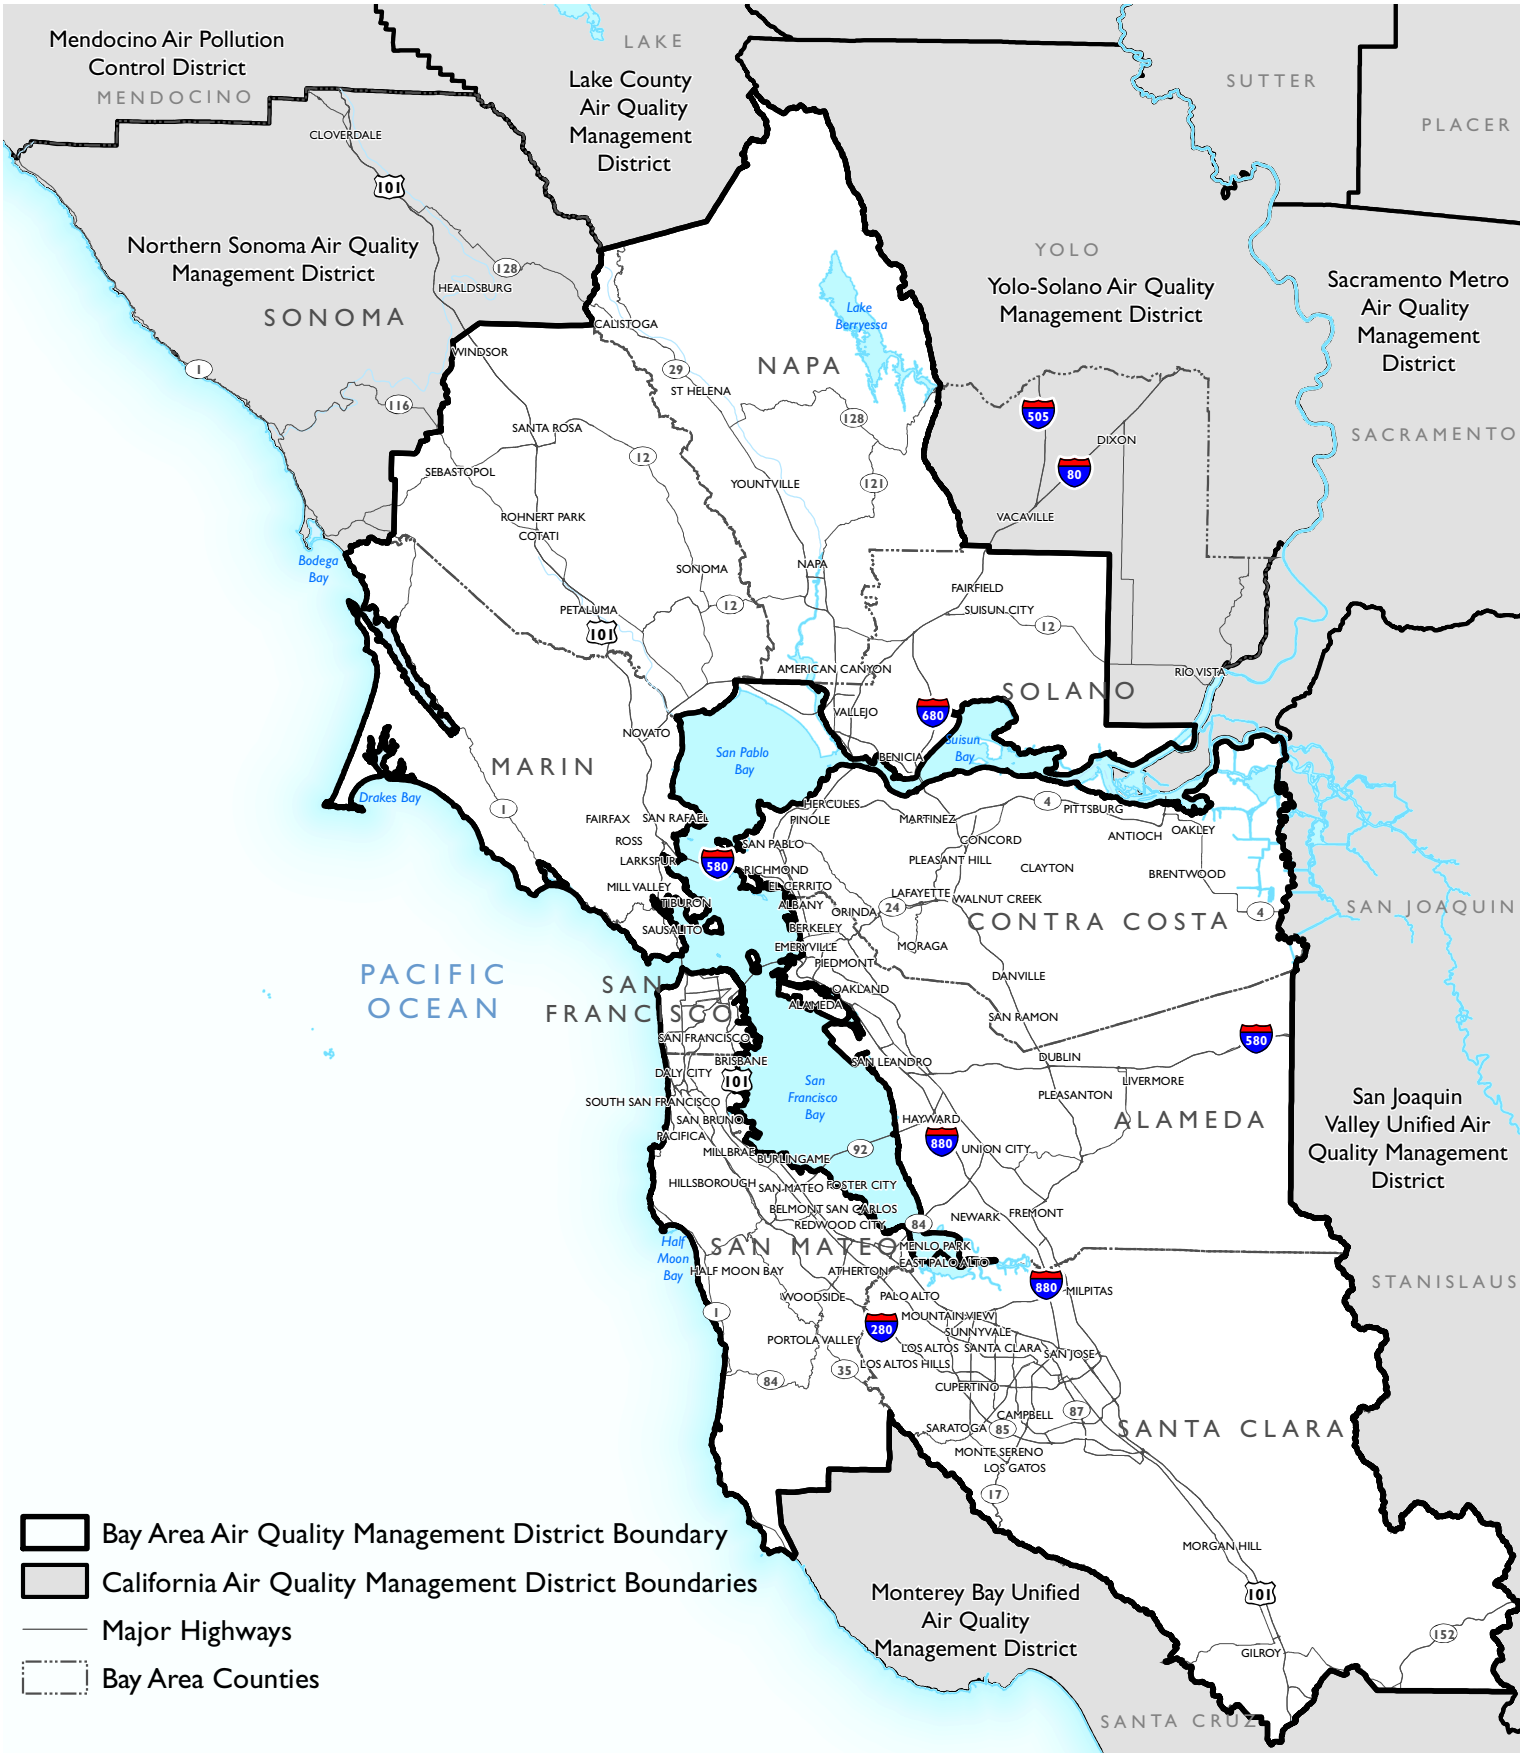
[4] http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/Particulate%20Matter/sb656_staff_report.ashx.

there is a need for further control, which led to creation of the Diesel Advisory Committee to assist in the development of a risk management guidance document and risk reduction plan. In September 2000, the ARB adopted the Diesel Risk Reduction Plan, which recommends control measures to reduce the risks associated with diesel PM and achieve a goal of 75 percent diesel PM reduction by 2010 and 85 percent by 2020.

Specific statewide regulations designed to further reduce diesel PM emissions from diesel-fueled engines and vehicles will be evaluated and developed. The goal of these regulations is to make diesel engines as clean as possible by establishing state-of-the-art technology requirements or emission standards to reduce diesel PM emissions.

California Health and Safety

Under the California Health and Safety Code, Division 26 (Air Resources), the ARB is authorized to adopt regulations to protect public health and the environment through the reduction of TACs and other air pollutants with adverse health effects. As such, the ARB has promulgated several mobile and stationary source airborne toxic control measures (ATCMs). For instance, effective as of July 2003, ARB approved an ATCM that limits school bus idling and idling at or near schools to only when necessary for safety or operational concerns (13 CCR Chapter 10 Section 2480). This ATCM is intended to reduce diesel PM and other TACs and air pollutants from heavy-duty motor vehicle exhaust. It applies to school buses, transit buses, school activity buses, youth buses, general public paratransit vehicles, and other commercial motor vehicles. This ATCM focuses on reducing public exposure to diesel PM and other TACs, particularly for children riding in and playing near school buses and other commercial motor vehicles, who are disproportionately exposed to pollutants from these sources. In addition, effective February 2005, the ARB approved an ATCM to limit the idling of diesel-fueled commercial motor vehicles with gross vehicular weight ratings of greater than 10,000 pounds, regardless of the state or country in which the vehicle is registered (13 CCR Chapter 10 Section 2485).



Regional Regulations

Air District Boundaries

The nine-county MTC region encompasses three air basins: the San Francisco Bay Air Basin in its entirety, portions of the North Coast Air Basin, and portions of the Sacramento Valley Air Basin. Northern Sonoma County is located within the North Coast Air Basin, and eastern Solano County is located within the Sacramento Valley Air Basin (the remaining areas not located within those air basins are located within the San Francisco Bay Air Basin). BAAQMD governs the San Francisco Bay Air District, the Northern Sonoma County Air Pollution Control District (NSCAPCD) governs the North Coast Air Basin, and the Yolo-Solano Air Pollution Control District (YSAPCD) governs the Sacramento Valley Air Basin. The geographic boundaries of these three air basins and air districts are shown in **Figure 2.2-1**. Each air pollution control district is responsible for attaining and maintaining air quality standards and undertakes a variety of activities, including: adopting and enforcing rules and regulations, issuing permits for stationary sources of air pollution, inspecting stationary sources of air pollution, responding to citizen inquiries and complaints, monitoring ambient air quality and meteorological conditions, administering incentives-based programs to reduce motor vehicle emissions, and conducting public education campaigns. In California, air pollution control districts generally follow county boundaries; in the more urban areas, county agencies were merged by State legislation into unified air quality management districts.

Impact Analysis

IMPACT SIGNIFICANCE CRITERIA

Implementation of the proposed Plan would have a potentially significant adverse impact if it would:

Criterion 1: Conflict with or obstruct implementation of an applicable air quality plan, including: (a) the primary goals; (b) applicable control measures; or (c) implementation of any control measures.

Criterion 2: Cause a substantial net increase in construction-related emissions.

Criterion 3: Cause a net increase of emissions of criteria pollutants from on-road mobile sources compared to existing conditions, including: (a) ROG, NO_x, CO, and $PM_{2.5}$; or (b) PM_{10}.

Criterion 4: Cause a cumulative net increase in emissions of diesel PM, 1,3-butadiene, and benzene (TACs) from on-road mobile sources compared to existing conditions.

Criterion 5: Cause a localized net increase in sensitive receptors located in Transit Priority Project (TPP) corridors where: (a) TACs or fine particulate matter ($PM_{2.5}$) concentrations result in a cancer risk greater than 100/million or a concentration of $PM_{2.5}$ greater than 0.8 $\mu g/m^3$ of $PM_{2.5}$; or (b) sensitive receptors are located within set distances (**Table 2.2-10**) to mobile or stationary sources of TAC or $PM_{2.5}$ emissions; or (c) TACs or fine particulate matter ($PM_{2.5}$) concentrations result in noncompliance with an adopted Community Risk Reduction Plan.

Criterion 6: Cause a localized larger increase or smaller decrease of TACs and or $PM_{2.5}$ emissions in disproportionally impacted communities compared to the remainder of the Bay Area communities.

METHOD OF ANALYSIS

Consistency with Air Quality Plans

The EIR includes a qualitative assessment to evaluate whether the proposed Plan's transportation investments and land development pattern will result in any inconsistencies with BAAQMD's 2010 Clean Air Plan (2010 CAP) or the 2001 State Implementation Plan (SIP) for ozone.

A more detailed analysis related to consistency with the 2001 SIP is addressed in the required federal transportation conformity analysis and findings prepared by MTC, which is being prepared separately from the environmental review process for Plan Bay Area, and will be included as a Supplemental Report to Plan Bay Area and can be found at www.onebayarea.org.

Construction-Related Emissions

Construction emissions can vary depending on the level of activity, the specific operations taking place, the equipment being operated, local soil conditions, weather conditions, and other factors. A qualitative

analysis of potential local and regional air quality impacts from construction activity associated with proposed Plan investments was conducted. The qualitative analysis is based on dispersion modeling that has been completed for representative construction projects. At the program level of analysis, it is not possible to quantify the amount of emissions expected from implementation of the transportation projects or land use development that would be consistent with the proposed Plan. However, the overall impact on local and regional air quality from any one project or all of the projects combined will be primarily dependent on the number of pieces and age of diesel powered equipment operating daily and the duration of their operation at the construction site or in the region. Should implementing agencies adopt feasible mitigation measures for each construction project resulting from the proposed Plan, impacts associated with construction activity on local and regional air quality will be less than significant. Therefore, this analysis identifies the measures, or best management practices (BMPs), that must be implemented for an individual construction project to have less than significant impacts.

Motor Vehicle Emissions

MTC's travel demand forecasting models produce forecasts of travel behavior and vehicle activity. These models have been extensively reviewed by federal and State agencies and refined in connection with their application to air quality analyses of various kinds. Key model outputs for use in air quality analyses include: total daily vehicle trips, vehicle miles of travel (VMT), and distribution of vehicle miles of travel by speed. This information was then used to determine total emissions from transportation activity in the Bay Area using motor vehicle emissions models developed and maintained by the ARB.

Table 2.2-5 provides the core 2040 travel activity data used to calculate regional motor vehicle emissions. Between 2010 and 2040, the Bay Area is projected to add about 2.1 million people (30 percent increase) and 1.1 million jobs (33 percent increase). Based on expected future growth, MTC and ABAG estimate that the total vehicles miles traveled will increase by 20 percent, which means that VMT is growing at a slower rate compared to population growth and job growth in the region. This can be attributed to the focused land use pattern and investment in transit and roadway projects in the proposed Plan.

TABLE 2.2-5: TRAVEL DATA

	2010	*2040 Plan*	*Change 2010 to 2040 Plan*	
			Numerical	*Percent*
Vehicles in Use	4,608,722	5,463,760	855,038	19%
Daily Vehicle Miles Traveled (VMT)	163,903,095	196,927,122	33,024,027	20%
Engine Starts	30,834,375	36,362,648	5,528,273	18%
Total Population	**7,091,000**	**9,196,000**	**2,105,000**	**30%**
Total Employment	**3,385,000**	**4,505,000**	**1,120,000**	**33%**

Source: Metropolitan Transportation Commission, 2012.

ARB's latest emissions inventory model that calculates emissions for motor vehicles operating on roads in California is EMFAC2011. Emission estimates of on-road vehicle emissions include consideration of the fleet mix (vehicle type, model year, and accumulated mileage); miles traveled; ambient temperatures; vehicle speeds; and vehicle emission factors, as developed from Smog Check data, Caltrans vehicle counts, and ARB testing programs. The model also incorporates the effects of recent diesel regulations including ARB's truck and bus rules; and greenhouse gas regulations including the Pavley Clean Car

Standard and the Low Carbon Fuel standard; however the newest national fuel standards for model year (MY) 2017 through 2025 light-duty motor vehicles are not included in EMFAC2011. EMFAC2011 has CO_2 controls for MYs 2009 through 2016 (Pavley Phase I) only. Because of this, and the ARB Advanced Clean Car Standards approved in 2012, it is anticipated that emissions in the future will be lower than those calculated by this current version of the EMFAC model (EMFAC2011).[5]

EMFAC2011 generates emission factors for all types of on-road vehicles under different ambient and driving conditions. ARB developed these factors based on thousands of emissions tests on both new and used vehicles recruited randomly from the California fleet. In the EMFAC2011 model, the emission rates were combined with vehicle activity data provided by regional transportation agencies (such as MTC) to calculate the regional emissions inventories.

Emission estimates for ROG, NO_X, CO and particulate matter (associated with engine exhaust and tire wear) are direct outputs from EMFAC2011. To obtain rough estimates of the amount of particulate matter generated by autos from roads (called "entrained dust"), regional VMT[6] was multiplied by the following (annual) factors: (1) 0.132 grams/mile entrained dust for $PM_{10,}$ and (2) 0.020 grams/mile entrained dust for $PM_{2.5}$.[7]

Toxic Air Contaminants (TACs)

TACs were evaluated on both a regional and local level. The regional analysis studies the impacts of the cumulative TAC emissions for the entire Bay Area; the local analysis studies the impacts of TAC emissions on corridors within TPPs and disproportionally impacted communities to provide a better understanding of localized health impacts. The methodologies for both the regional TACs and localized TACs analysis are described below.

Regional TACs

To calculate TACs from all on-road motor vehicles, MTC uses the CT-EMFAC model, a complementary model to EMFAC2011, which estimates diesel PM, benzene and 1,3-butadiene emissions in units of kilograms per day. The EMFAC2011 and CT-EMFAC emissions factors reflect travel speeds and vehicle types specific to each roadway link.

Local Pollutant Impact Analysis

The purpose of the local pollutant impact analysis is to assess potential localized health impacts to new sensitive receptors that could be located within TPP corridors based on the proposed Plan transportation investments and proposed Plan land use scenario. One of the primary objectives of SB 375 and the SCS is to locate more residential and commercial/retail development along existing transit corridors to reduce vehicle trips, vehicle miles traveled and mobile source air pollution. While this strategy can be beneficial

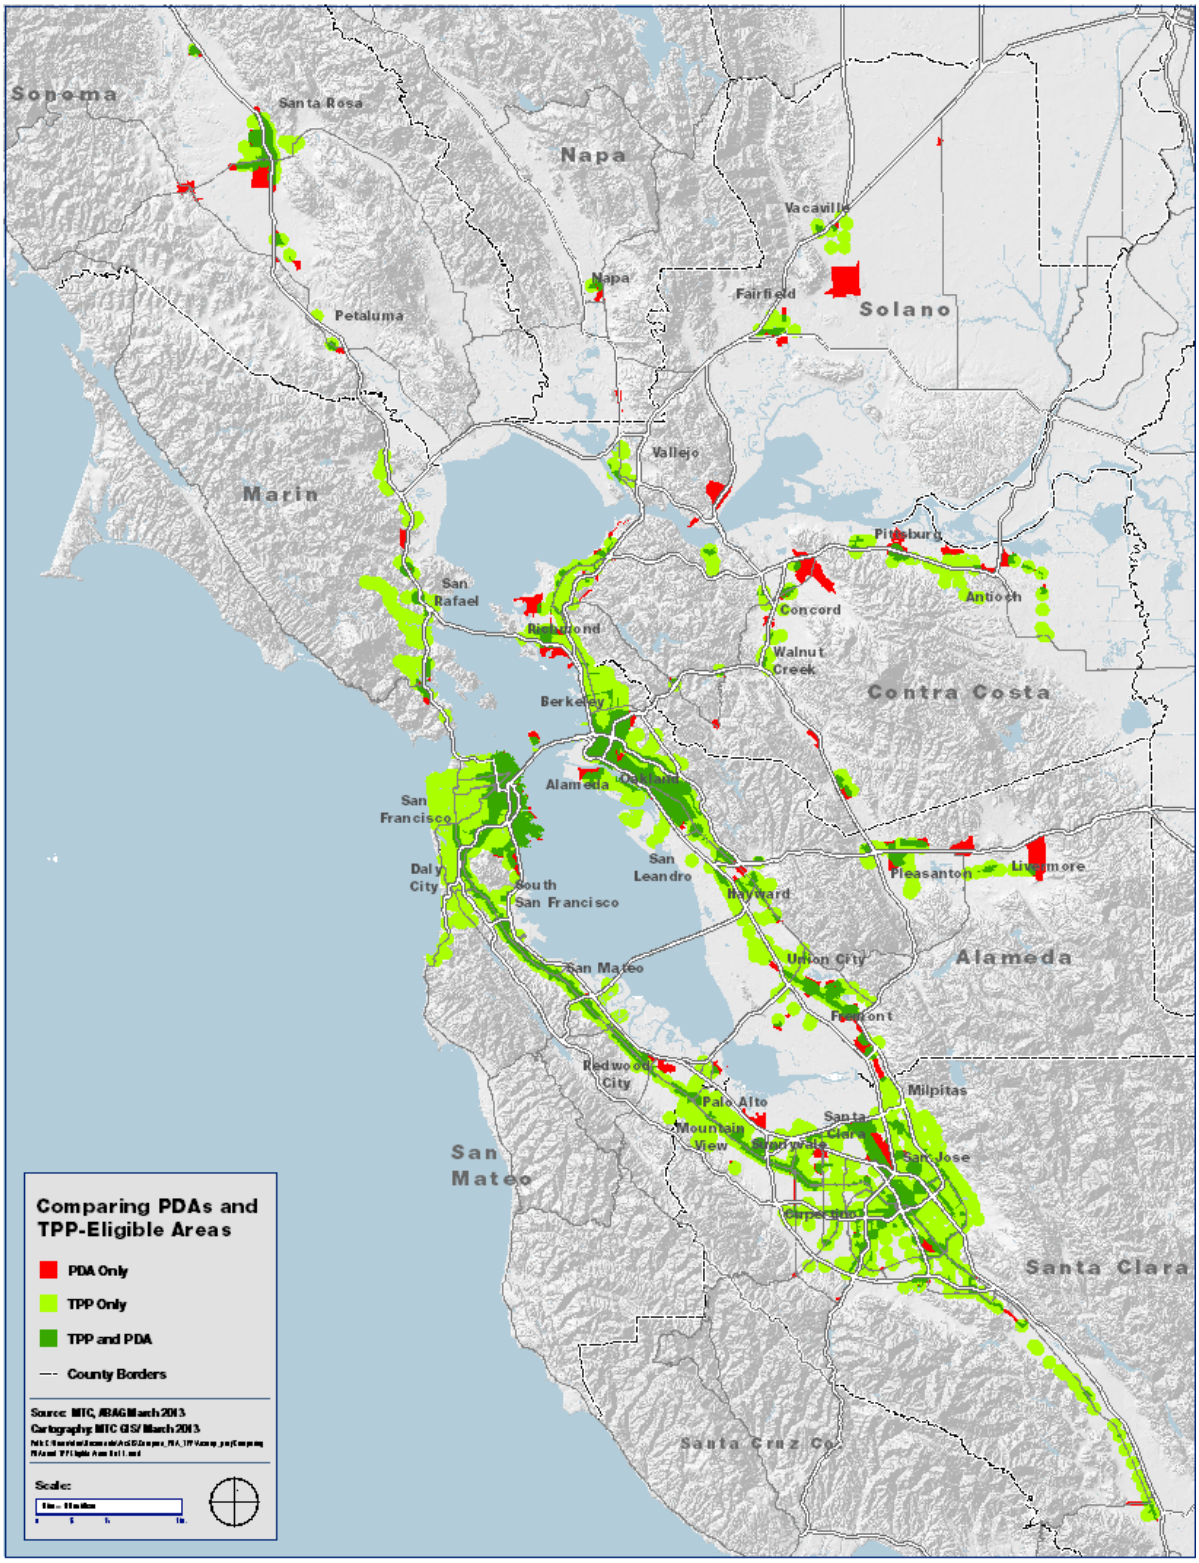
[6] Note that MTC upwardly adjusts the regional VMT forecasts from the MTC travel demand models to account for differences in VMT estimates produced by ARB and MTC using a protocol prescribed by ARB.



[7] California Air Resources Board, Miscellaneous Process Methodology 7.9 - Entrained Paved Road Travel, Paved Road Dust. Revised and Updated, July 2012

to air quality in general by reducing the amount of air pollution emitted into the atmosphere every day, serious adverse health impacts can result by locating sensitive receptors within close proximity to sources of TACs and $PM_{2.5}$. The urbanized areas along these transit corridors typically contain a wide range of air pollution sources including stationary and area sources (e.g., gas stations, manufacturing facilities, etc.) and mobile sources (e.g., cars, trucks, trains etc.) which generate TACs and $PM_{2.5}$ that can create localized health risks to residents and other sensitive receptors from prolonged exposure to elevated concentrations.

An analysis of TAC concentrations from stationary and mobile emission sources was conducted within TPP areas, which can include Priority Development Areas (PDAs). As shown in **Figure 2.2-2**, many PDAs (74 percent of PDA acreage) overlap with TPP areas. While PDAs were locally defined and used by MTC and ABAG to identify future growth areas in the proposed Plan, TPP areas are defined by SB 375 as areas within half a mile of a major transit stop or high quality transit corridor, amongst other criteria[8]. TPP corridors generally include existing neighborhoods served by transit, and contain a wide range of housing options along with jobs, schools, and amenities. Under SB 375, certain residential or mixed use residential projects and projects located within TPP corridors that meet defined criteria may be eligible for CEQA streamlining. The local pollutant impact analysis focuses on impacts within TPP areas, rather than in PDAs, to more closely mirror SB 375 and to more closely reflect data and modeling prepared by BAAQMD and used in the local pollutant impact analysis. Implementing agencies can utilize the analysis for certain CEQA streamlining purposes, as appropriate.

[8] More information on TPP areas can be found here: http://opr.ca.gov/docs/SB375-Intro-Charts.pdf.

Figure 2.2-2: Priority Development Areas and Transit Priority Projects Corridors

Under the proposed Plan land use scenario, it is anticipated that TPP corridors will absorb a majority of the approximately 700,000 new households and 1.1 million new jobs expected in the Bay Area by 2040. The majority of the housing growth and job growth is expected to occur around the Bay Area's core transit network (e.g., BART, Caltrain, etc.) in San Francisco, Alameda, San Mateo, and Santa Clara counties. With more limited transit access, the North Bay counties of Marin, Napa, Sonoma, and Solano are expected to take on a much smaller share of regional growth.

Using emissions data from BAAQMD, stationary and mobile emission sources were estimated through dispersion modeling for highways and rail lines. For the cities of San Francisco and San José, BAAQMD is assisting with the preparation of Community Risk Reduction Plans (CRRPs) to address TACs and $PM_{2.5}$. To identify the potential for adverse health effects to occur if sensitive receptors were located within TPPs, BAAQMD evaluated TPP corridors to identify areas that may be exposed to existing sources of TACs and $PM_{2.5}$ that would exceed impact significance Criterion 5. BAAQMD used its extensive stationary source database to estimate cancer risk and particulate matter concentrations around these stationary sources. The cancer risk and $PM_{2.5}$ concentrations for stationary sources were calculated using health effect values adopted by the Office of Environmental health Hazard Assessment (OEHHA); health protective assumptions relating to the extent of an individual's exposure (a 70-year exposure duration was used) including age sensitivity factors; and a conservative modeling procedure (using the EPA SCREEN 3 model) that established how TACs are dispersed in the atmosphere.[9] For a few of the stationary sources, BAAQMD staff had conducted a site-specific health risk assessment as part of a separate permit process. The cancer risk and $PM_{2.5}$ concentrations from these health risk assessments are also included in the database.

BAAQMD estimated cancer risk and $PM_{2.5}$ concentration data for mobile sources located in and within 1,000 feet of TPP areas. Mobile sources include freeways, roadways with over 30,000 annual average daily trips (AADT), and railroads. Mobile source TAC and $PM_{2.5}$ emissions from Bay Area highways were calculated through modeling using CALINE3, developed by the California Department of Transportation. The dispersion modeling applied EMFAC2011 emission factors from ARB and daily vehicle activity profiles by highway link provided by Caltrans and MTC. BAAQMD meteorological data were used for each County within the Bay Area. A similar analysis was conducted to estimate TAC and $PM_{2.5}$ emissions from the Bay Area's railroad network (further described below).

A geospatial analysis was conducted using GIS software to evaluate potential increased cancer risks and/or $PM_{2.5}$ concentrations due to TAC and/or $PM_{2.5}$ emissions from mobile and stationary sources in TPP areas. The geospatial analysis was executed using BAAQMD's estimated health risk data on stationary and mobile sources of TAC's and $PM_{2.5}$. The geospatial analysis identifies areas where the cumulative cancer risks and/or $PM_{2.5}$ concentrations exceed MTC's air quality significance thresholds using a spatial additive process. The spatial additive process involves three data sets: a regularized raster dataset[10] representing the spatial extent of the TPP areas, to which all pollution values associated with the

[9] Except for gas stations, where EPA's AERMOD atmospheric dispersion model was used instead.

[10] Raster data consists of a matrix of cells (or pixels) organized into rows and columns (a grid) where each cell contains a value representing information, such as temperature (or, in this case, health risk data). Source: Esri.com.

stationary and mobile sources are added; raster datasets representing the TAC and/or $PM_{2.5}$ plumes associated with each stationary sources that were decayed to a specified distance (discussed in greater detail in Appendix E); and raster datasets representing TAC emissions and/or $PM_{2.5}$ concentrations generated by mobile sources. Appendix E contains a more detailed description of the GIS model methodology.

The following subsections describe the emission sources included in the local pollutant analysis and how health risks from each source were estimated.

Highways

Highways include all freeways, highways, and state routes that run through a TPP corridor. Cancer risk and $PM_{2.5}$ concentrations were derived for highways using BAAQMD's Highway Screening Analysis Tool. The data in the tool is based on dispersion modeling conducted by BAAQMD for every highway in the Bay Area.

High Traffic Roadways

This source includes all roadways with over 30,000 vehicles per day that run through a TPP corridor. Cancer risk and $PM_{2.5}$ concentrations were estimated using BAAQMD's Roadway Screening Analysis Tool. BAAQMD developed county-specific roadway screening tables based on annual average daily vehicle trips on roadways.

Railroads

Railroad sources include all rail lines and rail stations in TPP corridors. BAAQMD prepared screening tables for Amtrak, Caltrain, SMART rail, ACE, and freight rail. The screening tables are based on dispersion modeling.

Ferry Terminals

Ferry Terminals include commuter ferry stations located in TPP corridors. BAAQMD prepared general screening data for ferry terminals by county.

Large Mobile Sources

This source includes ports, railyards, distribution centers, refineries, and chrome platters located within or in close proximity to TPP corridors. Appropriate distances from large sources identified in the impact assessment (**Table 2.2-11**) are based on BAAQMD emission data, health studies, and ARB recommendations.

Stationary Sources

Stationary sources include sources permitted by BAAQMD such as refineries, gas stations, back-up generators, auto body shops, etc. Cancer risk and $PM_{2.5}$ concentrations are estimated using BAAQMD's Stationary Source Screening Analysis Tool.

The TAC analysis also analyzed exposure to impacted communities within the entire region. Using MTC roadway modeling information, all freeway links within impacted communities were evaluated to determine if there will be a localized increase or decrease in TACs associated with the implementation of the proposed Plan. These levels were compared to a "no net increase" threshold.

Regional Pollutant Analysis of Toxic Air Contaminants and $PM_{2.5}$ in Disproportionally Impacted Communities

There are numerous locations within the Bay Area where concentrations of TACs and fine particulate matter ($PM_{2.5}$) are substantially higher than other areas. These areas tend to be along major transportation and goods movement corridors. These areas also often include communities that are more vulnerable to the effects of air pollution, due to age of residents (youth and seniors), higher rates of adverse health outcomes, or low household income. The effects of the proposed transportation projects and land use scenario are evaluated to determine if TAC and $PM_{2.5}$ emissions will increase or decrease in these disproportionally impacted communities compared to other communities. For the purpose of this analysis, disproportionally impacted communities were identified through BAAQMD's Community Air Risk Evaluation Program.

CARE Communities

BAAQMD's Community Air Risk Evaluation Program (CARE) was initiated in 2004 to identify areas with elevated concentrations of, and public exposure to, TACs. The CARE program is examining population exposure to elevated concentrations of $PM_{2.5}$ and other pollutants as additional criteria for identifying areas that are disproportionally impacted. The intent of the CARE program is to estimate the potential increased health risks associated with exposure to TACs and $PM_{2.5}$ from stationary and mobile sources, to identify the primary sources causing this disproportionate impact, and to develop risk reduction strategies to reduce public exposure and therefore public health risks.[11]

CARE communities are defined as areas that (1) are close to or within areas of high TAC and $PM_{2.5}$ emissions; (2) contain sensitive populations, defined as youth and seniors; and (3) where over 40 percent of the population has income levels below the federal poverty level. Six CARE communities have been identified to date: Concord, eastern San Francisco, western Alameda County, Redwood City/East Palo Alto, Richmond/San Pablo, and San José. In general, these communities are adjacent to major arterials, roadways, freeways and ports. The counties of Marin, Napa, Solano, and Sonoma are not evaluated in this impact discussion since they do not contain any CARE communities.

The six CARE communities overlap with most of the MTC's Communities of Concern (COC)—which are low income and minority communities defined by MTC as experiencing potential transportation accessibility disparities.[12] MTC's evaluation of the proposed Plan's transportation investments on COCs will be addressed in the Plan Bay Area Equity Analysis, prepared as a Supplemental Report and available at www.onebayarea.org. The analysis in this EIR focuses on potential impacts in CARE communities alone because these areas have been identified as those with the highest existing emissions of TACs and $PM_{2.5}$ and are currently disproportionately impacted when compared to other communities in the Bay Area.

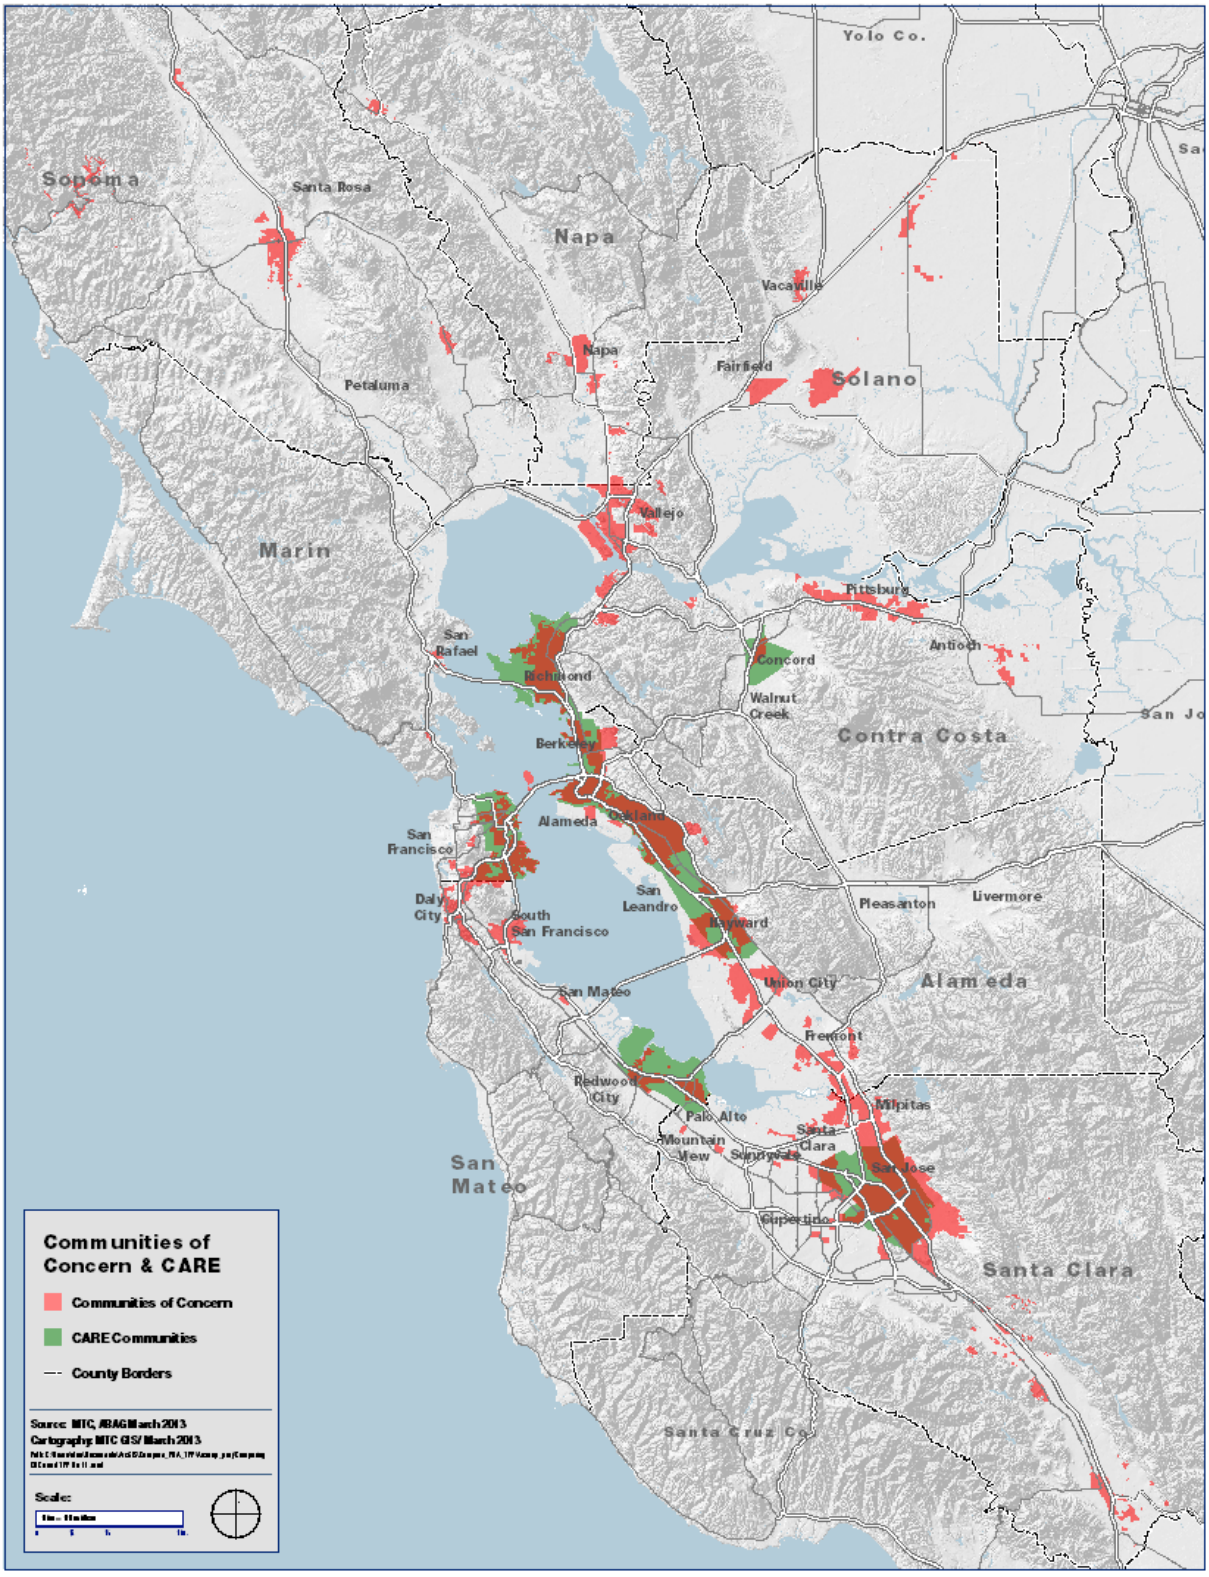


Figure 2.2-3 below highlights the region's six CARE communities and demonstrates how the CARE communities overlap with the majority of MTC's COCs.

---

[11] http://baaqmd.gov/Divisions/Planning-and-Research/CARE-Program.aspx.

[12] More information on MTC's Communities of Concern is available here, http://www.mtc.ca.gov/planning/snapshot/

Figure 2.2-3: Communities of Concern and CARE

Motor Vehicle Emissions

Travel activity data for the roadway network in CARE communities and the Bay Area in general were derived from MTC's travel demand forecasting model. The model produced forecasts of travel behavior and vehicle activity for the proposed Plan's base year, 2010; the horizon year 2040 with Project; and the horizon year 2040 without the Project. The model provides outputs for VMT, along with daily vehicle trips and distribution of vehicle miles of travel by speed. This data is then imported into EMFAC2011, the motor vehicles emissions model developed and maintained by ARB to obtain emissions data.

In this analysis, MTC only included in its model runs roadway links that carry 10,000 or more vehicles per day with sensitive land uses (including residential, schools, and day cares) within 1,000 feet of the roadway's centerline. Roadway links without any sensitive land uses within 1000 feet of the roadway centerline were not included in the analysis. This approach was developed through MTC's Equity Analysis workgroup and is consistent with BAAQMD's methodology for evaluating TACs and $PM_{2.5}$ impacts. MTC then identified all the roadway links that run through identified CARE communities and non-CARE communities per the criteria listed above. TAC and $PM_{2.5}$ emissions were then estimated for CARE and non-CARE roadway links in each county. For example, the emission estimates for CARE communities in Contra Costa County reflect vehicle activity on the roadway links in the Concord and Richmond/San Pablo CARE communities.

SUMMARY OF IMPACTS

The combined impact of the land use and transportation changes anticipated from implementation of the proposed Plan would not conflict with or obstruct implementation of the applicable air quality plans. The overall impact of the proposed Plan due to construction of land-use and transportation projects would result in a direct but short-term impact as projects advance into construction at different times, over the horizon of the proposed Plan.

Compared to existing conditions, the impacts in 2040 with the proposed Plan show lower ROG, NOx (summertime and wintertime), CO, and $PM_{2.5}$ emissions, largely because of stringent controls for new vehicles, engines and fuels. However, due to growth in VMT and generation of road dust, emissions for PM_{10} are expected to increase under the proposed Plan compared to existing conditions.

The impacts for TACs (diesel PM, 1,3-butadiene, and benzene) show lower emissions in 2040 with the implementation of the proposed Plan, also as a result of stronger state regulations for vehicles and fuels. There would be a net increase in sensitive receptors located in TPP corridors (including PDAs located within TPPs) where TAC concentrations result in a cancer risk greater than 100/million or a $PM_{2.5}$ concentration greater than 0.8 $\mu g/m^3$; or within set distances to mobile and/or stationary sources of TAC or $PM_{2.5}$ emissions; however, in jurisdictions with an adopted CRRP, any proposed project that includes sensitive land uses and or receptors should be evaluated against the standards, thresholds and mitigation measures in those adopted plans and where a proposed project is consistent with an adopted CRRP, the impact would be less than significant.

Between CARE and non-CARE communities there are slight differences in the percent reductions in TACs and $PM_{2.5}$ expected in 2040 under the proposed Plan and 2010 existing conditions. When re-entrained road dust is included in total emissions, some CARE communities will experience an increase in emissions while non-CARE communities will experience either a smaller increase or a decrease in

these emissions. This disproportionate effect in CARE communities would result in a potentially significant impact.

IMPACTS AND MITIGATION MEASURES

Impact

2.2-1(a) Implementation of the proposed Plan could conflict with or obstruct implementation of the primary goals of an applicable air quality plan.

The region's most recent ozone plan, the Bay Area 2010 Clean Air Plan (2010 CAP), prepared by BAAQMD, was developed in response to ozone planning requirement in the California Health and Safety Code. The 2010 CAP set forth a control strategy that includes control measures to reduce emissions and atmospheric concentrations of ozone and its precursors, $PM_{2.5}$, key toxic air contaminants, as well as the "Kyoto 6" greenhouse gases (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulpher hexafluoride).[13]

The primary goals of the 2010 CAP are to improve Bay Area air quality and protect public health. The control strategy in the 2010 CAP recognizes the need to reduce motor vehicle travel and emissions by integrating transportation, land use, and air quality planning. Cleaner fuels and improved emission controls have substantially reduced emissions from mobile sources in recent decades. However, growth in motor vehicle use (as measured in VMT on both a per capita and an absolute basis) has offset some of the benefit of the improved emission controls. This increase in VMT has been caused or facilitated by dispersed development patterns that result in people being dependent on motor vehicles for all types of trips and activities, in addition to increases that are the result of population and job growth. Therefore, the 2010 CAP recognizes the need to encourage future population and job growth in areas that are well served by transit and where mixed-use communities provide jobs, housing, and retail in close proximity.

Key themes embedded in the 2010 CAP include:

- The need to reduce motor vehicle emissions by driving cleaner, driving smarter, and driving less;
- Reducing per capita VMT and promoting policies that enable families to choose reduce their motor vehicle ownership;
- Designing communities where people can walk, bike, or use transit on a convenient basis; and
- Ensuring that focused growth in priority areas is planned and designed so as to protect people from both existing sources and new sources of emissions.

Consistent with the 2010 CAP, the proposed Plan is based on the goals of reducing emissions of greenhouse gases from the transportation sector, reducing VMT on a per capita basis, and focusing growth in areas that are well-served by transit and existing infrastructure.

[13] The 2010 Clean Air Plan prepared by BAAQMD can be found here: http://www.baaqmd.gov/Divisions/Planning-and-Research/Plans/Clean-Air-Plans.aspx

Both the land use patterns and the transportation investments defined in the proposed Plan support the primary goals of the Bay Area 2010 Clean Air Plan. The proposed Plan would therefore not conflict with or obstruct implementation of the primary goals of an applicable air quality plan and the impact is less than significant (LS). No mitigation measures are required.

Mitigation Measures

None required.

Impact

2.2-1(b) Implementation of the proposed Plan could conflict with or obstruct implementation of applicable control measures of an applicable air quality plan.

Numerous transportation projects included in the proposed Plan will help implement the applicable control measures listed in the 2010 CAP. **Table 2.2-6** provides a summary of the proposed Plan transportation investments that will help implement relevant control measures in the 2010 CAP. For purposes of evaluating consistency with the proposed Plan, the relevant 2010 CAP control measures include mobile source measures (MSMs) A-1 and A-2, the full set of 17 transportation control measures (TCMs), and local impact measure (LUM) #4.

TABLE 2.2-6: PROPOSED PLAN INVESTMENTS AND POLICIES THAT SUPPORT IMPLEMENTATION OF 2010 CAP CONTROL MEASURES

Relevant Control Measures in 2010 Clean Air Plan	*Supporting Policies and Investments in the proposed Plan **
MSM A-1: Promote Clean and Fuel-Efficient Vehicles: Promote the use of clean and fuel-efficient vehicles, and efficient driving habits and proper vehicle maintenance to reduce emissions.	The Climate Policy Initiatives in the proposed Plan (RTP ID # 230550) will include measures to promote efficient driving habits.
MSM A-2: Zero Emission Vehicles and Plug-In Hybrids: Acquire and deploy battery-electric and plug-in hybrid electric vehicles. Install and expand public charging infrastructure. Promote the use of public charging infrastructure.	As an element of the Climate Policy Initiatives (RTP ID # 230550), the proposed Plan will allocate approximately $170 million over ten years to promote electric vehicles, including consumer incentives, education, and installation of charging stations.
TCM A-1: Local and Area-Wide Bus Service Improvements: Sustain and improve bus service by funding existing service, implementing Bus Rapid Transit (BRT) in key corridors, and implementing transit priority measures to improve the speed of bus service.	The proposed Plan includes substantial funding for bus operators throughout the region, including funding to implement BRT in key corridors. Projects to fund bus service improvements include RTP ID #s 21017, 94526, 94527, 94558, 94572, 94610, 94636, 94666, 94683, 98207, 22455, 240526, 230161, 230164 and 240077.
TCM A-2: Local and Regional Rail Service Improvements: Sustain and expand rail service providing funding for rail cars and stations. Fund BART extensions, Caltrain electrification, new Transbay Terminal, Capitol Corridor, and SMART commuter rail in the North Bay.	The proposed Plan includes substantial funding for commuter rail operators throughout the region. This includes BART (RTP ID #s 21132, 94525, 240196, 21211, 240374 and 240375); Transbay Transit Center/Caltrain extension (RTP ID #s 21342 and 230290); Caltrain electrification and improvements (RTP ID #s 22481, 21627, 240019, 240031, 240048); SMART rail (RTP ID #s 22001 and 240736); Capitol Corridor (RTP ID # 22009); and ACE commuter rail (21790).
TCM B-1: Freeway and Arterial Operations Strategies: Implement freeway and arterial performance improvements, including the Freeway Performance Initiative, the Bay Area Freeway Service Patrol, and the Arterial Management Program.	The proposed Plan projects 230221, 230222, 230419, and 230597 will all help to implement TCM B-1 by improving traffic flow on freeways and key arterials.
TCM B-2: Transit Efficiency and Use Strategies: Improve transit efficiency and rider convenience through continued operation of 511 Transit, and full implementation of Clipper fare payment system and the Transit Hub Signage Program.	The proposed Plan includes funds to implement the regional Transit Performance Initiative (RTP ID # 240735), MTC's Transit Connectivity Plan (RTP ID # 230336), as well as projects in specific counties, such as Contra Costa (230196) and the San Francisco Transit Effectiveness Project (240171).
TCM B-3: Bay Area Express Lane Network: Implement the regional express lane network; provide express bus service in these corridors.	The proposed Plan includes funds to implement the regional express lane network via 25 specific projects, including 22002, 22042, 230088, 230656, and 230657.
TCM B-4: Goods Movement Improvements and	The proposed Plan projects that will help to

TABLE 2.2-6: PROPOSED PLAN INVESTMENTS AND POLICIES THAT SUPPORT IMPLEMENTATION OF 2010 CAP CONTROL MEASURES

Relevant Control Measures in 2010 Clean Air Plan	*Supporting Policies and Investments in the proposed Plan **
Emission Reductions Strategies: Reduce diesel emissions from trucks used in goods movement. Implement seven Proposition 1B Trade Corridors Improvement Fund projects identified in this measure.	implement TCM B-4 include Alameda County Goods Movement Program (RTP ID # 22082, 22760, and 240394); Martinez Rail Corridor improvements (240738); and relocation of Cordelia truck scales facility in Solano County (230322).
TCM C-1: Voluntary Employer Trip-Reduction Programs: Work with employers, transit agencies, and shuttle providers to promote ridesharing, transit, cycling and walking for work trips. Consider adopting a commute benefits ordinance to reduce out-of-pocket transit costs to employees.	The proposed Plan Climate Policy Initiatives (see RTP ID # 230550), including vanpool incentives, will support implementation of TCM C-1. The proposed Plan policy initiatives also include adoption and implementation of a regional commute benefits ordinance, a key element of TCM-1.
TCM C-2: Safe Routes to Schools and Safe Routes to Transit Programs: Implement Safe Routes to Schools (SR2S) programs and other measures to promote safe access for pedestrians and cyclists to schools and transit.	The proposed Plan includes $30 million to implement Safe Routes to Transit (RTP ID # 22245). Additional projects that will help to implement TCM C-2 include Alameda County Transportation Demand Management Program (240393), and Safe Routes to Schools programs in Napa County (22417), San Mateo County (240084), and Sonoma County (240561).
TCM C-3: Ridesharing Services and Incentives: Encourage ridesharing and promote and expand car-sharing services.	The proposed Plan includes $5 million to expand City Carshare (RTP ID #22244). The proposed Plan also earmarks $6 million for vanpool incentives as part of the Climate Policy Initiatives.
TCM C-4: Conduct Public Education and Outreach: Implement the Spare the Air program and related elements in the regional Transportation Climate Action Campaign.	The proposed Plan includes approximately $700 million to implement various Climate Policy Initiatives (RTP ID #230550), including public outreach and education.
TCM C-5: Promote "Smart Driving": Promote smart driving, compliance with posted speed limits, and related efforts to reduce greenhouse gas emissions from the transportation sector.	The proposed Plan includes approximately $700 million to implement various Climate Policy Initiatives (RTP ID #230550), including a public education campaign, a tire pressure cap rebate program, and a fuel economy meter rebate program.
TCM D-1: Bicycle Access and Facilities Improvements: Provide a comprehensive network of bicycle lanes, routes, and pathways, as well as continued and routine maintenance on existing bicycle facilities. Implement "complete streets" policies to ensure that cyclists and pedestrians are safely accommodated on all streets and roads. Maintain and expand facilities to accommodate bicycles on rail transit, buses and ferries. Consider implementing bicycle-sharing programs.	The proposed Plan will provide funding to implement bicycle projects throughout the region, including: Alameda County: 24003, 240206, 240227, Contra Costa County: 240381, 21225, 230542, 240459, 240637 Marin County: 240678 Napa County: 230527, 240612 San Francisco: 240488, 240533, 240551 San Mateo County: 230430, 240590 Santa Clara County: 240509 Solano County: 98212, 2405566, 240558

TABLE 2.2-6: PROPOSED PLAN INVESTMENTS AND POLICIES THAT SUPPORT IMPLEMENTATION OF 2010 CAP CONTROL MEASURES

Relevant Control Measures in 2010 Clean Air Plan	*Supporting Policies and Investments in the proposed Plan **
	Sonoma County: 240651
TCM D-2: Pedestrian Access and Facilities Improvements: Provide a comprehensive network of facilities, including sidewalks, pathways and provide for pedestrian access in their development plans. Implement "complete streets" policies to ensure that cyclists and pedestrians are safely accommodated on all streets and roads. Adopt land use policies that support more compact, infill development to make neighborhoods more walkable.	The proposed Plan projects to improve pedestrian facilities include the City of Berkeley Pedestrian Master Plan (240197), the Napa County Safe Routes to Schools program (22417), and projects to implement bike and ped improvements in San Mateo County (230430). (Also see pedestrian improvements in Santa Clara, Solano and Sonoma counties described for TCM D-1 above.)
TCM D-3: Local Land-Use Strategies: Update general plans and area plans to promote infill development and support land use that allows residents and employees to walk, bicycle, and use transit, instead of relying on private automobiles. Create mixed-use transit-oriented developments in proximity to transit stations and key bus routes.	Many of the policies and investments in the proposed Plan, such as the One Bay Area Grant (OBAG) program, are directed toward implementation of the land-use strategies described in TCM D-3. Examples of local projects include projects # 21624 (incentive program to support transit-oriented development) and # 240086 (Transportation for Livable Communities program) in San Mateo county.
TCM E-1: Value-Pricing Strategies: Implement value pricing policies and programs such as time-of-day pricing on trans-bay bridges and cordon pricing recommendations from San Francisco County's Mobility, Access, and Pricing Study.	The proposed Plan includes funding to implement the San Francisco congestion pricing program, including Treasure Island pricing program and cordon pricing (240728).
TCM E-2: Promote Parking Policies to Reduce Motor Vehicle Travel: Implement parking policies to reduce motor vehicle travel, such as limiting the supply of off-street parking in areas well served by transit, eliminating or reducing minimum parking requirements, unbundling the price of parking spaces from rents, and implementing performance-based pricing for curb parking in high-use areas.	Policy Action 4.2 (see Table __ above) calls for revising parking policies to support infill development. PDA earmarks funding to expand San Francisco's innovative *SFpark* program (RTP ID # 240334 and 240476).
TCM E-3: Implement Transportation Pricing Reform: Develop and implement policies to ensure that user costs to own and operate motor vehicles reflect the full environmental and social costs related to vehicle use.	The proposed Plan includes funding to implement the San Francisco congestion pricing program, including Treasure Island pricing program and cordon pricing (240728) and programs that MTC has underway, including bridge tolls and express lane network.
LUM 4: Land Use Guidance: Provide tools and resources to local agencies to help them develop policies and plans to improve air quality, reduce motor vehicle travel, and reduce population exposure to air pollutants.	PDA Policy Action # 1.6 calls for regional agencies to provide tools to help local jurisdictions develop and implement plans to focus new growth in priority development areas.

TABLE 2.2-6: PROPOSED PLAN INVESTMENTS AND POLICIES THAT SUPPORT IMPLEMENTATION OF 2010 CAP CONTROL MEASURES

Relevant Control Measures in 2010 Clean Air Plan	*Supporting Policies and Investments in the proposed Plan **

Note:

* The proposed Plan investments shown in Table 2.2-6 are intended to demonstrate how the proposed Plan will help to implement the 2010 CAP. There may be additional proposed Plan investments not shown in Table 2.2-6 that also help to implement the 2010 CAP control measures.

Both the policies and the transportation investments defined in the proposed Plan are consistent with the relevant control measures in the 2010 CAP and the impact is less than significant (LS). No mitigation measures are required.

Mitigation Measures

None required.

Impact

2.2-1(c) Implementation of the proposed Plan could conflict with or obstruct implementation of any control measures in an applicable air quality plan.

As a whole, the proposed Plan investments described in **Table 2.2-6** support the goals of the 2010 CAP and will help implement key control measures in the 2010 CAP. However, it is possible that certain proposed Plan investments could increase VMT and/or emissions of air pollutants and GHGs, including projects that increase highway capacity, such as expansion of express lanes in the region. The expanded regional ferry network was changed from a TCM to a further study measure (FSM) in the 2010 CAP due to uncertainty as to whether expanded ferry service will actually achieve a net reduction in emissions of air pollutants and GHGs. These issues should be addressed in the project-level CEQA analyses prepared for these projects.

A key theme in the 2010 CAP is the need to ensure that the region plans for focused growth in PDAs in a way that protects people from both existing sources and new sources of emissions.[14] Protecting Bay Area residents who live and/or work in areas identified for future development in the proposed Plan will require a combination of good land use planning and project design to identify and avoid potential impacts to public health, in addition to appropriate measures to mitigate any potentially significant impacts that are identified.

Issues related to potential localized air quality impacts from specific projects will be addressed in the sections below which analyze potential impacts in terms of short-term construction emissions, cumulative increase of criteria pollution from on-road mobile sources, and avoiding exposure of sensitive receptors to substantial concentrations TACs and $PM_{2.5}$.

[14] See discussion on pages 4-21 to 4-23 in Volume I of the 2010 Clean Air Plan, as well as the description of LUM 4 in Volume II of the 2010 Clean Air Plan

Based on the assessment of each measure of consistency, the combined impact of the land use and transportation changes anticipated from implementation of the proposed Plan would not conflict with or obstruct implementation of the applicable air quality plan. As discussed above, proposed Plan investments could be inconsistent with the 2010 CAP goals of reducing VMT. However, subsequent project level review of those investments should ensure any potential impacts are identified and mitigated. Therefore, the impact on the implementation of other applicable air quality plans would be less than significant (LS). No mitigation measures are required.

Mitigation Measures

None required.

Impact

2.2-2 Implementation of the proposed Plan could result in a substantial net increase in construction-related emissions.

The U.S. EPA and the ARB have adopted rules and regulations establishing criteria pollutant and hazardous emissions limits for diesel powered on-road vehicles and off-road equipment. The current EPA and ARB rules and emission standards are in the process of being implemented and are therefore reasonably foreseeable. They will continue to be phased in over the next 10 years and are expected to reduce diesel PM emissions by 90 percent or more when compared to vehicles and equipment built prior to 2004. EPA and ARB on-road and off-road regulations target the primary sources of emissions at construction sites. These include on-road heavy duty trucks, and cranes and off-road aerial lifts, backhoes, crawler tractors, excavators, forklifts, graders, loaders, mowers, rollers, scrapers, skid steer loaders, tractors, trenchers, two engine vehicles and workover rigs. In addition, ARB's cleaner fuel standards will reduce emissions from all internal combustion engines and their stationary and portable equipment regulations will reduce emissions from the smaller equipment used at construction sites, such as portable generators and tub grinders.

The most effective way to ensure that construction projects do not adversely impact local and regional air quality and therefore public health is to minimize the amount of criteria and TACs associated with each individual projects' construction activity. The EPA and ARB have adopted stringent air emission regulations for new and existing fleets of construction equipment that is common to all construction sites. However, these regulations alone cannot assure that all projects consistent with the proposed Plan will use only the lowest emission construction equipment due primarily to the fleet averaging component of the regulations compliance requirements. Therefore, construction impacts are considered potentially significant (PS). Mitigation measure 2.2(a) is described below.

Mitigation Measures

Implementing agencies and/or project sponsors shall consider implementation of mitigations measures including but not limited to those identified below.

2.2(a) Mitigation measures that shall be considered by implementing agencies and/or project sponsors where feasible based on project-and site-specific considerations include, but are not limited to best management practices (BMPs), such as the following:[15]

Construction Best Practices for Exhaust

- The applicant/general contractor for the project shall submit a list of all off-road equipment greater than 25 hp that will be operating for more than 20 hours over the entire duration of the construction activities at the site, including equipment from subcontractors, to BAAQMD for review and certification. The list shall include all of the information necessary to ensure the equipment meets the following requirement:
  - All off-road equipment shall have: 1) engines that meet or exceed either USEPA or ARB Tier 2 off-road emission standards; and 2) engines are retrofitted with an ARB Level 3 Verified Diesel Emissions Control Strategy (VDECS), if one is available for the equipment being used.[16]
- Idling time of diesel powered construction equipment and trucks shall be limited to no more than two minutes. Clear signage shall be provided for construction workers at all access points.
- All construction equipment shall be maintained and properly tuned in accordance with the manufacturers' specifications.
- Portable diesel generators shall be prohibited. Grid power electricity should be used to provide power at construction sites; or propane and natural gas generators may be used when grid power electricity is not feasible.

Construction Best Practices for Dust

- All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day. For projects over five acres of size, soil moisture should be maintained at 12 percent. Moisture content can be verified by lab samples or moisture probe.
- All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
- All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping should be done in conjunction with thorough watering of the subject roads.
- All vehicle speeds on unpaved roads shall be limited to 15 mph.
- All roadway, driveway, and sidewalk paving shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading.

---

[15] Adapted from BAAQMD, CEQA Air Quality Guidelines (May 2011).

[16] Equipment with engines meeting Tier 4 Interim or Tier 4 Final emission standards automatically meet this requirement, therefore a VDECS would not be required.

- All construction sites shall provide a posted sign visible to the public with the telephone number and person to contact at the Lead Agency regarding dust complaints. The recommended response time for corrective action shall be within 48 hours. BAAQMD's Complaint Line (1-800 334-6367) shall also be included on posted signs to ensure compliance with applicable regulations.
- All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph.
- Wind breaks (e.g., trees, fences) shall be installed on the windward side(s) of actively disturbed areas of construction. Wind breaks should have at maximum 50 percent air porosity.
- Vegetative ground cover (e.g., fast-germinating native grass seed) shall be planted in disturbed areas as soon as possible and watered appropriately until vegetation is established.
- The simultaneous occurrence of excavation, grading, and ground-disturbing construction activities on the same area at any one time shall be limited. Activities shall be phased to reduce the amount of disturbed surfaces at any one time.
- All trucks and equipment, including their tires, shall be washed off prior to leaving the site.
- Site accesses to a distance of 100 feet from the paved road shall be treated with a six- to 12-inch compacted layer of wood chips, mulch, or gravel.
- Sandbags or other erosion control measures shall be installed to prevent silt runoff to public roadways from sites with a slope greater than 1 percent.

Significance after Mitigation

The measures described above are intended to keep dust from becoming airborne and to keep diesel PM emissions as low as possible through the use of readily available, lower-emitting diesel equipment, and/or equipment using alternative cleaner fuels, such as propane, natural gas, and electricity, as well as on-road trucks using diesel PM filters.

Projects taking advantage of CEQA Streamlining provisions of SB 375 (Public Resources sections 21155.1, 21155.2, and 21159.28) must apply the mitigation measures described above, as feasible, to address site-specific conditions. To the extent that an individual project adopts and implements all feasible mitigation measures described above, the impact would be less than significant with mitigation (LS-M).

MTC/ABAG cannot require local implementing agencies to adopt the above mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Therefore it cannot be ensured that this mitigation measure would be implemented in all cases, and this impact remains significant and unavoidable (SU).

Impact

2.2-3(a) Implementation of the proposed Plan could cause a net increase in emissions of criteria pollutants ROG, NO_x, CO, and $PM_{2.5}$ from on-road mobile sources compared to existing conditions.

As shown in **Table 2.2-7**, the emissions for criteria pollutants ROG, NO_x (summertime and wintertime), CO, and $PM_{2.5}$ from mobile sources would decrease between 2010 and the 2040 horizon for the proposed Plan (emissions of PM_{10} would increase and are described under Impact 2.2-3b). When compared to existing conditions (2010), the proposed Plan reduces ROG emissions by 61 percent, summertime NO_x emissions by 70 percent, wintertime NO_x emissions by 71 percent, CO emissions by 70 percent, and $PM_{2.5}$ emissions by five percent. A major reason for these reductions is the increasingly stringent emission controls ARB has adopted for new vehicle engines and fuels over the past few decades. This includes the Truck and Bus Regulation which requires diesel trucks and buses to be upgraded to reduce emissions. As of January 1, 2012, heavier trucks must be retrofitted with PM filters; older trucks must be replaced starting January 1, 2015, and nearly all trucks and buses will need to have 2010 model year engines or equivalent by January 1, 2023. Other contributors include emission-control devices, the Enhanced Smog Check Program, and fleet turnover wherein older polluting cars are retired and replaced with newer and substantially less polluting cars. Additionally, the land use pattern in the proposed Plan includes concentrating future growth at higher densities around existing and proposed transit investments, which would reduce driving and motor vehicle emissions. Therefore, there is no adverse impact (NI).

TABLE 2.2-7: EMISSION ESTIMATES FOR CRITERIA POLLUTANTS USING EMFAC2011 EMISSION RATES (TONS PER DAY)

	2010	*2040 Plan*	*Change 2010 to 2040 Plan*

$PM_{2.5}$	10.4	9.9	-0.5	-5%

Source: Metropolitan Transportation Commission, 2012.

Mitigation Measures

None required.

Impact

2.2-3(b) Implementation of the proposed Plan could cause a net increase in emissions of PM_{10} from on-road mobile sources compared to existing conditions.

As shown in **Table 2.2-8**, PM_{10} emissions from mobile sources would increase by 12 percent during the proposed Plan's timeframe compared to existing conditions. The higher levels of PM_{10} emissions in 2040 conditions are due to the fact that these emissions are strongly influenced by the 20 percent growth in VMT (which directly affects entrained roadway dust), with some contributions from tire and brake wear and exhaust. The reason particulate matter emissions from mobile sources are not expected to increase at the same rate as VMT (20 percent) is the stringent emission control ARB has adopted for new vehicle engines, particularly diesel engines, including the Truck and Bus Regulation. Note that daily VMT and daily VHD are increasing when comparing the proposed Plan to existing conditions, but to a large

degree, these increases are offset by the regulatory and fleet improvements. PM control programs implemented by local Air Districts also contribute to the emission reductions relative to VMT.

In addition to the Truck and Bus Regulation, there are already ongoing State and regional efforts to mitigate the effects of particulate matter emissions. For instance, the ARB adopted a Diesel Risk Reduction Plan (DRRP) in October 2000, and as a part of that, has since adopted a series of regulations to require cleaner diesel fuel, to restrict idling of diesel engines, and to reduce emissions from both old and new on-road and off-road diesel engines. In 2005, MTC implemented a $14 million program to retrofit 1,700 diesel bus engines operated by Bay Area transit agencies to reduce particulate matter emissions, and in 2006, MTC and BAAQMD implemented a $2 million incentive program to reduce emissions from solid waste collection vehicle fleets that operate within BAAQMD. Furthermore, BAAQMD implements a variety of incentive programs that help fleet operators offset the cost of purchasing low-emission vehicles, re-powering old polluting heavy duty engines with cleaner, lower-emission engines, and installing control devices that reduce particulate and NO_x. Nonetheless, this increase in PM_{10} emissions overall represents a potentially significant (PS) impact. Mitigation measures 2.2(b) and 2.2 (c) are described below.

TABLE 2.2-8: EMISSION ESTIMATES FOR CRITERIA POLLUTANTS USING EMFAC2011 EMISSION RATES (TONS PER DAY)

	2010	*2040 Plan*	*Change 2010 to 2040 Plan*	
			Numerical	*Percent*
PM_{10}	36.4	41.0	4.5	12%

Source: Metropolitan Transportation Commission, 2012.

Mitigation Measures

2.2(b) MTC and ABAG, in partnership with BAAQMD, and other partners who would like to participate, shall work to leverage existing air quality and transportation funds and seek additional funds to continue to implement BAAQMD and ARB programs aimed at retrofits and replacements of trucks and locomotives.

2.2(c) MTC and ABAG, in partnership with BAAQMD and the Port of Oakland, and other partners who would like to participate, shall work together to secure incentive funding that may be available through the Carl Moyer Memorial Air Quality Standards Attainment Program to reduce port-related emissions.

Mitigation Measures 2.1 (a), 2.1(b), and 2.1 (c) (included in *Chapter 2.1: Transportation*) as well as 2.2 (d) and 2.2 (e) (included below under Impacts 2.2-5(b) and 2.2-6) could help reduce the increase in PM_{10}.

Significance after Mitigation

The increase in PM_{10} represents a significant impact compared to existing conditions. The mitigation measures identified above are anticipated to reduce this potentially significant impact. However, the exact reductions are not known at this time. Therefore, the impact is determined to remain significant and unavoidable (SU).

Impact

2.2-4 Implementation of the proposed Plan could cause a cumulative net increase in emissions of diesel PM, 1,3-butadiene, and benzene (toxic air contaminants) from on-road mobile sources compared to existing conditions.

As shown in **Table 2.2-9**, there would be a 71 percent decrease in diesel PM, a 70 percent decrease in 1,3-butadiene, and a 70 percent decrease in benzene compared to existing conditions. These reductions can be attributed to California's state laws to evaluate and control TACs, namely AB 1807 that created the Toxic Air Contaminant Identification and Control Act, SB 2588 that established the Air Toxics "HOT Spots" Information and Assessment Act, and SB 656 that requires ARB and local Air Districts to identify control measures for PM. Other state regulations that reduce smog or other pollutants also reduce TACs, such as the standards for low emission vehicles, clean fuels, reformulated gasoline, diesel fuel specifications, and ARB's Heavy Duty Diesel Inspection Programs. In addition, there are a number of regional programs in place to address PM in general and TACs in particular, including the ARB, BAAQMD, and Port of Oakland's Bay Area Goods Movement Program that provides financial incentives to owners of equipment used in freight movement to upgrade to cleaner technologies, and numerous Port of Oakland Clean Air Programs such as the Maritime Air Quality Improvement Plan, Comprehensive Truck Management Plan, Truck Air Quality Project, Vision 2000 Program and Air Emissions, and West Oakland Particulate Air Quality Monitoring Program. Overall, the reduction in TAC emissions and ongoing regulations and programs would ensure there would be no adverse impact (NI).

TABLE 2.2-9: EMISSION ESTIMATES FOR TOXIC AIR CONTAMINANTS POLLUTANTS (KILOGRAMS PER DAY)

	2010	*2040 Plan*	*Change 2010 to 2040 Plan*	
			Numerical	*Percent*
Diesel PM	2,599.6	755.9	-1,843.8	-71%
1,3-Butadiene	162.4	48.2	-114.1	-70%
Benzene	731.2	219.3	-511.9	-70%

Source: Metropolitan Transportation Commission, 2012.

Mitigation Measures

None required. However, see also mitigation measures for Impact 2.2-3(b) above, which have co-benefits for addressing TAC emissions.

Local Impact

2.2-5(a) Implementation of the proposed Plan could cause a localized net increase in sensitive receptors located in Transit Priority Project (TPP) corridors where TACs or fine particulate matter ($PM_{2.5}$) concentrations result in a cancer risk greater than 100/million or a concentration of $PM_{2.5}$ greater than 0.8 µg/m³.

The local pollutant analysis quantified and mapped the anticipated increased risk and $PM_{2.5}$ concentrations within TPPs throughout the Bay Area based on existing conditions. Any areas identified as having an increased cancer risk greater than 100 in a million or $PM_{2.5}$ concentration greater than 0.8

$\mu g/m^3$ would result in a potentially significant and unavoidable impact. TAC and $PM_{2.5}$ sources that were evaluated in this analysis include freeways, high volume roadways, ports, rail yards, refineries, chrome plating facilities; dry cleaners using perchloroethylene, gas stations and numerous other Air District permitted stationary sources. The emission sources and GIS spatial analysis that makes up the local pollutant analysis is described in more detail below.

Note that, for future projects not within one of these mapped areas, the significance of impacts is considered in the analyses presented under impacts 2.2-5(b) and 2.2-5(c) below.

Stationary Source Data

Using air pollutant emissions data from 2012 stationary source permits, BAAQMD developed a stationary source screening tool that contains cancer risk and $PM_{2.5}$ concentration data for all stationary sources in the Bay Area, available on BAAQMD's website.[17] The stationary source screening tool provides estimated cancer risk and $PM_{2.5}$ concentrations for stationary sources based on conservative modeling parameters, including worst case assumptions for meteorology. The estimated cancer risk and $PM_{2.5}$ concentration are considered "worst case" potential impacts since consideration of source specific conditions, such as exhaust stack heights, exhaust flow rates, and more site specific meteorology would result in lower estimates of cancer risk and $PM_{2.5}$ concentrations.

Where data were available, cancer risk and $PM_{2.5}$ concentrations were adjusted to reflect decreasing values based on distance from a source. For example, BAAQMD developed distance multiplier tools for gas stations and diesel back-up generators (also known as emergency or standby generators). These multiplier tools, available on BAAQMD's website, provide dispersion values to estimate the reductions in cancer risk and $PM_{2.5}$ concentrations expected further away from the source of emissions.[18] For other sources besides gas station and generators, where BAAQMD could not identify dispersion values, the cancer risk and $PM_{2.5}$ concentrations for each source were assumed to be the same at the source and up to 1,000 feet from the source.

BAAQMD's stationary source data also includes the effects of the ARB's air toxics control measure (ATCM) for dry cleaners using perchloroethylene (PERC). The ATCM regulation requires that dry cleaners using PERC be phased out by January 2023. The cancer risk estimates in the stationary source screening tool are based on a 70 year exposure rate, the health risk exposure standard used by OEHHA. The cancer risks for dry cleaners used in the GIS model were adjusted to be based on a 13-year exposure, from the years 2010 to 2035, to reflect the phasing out of PERC.

Large sources, such as refineries, ports, and land use sources without available emissions data, such as truck distribution centers, are addressed below under Impact 2.2-5(b).

Mobile Source Data

For freeways, BAAQMD conducted dispersion modeling, using vehicle activity data for 2009 and vehicle fleet emissions data for 2014, to estimate cancer risk and $PM_{2.5}$ concentrations for every freeway link in

[17] http://baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx

[18] http://baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx.

the Bay Area. The 2009 activity data was the most recent available from Caltrans at the time of the BAAQMD modeling in 2012. The 2014 vehicle fleet emissions data reflects the best available emissions data available from ARB's EMFAC2011 model. Known as the highway screening tool, it considers average annual daily traffic (AADT) counts, fleet mix and profiles, ARB emission factors using EMFAC 2011, vehicle speeds from MTC's travel demand model, and other modeling parameters per freeway link. The screening tool captures anticipated diesel PM emission reductions from ARB's on-road heavy duty diesel vehicle regulations, specifically the On-Road Heavy Duty Diesel Vehicles Regulation targeting trucks and buses. The tool provides estimated cancer risk and $PM_{2.5}$ concentration data measured from the edge of the freeway for distances from 10 to 1,000 feet on either side of the freeway, demonstrating how health risks lessen with distance from the freeway.[19]

For roadways with over 30,000 AADT, BAAQMD conducted dispersion modeling to develop a roadway screening tool. The tool, available on BAAQMD's website, is organized as county specific tables based on: a roadways AADT count, percent of heavy duty trucks and truck profiles, distance from roadway (10 to 1000 feet), north/south or east/west direction from roadway, ARB emission factors (EMFAC 2007 was best available data at time of modeling), and county-specific meteorological data from Air District monitoring stations. The roadway tool also reflects anticipated diesel PM emission reductions from ARB's On-Road Heavy Duty Diesel Vehicles Regulation.

BAAQMD estimated cancer risk and $PM_{2.5}$ concentrations for railroads and rail stations. Rail emissions were estimated along existing passenger and freight lines as well as proposed future lines in Marin County (i.e., SMART line) and eBART along Highway 4 in Contra Costa County. Emissions along freight corridors were estimated based on fuel consumption and passenger rail emissions were estimated based on the rail activity, idling times at stations, and speeds of individual trains. Passenger and freight (including switchers) emissions that run on parallel or shared tracks were aggregated to estimate total emissions along rail corridors. Site-specific meteorological conditions for each rail link were used. Estimates of cancer risk and $PM_{2.5}$ concentrations at various distances from the edge of the rail lines were provided in the GIS layer for railroad emissions.

Local Pollutant Impact Conclusion

The GIS spatial analysis model was used to compile and process all the stationary and mobile source cancer risk and $PM_{2.5}$ concentration data described above to identify areas in and within 1,000 feet of the TPP areas where an increased cancer risk is greater than 100 in a million and/or $PM_{2.5}$ concentrations exceed 0.8 $\mu g/m^3$. **Figures 2.2-4** through **2.2-21** below display the results of the GIS spatial analysis by county. In general, the figures show that areas over the threshold tend to occur along high traffic freeways, high use rail lines, locations with numerous stationary sources, and locations where a single stationary source has very high estimated cancer risk or $PM_{2.5}$ concentration levels.

TPP areas with cancer risk and $PM_{2.5}$ concentrations estimated to be below the thresholds; and that are not within the set distances (described in Impact 2.2-5(b) below); and are compliant with an adopted Community Risk Reduction Plan (described in Impact 2.2-5(c) below) are considered to have a less than

[19] The screening tool provides modeled health risks at 6 feet and 20 feet heights. The 20 feet heights are meant for project level analysis where residents may only be located on the second floor and above. The GIS model applies the modeled health risks at 6 feet, which is the worst case scenario.

significant impact to locating new sensitive receptors within these areas of TPPs and do not present a significant public health risk from localized TAC and $PM_{2.5}$ emissions.

TPP areas with an increased cancer risk and/or $PM_{2.5}$ concentration over the thresholds do present a potential public health impact and are considered to have potentially significant impacts for locating new sensitive receptors. Any future land use proposals for these areas that include sensitive receptors should evaluate potential TAC and $PM_{2.5}$ impacts during project level environmental review.[20] It is anticipated that future project level environmental review will in most cases result in less conservative and therefore lower estimates of cancer risk and $PM_{2.5}$ concentrations from existing sources. This would be due primarily to the use of more site specific TAC and $PM_{2.5}$ emissions and meteorology data. In some cases, estimated increased cancer risks or $PM_{2.5}$ concentrations may be found to be less than the preliminary estimates provided here.

The results of the GIS spatial analysis are based on increased cancer risk and $PM_{2.5}$ data for existing stationary and mobile sources in and within 1,000 feet of TPP areas. Proposed projects that include a new source of TAC and/or $PM_{2.5}$ or are located within a source that was not included in this analysis should conduct project specific environmental review to assess their potential increased cancer risk and $PM_{2.5}$ concentrations. Any new stationary sources of emissions subject to a BAAQMD permit will be required to analyze TAC and $PM_{2.5}$ emissions which will ensure that they do not adversely impact existing or new sensitive receptors above MTC thresholds. Projects locating sensitive receptors in areas mapped above the significance thresholds would result in potentially significant (PS) impacts.

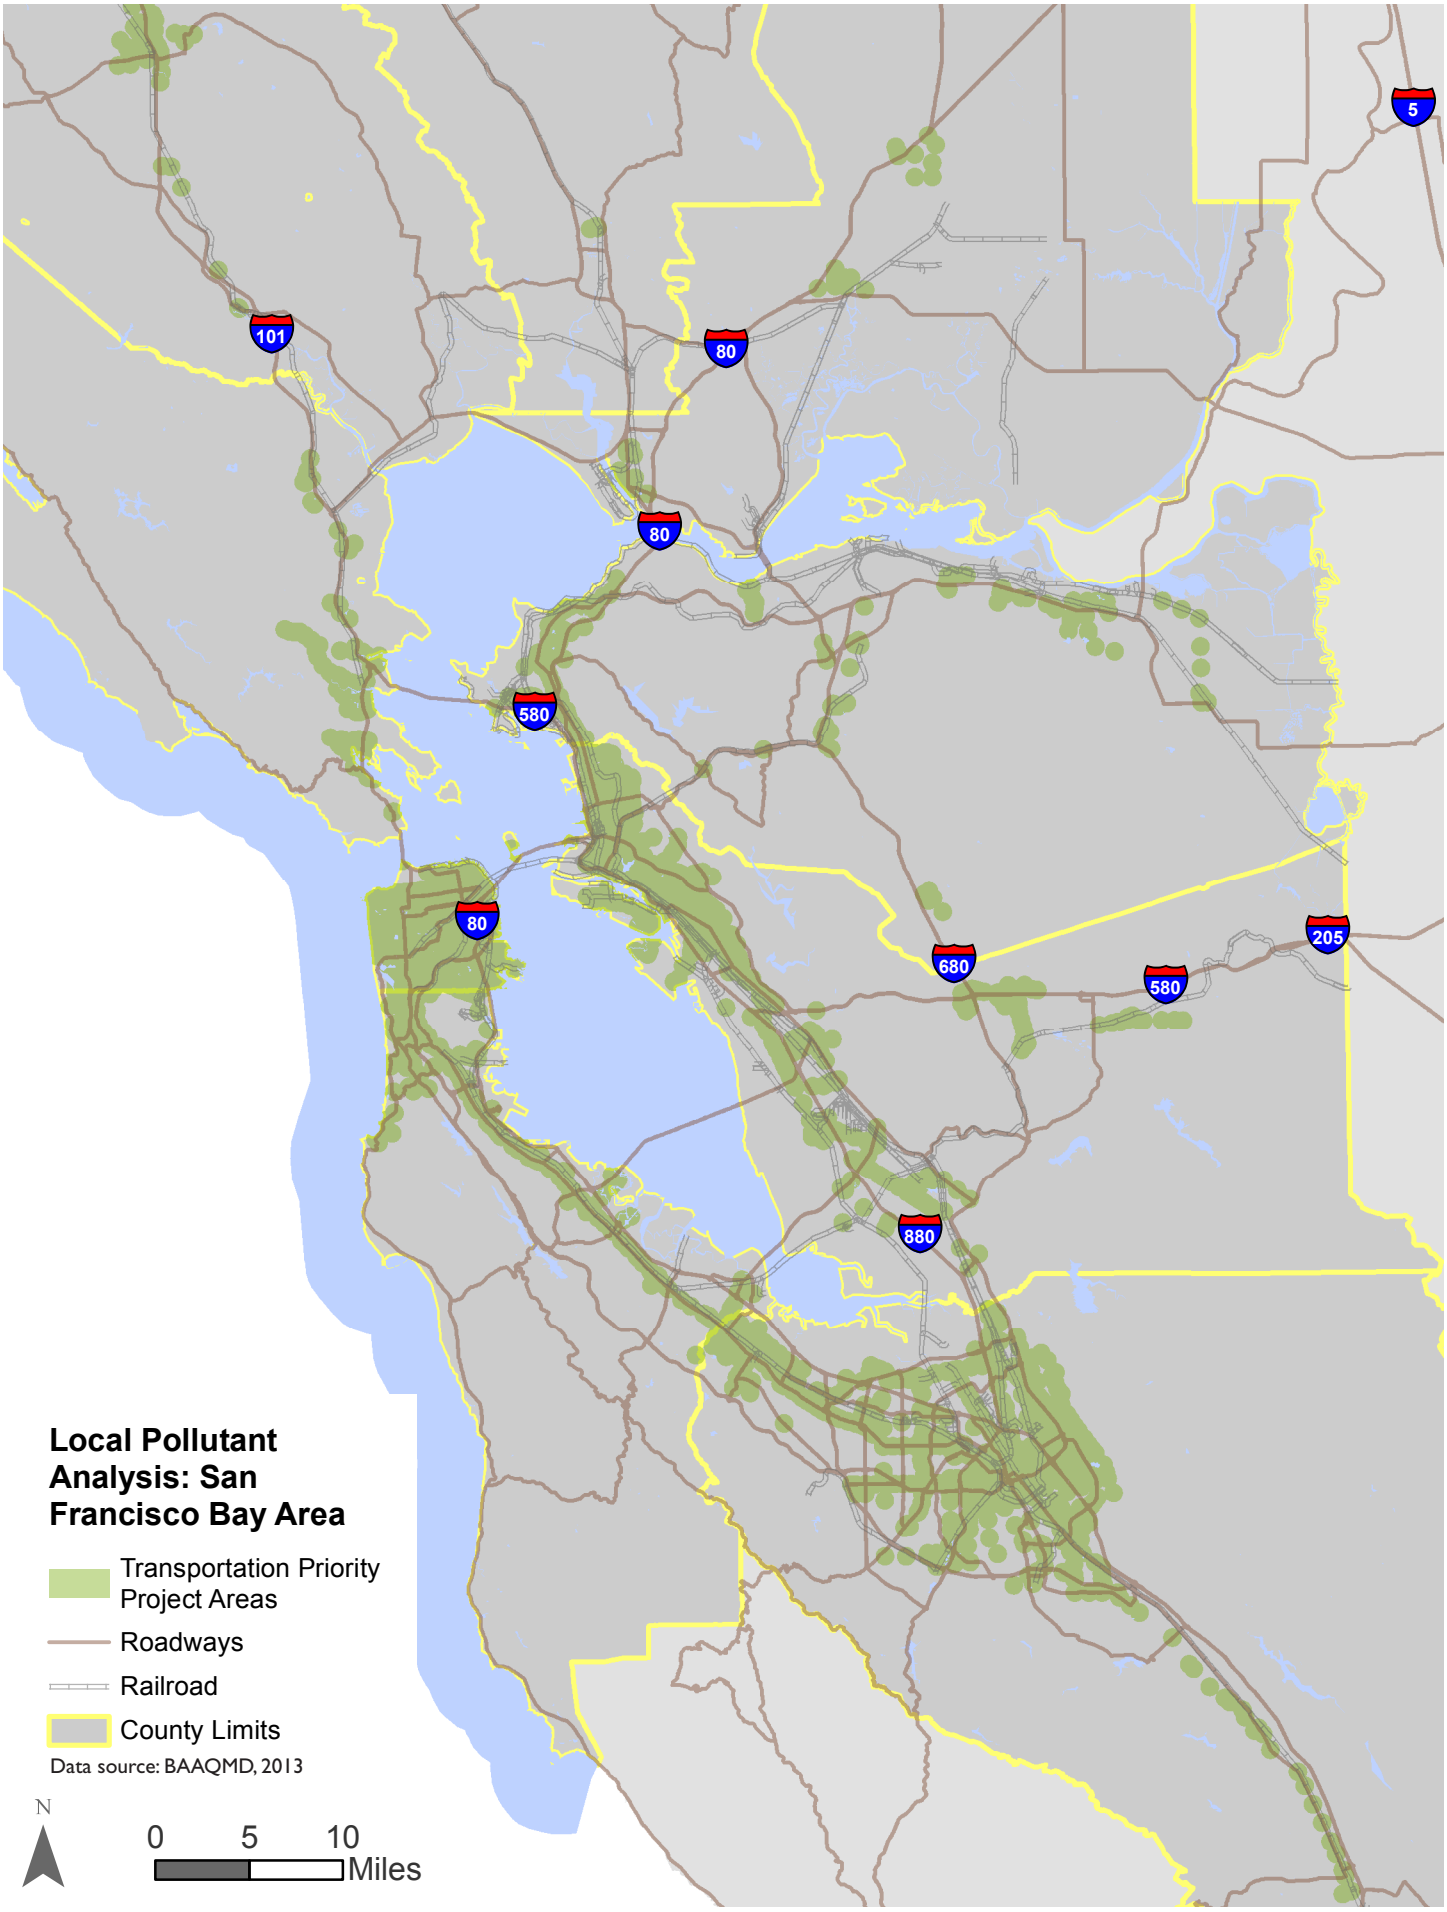
Mitigation Measures

Implement Mitigation Measure 2.2(d) under Impact 2.2-5(b) below.

Significance after Mitigation

Implementation of Mitigation Measure 2.2(d) would reduce the severity of the impacts identified for projects that would locate sensitive receptors in TPP areas where the increased cancer risk is greater than 100 in a million or $PM_{2.5}$ concentrations are greater than 0.8 $\mu g/m^3$. However, the mitigation measure may not be sufficient to reduce all impacts to less than significant in all areas above the thresholds. Additional site specific analysis would be needed when a project is proposed in these areas to determine the actual level of impact and if feasible mitigation measures exist for the project to implement to get them below the thresholds.

Projects taking advantage of CEQA Streamlining provisions of SB 375 (Public Resources Code sections 21155.1, 21155.2, and 21159.28) must apply the mitigation measures described above, as feasible, to address site-specific conditions. To the extent that an individual project adopts and implements all feasible mitigation measures described above, the impact would normally be less than significant with mitigation (LS-M). However, there may be instances in which site-specific or project-specific conditions



[20] Lead agencies for proposed projects should contact BAAQMD if they are unsure whether their project site falls in an impacted area or not.

preclude the reduction of all project impacts to less than significant levels. For purposes of a conservative analysis, therefore, this impact remains significant and unavoidable (SU).

MTC/ABAG cannot require local implementing agencies to adopt the above mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Therefore it cannot be ensured that this mitigation measure would be implemented in all cases. Further, there may be instances in which site-specific or project-specific conditions preclude the reduction of all project impacts to less-than-significant levels. For purposes of a conservative analysis, therefore, this impact remains significant and unavoidable (SU).

Impact

2.2-5(b) Implementation of the proposed Plan could cause a localized net increase in sensitive receptors located in Transit Priority Project (TPP) corridors within set distances (Table 2.2-10) to mobile or stationary sources of TAC or $PM_{2.5}$ emissions.

New research on the health effects of TACs and $PM_{2.5}$ reinforces earlier findings regarding adverse health impacts on both respiratory and cardiovascular health but also a wider range of potential effects, such as diabetes, autism, cognitive functions in older adults, and oxidative damage to DNA. In addition, US EPA has not identified a level of TAC/ $PM_{2.5}$ concentration where no negative health effects are observed.[21]

In general, the closer one gets to a source of emissions, the higher the pollutant concentrations one will be exposed to. Ideally, sensitive land uses would be set back an appropriate distance such that sensitive receptors would not be exposed to TAC and $PM_{2.5}$ concentrations that could adversely affect their health. However, this is the central issue surrounding infill development, such as in TPPs and PDAs, where the objective is to locate jobs and housing in close proximity to each other to reduce automobile trips and therefore mobile source emissions. In doing so, sensitive receptors can be located too close to stationary or mobile sources and exposed to unhealthy levels of TACs and $PM_{2.5}$ concentrations.

To help identify the appropriate distances that sensitive receptors should be protected from these stationary and mobile sources, MTC utilized work prepared by ARB 2005 *Air Quality and Land Use Handbook: A Community Health Perspective* (Handbook), and BAAQMD permit data. ARB developed the Handbook to bring attention to the potential health impacts associated with locating sensitive receptors in close proximity to air pollution sources. Using available health data, air quality modeling, and monitoring studies, the Handbook provides recommendations for how far sensitive land uses should be located away from some specific sources of air pollution. The ARB recommended distances are based primarily on data showing that air pollution exposure from TACs and $PM_{2.5}$ can be reduced as much as 80 percent when sensitive land uses are set back the recommended distance. The distance recommendations were based on existing health studies and data available at that time. ARB distance recommendations were only made when the relative exposure and health risk from a source could be reasonably characterized from the available data. For each source type, the Handbook summarizes the key health and distance related findings that helped form the distance recommendation for that source.

ARB recommends using local air pollution source data, where appropriate and if available, to better determine specific health risk near local TAC and $PM_{2.5}$ sources, especially for sources not included in ARB's Handbook, or to identify more appropriate distance recommendations than they provide in the Handbook.

For sources of TACs and $PM_{2.5}$ not included in ARB's Land Use Handbook or for sources where Air District data was more site specific than ARB's data, MTC and ABAG worked with BAAQMD to develop distance recommendations for siting new sensitive land uses for use in this analysis. BAAQMD provided site specific stationary source permit data or existing studies to support the distance

[21] "Understanding Particulate Matter: Protecting Public Health in the San Francisco Bay Area," Bay Area Air Quality Management District, November 2012.

recommendations for diesel generators, refineries, sea ports, airports, railroads, rail stations, and ferry terminals.

The specific set distances recommended for avoiding locating sensitive land uses are listed below in **Table 2.2-10**. For detailed explanations of set distances recommended by ARB, see the 2005 *Air Quality and Land Use Handbook: A Community Health Perspective*. Recommended distances used for this analysis are summarized below and described in detail in Appendix E.

The ARB recommends that land use agencies "avoid siting" any sensitive land uses within the set distances identified within the Handbook. This recommendation is due to potential adverse health impacts that could affect sensitive receptors from prolonged exposure to higher concentrations of TACs and $PM_{2.5}$. Therefore, any future land use development that includes sensitive receptors within any of the set distances identified above would be considered a potentially significant (PS) impact. Mitigation Measure 2.2(d) is described below.

TABLE 2.2-10: DISTANCE RECOMMENDATION FROM SENSITIVE RECEPTORS

Source	*Distance Recommendation from Sensitive Receptors*
Freeway/Highway, Roadway	500 feet of a freeway, urban roads with 100,000 vehicles/day, or rural roads with 50,000 vehicles/day.
Distribution Center	1,000 feet of a distribution center with over 100 daily truck trips.
Gas Dispensing Facility	300 feet of a large gas dispensing facility (a facility with a throughput of 3.6 million gallons or more per year); 50 feet of a small gas dispensing facility (a facility with a throughput of less than 3.6 million gallons per year).
Dry Cleaning Operation	300 feet of dry cleaning operation using PERC; 500 feet of dry cleaning operations with two or more machines using PERC.
Chrome Plating Facility	1,000 feet of a chrome plating facility.
Railyard	1,000 feet of BNSF Richmond; BNSF Railway, Pittsburg; Union Pacific, Martinez; and Union Pacific, Milpitas. 0.5 miles of Maritime Port of Oakland/UP Railyard.
Railroad and Rail Station	200 feet of a railroad or rail station.
Ferry Terminal	500 feet of a ferry terminal.
Diesel Generator	350 feet of a diesel generator with an estimated cancer risk greater than 10 in a million.
Sea Port	0.5 miles of Maritime Port of Oakland/UP Railyard; 1,000 feet of Port of Benicia, Port of Redwood City; Port of Richmond.
Oil Refinery	0.5 miles of Chevron, Richmond; Shell, Martinez; Phillips 66, Rodeo; Tesoro, Martinez; and Valero, Benicia.
Airport	0.5 miles of all major airports, including San Francisco International, Oakland International Airport, and Norman Y. Mineta San José International Airport.

Mitigation Measures

Implementing agencies and/or project sponsors shall consider implementation of mitigations measures including but not limited to those identified below.

2.2(d) Mitigation measures that shall be considered by implementing agencies and/or project sponsors where feasible based on project-and site-specific considerations include, but are not limited to best management practices (BMPs), such as the following:

- Installation of air filtration to reduce cancer risks and PM exposure for residents, and other sensitive populations, in buildings that are in close proximity to freeways, major roadways, diesel generators, distribution centers, railyards, railroads or rail stations, and ferry terminals. Air filter devices shall be rated MERV-13 or higher. As part of implementing this measure, an ongoing maintenance plan for the building's HVAC air filtration system shall be required.
- Phasing of residential developments when proposed within 500 feet of freeways such that homes nearest the freeway are built last, if feasible.
- Sites shall be designed to locate sensitive receptors as far as possible from any freeways, roadways, diesel generators, distribution centers, and railyards. Operable windows, balconies, and building air intakes shall be located as far away from these sources as feasible. If near a distribution center, residents shall not be located immediately adjacent to a loading dock or where trucks concentrate to deliver goods.
- Limiting ground floor uses in residential or mixed-use buildings that are located within the set distance of 500 feet to a non-elevated highway or roadway. Sensitive land uses, such as residential units or day cares, shall be prohibited on the ground floor.
- Planting trees and/or vegetation between sensitive receptors and pollution source, if feasible. Trees that are best suited to trapping PM shall be planted, including one or more of the following: Pine (*Pinus nigra* var. *maritima*), Cypress (*X Cupressocyparis leylandii*), Hybrid popular (*Populus deltoids X trichocarpa*), and Redwoods *(Sequoia sempervirens*).
- Within developments, sensitive receptors shall be separated as far away from truck activity areas, such as loading docks and delivery areas, as feasible. Loading dock shall be required electrification and all idling of heavy duty diesel trucks at these locations shall be prohibited.
- If within the project site, diesel generators that are not equipped to meet ARB's Tier 4 emission standards shall be replaced or retrofitted.
- If within the project site, emissions from diesel trucks shall be reduced through the following measures:
  - Installing electrical hook-ups for diesel trucks at loading docks.
  - Requiring trucks to use Transportation Refrigeration Units (TRU) that meet Tier 4 emission standards.
  - Requiring truck-intensive projects to use advanced exhaust technology (e.g. hybrid) or alternative fuels.
  - Prohibiting trucks from idling for more than two minutes as feasible.

- Establishing truck routes to avoid residential neighborhoods or other land uses serving sensitive populations. A truck route program, along with truck calming, parking and delivery restrictions, shall be implemented to direct traffic activity at non permitted sources and large construction projects.

Significance after Mitigation

The mitigation measures described above may result in cancer risk and $PM_{2.5}$ concentration reductions of 40 to 90 percent, depending on their applicability in a proposed project. See Appendix E for more information on the effectiveness of each mitigation measure.

Projects taking advantage of CEQA Streamlining provisions of SB 375 (Public Resources Code sections 21155.1, 21155.2, and 21159.28) must apply the mitigation measures described above, as feasible, to address site-specific conditions. To the extent that an individual project located within a set distance to a freeway or roadway, diesel generator, distribution center, rail line or railyard as defined above adopts and implements all feasible mitigation measures described above, the impact would be less than significant with mitigation (LS-M) (so long as the proposed project is not located in an area above the 100/million cancer risk or $PM_{2.5}$ concentration of 0.8 $\mu g/m^3$, as outlined in Impact 2.2-5(a)). However, for future development with sensitive land uses within set distances for gas stations, dry cleaners, airports, sea ports, chrome plating facilities, and oil refineries, implementation of Mitigation Measure 2.2(d) may not be sufficient to reduce the impact in all cases. Additional site specific analysis would be needed when a project is proposed in these areas to determine the actual level of impact and if feasible mitigation measures exist for the project to implement to get them below the thresholds. The impact for these projects would therefore remain significant and unavoidable (SU).

MTC/ABAG cannot require local implementing agencies to adopt the above mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Therefore it cannot be ensured that this mitigation measure would be implemented in all cases. Further, there may be instances in which site-specific or project-specific conditions preclude the reduction of all project impacts to less-than-significant levels (as described above). For purposes of a conservative analysis, therefore, this impact remains significant and unavoidable (SU).

Impact

2.2-5(c) Implementation of the proposed Plan could cause a localized net increase in sensitive receptors located in Transit Priority Project (TPP) corridors where TACs or fine particulate matter ($PM_{2.5}$) concentrations result in noncompliance with an adopted Community Risk Reduction Plan.

BAAQMD launched an initiative in 2010 to assist cities and counties in reducing TACs and $PM_{2.5}$ through a plan-based, comprehensive, community-wide approach, commonly known as a community risk reduction plan (CRRP). BAAQMD prepared a guidance document, *Draft Guidelines for a Plan Approach for Reducing TACs and $PM_{2.5}$*, and partnered with the cities of San Francisco and San José to prepare CRRPs. BAAQMD provided funding, staff time, and technical resources, including emissions data and dispersion modeling, to each of the cities. At the time of this EIR's publication, BAAQMD completed the emissions inventory and dispersion modeling for San Francisco and the emissions inventory for San José. According to BAAQMD, the dispersion modeling for San José is anticipated to be completed in spring 2013.

In jurisdictions with an adopted CRRP, any proposed project that includes sensitive land uses and or receptors should be evaluated against the standards, thresholds and mitigation measures in those adopted plans. Where a proposed project is consistent with an adopted CRRP, the impact would be less than significant (LS).

Mitigation Measures

None required.

Impact

2.2-6 Implementation of the proposed Plan could result in a localized larger increase or smaller decrease of TACs and or $PM_{2.5}$ emissions in disproportionally impacted communities compared to the remainder of the Bay Area communities.

The method of analysis described above was used to determine if the investments and land use scenario would result in a larger increase or smaller decrease in TAC and $PM_{2.5}$ emissions in disproportionately impacted communities when compared to the Bay Area at large. TAC and $PM_{2.5}$ emissions were estimated along the major transportation corridors within the CARE communities for the proposed Plan's base year (2010) and the horizon year (2040).

Table 2.2-11 lists MTC's modeling results, expressed as a percentage change in TAC and $PM_{2.5}$ exhaust emissions when compared to the base year emissions for each county with a CARE community and the entire region. Overall TAC and $PM_{2.5}$ exhaust emissions from diesel and gasoline vehicles decrease significantly throughout the Bay Area between existing conditions in 2010 and the proposed Plan's horizon year 2040. Diesel PM, benzene, and 1, 3 butadiene TAC emissions from on-road vehicle exhaust are estimated to decrease between 68 and 75 percent. Region-wide $PM_{2.5}$ emissions from all on-road vehicle exhaust are expected to decrease by approximately 55 percent. These reductions are largely attributed to the implementation of ARB's On-Road Heavy-Duty Diesel Vehicle Regulations, which aims to achieve an 85 percent reduction in diesel PM by 2023.

Between CARE and non-CARE communities there are slight differences in the percent reductions expected in 2040. There are certain instances where non-CARE communities are estimated to have slightly higher $PM_{2.5}$ and TAC exhaust emission reductions than the CARE communities. The CARE community in Santa Clara County is an example where this occurs. These results may be explained by the fairly substantial increase expected in VMT within the Santa Clara CARE community when compared to the anticipated increase in VMT for the remainder of Santa Clara County. Then there are instances where a CARE community is expected to result in slightly higher reductions in TACs and $PM_{2.5}$, such as in Alameda County. While the percent difference in estimated $PM_{2.5}$ and TAC emissions isn't substantial between CARE and non-CARE communities, it does suggest that these disproportionally impacted communities may not realize the same level of $PM_{2.5}$ and TAC emission reductions expected throughout the remainder of the county.

TABLE 2.2-11: PERCENT CHANGE IN ON-ROAD MOBILE SOURCE EXHAUST EMISSIONS, YEARS 2010 - 2040

	Exhaust Only $PM_{2.5}$	*Diesel PM*	*Benzene*	*1, 3 Butadiene*	*VMT*
Alameda CARE Community	-56.11%	-69.23%	-71.16%	-71.56%	18.64%
Remainder of County	-55.13%	-67.24%	-69.27%	-69.58%	24.69%
Contra Costa CARE Community	-57.54%	-69.35%	-71.82%	-72.15%	14.56%
Remainder of County	-57.69%	-68.71%	-70.57%	-70.84%	15.92%
San Francisco CARE Community	-53.23%	-70.01%	-74.02%	-74.47%	11.57%
Remainder of County	-46.22%	-69.78%	-75.53%	-75.80%	7.89%
San Mateo CARE Community	-56.91%	-69.90%	-70.68%	-71.19%	19.00%
Remainder of County	-57.67%	-69.16%	-71.20%	-71.51%	15.53%
Santa Clara CARE Community	-50.86%	-66.16%	-67.58%	-68.08%	31.63%
Remainder of County	-54.14%	-67.23%	-69.55%	-69.92%	23.00%
Regionwide CARE Communities	-54.49%	-68.43%	-70.55%	-70.99%	21.12%
Remainder of Region	-55.64%	-67.66%	-69.97%	-70.27%	20.21%

Source: The Bay Area Air Quality Management District, 2013.

Table 2.2-12 lists MTC's modeling results, expressed as a percentage change in Total $PM_{2.5}$ emissions when compared to the 2010 base year emissions, for each county with a CARE community and the entire region. Total $PM_{2.5}$ includes exhaust from all vehicles, as well as re-entrained road dust, brake wear and tire wear, and does not include TACs from gasoline vehicles. Brake wear and tire wear emission rates are estimated in EMFAC2011. Road dust emissions are estimated from ARB's paved road dust methodology, which is based on EPA's dust emission rates estimates (EPA, AP-42 13.2.1, January 2011). When all sources of $PM_{2.5}$ are aggregated, the anticipated $PM_{2.5}$ emission reductions are much smaller than the emission changes presented in **Table 2.2-11**, which only show vehicle exhaust emissions. In fact, when Total $PM_{2.5}$ is estimated some counties even show an increase between 2010 and 2040.

This outcome may be explained by a number of factors. Emissions from gasoline and diesel on-road vehicles have been substantially reduced by stringent California and federal exhaust emission standards. ARB on-road Heavy-Duty Diesel Regulations are expected to reduce diesel PM by 85 percent by 2020. In addition, $PM_{2.5}$ from brake and tire wear from passenger vehicles is expected to represent approximately 85 to 90 percent of particulate matter from vehicles well into the future.[22] Currently, there are no regulations that have been adopted that will reduce future levels of particulate matter from tire and brake wear and re-entrained road dust emissions. Therefore, EMFAC2011 does not consider any improvements in brake and tire wear and re-entrained road dust emissions in future year's emission estimates. This means that as VMT increases, so do $PM_{2.5}$ emissions from brake and tire wear and re-entrained road dust. This is an example where increases in VMT are outstripping the technological advances of low emission vehicles.

[22] EMFAC 2011 Technical Documentation, ARB, September 19, 2011, p. 112.

Table 2.2-12 also shows that the CARE community in Santa Clara County, as well as regionwide CARE communities, will experience higher total $PM_{2.5}$ emissions between 2010 and 2040 in comparison with non-CARE portions of the County, and the region as a whole. As a result of the projected increase of $PM_{2.5}$ emissions in the CARE communities from 2010 to 2040, a potentially significant (PS) impact will occur based on the impact criteria for disproportionally impacted communities. Mitigation measures 2.2 (e) and 2.2 (f) are described below.

TABLE 2.2-12: PERCENT CHANGE IN ON-ROAD MOBILE SOURCE TOTAL PM EMISSIONS, YEARS 2010–2040 (TOTAL $PM_{2.5}$ INCLUDES VEHICLE EXHAUST, RE-ENTRAINED ROAD DUST, TIRE AND BRAKE WEAR)

Alameda CARE Community	**-1.36%**
Remainder of County	**2.49%**

Mitigation Measures

Mitigation measures to reduce TAC and $PM_{2.5}$ emissions from on-road trucks and locomotives that shall be implemented by MTC/ABAG and BAAQMD include, but are not limited to the following:

2.2(e) MTC/ABAG shall partner with BAAQMD to develop a program to install air filtration devices in existing residential buildings, and other buildings with sensitive receptors, located near freeways or sources of TACs and $PM_{2.5}$.

2.2(f) MTC/ABAG shall partner with BAAQMD to develop a program to provide incentives to replace older locomotives and trucks in the region to reduce TACs and $PM_{2.5}$.

In addition, Mitigation Measures 2.1 (a), 2.1(b), and 2.1 (c) (included in *Chapter 2.1: Transportation*) and 2.2 (d) (included under Impact 2.2-5(b)) could help reduce TAC and $PM_{2.5}$ emissions.

Significance after Mitigation

The proposed Plan could result in a larger increase or smaller decrease of TACs and $PM_{2.5}$ emissions in disproportionally impacted communities. These impacts vary across counties. The mitigation measures

identified above are anticipated to reduce this potentially significant impact. However, the exact reductions are not known at this time. Therefore, this impact remains significant and unavoidable (SU).

Table of Contents

Preface 1

1 - Introduction 1-1

1.1 Development of Guidelines 1-1
1.2 Use of the Guidance Manual 1-2
1.3 Who is Required to Conduct a Risk Assessment 1-3
1.4 The Hot Spots Analysis and Reporting Program (HARP) Software 1-4
1.5 Risk Assessment Review Process 1-4
1.6 Uncertainty in Risk Assessment 1-5
1.7 Tiered Approach to Risk Assessment 1-7
1.8 References 1-7

2 - Overview of Health Risk Assessment 2-1

2.1 The Model for Risk Assessment 2-1
2.2 Hazard Identification 2-1
2.3 Exposure Assessment 2-1
2.4 Dose-Response Assessment 2-2
2.5 Risk Characterization 2-3
2.5.1 Point Estimate Approach 2-4
2.5.2 Stochastic Exposure Assessment 2-5
2.5.3 Tiered Approach to Risk Assessment 2-6
2.6 References 2-6

3 - Hazard Identification - Air Toxics Hot Spots Emissions 3-1

3.1 The Air Toxics Hot Spots List of Substances and Emissions Inventory 3-1
3.2 References 3-2

4 - Air Dispersion Modeling 4-1

4.1 Air Dispersion Modeling in Exposure Assessment: Overview 4-1
4.2 Emission Inventories 4-5
4.2.1 Air Toxics Hot Spots Emissions 4-5
4.2.2 Landfill Emissions 4-9
4.3 Source Characterization 4-9
4.3.1 Source Type 4-9
4.3.2 Quantity of Sources 4-11
4.4 Terrain Type 4-11
4.4.1 Terrain Type – Land Use 4-12
4.4.2 Terrain Type - Topography 4-14
4.5 Level of Detail: Screening vs. Refined Analysis 4-14
4.6 Population Exposure 4-15
4.6.1 Zone(s) of Impact 4-15

4.6.2 Screening Population Estimates for Risk Assessments 4-17
4.6.3 Refined Population Estimates for Risk Assessments 4-18
4.6.4 Sensitive Receptor Locations 4-20
4.7 Receptor Siting 4-20
4.7.1 Receptor Points 4-20
4.7.2 Centroid Locations 4-22
4.7.3 Spatial Averaging 4-22
4.8 Meteorological Data 4-27
4.8.1 Meteorological Data Formats 4-29
4.8.2 Treatment of Calms 4-29
4.8.3 Treatment of Missing Data 4-30
4.8.4 Representativeness of Meteorological Data 4-31
4.8.5 Alternative Meteorological Data Sources 4-33
4.8.6 Quality Assurance and Control 4-33
4.9 Model Selection 4-34
4.9.1 Recommended Models 4-34

Preface

The draft of the *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* (Guidance Manual) is a description of the algorithms, recommended exposure variates, cancer and noncancer health values, and the air modeling protocols needed to perform a health risk assessment (HRA) under the Air Toxics Hot Spots Information and Assessment Act of 1987(Health and Safety Code Section 44300 et seq., see Appendix B). The Children's Environmental Health Protection Act of 1999 (Health and Safety Code Section 39606, also contained in Appendix B), which requires explicit consideration of infants and children in assessing risks from air toxics, necessitated revisions of the methods for both noncancer and cancer risk assessment, and of the exposure variates. This draft version of the Guidance Manual updates the previous version (OEHHA, 2003), and reflects advances in the field of risk assessment along with explicit consideration of infants and children.

The information presented in the draft manual is compiled from three technical support documents (TSDs) released by the Office of Environmental Health Hazard Assessment (OEHHA) for the Hot Spots Program. The three TSDs (which are also revised versions, replacing the original four Hot Spots TSDs adopted between 1999 and 2003) underwent public comment and peer review and were adopted for use in the Air Toxics Hot Spots program by the Director of OEHHA. The Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (June, 2008) addressed the methodology for deriving acute, chronic and eight hour Reference Exposure Levels. The Technical Support Document for Cancer Potency Factors (May 2009) addresses the methodology for deriving cancer potency factors and adjusting cancer potency to account for the increased sensitivity of early-in-life exposure to carcinogens. The Technical Support Document for Exposure Assessment and Stochastic Analysis (June 2012) presents the exposure model for the Hot Spots program and reviews the available literature on exposure and relevant fate and transport variates. All three TSDs are available on OEHHA's web site at: http://www.oehha.ca.gov/air/hot_spots/index.html. Excerpts of these three TSDs are presented in this document. There is relatively little new information in the Guidance Manual since the adoption of the TSDs.

The draft Guidance Manual was released for public review. Public comments were received and changes were made in response to some comments. Responses were developed to all public comments. Both the Guidance Manual and OEHHA's response to comments were then reviewed by the State's Scientific Review Panel on Toxic Air Contaminants (SRP), who previously reviewed the three TSDs upon which this guidance is based. Following review by the SRP, OEHHA finalized this Guidance Manual. This Guidance Manual supersedes the risk assessment methods presented in the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2003), which in turn replaced earlier guidance provided by the California Air Pollution Control Officer's Association (CAPCOA, 1993). This manual updates health effects values, exposure pathway variates (e.g., breathing rates), and

continues to use a tiered approach for performing HRAs based on current science and policy assessment. The Technical Support Document for Cancer Potency Factors (OEHHA, 2009) recommends a tenfold early-in-life potency factor adjustment for the third trimester and ages zero to less than two, and a threefold adjustment factor for ages two to less than sixteen. In addition, we recommend evaluating residency periods of nine, thirty and seventy years. This means that exposure variates are needed for the third trimester, ages zero to less than two, ages two to less than nine, ages two to less than 16, ages 16 to less than 30, and ages 16 to 70.

The tiered approach presented in this draft manual provides a risk assessor with flexibility and allows consideration of site-specific differences. Furthermore, risk assessors can tailor the level of effort and refinement of an HRA by using the point-estimate exposure variates or the stochastic treatment of distributions of exposure variates. The four-tiered approach to risk assessment primarily applies to residential cancer risk assessment. Compared to the OEHHA 2003 document, the exposure pathways in the Guidance Manual remain the same. The exposure and risk algorithms are similar, but they have been revised to accept new data or variables that are used in the tiered risk assessment approach.

The draft manual also contains example calculations and an outline for a modeling protocol and an HRA report. A software program, the Hot Spots Analysis and Reporting Program (HARP), has been developed by the Air Resources Board in consultation with OEHHA and Air Pollution Control/Air Quality Management District representatives. The HARP software, which is being updated with the new exposure variates and health values, is the recommended model for calculating and presenting HRA results for the Hot Spots Program. Information on obtaining the HARP software can be found on the ARB's web site at *www.arb.ca.gov* under the Hot Spots Program.

The intent of the Guidance Manual and the HARP software is to incorporate children's health concerns, update risk assessment practices, and to provide consistent risk assessment procedures. The use of consistent risk assessment methods and report presentation has many benefits, such as expediting the preparation and review of HRAs, minimizing revision and resubmission of HRAs, allowing a format for facility comparisons, and cost-effective implementation of HRAs and the Hot Spots Program. Risk assessments prepared with this Guidance Manual may be used for permitting new or modified stationary sources, or public notification, and risk reduction requirements of the Hot Spots Program. The use of uniform procedures allows comparison of risks from different facilities and enables identification of facilities that are problematic from a public health perspective. OEHHA reviews the HRAs to insure they are adequate for decision making, but does not play a role in permitting decisions that may result from the HRAs. OEHHA will provide advice to the Districts when requested on any of the risk assessment methods or health values they have used.

1 - Introduction

1.1 Development of Guidelines

The Air Toxics Hot Spots Information and Assessment Act is designed to provide information to state and local agencies and to the general public on the extent of airborne emissions from stationary sources and the potential public health impacts of those emissions. The Hot Spots Act requires that the Office of Environmental Health Hazard Assessment (OEHHA) develop risk assessment guidelines for the Hot Spots program (Health and Safety Code (HSC) Section 44360(b)(2)) (see Appendix B for the text of the HSC). In addition, the Hot Spots Act specifically requires OEHHA to develop a "likelihood of risks" approach to health risk assessment. In response, OEHHA developed a tiered approach to risk assessment where a point estimate approach is first employed. If a more detailed analysis is needed, OEHHA has developed a stochastic, or probabilistic, approach using exposure factor distributions that can be applied in a stochastic estimate of the exposure. A detailed presentation of the tiered approach, risk assessment algorithms, selected exposure variates (e.g., breathing rate), and distributions with a literature review is presented in the *Air Toxics Hot Spots Program Risk Assessment Guidelines*; *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012). A summary of this information can be found in Chapter 5 of this document.

The Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (OEHHA, 2008) addresses dose response relationships for noncancer health effects and the methodology for deriving acute, chronic and 8-hour Reference Exposure Levels (RELs). Currently there are 53 acute RELs, 82 chronic RELs, and 10 eight-hour RELs. Review and revision of RELs to take into account new information and sensitive subpopulations including infants and children is an ongoing process. All draft RELs for individual chemicals revised under the current noncancer methodology will undergo public comment and peer review, as mandated by the Hot Spots Act. The Technical Support Document for Cancer Potency Factors (OEHHA, 2009) addresses the methodology for deriving cancer potency factors and adjusting cancer potency to account for the increased sensitivity to early-in-life exposure to carcinogens. This document contains inhalation cancer potency factors and oral cancer potency factors for 142 toxicants and toxicant compound classes developed by OEHHA or developed by other authoritative bodies and endorsed by OEHHA. The OEHHA website (*www.oehha.ca.gov*) should be consulted for the most current adopted chronic, acute and 8-hour RELs and cancer potency factors. In addition, for a small subset of these substances that are subject to airborne deposition and hence human oral and dermal exposure, oral chronic RELs and oral cancer potency factors have been developed by OEHHA. A summary of cancer and noncancer health effects values can be found in Appendix L and Chapters 6 and 7 of the Guidance Manual. All three Technical Support Documents have undergone public and peer review and have been approved by the state's Scientific Review Panel on Toxic Air Contaminants and adopted by OEHHA. The Guidance Manual is undergoing the same public and peer review process.

The Guidance Manual contains a description of the algorithms, recommended exposure variates, and cancer and noncancer health values, and modeling protocols needed to perform a Hot Spots risk assessment under the Hot Spots Act (see Appendix B). The information for the Guidance Manual is taken from the three TSDs. The Guidance Manual supersedes the risk assessment methods presented in the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2003).

The Guidance Manual is intended to address health risks from airborne contaminants released by stationary sources. Some of the methodology used is common to other regulatory risk assessment applications, particularly for California programs. However, if the reader needs to prepare a Health Risk Assessment (HRA) under another program, the HRA may need additional analyses. Therefore, appropriate California and federal agencies should be contacted. For example, if a facility must comply with HRA requirements under the Resource Conservation and Recovery Act (RCRA) or the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), the California Department of Toxic Substances Control (DTSC) must be contacted to determine if an HRA written to comply with AB 2588 will also satisfy RCRA/CERCLA requirements.

1.2 Use of the Guidance Manual

The intent in developing this Guidance Manual is to provide HRA procedures for use in the Air Toxics Hot Spots Program or for the permitting of existing, new, or modified stationary sources. The Air Resources Board (ARB) website (*www.arb.ca.gov*) provides more information on the Hot Spots Program and risk management guidelines, including recommendations for permitting existing, new, or modified stationary sources. The use of consistent risk assessment procedures and report presentation allows comparison of one facility to another, expedites the review of HRAs by reviewing agencies, and minimizes revision and resubmission of HRAs.

OEHHA recognizes that no one risk assessment procedure or set of exposure variates could perfectly address the many types of stationary facilities in diverse locations in California. Therefore a tiered risk assessment approach was developed to provide flexibility and allow consideration of site-specific differences. The tiered approach to risk assessment is discussed in detail in Chapter 8 of this Guidance.

These guidelines should be used in conjunction with the emission data collected and reported pursuant to requirements of the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5*), and the *Emission Inventory Criteria and Guidelines Report for the Air Toxics "Hot Spots" Program* (EICG Report), which is incorporated by reference therein (see ARB's web site: http://www.arb.ca.gov/ab2588/2588guid.htm for the most current version, which was approved on August 27, 2007). This regulation outlines requirements for the collection of emission data, based on an inventory plan, which must be approved by the Air Pollution Control or Air Quality Management District (District). The emissions reported under this program are routine or predictable and include continuous

and intermittent releases and predictable process upsets or leaks. Emissions for unpredictable releases (e.g., accidental catastrophic releases) are not reported under this program.

For landfill sites, these guidelines should be applied to the results of the landfill testing required under Health and Safety Code Section 41805.5 as well as to any emissions reported under the emission inventory requirements of the Air Toxics Hot Spots Act (e.g., from flares or other on-site equipment). Districts should be consulted to determine the specific landfill testing data to be used.

1.3 Who is Required to Conduct a Risk Assessment

The Hot Spots Act requires that each local Air Pollution Control District or Air Quality Management District (hereinafter referred to as District) determine which facilities will prepare an HRA. As defined under the Hot Spots Act, an HRA includes a comprehensive analysis of the dispersion of hazardous substances in the environment, their potential for human exposure, and a quantitative assessment of both individual and population-wide health risks associated with those levels of exposure.

Districts are to determine which facilities will prepare an HRA based on a prioritization process outlined in the law. The process by which Districts identify priority facilities for risk assessment involves consideration of potency, toxicity, quantity of emissions, and proximity to sensitive receptors such as hospitals, daycare centers, schools, work-sites, and residences. The District may also consider other factors that may contribute to an increased potential for significant risk to human receptors. As part of this process Districts categorize facilities as high, intermediate, or low priority. The District prioritization process is described in the *CAPCOA Air Toxics Hot Spots Program Facility Prioritization Guidelines, July 1990* (CAPCOA, 1990), although some Districts may have adopted their own method for prioritizing facilities for the purposes of AB2588, permitting, etc. Consult the District for updates to the Prioritization Guidelines. See the Hot Spots Program on ARB's web site at *www.arb.ca.gov* for more information on facility prioritization procedures.

Facilities designated by a District as "high priority" are required to submit an HRA to the District within 150 days of designation. Districts may grant a 30-day extension. However, a District may require any facility to prepare and submit an HRA according to the District priorities established for purposes of the Hot Spots Act.

1.4 The Hot Spots Analysis and Reporting Program (HARP) Software

The ARB and the Districts have identified a critical need for software to assist with the programmatic aspects of the Hot Spots Program. HARP is computer software used by the ARB, OEHHA, Districts, and facility operators to promote statewide consistency, efficiency, and cost-effective implementation of HRAs and the Hot Spots Program. The HARP software package includes: 1) an Emissions Inventory Database Module, 2) an Air Dispersion Modeling Module, and 3) a Risk Analysis Module. The user-friendly Windows-based package provides for:

1. Electronic implementation of the risk assessment methods presented in the OEHHA guidelines (Guidance Manual);
2. Electronic data transfer from facilities and Districts;
3. The production of reports;
4. Facility prioritization;
5. Air dispersion modeling (AERMOD) of multiple emission releases or facilities for cumulative impact evaluations;
6. A summary report of acute, 8-hour, and chronic health hazard quotients or indices, and cancer risk at the point of maximum impact (PMI), maximally exposed individual resident (MEIR), maximally exposed individual worker (MEIW) and other receptors to be evaluated as needed;
7. Mapping displays of facility property boundaries, risk isopleths, and elevation contours;
8. The ability to display combined risk contours from multiple emission sources;
9. Output of data for use in other “off-the-shelf” Geographic Information Systems (GIS) programs for additional types of analysis; and
10. Census data for determining population-related health impacts showing the number of people exposed at various cancer risk levels and cancer burden.

1.5 Risk Assessment Review Process

The Hot Spots Act risk assessments are reviewed by the local District and by OEHHA. The Districts focus their review on the emissions data and the air dispersion modeling. OEHHA provides comments on the HRA’s general concordance with the Guidelines Manual and the completeness of the reported health risks. The District, taking into account the comments of OEHHA, approves the HRA or returns it to the facility for revision and resubmission. If the HRA is not revised and resubmitted by the facility within 60 days, the District may modify the HRA and approve it as modified. Based on the approved HRA, the District determines if there is a significant health risk associated with emissions from the facility. If the District determines that facility emissions pose a significant health risk, the facility operator provides notice to all exposed individuals regarding the results of the HRA and may be required to take steps to reduce emissions by implementing a risk reduction audit and plan. Notification is to be made according to

procedures specified by the District. Each District determines its own levels of significance for cancer and noncancer health effects for notification and risk reduction. See the Hot Spots Program on ARB's web site at *www.arb.ca.gov* for more information on significance levels selected by each District.

1.6 Uncertainty in Risk Assessment

OEHHA has striven to use the best science available in developing these risk assessment guidelines. However, there is a great deal of uncertainty associated with the process of risk assessment. The uncertainty arises from lack of data in many areas necessitating the use of assumptions. The assumptions used in these guidelines are designed to err on the side of health protection in order to avoid underestimation of risk to the public. Sources of uncertainty, which may overestimate or underestimate risk, include: 1) extrapolation of toxicity data in animals to humans, 2) uncertainty in the estimation of emissions, 3) uncertainty in the air dispersion models, and 4) uncertainty in the exposure estimates. In addition to uncertainty, there is a natural range or variability in measured parameters defining the exposure scenario. Scientific studies with representative sampling and large enough sample sizes can characterize this variability. In the specific context of a Hot Spots risk assessment, the source of variability with the greatest quantitative impact is variation among the human population in such properties as height, weight, food consumption, breathing rates, and susceptibility to chemical toxicants. OEHHA captures at least some of the variability in exposure by developing data driven distributions of intake rates, where feasible, in the TSD for Exposure Assessment (OEHHA, 2012).

Interactive effects of exposure to more than one carcinogen or toxicant are addressed in the risk assessment with default assumptions of additivity. Cancer risks from all carcinogens addressed in the HRA are added. Similarly, non-cancer hazard quotients for substances impacting the same target organ/system are added to determine the hazard index (HI). Although such effects of multiple chemicals are assumed to be additive by default, several examples of synergism (interactive effects greater than additive) are known. For substances that act synergistically, the HRA could underestimate the risks. Some substances may have antagonistic effects (lessen the toxic effects produced by another substance). For substances that act antagonistically, the HRA could overestimate the risks.

Other sources of uncertainty, which may underestimate or overestimate risk, can be found in exposure estimates where little or no data are available (e.g., soil half-life and dermal penetration of some substances from a soil matrix).

The differences among species and within human populations usually cannot be easily quantified and incorporated into risk assessments. Factors including metabolism, target site sensitivity, diet, immunological responses, and genetics may influence the response to toxicants. The human population is much more diverse both genetically and culturally (e.g., lifestyle, diet) than inbred experimental animals. The intraspecies variability among humans is expected to be much greater than in laboratory animals.

In most cases, cancer potency values have been estimated only for the single most affected tumor site. This represents a source of uncertainty in the cancer risk assessment. Adjustment for tumors at multiple sites induced by some carcinogens may result in a higher potency. Some recent assessments of carcinogens include such adjustments. Other uncertainties arise 1) in the assumptions underlying the dose-response model used, and 2) in extrapolating from large experimental doses, where other toxic effects may compromise the assessment of carcinogenic potential, to usually much smaller environmental doses.

When occupational epidemiological data are used to generate a carcinogenic potency or a health protective level for a non-carcinogen, less uncertainty is involved in the extrapolation from workplace exposures to environmental exposures. When using human data, no interspecies extrapolation is necessary eliminating a significant source of uncertainty. However, children are a subpopulation with hematological, nervous, endocrine, and immune systems that are still developing and may be more sensitive to the effects of toxicants. The worker population and risk estimates based on occupational epidemiological data are more uncertain for children than adults. Current risk assessment guidelines include procedures designed to address the possibly greater sensitivity of infants and children, but there are only a few compounds for which these effects have actually been measured experimentally. In most cases, the adjustment relies on default assumptions which may either underestimate or overestimate the true risks faced by infants and children exposed to toxic substances or carcinogens.

Risk estimates generated by an HRA should not be interpreted as the expected rates of disease in the exposed population but rather as estimates of potential for disease, based on current knowledge and a number of assumptions.

In the Hot Spots program, cancer risk is often expressed as the maximum number of new cases of cancer projected to occur in a population of one million people due to exposure to the cancer-causing substance over a 30-year residential period. However, there is uncertainty associated with the cancer risk estimate. An individual's risk of contracting cancer from exposure to facility emissions may be less or more than the risk calculated in the risk assessment. An individual's risk not only depends on the individual's exposure to a specific chemical but also on his or her genetic background, health, diet, lifestyle choices and other environmental and workplace exposures. OEHHA uses health-protective exposure assumptions to avoid underestimating risk. For example, the risk estimate for airborne exposure to chemical emissions uses the health-protective assumption that the individual has a high breathing rate and exposure began early in life when cancer risk is highest.

A Reference Exposure Level (REL) is the concentration level at or below which no adverse non-cancer health effects are anticipated for the specified exposure duration. RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. RELs are designed to protect the most sensitive individuals in the population by the inclusion of factors that account for uncertainties as well as individual differences in human susceptibility to chemical exposures. The factors used in the calculation of RELs are meant to err on the side of public health

protection in order to avoid underestimation of non-cancer hazards. Exceeding the REL does not automatically indicate an adverse health impact. However, increasing concentrations above the REL value increases the likelihood that the health effect will occur.

Risk assessments under the Hot Spots program are often used to compare one source with another and to prioritize concerns. Consistent approaches to risk assessment are necessary to fulfill this function.

1.7 Tiered Approach to Risk Assessment

OEHHA developed a tiered approach to accommodate consideration of site-specific data that may be more appropriate for a given facility than the default variate. The first tier is the simplest point estimate approach to estimating exposure to facility emissions. Tier 1 is the first step in conducting a comprehensive risk assessment using algorithms and point estimates of input values described in the *Technical Support Document for Exposure Assessment and Stochastic Analysis*. (OEHHA, 2012) Each facility conducts a Tier 1 risk assessment to promote consistency across the state in facility risk assessments and facilitate comparisons across facilities. To be health-protective, high-end estimates for the key intake exposure variates are used for the dominant exposure pathways.

Tier 2 allows use of site-specific point estimates of exposure variates as long as these estimates can be justified. For example, if there are data indicating that consumption of fish from an impacted body of water is lower than the OEHHA-recommended fish consumption rate, then the facility can use that data to generate a point estimate for sport-fish consumption from that body of water. The risk assessor must supply the data and methods used for the site-specific estimates, and the site-specific estimates must be reproducible and approved by both the District and OEHHA.

Tier 3 risk assessment involves stochastic analysis of exposure using data-based distributions for the key exposure variates compiled in the OEHHA (2012) *Technical Support Document*. Since a stochastic approach to risk assessment provides more information about the range of risk estimates based on the range of exposures, Tier 3 can serve as a useful supplement to the Tier 1 and 2 approaches. Variance propagation methods (e.g., Monte Carlo analysis) are used to derive a range of cancer risk estimates reflecting the known variability in the inputs. Finally, a Tier 4 approach would use distributions of exposure variates that may be more appropriate for a site, such as the distribution of fish consumption rates for a specific body of water impacted by a facility. As in a Tier 2 approach, the risk assessment must supply the data and methods used for the site-specific distributions for exposure variates, and the site-specific estimates must be justified to and reproducible by the Districts and OEHHA.

2 - Overview of Health Risk Assessment

2.1 The Model for Risk Assessment

The standard approach currently used for health risk assessment (HRA) was originally proposed by the National Academy of Sciences in the 1983 book: *Risk Assessment in the Federal Government: Managing the Process* (NAS, 1983) and was updated in the Academy's 1994 book: *Science and Judgment in Risk Assessment* (NAS, 1994). In 2009 the National Academy published *Science and Decisions: Advancing Risk Assessment* (NAS, 2009), in which a number of recommendations are made on improving the risk assessment process and expanding it to include community concerns and cumulative risks. The four steps involved in the risk assessment process are 1) hazard identification, 2) exposure assessment, 3) dose-response assessment, and 4) risk characterization. These four steps are briefly discussed below.

2.2 Hazard Identification

For air toxics sources, hazard identification involves the pollutant(s) of concern emitted by a facility, and the types of adverse health effects associated with exposure to the chemical(s), including whether a pollutant is a potential human carcinogen or is associated with other types of adverse health effects. For the Air Toxics Hot Spots Program (Hot Spots), the emitted substances that are addressed in a risk assessment are found in the list of substances designated in the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5), and the Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007*)*. This list of substances is contained in Appendix A of this document and the EICG Report. The list of substances also identifies those substances that are considered human carcinogens or potential human carcinogens.

2.3 Exposure Assessment

The purpose of the exposure assessment is to estimate the extent of public exposure to emitted substances. For the Hot spots program, in practice this means estimating exposures for those emitted substances for which potential cancer risk or noncancer health hazards for acute, repeated 8-hour, and chronic exposures will be evaluated. This involves emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure routes, identification of exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels. These activities are described in Chapters 4 and 5. Chapter 5 also discusses the tiered approach to risk assessment.

The ARB's Emission Inventory Criteria and Guidelines (EICG) Report provides assistance in determining those substances that must be evaluated in an HRA and the reporting requirements of facilities, while the Hot Spots Analysis and Reporting Program (HARP) software can be used to model ground level concentrations at specific off-site

locations resulting from facility emissions. The United States Environmental Protection Agency (U.S. EPA) has adopted the AERMOD air dispersion model into its list of regulatory approved models, in place of the previously used ISCST3 model. AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain (U.S. EPA, 2009). The Air Resources Board recommends AERMOD for Hot Spots risk assessments. The AERMOD air modeling software will be incorporated into the HARP software, which allows the user to input all dispersion parameters directly into the program to generate air dispersion data. Alternatively, the air dispersion data may be generated separately from HARP using other air dispersion models, and then imported into HARP to generate risk estimates. Data imported into HARP must already be in the format required by HARP. HARP has the flexibility to generate a summary of the risk data necessary for an HRA by either of the above approaches.

Most of the toxicants assessed under the Hot Spots program are volatile organic compounds that remain as gases when emitted into the air. These chemicals are not subject to appreciable deposition to soil, surface waters, or plants. Therefore, human exposure via ingestion or dermal exposure, at least at concentrations typically encountered in the ambient air, is not considered for volatile organic compounds in the Hot Spots risk assessments. While some models indicate potential for dermal exposure to certain volatile organic compounds, at this time, the Hot spots program does not consider this pathway. Significant exposure to volatile organic toxicants emitted into the air occurs through the inhalation pathway, and this pathway is the primary consideration in the Hot Spots risk assessments. A small subset of Hot Spots substances consists of semi-volatile organic and metal toxicants emitted partially or totally as particles subject to deposition. Ingestion and dermal pathways as well as the inhalation pathway must be evaluated for these chemicals. A few of these semi-volatile organic and metal toxicants must also include the breast milk ingestion pathway. Additional ingestion pathways may also need to be evaluated depending on the pathways of exposure for the specific receptor of interest. Table 5.1 in Chapter 5, Table 6.4 in Chapter 6, and Table 7.1 in Chapter 7 list the substances that must be evaluated for multipathway impacts. HARP is designed to assess potential health impacts posed by substances that must be analyzed by a multipathway approach.

2.4 Dose-Response Assessment

Dose-response assessment is the process of characterizing the relationship between exposure to an agent and incidence of an adverse health effect in exposed populations. In quantitative carcinogenic risk assessment, the dose-response relationship is expressed in terms of a potency slope that is used to calculate the probability or risk of cancer associated with an estimated exposure. Cancer potency factors are expressed as the 95^{th} percent upper confidence limit of the slope of the dose response curve estimated assuming continuous lifetime exposure to a substance. Typically, potency factors are expressed as units of inverse dose (e.g., $(mg/kg\ BW/day)^{-1}$) or inverse concentration (e.g., $(\mu g/m^3)^{-1}$). It is assumed in cancer risk assessments that risk is directly proportional to dose and that there is no threshold for carcinogenesis.

The Office of Environmental Health Hazard Assessment (OEHHA) has compiled cancer potency factors, which should be used in risk assessments for the Hot Spots program, in Table 7.1. Cancer potency factors listed in Table 7.1 were derived either by the U.S. EPA or by OEHHA, underwent public and peer-review, and were adopted for use in the program. Chapter 8 describes procedures for use of potency values in estimating excess cancer risk. For a detailed description of cancer potency factors, refer to the *Technical Support Document for Cancer Potency Factors* (OEHHA, 2009).

For noncarcinogenic effects, dose-response data developed from animal or human studies are used to develop acute, 8-hour, and chronic noncancer Reference Exposure Levels (RELs). The acute, 8-hour and chronic RELs are defined as the concentration at which no adverse noncancer health effects are anticipated even in sensitive members of the general population, with infrequent one hour exposures, repeated 8-hour exposures over a significant fraction of a lifetime, or continuous exposure over a significant fraction of a lifetime, respectively. The most sensitive health effect is chosen to develop the REL if the chemical affects multiple organ systems. Unlike cancer health effects, noncancer health effects are generally assumed to have thresholds for adverse effects. In other words, injury from a pollutant will not occur until exposure to that pollutant has reached or exceeded a certain concentration (i.e., threshold) and/or dose. The acute, 8-hour, and chronic RELs are air concentrations intended to be below the threshold for health effects for the general population.

The actual threshold for health effects in the general population is generally not known with any precision. Uncertainty factors are applied to the Lowest Observed Adverse Effects Level (LOAEL) or No Observed Adverse Effects Level (NOAEL) or Benchmark Concentration values from animal or human studies to help ensure that the chronic, 8-hour and acute REL values are below the threshold for human health for nearly all individuals. This guidance manual provides the acute, 8-hour, and chronic Reference Exposure Levels in Tables 6.1 through 6.3. Some substances that pose a chronic or repeated 8-hour inhalation hazard may also present a chronic hazard via non-inhalation routes of exposure (e.g., ingestion of contaminated water, foods, or soils, and dermal absorption). The oral RELs for these substances are presented in Table 6.4. The methodology and derivations for acute, 8-hour, and chronic, RELs are described in the *Technical Support Document for the Derivation of Noncancer Reference Exposure Levels* (OEHHA, 2008).

2.5 Risk Characterization

This is the final step of risk assessment. In this step, modeled concentrations and exposure information, which are determined through exposure assessment, are combined with potency factors and RELs that are developed through dose-response assessment. The use of cancer potency factors to assess total cancer risk and the use of the hazard index approach for evaluating the potential for noncarcinogenic health effects are described in Chapter 8. Example calculations for determining (inhalation) cancer risk and noncancer acute, 8-hour, and chronic hazard quotients and hazard indices are presented in Appendix I. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

Under the Hot Spots Act, health risk assessments are to quantify both individual and population-wide health impacts (Health and Safety Code, Section 44306) (Appendix B). The health risk assessments are facility specific and the calculated risk should be combined for all pollutants emitted by a single facility. For example, cancer risk from multiple carcinogens is considered additive. For exposures to multiple non-carcinogen pollutants, a hazard index approach is applied for air contaminants affecting the same organ system. All substances emitted by the facility that are on the Hot Spots Act list of substances must be identified in the HRA, including those on the list that do not have a potency value or REL.

For assessing risk, OEHHA has developed two methods for determining dose via inhalation, dermal absorption, and ingestion pathways. These two methods, the point estimate approach and the stochastic exposure assessment approach, are described below and in Chapters 5 and 8. Detailed presentations of these methods can be found in*: Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012*)*.

2.5.1 *Point Estimate Approach*

OEHHA provides information in this document on average and high-end values for key exposure pathways (e.g., breathing rate for the inhalation exposure pathway). The average and high-end of point estimates in this document are defined in terms of the probability distribution of values for that variate. The mean represents the average values for point estimates and the 95th percentiles represent the high-end point estimates from the distributions identified in OEHHA (2012). Thus, within the limitations of the data, average and high-end point estimates are supported by the distribution.

Tier 1 of the tiered approach to risk assessment, which is briefly discussed in Section 2.5.3 and presented in more detail in Chapter 8, utilizes a combination of the average and high-end point estimates to more realistically estimate exposure in multipathway risk assessments. This method uses high-end exposure estimates for the pathways that are the main drivers of exposure and the average point estimate for the other non-driving exposure pathways. This approach will lessen the issue of compounding high-end exposure estimates, while retaining a health-protective approach for the more important exposure pathways. It is unlikely that an individual receptor would be on the high-end of exposure for all exposure pathways. See Chapter 8 for detailed discussions of how this multipathway methodology is applied to cancer and noncancer calculations. The HARP software can perform this analysis (referred to as the derived approach in the HARP software).

In addition to using an estimate of average and high-end consumption rates, cancer risk evaluations at individual receptors are presented for 9, 30, and 70-year exposure durations. The 9 and 30-year durations correspond to the average and high-end of residency time recommended by U.S. EPA (1997). The California data presented in Appendix L of the Exposure TSD (OEHHA, 2012) are generally supportive of the nationwide data. The 9 and 70-year exposure durations present potential impacts over the range of residency periods, while the 30-year exposure duration is recommended

for use as the basis for estimating cancer risk at the MEIR in all HRAs. Population-wide impacts should use the 70-year exposure duration.

The parameters used for all exposure durations assume exposure begins in the last trimester of pregnancy and progresses through the exposure duration of interest (e.g., 9, 30, or 70 years). These assumptions are thus protective of children. Children have higher intake rates on a per kilogram body weight basis (e.g., they breathe, drink and eat more per kg body weight than adults) and thus receive a higher dose from contaminated media. See Chapter 5 for the point estimates that can be used to estimate impacts for children. Chapters 5 and 8 discuss how to calculate cancer risk based on various exposure durations and point estimates. Appendix I contains an example calculation and Chapter 9 clarifies how to present the findings in an HRA.

2.5.2 *Stochastic Exposure Assessment*

OEHHA was directed under the Air Toxics "Hot Spots" program (SB 1731, Calderon, stat. 1992; Health and Safety Code Section 44360(b)(2)) to develop a "likelihood of risk" approach to risk assessment. To satisfy this requirement, OEHHA developed a stochastic approach to risk assessment that utilizes distributions for exposure variates such as breathing rate and water consumption rate rather than a single point estimate. The variability in exposure can be propagated through the risk assessment model using the distributions as input and a Monte Carlo or similar method. The result of such an analysis is a range of risks that at least partially characterizes variability in exposure.

Distributions of key exposure variates that are presented in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012) were taken from the literature, if adequate, or developed from raw data of original studies. Intake variates such as vegetable consumption are relatively data rich; for these variates reasonable probability distributions can be constructed. However, the data necessary to characterize the variability in risk assessment variates are not always available. For example, for the fate and transport variates (e.g., fish bioaccumulation factors), there are only a few measurements for a given chemical available which precludes the adequate characterization of a probability distribution. We only developed distributions for those key exposure variates that were adequately characterized by data. Development of distributions is described in detail in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012).

2.5.3 *Tiered Approach to Risk Assessment*

OEHHA recommends using a tiered approach to risk assessment. Tier 1 is a standard point estimate approach using the recommended point estimates presented in this document. If site-specific information is available to modify some point estimates developed in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012) and is more appropriate to use than the recommended point estimates in this document, then Tier 2 allows use of that site-specific information. Site-specific information should be presented to the District before being used. The District may contact OEHHA for additional advice. Note that all non-default variates need to be adequately justified to OEHHA and the Districts to be used. In Tier 3, a stochastic approach to exposure assessment is used with the data distributions developed in the TSD (OEHHA, 2012) and presented in this document. Tier 4 is also a stochastic approach but allows for utilization of site-specific distributions, if they are justifiable (to OEHHA and the Districts) and more appropriate for the site under evaluation than those recommended in this document. Persons preparing an HRA that has a Tier 2 through Tier 4 evaluation must also include the results of a Tier 1 evaluation. Tier 1 evaluations are required for all HRAs prepared for the Hot Spots Program to promote consistency across the state for all facility risk assessments and allow comparisons across facilities. Chapter 8 provides a summary of the tiered approach and the TSD (OEHHA, 2012) discusses it in detail. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

3 - Hazard Identification - Air Toxics Hot Spots Emissions

3.1 The Air Toxics Hot Spots List of Substances and Emissions Inventory

For air toxics sources, hazard identification involves identifying pollutants of concern and whether these pollutants are potential human carcinogens or associated with other types of adverse health effects. For the Air Toxics Hot Spots (Hot Spots) Program, the emitted substances that are addressed in a health risk assessment (HRA) are found in the list of hazardous substances designated in the Air Resources Board's (ARB's) *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5), and the Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007). This list of substances is contained in both Appendix A of this document and the EICG Report. The list of substances also identifies those substances that are considered human carcinogens or potential human carcinogens.

The substances included on the Hot Spots Program list of substances are defined in the statute as those substances found on lists developed by the following sources:

- International Agency for Research on Cancer (IARC);
- U.S. Environmental Protection Agency (U.S. EPA);
- U.S. National Toxicology Program (NTP);
- ARB Toxic Air Contaminant Identification Program List;
- Hazard Evaluation System and Information Service (HESIS) (State of California);
- Proposition 65 (Safe Drinking Water and Toxic Enforcement Act of 1986) list of carcinogens and reproductive toxicants (State of California);
- Any additional substance recognized by the State Board as presenting a chronic or acute threat to public health when present in the ambient air.

All substances emitted by the facility that are on the Hot Spots Act list of substances must be identified in the HRA.

The ARB EICG Report (ARB, 2007) specifies that each facility subject to the Hot Spots Act must submit an Emission Inventory Report to the local air pollution control or air quality management district. This Emission Inventory Report must identify and account for all listed substances used, manufactured, formulated, or released by the facility. All routine, predictable releases must be reported. These inventory reports include the emission data necessary to estimate off-site levels of facility-released Hot Spots substances. These inventory reports will be discussed in further detail in Chapter 4. See Chapter 9 for an outline that specifies the content and recommended format for presenting the air dispersion modeling and HRA results. As presented in Appendix A, the EICG Report divides the list into three groups for reporting purposes. Potency or severity of toxic effects and potential for facility emission were considered in placing compounds into the three groups.

For the first group (listed in these guidelines in Appendix A-I), all emissions of these substances must be quantified in the HRA. For substances in the second group (listed in these guidelines in Appendix A-II), emissions are not quantified; however, facilities must report whether the substance is used, produced, or otherwise present on-site (i.e., these substances are simply listed in a table in the HRA). Lastly, substances in the third group (Appendix A-III) also only need to be reported in a table in the HRA if they are manufactured by the reporting facility.

Facilities that must comply with the Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation and Liability Act (RCRA/CERCLA) requirements for risk assessment need to consult the California Department of Toxic Substances Control (DTSC) Remedial Project Manager to determine which substances must be evaluated in their risk assessment. Some RCRA/CERCLA facilities may emit substances which are not currently listed under the Hot Spots Program but which may require evaluation in a RCRA/CERCLA risk assessment.

3.2 References

ARB, 2007. *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5), and the Emission Inventory Criteria and Guidelines Report* (EICG Report).

4 - Air Dispersion Modeling

The information contained in this section is primarily an abbreviated version of the material found in Chapter 2 of the Air Toxics Hot Spots Risk Assessment Guidelines; Exposure Assessment and Stochastic Analysis Technical Support Document (OEHHA, 2012). Several references have been included in this section to indicate those areas that are covered in more detail in Chapter 2 of the Technical Support Document. However, some air dispersion concepts and procedures have been added to assist the reader in the health risk assessment (HRA) process. In particular, a brief summary of the Hot Spots Analysis and Reporting Program (HARP) software applicability to air dispersion analysis has been included. The HARP software has been developed by the Air Resources Board (ARB), in consultation with OEHHA and Air Pollution Control or Air Quality Management District (District) representatives. The HARP software is the recommended model for calculating and presenting HRA results for the Air Toxics Hot Spots Program (Hot Spots). Information on obtaining the HARP software can be found under the Hot Spots Program on the ARB's web site at *www.arb.ca.gov*. See Chapter 9 for an outline that specifies the content and recommended format for presenting the air dispersion modeling and HRA results.

The U.S. EPA has adopted the AERMOD air dispersion model into their list of regulatory approved models, in place of the previously used ISCST3 model. AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain (U.S. EPA, 2009). The Air Resources Board recommends AERMOD for Hot Spots risk assessments.

4.1 Air Dispersion Modeling in Exposure Assessment: Overview

Estimates of air concentrations of emitted toxicants in the surrounding community from a facility's air emissions are needed in order to determine cancer and noncancer risks. One approach to determining the concentration of air pollutants emitted from the facility is to do air monitoring in the surrounding community. However, there are a number of disadvantages to this approach. Ambient air monitoring is costly because good estimates of an annual average concentration typically require monitoring at least one day in six over a year. Because it is costly, monitoring is usually limited to a select number of pollutants, and a limited number of sites. There can be significant risks from some chemicals at or even below the monitoring detection limit, which can add considerable uncertainty to risk estimates if many of the measurements are below or near the detection limit. Monitoring measures not only facility emissions but also general ambient background as well. It can be difficult and expensive to distinguish between the two using monitoring, particularly if general ambient background levels are high relative to the contribution of facility emissions. These limitations often make it impractical to use monitoring in a program such as the Air Toxics Hot Spots program with hundreds of facilities.

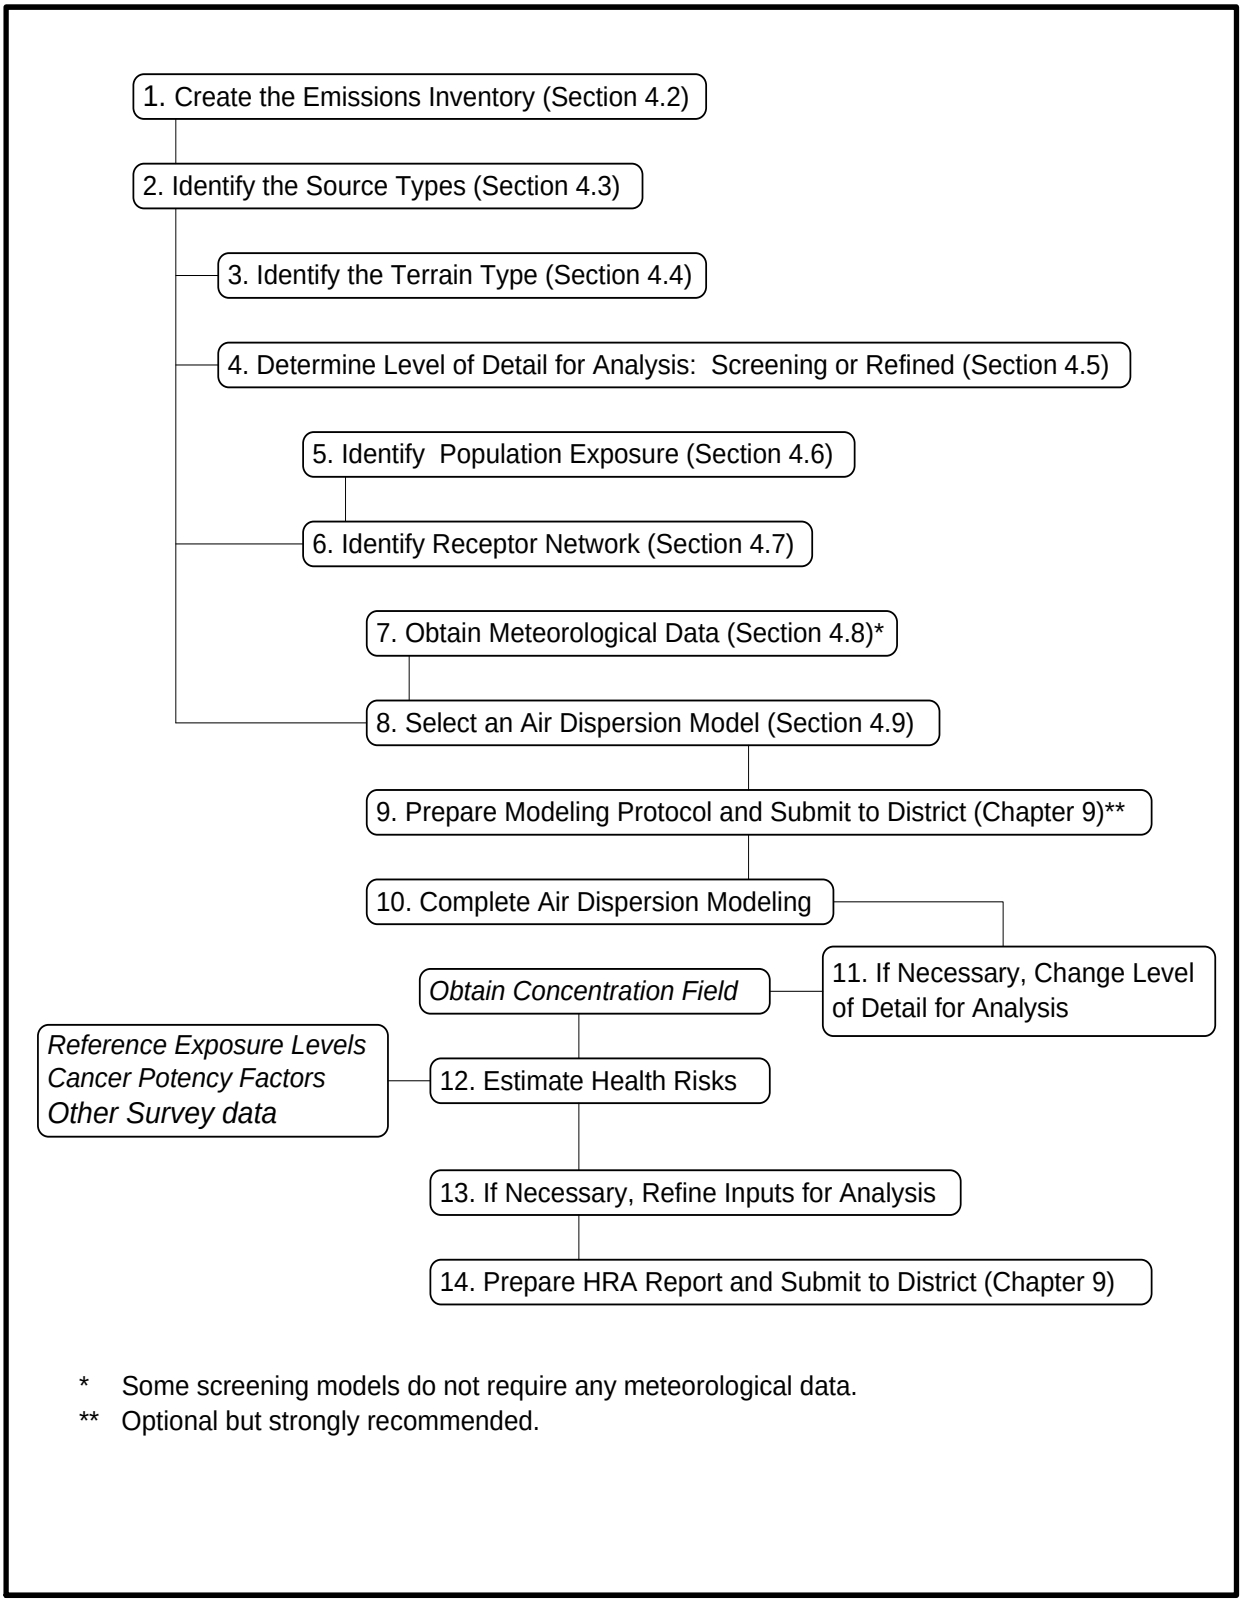
Air dispersion models have several advantages over monitoring. Modeling can provide greater spatial detail and the costs are relatively cheap by comparison. For example, dispersion models can estimate the pollutant concentration in air at many receptor locations (hundreds to thousands) and for a multitude of averaging periods. Air dispersion models have been validated using air monitoring.

There are, however, uncertainties associated with the typical usage of air dispersion modeling. The use of meteorological data from the nearest airport may not ideally be the best representation of localized conditions. Gaussian plume air dispersion models ignore calm hours. This can bias model predictions towards underestimation. Some dispersion models offer limited chemical reactions within the algorithms; however, we generally assume the pollutant is inert for the near-field atmospheric travel time. This may bias estimated concentrations towards over-prediction for those pollutants that are highly reactive in the atmosphere. Air dispersion model results are only as good as the emissions estimates and emissions estimates can be uncertain. However, on the whole, the advantages of air dispersion modeling for a program like the Air Toxics Hot Spots far outweigh the disadvantages.

Professional judgment is required throughout the dispersion modeling process. The local air quality district has final authority on modeling protocols. The following guidance is intended to assist in the understanding of dispersion modeling for risk assessments.

Air dispersion modeling includes the following steps (see Figure 1):

1. Create an emission inventory of the toxic releases (Section 4.2)
2. Identify the source types (Section 4.3)
3. Identify the terrain type and land use (Section 4.4)
4. Determine the detail needed for the analysis: screening or refined (Section 4.5)
5. Identify the population exposure (Section 4.6)
6. Identify the receptor network (Section 4.7)
7. Obtain meteorological data (for refined air dispersion modeling only) (Section 4.8)
8. Select an air dispersion model (Section 4.9)
9. Prepare a modeling protocol and submit to the local Air District (hereafter referred to as “the District”) (Section 4.14)
10. Complete the air dispersion analysis
11. If necessary, redefine the receptor network and return to Step 10



12. Complete the risk assessment

13. If necessary, refine the inputs and/or the model selection and return to Step 8

14. Present the HRA results (Chapter 9 provides an outline that specifies the content and recommended format of HRA results).

The output of the air dispersion modeling analysis includes a receptor field of ground level concentrations of the pollutant in ambient air. These concentrations can be used to estimate an inhaled or ingested dose for the estimation of multipathway cancer risk, or used to determine a hazard index for acute (inhalation), and chronic noncancer multipathway risks. It should be noted that in the Air Toxics "Hot Spots" program, facilities simulate the dispersion of the chemical emitted as an inert compound, and do not model any atmospheric transformations or dispersion of products from such reactions. The U.S. EPA Guideline on Air Quality Models (U.S. EPA, 2005) should be consulted when evaluating reactive pollutants for other regulatory purposes.

Figure 1 Overview of the Air Dispersion Modeling Process.

* Some screening models do not require any meteorological data.
** Optional but strongly recommended.

4.2 Emission Inventories

The Emission Inventory Reports (Inventory Reports) developed under the Hot Spots Program provide data to be used in the HRA and in the air dispersion modeling process. The Inventory Reports contain information regarding emission sources, emitted substances, emission rates, emission factors, process rates, and release parameters (area and volume sources may require additional release data beyond that generally available in Emissions Inventory reports). This information is developed according to the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007*)*.

Updated emission data for process changes, emission factor changes, material/fuel changes, or shutdown must be approved by the District prior to the submittal of the health risk assessment (HRA). Ideally, the District review of updated emissions could be completed within the modeling protocol. In addition, it must be stated clearly in the risk assessment if the emission estimates are based on updated or revised emissions (e.g., emission reductions). This section summarizes the requirements that apply to the emission data which are used for Air Toxics "Hot Spots" Act risk assessments.

4.2.1 *Air Toxics Hot Spots Emissions*

As noted in Chapter 3, Hazard Identification, the HRA should identify all substances emitted by the facility, which are on the Hot Spots Act list of substances (see Appendix A of the Guidance Manual or the EICG Report). The EICG Report specifies that Inventory Reports must identify and account for all listed substances used, manufactured, formulated, or released by the facility. All routine, predictable releases must be reported. Under the regulations, the list is divided into three groups for reporting purposes. The first group (listed in Appendix A-I of the Inventory Guidelines Report) has all pollutants whose emissions must be quantified. The second group (listed in Appendix A-II of the Inventory Guidelines Report) includes substances where emissions do not need to be quantified; however, facilities must report whether the substance is used, produced, or otherwise present on-site. The third group (listed in Appendix A-III of the Emissions Inventory Guidelines Report) includes substances whose emissions need not be reported unless the substance is manufactured by the facility. Chemicals or substances in the second and third groups should be listed in a table in the risk assessment.

Facilities that must comply with the Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation and Liability Act (RCRA/CERCLA) requirements for risk assessment need to consult the Department of Toxic Substances Control (DTSC) Remedial Project Manager to determine which substances must be evaluated in their risk assessment in addition to the list of "Hot Spots" chemicals. Some RCRA/CERCLA facilities may emit chemicals that are not currently listed under the "Hot Spots" Program. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

4.2.1.1 Emission Estimates Used in the Risk Assessment

The HRA must include emission estimates for all substances that are required to be quantified in the facility's emission inventory report. Specifically, HRAs should include both annual average emissions and maximum 1-hour emissions for each pollutant. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).

Emissions for each substance must be reported for individual emitting processes associated with unique devices within a facility. Total facility emissions for an individual air contaminant will be the sum of emissions, reported by process, for that facility. Information on daily and annual hours of operation, and relative monthly activity, must be reported for each emitting process. Devices and emitting processes must be clearly identified and described and must be consistent with those reported in the emissions inventory report.

The HRA should include tables that present the emission information (i.e., emission rates for each substance released from each process) in a clear and concise manner. The District may allow the facility operator to base the HRA on more current emission estimates than those presented in the previously submitted emission inventory report (i.e., actual enforceable emission reductions realized by the time the HRA is submitted to the District). If the District allows the use of more current emission estimates, the District must review and approve the new emissions estimates prior to use in the HRA. The HRA report must clearly state what emissions are being used and when any reductions became effective. Specifically, a table presenting emission estimates included in the previously submitted emission inventory report as well as those used for the HRA should be presented. The District should be consulted concerning the specific format for presenting the emission information. Chapter 9 provides an outline that specifies the content and recommended format of HRA results. A revised emission inventory report must be submitted to the District prior to submitting the HRA and forwarded by the District to the ARB, if revised emission data are used.

4.2.1.1.1 Molecular Weight Adjustments for the Emissions of Metal Compounds

For most of the Hot Spots toxic metals, the OEHHA cancer potency factors, acute and chronic RELs apply to the weight of the toxic metal atom contained in the overall compound. Some of the Hot Spots compounds contain various elements along with the toxic metal atom (e.g., "Nickel hydroxide", CAS number 12054-48-7, has a formula of H_2NiO_2). Therefore, an adjustment to the reported pounds of the overall compound is needed before applying the OEHHA cancer potency factor for "Nickel and compounds" to such a compound. This ensures that the cancer potency factor, acute or chronic REL is applied only to the fraction of the overall weight of the emissions that are associated with health effects of the metal. In other cases, the Hot Spots metals are already reported as the metal atom equivalent (e.g., CAS 7440-02-0, "Nickel"), and these cases do not use any further molecular weight adjustment. (Refer to Note [7] in Appendix A,

List of Substances in the EICG Report for further information on how the emissions of various Hot Spots metal compounds are reported.)

The appropriate molecular weight adjustment factors (MWAF) to be used along with the OEHHA cancer potency factors, acute and chronic RELs for Hot Spots metals can be found in the MWAF column[1] of the table containing OEHHA/ARB Approved Health Values for use in Hot Spots Facility Risk Assessments that is in Appendix L of this document.

As an example, the compound "Nickel hydroxide" has a molecular formula of H_2NiO_2. The atomic weight of each of the elements in this compound, and the fraction they represent of the total weight, are therefore as follows:

Element	Number of atoms	Atomic Weight	Fraction of Total Weight = MWAF
1 x Nickel (Ni)	1 x	58.70	58.70 / 92.714 = **0.6332** (MWAF for Nickel)
2 x Oxygen (O)	2 x	15.999	
2 x Hydrogen (H)	2 x	1.008	
Total Molecular Weight of H_2NiO_2:		92.714	

So, for example, assume that 100 pounds of "Nickel hydroxide" emissions are reported under CAS number 12054-48-7. To get the Nickel atom equivalent of these emissions, multiply by the listed MWAF (0.6332) for Nickel hydroxide:

- 100 pounds x 0.6332 = 63.32 pounds of Nickel atom equivalent.

This step should be completed prior to applying the OEHHA cancer potency factor for "Nickel and compounds" in a calculation for a prioritization score or risk assessment calculation. (Note - The HARP software automatically applies the appropriate MWAF for each Hot Spots chemical (by CAS number), so the emissions should not be manually adjusted when using HARP. Therefore, if using HARP, you would use 100 pounds for Nickel hydroxide and HARP will make the MWAF adjustment for you. If not using HARP, you would use 63.32 pounds.)

[1] The value listed in the MWAF column for Asbestos is not a molecular weight adjustment. This is a conversion factor for adjusting mass and fibers or structures. See Appendix C for more information on Asbestos reporting and risk assessment information or see the EICG report for reporting guidance.

4.2.1.2 Release Parameters

Emission release parameters (e.g., stack height and inside diameter, stack gas exit velocity, release temperature and emission source location in UTM coordinates) are needed as inputs to the air dispersion model. The Inventory Guidelines specify the release parameters that must be reported for each stack, vent, ducted building, exhaust site, or other site of exhaust release. Additional information may be required to characterize releases from non-stack (volume and area) sources; see U.S. EPA dispersion modeling guidelines or specific user's manuals. This information should also be included in the air dispersion section of the risk assessment. This information must be presented in tables included in the risk assessment. Note that some dimensional units needed for the dispersion model may require conversion from the units reported in the Inventory Report (e.g., Kelvin (K) vs. degrees Fahrenheit (°F)). Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

4.2.1.3 Operation Schedule

The HRA should include a discussion of the facility operation schedule and daily emission patterns. For AB2588 purposes, emissions should be reported based on routine and predictable operations. Weekly or seasonal emission patterns may vary and should be discussed. This is especially important in a refined HRA. Diurnal emission patterns should be simulated in the air dispersion model because of diurnal nature of meteorological observations. Diurnal evaluations are important to include since diurnal weather patterns and emission releases may cause significant differences in the concentration at a receptor of interest.

A table should be included listing the emission schedule on an hourly and yearly basis. In addition, the emission schedule and exposure schedule should corroborate any exposure adjustment factors used for approximating an inhaled dose. For more information about exposure adjustment factors, see Section 4.8.1. Alternatively, exposure adjustments can be made through refining the air dispersion analysis. See Section 4.11.1.2(h) for special case modeling or Appendix M. An alternative to including modeling that addresses diurnal influences would be to include a sensitivity study showing, and/or text explaining, the reason(s) why there are no significant differences due to diurnal influences on the emissions from the facility or at the receptor(s) of interest. For more guidance, you can contact the district or reviewing authority**.** Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

4.2.1.4 Emission Controls

The HRA should include a description of control equipment, the emitting processes it serves, and its efficiency in reducing emissions of substances on the Air Toxics “Hot Spots” list. The EICG Report requires that this information be included in the Inventory Reports, along with the emission data for each emitting process. If the control equipment did not operate full-time throughout the year, then the reported overall control efficiency must be adjusted to account for any predictable downtime of the

control equipment. Any entrainment of toxic substances to the atmosphere from control equipment should be accounted for; this includes fugitive releases during maintenance and cleaning of control devices (e.g., baghouses and cyclones). Contact the District for guidance with control equipment adjustments. Recommended default deposition rates that are used when calculating potential noninhalation health impacts are listed in Section 5.3.2. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

4.2.2 *Landfill Emissions*

Emission estimates for landfill sites should be based on testing required under Health and Safety Code, Section (HSC) 41805.5 (AB 3374, Calderon) and any supplemental AB 2588 source tests or emission estimates used to characterize air toxics emissions from landfill surfaces or through off-site migration. The District should be consulted to determine the specific Calderon data to be used in the HRA. The "Hot Spots" Program HRA for landfills should also include emissions of listed substances for all applicable power generation and maintenance equipment at the landfill site. Processes that need to be addressed include stationary internal combustion engines, flares, evaporation ponds, composting operations, boilers, and gasoline dispensing systems.

4.3 Source Characterization

Pollutants are released into the atmosphere in many different ways. The release conditions need to be properly identified and characterized to appropriately use the air dispersion models.

4.3.1 *Source Type*

Source types can be identified as point, line, area, or volume sources for input to the air dispersion model. Several air dispersion models have the capability to simulate more than one source type.

4.3.1.1 Point Sources

Point sources are probably the most common type of source and most air dispersion models have the capability to simulate them. Typical examples of point sources include exhaust stacks. Isolated vents from buildings are special examples of point sources.

4.3.1.2 Line Sources

The version 12345 or newer of the AERMOD can accommodate line sources. Line sources can be also treated as a special case of either an area or a volume source. Examples of line sources include: conveyor belts and rail lines, freeways, and busy roadways. Not all mobile sources may be subject to the Hot Spots program; however, non-motor vehicles that operate within a facility (e.g., ships, trains, and cranes, etc.) are subject to the Hot Spots program. For more information, see the ARB's Emission Inventory and Criteria Guidelines document or ARB's interpretation and guidance

memorandum to CAPCOA regarding mobile sources which are subject to the "Hot Spots" program. This memo can be found at http://www.arb.ca.gov/ab2588/motorv.pdf.

Mobile sources and rail lines are required to be evaluated under SB 352. SB 352 requires a risk assessment performed under the Hot Spots risk assessment guidance for proposed school sites within 500 feet of a busy roadway. Dedicated air dispersion models are available for motor vehicle emissions from roadways which are a special type of line source. These models (i.e., CALINE3, CAL3QHCR, and CALINE4) are designed to simulate the mechanical turbulence and thermal plume rise due to the motor vehicle activity on the roadway. However, these dedicated models use the Pasquill-Gifford dispersion stability classes for dispersion; the AERMOD dispersion model uses a more advanced continuous stability estimation method based on observations. The limitation with AERMOD is that the user needs to estimate initial mixing (Szo and Syo) for mechanical turbulence and thermal plume rise. Consult with the District prior to conducting roadway modeling to determine model use.

For practical information on how to simulate roadway emission dispersion using these models, see the California Air Pollution Control Officer's Association (CAPCOA) website at http://www.capcoa.org or the Sacramento Metropolitan AQMD (SMAQMD) website at http://www.airquality.org/ceqa/RoadwayProtocol.shtml. The SMAQMD has a document titled, "Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways"(January, 2010). The ARB recommends this document for SB-352 risk assessments.

4.3.1.3 Area Sources

Emissions that are to be modeled as area sources are typical of fugitive sources characterized by non-buoyant emissions containing negligible vertical extent (e.g., no plume rise or emissions distributed over a large horizontal area).

Fugitive particulate (PM2.5, PM10, TSP) emission sources include areas of disturbed ground (e.g., open pits, parking lots) which may be present during operational phases of a facility's life. Also included are areas of exposed material (e.g., storage piles and slag dumps) and segments of material transport where potential fugitive emissions may occur (uncovered haul trucks or rail cars, emissions from unpaved roads). Fugitive emissions may also occur during stages of material handling where particulate material is exposed to the atmosphere (uncovered conveyors, hoppers, and crushers).

Other fugitive emissions emanating from many points of release may be modeled as area sources. Examples include fugitive emissions from valves, flanges, venting, and other connections that occur at ground level or at an elevated level or deck if on a building or structure. Modern dispersion models include an option for an initial vertical extent (Szo) where needed.

Modeling portable equipment as an area source is a case-by-case situation that should be discussed with the District or reviewing authority. Situations may exist where this type of operation is best represented as another type of release.

4.3.1.4 Volume Sources

Non-point sources with emissions containing an initial vertical extent should be modeled as volume sources. The initial vertical extent may be due to plume rise or a vertical distribution of numerous smaller sources over a given area. Examples of volume sources include buildings with natural fugitive or passive ventilation, and line sources such as conveyor belts and rail lines.

4.3.2 *Quantity of Sources*

The number of sources at a facility may influence the selection of the air dispersion model. Some dispersion models are capable of simulating only one source at a time, and are therefore referred to as single-source models (e.g., AERSCREEN).

In some cases, for screening purposes, single-source models may be used in situations involving more than one source using one of the following approaches:

- Combining all sources into one single “representative” source

In order to be able to combine all sources into one single source, the individual sources must have similar release parameters. For example, when modeling more than one stack as a single “representative” stack, the stack gas exit velocities and temperatures must be similar. In order to obtain a conservative estimate, the values leading to the higher concentration estimates should typically be used (e.g., the lowest stack gas exit velocity and temperature, the height of the shortest stack, and a receptor distance and spacing that will provide maximum concentrations, etc.).

- Running the model for each individual source and superimposing results

Superimposition of results of single sources of emissions is the actual approach followed by all the Gaussian models capable of simulating more than one source. Simulating sources in this manner may lead to conservative estimates if worst-case meteorological data are used or if the approach is used with a model that automatically selects worst-case meteorological conditions, especially wind direction. The approach will typically be more conservative the farther apart the sources are because each run would use a different worst-case wind direction.

Additional guidance regarding source merging is provided by the U.S. EPA (1995a). It should be noted that depending upon the population distribution, the total burden can actually increase when pollutants are more widely dispersed. If the total burden from the facility or zone of impact (see Section 4.6.1) could increase for the simplifying modeling assumptions described above, the District should be consulted.

4.4 Terrain Type

Two types of terrain characterizations are required to select the appropriate model. One classification is made according to land type and another one according to terrain topography.

4.4.1 *Terrain Type – Land Use*

Some air dispersion models (e.g., CALINE) use different dispersion coefficients (sigmas) depending on the land use over which the pollutants are being transported. The land use type is also used by some models to select appropriate wind profile exponents. Traditionally, the land type has been categorized into two broad divisions for the purposes of dispersion modeling: urban and rural. Accepted procedures for determining the appropriate category are those suggested by Irwin (1978): one based on land use classification and the other based on population.

The land use procedure is generally considered more definitive. Population density should be used with caution and should not be applied to highly industrialized areas where the population density may be low. For example, in low population density areas a rural classification would be indicated, but if the area is sufficiently industrialized the classification should already be "urban" and urban dispersion parameters should be used.

If the facility is located in an area where land use or terrain changes abruptly, for example, on the coast, the District should be consulted concerning the classification. If need be, the model should be run in both urban and rural modes and the District may require a classification that biases estimated concentrations towards over prediction. As an alternative, the District may require that receptors be grouped according to the terrain between source and receptor.

AERMOD is the U.S. EPA's preferred dispersion model for a wide range of applications in rural or urban conditions. The users should refer to section 5.0 of the AERMOD Implementation Guide to determine urban or rural conditions.

The Land Use and the Population Density Procedures discussed above are described as follows.

4.4.1.1 Land Use Procedure

(1) Classify the land use within the total area A, circumscribed by a 3 km radius circle centered at the source using the meteorological land use typing scheme proposed by Auer (1978) and shown in Table 4.1.

(2) If land use types I1, I2, C1, R2 and R3 account for 50 percent or more of the total area *A* described in (1), use urban dispersion coefficients. Otherwise, use appropriate rural dispersion coefficients.

4.4.1.2 Population Density Procedure

(1) Compute the average population density (*p*) per square kilometer with *A* as defined in the Land Use procedure described above. (Population estimates are also required to determine the exposed population; for more information see Section 4.6.3.)

(2) If *p* is greater than 750 people/km^2 use urban dispersion coefficients, otherwise, use appropriate rural dispersion coefficients.

Table 4.1 Identification and classification of land use types (Auer, 1978)

Used to define rural and urban dispersion coefficients in certain models.

Type	Use and Structures	Vegetation
I1	*Heavy Industrial* Major chemical, steel and fabrication industries; generally 3-5 story buildings, flat roofs	Grass and tree growth extremely rare; <5% vegetation
I2	*Light-moderate industrial* Rail yards, truck depots, warehouses, industrial parks, minor fabrications; generally 1-3 story buildings, flat roofs	Very limited grass, trees almost totally absent; <5% vegetation
C1	*Commercial* Office and apartment buildings, hotels; >10 story heights, flat roofs	Limited grass and trees; <15% vegetation
R1	*Common residential* Single family dwelling with normal easements; generally one story, pitched roof structures; frequent driveways	Abundant grass lawns and light-moderately wooded; >70% vegetation
R2	*Compact residential* Single, some multiple, family dwelling with close spacing; generally <2 story, pitched roof structures; garages (via alley), no driveways	Limited lawn sizes and shade trees; <30% vegetation
R3	*Compact residential* Old multi-family dwellings with close (<2 m) lateral separation; generally 2 story, flat roof structures; garages (via alley) and ashpits, no driveways	Limited lawn sizes, old established shade trees; <35% vegetation
R4	*Estate residential* Expansive family dwelling on multi-acre tracts	Abundant grass lawns and lightly wooded; >80% vegetation
A1	*Metropolitan natural* Major municipal, state, or federal parks, golf courses, cemeteries, campuses; occasional single story structures	Nearly total grass and lightly wooded; >95% vegetation
A2	Agricultural rural	Local crops (e.g., corn, soybean); >95% vegetation
A3	*Undeveloped* Uncultivated; wasteland	Mostly wild grasses and weeds, lightly wooded; >90% vegetation
A4	Undeveloped rural	Heavily wooded; >95% vegetation
A5	*Water surfaces* Rivers, lakes	

4.4.2 *Terrain Type - Topography*

Surface conditions and topographic features generate turbulence, modify vertical and horizontal winds, and change the temperature and humidity distributions in the boundary layer of the atmosphere. These in turn affect pollutant dispersion and models differ in their need to take these factors into account.

The classification according to terrain topography should ultimately be based on the topography at the receptor location with careful consideration of the topographical features between the receptor and the source. Differentiation of simple versus complex terrain is unnecessary with AERMOD. In complex terrain, AERMOD employs the well-known dividing-streamline concept in a simplified simulation of the effects of plume-terrain interactions. For other plume models, topography can be classified as follows:

4.4.2.1 Simple Terrain (also referred to as "Rolling Terrain")

Simple terrain is all terrain located below stack height including gradually rising terrain (i.e., rolling terrain). Note that *Flat Terrain* also falls in the category of simple terrain.

4.4.2.2 Intermediate Terrain

Intermediate terrain is terrain located above stack height and below plume height. The recommended procedure to estimate concentrations for receptors in intermediate terrain is to perform an hour-by-hour comparison of concentrations predicted by simple and complex terrain models. The higher of the two concentrations should be reported and used in the risk assessment.

4.4.2.3 Complex Terrain

Complex terrain is terrain located above plume height. Complex terrain models are necessarily more complicated than simple terrain models. There may be situations in which a facility is "overall" located in complex terrain but in which the nearby surroundings of the facility can be considered simple terrain. In such cases, receptors close to the facility in this area of simple terrain will "dominate" the risk analysis and there may be no need to use a complex terrain model. It is unnecessary to determine which terrain dominates the risk analysis for users of AERMOD.

4.5 Level of Detail: Screening vs. Refined Analysis

Air dispersion models can be classified according to the level of detail which is used in the assessment of the concentration estimates as "screening" or "refined". Refined air dispersion models use more robust algorithms capable of using representative meteorological data to predict more representative and usually less conservative estimates. Refined air dispersion models are, however, more resource intensive than their screening counterparts. It is advisable to first use a screening model to obtain conservative concentration estimates and calculate health risks. If the health risks are estimated to be above the threshold of concern, then use of a refined model to calculate

more representative concentration and health risk estimates would be warranted. There are situations when screening models represent the only viable alternative (e.g., when representative meteorological data are not available). The district or reviewing authority should be consulted to determine the appropriate method for determining the level of detail in the modeling analysis. The HARP software will incorporate the capability of using either representative meteorological data from AERMOD or the default meteorological conditions from the AERSCREEN model.

It is acceptable to use a refined air dispersion model in a "screening" mode for this program's health risk assessments. In this case, a refined air dispersion model is used:

- with worst-case meteorology instead of representative meteorology;

- with a conservative averaging period conversion factor to calculate longer term concentration estimates (see Section 4.10 for more discussion on screening air dispersion models and adjustments factors).

Note that use of worst case meteorology in a refined model is not the normal practice in New Source Review or Ambient Air Quality Standard evaluation modeling.

4.6 Population Exposure

The level of detail required for the analysis (e.g., screening or refined), and the procedures to be used in determining geographic resolution and exposed population require case-by-case analysis and professional judgment. The District should be consulted before beginning the population exposure estimates, and as results are generated, further consultation may be necessary. Some suggested approaches and methods for handling the breakdown of population and performance of a screening or detailed risk analysis are provided in this section.

In addition to estimating individual cancer risk at specific points such as the MEI (maximally exposed individual), OEHHA recommends determining the number of people who reside within the 1×10^{-6}, 1×10^{-5}, $1x\ 10^{-4}$, and higher cancer risk isopleths. For noncancer population evaluations, the number of people who reside within the 0.5, one, five, or higher hazard index isopleths should be reported. The HARP software can provide population exposure estimates as cancer burden or as the number of persons exposed to a selected (user identified) health risk/impact level. Information on obtaining the HARP software can be found under the Hot Spots Program on the ARB's web site at *www.arb.ca.gov*. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

4.6.1 *Zone(s) of Impact*

As part of the estimation of the population exposure for the cancer risk analysis, it is necessary to determine the geographic area affected by the facility's emissions. An initial approach to define a "zone of impact" surrounding the source is to generate an isopleth where the total excess lifetime cancer risk from inhalation exposure to all emitted carcinogens is greater than 10^{-6} (one in 1,000,000).

For noncarcinogens, a second, third, and fourth isopleth (to represent the chronic, 8-hour, and acute impacts) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 1.0. For clarity these isopleths may need to be presented on separate maps in the HRA.

Contact the District or reviewing authority to discuss inclusion of isopleth maps if all potential health risks fall within the facility boundary and no receptors have, or will ever, be present within the boundary (also see Section 4.7.1 for a discussion of on-site receptors).

The initial "zone of impact" can be determined as follows:

- Use a screening dispersion model (e.g., AERSCREEN) to obtain concentration estimates for each emitted pollutant at varying receptor distances from the source. Several screening models feature the generation of an automatic array of receptors which is particularly useful for determining the zone of impact. In order for the model to generate the array of receptors the user needs to provide some information normally consisting of starting distance, increment and number of intervals.

- Calculate total cancer risk and hazard index (HI) for each receptor location by using the methods provided in the risk characterization sections in Chapter 8 of the Air Toxics Hot Spots Risk Assessment Guidance Manual.

- Find the distance where the total inhalation cancer risk is equal to 10^{-6}; this may require redefining the receptor array in order to have two receptor locations that bound a total cancer risk of 10^{-6}. Next, find the distance where the chronic, 8-hour, and acute health hazard indices are declared significant by the District (e.g., acute, 8-hour, or chronic HI = 1.0).

Some Districts may prefer to use a cancer risk of 10^{-7} or an HI of 0.5 as the zone of impact. Therefore, the District should be consulted before modeling efforts are initiated. If the zone of impact is greater than 25 km from the facility at any point, then the District should be consulted. The District may specify limits on the area of the zone of impact. Ideally, these preferences would be presented in the modeling protocol (see Section 4.14).

Note that when depicting the risk assessment results, risk isopleths must present the total cancer and noncancer risk from both inhalation and noninhalation pathways. The zone of impact should be clearly shown on a map with geographic markers of adequate resolution (see Section 4.6.3.1). The text below discusses methodology for defining the zone of impact and has format recommendations. Chapter 9 provides an outline that specifies the content and recommended format of all HRA results.

The zone of impact can be defined once the exposure assessment (air dispersion modeling) process has determined the pollutant concentrations at each designated off-site receptor and a risk analysis (see Chapter 8) has been performed. For clarity, the cancer and noncancer zone(s) of impact should be presented on separate maps. A

map illustrating the carcinogenic zone of impact is required. The District may at its discretion ask for the map illustrating the potential carcinogenic zone of impact to identify the zone of impact for the minimum exposure pathways (inhalation, soil, dermal, and mother's milk) and the zone of impact for all applicable pathways of exposure (minimum pathways plus site/route dependent pathways). Two maps may be needed to accomplish this. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways that were included in the assessment.

The noncancer maps should also clearly identify the noncancer zones of impact. These include the acute (inhalation) zone of impact, 8-hour (inhalation) zone of impact and the chronic (including both inhalation, multipathway) zone of impact. The District may at its discretion require separate chronic inhalation and chronic multipathway zones of impact maps. For clarity, presentation of the two chronic zones of impact may also require two or more maps. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways (and target organs) that were included in the assessment. Further information regarding the methods for determination of hazard indices and cancer risk are discussed in Chapter 8 and Appendix I.

4.6.2 *Screening Population Estimates for Risk Assessments*

A screening risk assessment should include an estimate of the maximum exposed population. For screening risk assessments, a detailed description of the exposed population is not required. The impact area to be considered should be selected to be health protective (i.e., will not underestimate the number of exposed individuals). A health-protective assumption is to assume that all individuals within a large radius of the facility are exposed to the maximum concentration. If a facility must also comply with the RCRA/CERCLA risk assessment requirements, health effects to on-site workers may also need to be addressed. The DTSC's Remedial Project Manager should be consulted on this issue. The District should be consulted to determine the population estimate that should be used for screening purposes. Guidance for one screening method is presented here.

1. Use a screening dispersion model (e.g., AERSCREEN) to obtain concentration estimates for each emitted pollutant at varying receptor distances from the source. Several screening models feature the generation of an automatic array of receptors that is particularly useful for determining the zone of impact. In order for the model to generate the array of receptors, the user needs to provide some information normally consisting of starting distance, increment, and number of intervals.

2. Calculate the potential cancer risk and hazard index for each receptor location by using the methods provided in the risk characterization sections of this document (Chapter 8).

3. Find the distance where the potential cancer risk is equal to District specified levels (e.g., 10^{-6}); this may require redefining the receptor array in order to have

two receptor locations that bound a total cancer risk of 10^{-6}. This exercise should be repeated for the noncancer health impacts.

4. Calculate cancer burden by estimating the number of people in the grid and stipulate that all are exposed at the highest level.

4.6.3 *Refined Population Estimates for Risk Assessments*

The refined HRA requires a detailed analysis of the population exposed to emissions from the facility. Where possible, a detailed population exposure analysis provides estimates of the number of individuals in residences and offsite workplaces, as well as at sensitive receptor sites such as schools, daycare centers and hospitals. The District may require that locations with high densities of sensitive individuals be identified (e.g., schools, daycare centers, hospitals). These population analyses can include exposure estimates for workers and residents through the use of land use maps or other tools. The overall exposed residential and worker populations should be apportioned into smaller geographic subareas. The information needed for each subarea is:

1. The number of exposed persons, and
2. The receptor location at which the calculated ambient air concentration is assumed to be representative of the exposure to the entire population in the subarea.

A multi-tiered approach is suggested for the population analysis. Census tracts, which the facility could significantly impact, should be identified (see Section 4.6.3.1). A census tract should be divided into smaller subareas if it is close to the facility where ambient concentrations vary widely. The District may determine that census tracts provide sufficient resolution near the facility to adequately characterize population exposure or they may prefer the census information to be evaluated using smaller blocks. Further downwind where ambient concentrations are less variable, the census tract level may be acceptable to the District. The District may determine that the aggregation of census tracts (e.g., when the census tracts making up a city are combined) is appropriate for receptors that are considerable distances from the facility.

If a facility must also comply with the RCRA/CERCLA HRA requirements, health effects to on-site workers may also need to be addressed. The DTSC's Remedial Project Manager should be consulted on this issue. In some cases it may be appropriate to evaluate risks to on-site receptors. The district should be consulted about special cases for which evaluation of on-site receptors is appropriate, such as facilities frequented by the public or where people may reside (e.g., military facilities).

4.6.3.1 Census Tracts

For a refined risk assessment, the boundaries of census tracts can be used to define the geographic area to be included in the population exposure analysis. Digital maps showing the census tract boundaries in California can be obtained from "The Thomas

Guide"® on the World Wide Web. Statistics for each census tract can be obtained from the U.S. Census Bureau. The website address for the U.S. Census Bureau is http://www.census.gov. Numerous additional publicly accessible or commercially available sources of census data can be found on the World Wide Web. A specific example of a census tract is given in Appendix K. The HARP software includes U.S. census data and is a recommended tool for performing population exposure estimates.

The two basic steps in defining the area under analysis are:

(1) Identify the "zone of impact" (as defined previously in Section 4.6.1) on a map detailed enough to provide for resolution of the population to the subcensus tract level. (The U.S. Geological Survey (USGS) 7.5-minute series maps and the maps within the HARP software provide sufficient detail.) This is necessary to clearly identify the zone of impact, location of the facility, and sensitive receptors within the zone of impact. If significant development has occurred since the USGS survey, this should be indicated. A specific example of a 7.5-minute series map is given in Appendix K.

(2) Identify all census tracts within the zone of impact using a U.S. Bureau of Census or equivalent map (e.g., Thomas Brothers, HARP Software). If only a portion of the census tract lies within the zone of impact, then only the population that falls within the isopleth should be used in the population estimate or burden calculation. To determine this level of detail, local planning and zoning information may need to be collected. When this more detailed information is not available, then a less refined approach is to include the census data if the centroid of the census block falls within the isopleths of interest. The census tract boundaries should be transferred to a map, such as a USGS map (referred to hereafter as the "base map".)

An alternative approach for estimating population exposure in heavily populated urban areas is to apportion census tracts to a Cartesian grid cell coordinate system. This method allows a Cartesian coordinate receptor concentration field to be merged with the population grid cells. This process can be computerized and minimizes manual mapping of centroids and census tracts. The HARP software includes this function and will provide population estimates that are consistent with the methodology discussed here.

The District may determine that aggregation of census tracts (e.g., which census tracts making up a city can be combined) is appropriate for receptors that are located at considerable distances from the facility. If the District permits such an approach, it is suggested that the census tract used to represent the aggregate be selected in a manner to ensure that the approach is health protective. For example, the census tract included in the aggregate that is nearest (downwind) to the facility should be used to represent the aggregate.

4.6.3.1.1 Subcensus Tract

Within each census tract are smaller population units. These units [urban block groups (BG) and rural enumeration districts (ED)] contain about 1,100 persons. BGs are

further broken down into statistical units called blocks. Blocks are generally bounded by four streets and contain an average of 70 to 100 persons. However, this range in population is an average and population units may vary significantly. In some cases, the EDs are very large and identical to a census tract.

The area requiring detailed (subcensus tract) resolution of the exposed residential and worker population will need to be determined on a case-by-case basis through consultation with the District. The District may determine that census tracts provide sufficient resolution near the facility to adequately characterize population exposure.

Employment population data can be obtained at the census tract level from the U.S. Census Bureau or from local planning agencies. This degree of resolution will generally not be sufficient for most risk assessments. For the area requiring detailed analysis, zoning maps, general plans, and other planning documents should be consulted to identify subareas with worker populations.

The boundaries of each residential and employment population area should be transferred to the base map.

4.6.4 *Sensitive Receptor Locations*

Individuals who may be more sensitive to toxic exposures than the general population are distributed throughout the total population. Sensitive populations may include young children and chronically ill individuals. The District may require that locations with high densities of sensitive individuals be identified (e.g., schools, nursing homes, residential care facilities, daycare centers, and hospitals). The HRA should state what the District requirements are regarding identification of sensitive receptor locations.

Although protection of sensitive individuals is incorporated into OEHHA's risk assessment methodology in both cancer risk and noncancer risk assessment, the assessment of risk at the specific location of such sensitive individuals (e.g., schools, hospitals, or nursing homes) may be useful to assure the public that such individuals are being considered in the analysis. For some chemicals (e.g., mercury and manganese) children have been specifically identified as the sensitive subpopulation for noncancer health impacts, so it can be particularly appropriate to assess school sites.

4.7 Receptor Siting

4.7.1 *Receptor Points*

The modeling analysis should contain a network of receptor points with sufficient detail (in number and density) to permit the estimation of the maximum concentrations. Locations that must be identified include:

- The maximum estimated off-site impact or point of maximum impact (PMI),
- The maximum exposed individual at an existing residential receptor (MEIR),
- The maximum exposed individual at an existing occupational worker receptor (MEIW).

Note that some situations may also require that on-site receptor (worker or residential) locations be evaluated. The risk assessor can contact the District or reviewing authority for guidance if on-site exposure situations are present at the emitting facility. However, these on-site locations should be included in the HRA. Some examples where the health impacts of on-site receptors may be appropriate could be military base housing, prisons, universities, day care facilities, or locations where the public may have regular access for the appropriate exposure period (e.g., a lunch time café or museum for acute exposures). When a receptor lives and works on the facility, site, or property, then these receptors should be evaluated and reported under both residential and worker scenarios and the one that is most health protective should be used for risk management decisions. The cancer risk estimates for the onsite residents may use a 30-year exposure duration while the 25-year exposure duration is used for a worker. Under a Tier 2 analysis, alternate exposure durations may be evaluated and presented with all assumptions supported.

All of these locations (i.e., PMI, MEIR, and MEIW) must be identified for potential multipathway carcinogenic and noncarcinogenic effects. It is possible that the estimated PMI, MEIR, and MEIW risk for cancer, chronic noncancer, 8-hour, and acute noncarcinogenic risks occur at different locations or that some of these evaluations may not be necessary (e.g., the receptor does not exist). For example, some facilities will not have off-site workers in the vicinity of the facility and will not need to evaluate worker exposure, or the exposure situation may only require the evaluation of short-term carcinogenic or acute noncancer impacts (see Section 8.2.10 for a discussion of short-term projects). The approval to revise the exposure assessment for a receptor, or to omit the MEIW receptor, should be verified in writing with the District or reviewing authority and included in the HRA.

Other sensitive receptor locations may also be of interest and required to be included in the HRA. The District or reviewing authority should be consulted to determine which sensitive receptor locations must be included.

The results from a screening model (if available) can be used to identify the area(s) where the maximum concentrations are likely to occur. Receptor points should also be located at the population centroids (see Section 4.7.2) and sensitive receptor locations (see Section 4.6.4). The exact configuration of the receptor array used in an analysis will depend on the topography, population distribution patterns, and other site-specific factors. All receptor locations should be identified in the HRA using UTM (Universal Transverse Mercator) coordinates and receptor number. The receptor numbers in the summary tables should match receptor numbers in the computer output (e.g., HARP output files). In addition to actual UTM coordinates, the block/street locations (i.e., north side of 3,000 block of Smith Street) should be provided in the HRA for the PMI, MEIR, and MEIW for carcinogenic and noncarcinogenic health effects. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

4.7.1.1 Receptor Height

To evaluate localized impacts, receptor height should be taken into account at the point of maximum impact on a case-by-case basis. For example, receptor heights may have to be included to account for receptors significantly above ground level. Flagpole receptors at the height of the breathing zone of a person may need to be considered when the source receptor distance is less than a few hundred meters. Consideration must also be given to the noninhalation pathway analysis which requires modeling of chemical deposition onto soil or water at ground level. For the inhalation pathway, a health protective approach is to select a receptor height from 0 meters to 1.8 meters that will result in the highest predicted downwind concentration. Final approval of this part of the modeling protocol should be with the District or reviewing authority.

4.7.2 *Centroid Locations*

For each subarea analyzed, a centroid location (the location at which a calculated ambient concentration is assumed to represent the entire subarea) should be determined. When population is uniformly distributed within a population unit, a geographic centroid based on the shape of the population unit can be used. If only a portion of the census tract lies within the isopleth or area of interest, then only the population that falls within the isopleth should be used in the calculation for population exposure. To determine this level of detail, local planning and zoning information may need to be collected. Where populations are not uniformly distributed, a population-weighted centroid may be used. Another alternative uses the concentration at the point of maximum impact within that census tract as the concentration to which the entire population of that census tract is exposed. While this less refined approach is commonly accepted, Districts should be contacted to approve this method prior to its use in a risk assessment.

The centroids represent locations that should be included as receptor points in the dispersion modeling analysis. Annual average concentrations should be calculated at each centroid using the modeling procedures presented in this chapter.

For census tracts and BG/EDs, judgments can be made using census tracts maps and street maps to determine the centroid location. At the block level, a geographic centroid is sufficient.

4.7.3 *Spatial Averaging*

Since the inception of the “Hot Spots” and California’s Air Toxics Programs, HRA results for an individual receptor have typically been based on air dispersion modeling results at a single point or location. With a few exceptions, this method has been traditionally used for all types of receptors (e.g., PMI, MEIR, MEIW, pathway receptors, etc.). The assumptions used in risk assessment are designed to prevent underestimation of health impacts to the public resulting in a health protective approach. However, basing risk estimates on a single highest point (PMI, MEIR, or MEIW) does not take into account that a person does not remain at one location on their property, or in one location at the

workplace over an extended period of time. Therefore, the average air concentration over a small area is likely to be more representative than using the air concentration at a single point, particularly in those situations where concentrations fall off rapidly around that single point. The concept of averaging air concentrations over a small area is known as spatial averaging.

In order to understand how spatial averaging can impact air dispersion modeling results with various types of facilities, the ARB, in conjunction with the OEHHA, performed sensitivity analyses to evaluate the impacts of spatially averaging air dispersion modeling results (see Appendix C of the Air Toxics Hot Spots Program Risk Assessment Guidelines: Technical Support Document for Exposure Assessment and Stochastic Analysis (EASA)). Based on these sensitivity analyses, it is reasonable and appropriate to include spatial averaging techniques in air toxic risk assessments as supplemental information to Tier 1 information (i.e., modeling results that are based on the air concentration from a single point or location). While all risk assessments must include results based on Tier 1 methodology, the spatially averaged concentrations around the point of interest (e.g., PMI, MEIR, MEIW, multipathway exposure evaluations, etc.) could also be included as an option in risk assessments and acceptable for risk management decisions subject to approval by the District or reviewing agency. Spatial averaging is an option for the purpose of additional refinement to the risk assessment.

A few reasons that support the inclusion of spatially averaged modeled concentrations in risk assessment include the following:

- Averaging results over a small domain will give a more representative picture of individual exposure and risk than an estimate based on one single location within their property.
- Spatial averaging will allow air dispersion modeling and risk assessment results to be characterized as the estimated concentration and risk in a discrete area of interest, rather than an exact value for a single location.
- From a risk communication standpoint, the ARB and OEHHA feel it is more appropriate to present the modeling output and the calculated health impacts as the potential impacts within a small or discrete area, rather than an exact value at a specific point on a grid or map.
- Spatial averaging is the recommended procedure in ARB's Lead Risk Management Guidelines (2001) and has been used in several complex source HRAs [e.g., Roseville Railyard (2004), Ports of LA/LB (2006), Port of Oakland (2008)].
- Spatially averaging the deposition concentrations over pasture land, a garden, or a water body for multipathway exposure scenarios is a planned upgrade for the HARP Software. This will provide an option that will refine multipathway exposure assessments. Average deposition on these types of areas (e.g., a water body) is not necessarily well represented by the single highest point of deposition, or deposition at the geographic center of the water body. Likewise, since produce is grown over the entire surface of the garden and cows graze the

entire pasture, deposition is better estimated by evaluating the entire area rather than using a single point.

4.7.3.1 Spatial Averaging Methodology

The spatial averaging sensitivity study in Appendix C of the EASA is based on simulating emissions from point, volume, area, and line sources. Most source types (e.g., point) are simulated as a small, medium or large source. Line sources are only simulated as small and large. In addition, meteorological data collected at five different locations in California were used. Nested spatial average grids of various domains were used to study the differences on the spatial average concentration. In the case of the 20 meter by 20 meter spatial average nested grid, the spatial average concentration showed little change over the PMI for medium and large sources. In the case for small sources, the spatial average concentration is approximately 45% to 80% of the PMI concentration. Individual source type and meteorological conditions will cause variations in these results.

The results of the spatial averaging sensitivity study in Appendix C of the EASA shows that sources with low plume rise that result in a PMI, MEIW, or MEIR located at or near the property fence line are most sensitive to spatial averaging. Source types with high plume rise (e.g., tall stacks) show a PMI far downwind where the concentration gradient is more gradual and therefore spatial averaging has a lesser effect. While spatial averaging can be used regardless of source size or the location of the PMI, the following conditions generally apply when a source is a good candidate for spatial averaging:

- The MEIR, MEIW, or PMI is located at the fence line or close to the emission source.
- The concentration gradient is high near the PMI. This is more associated with low level plumes such as fugitive, volume, area, or short stacks.
- A long term average is being calculated to represent a multi-year risk analysis based on one to five years of meteorological data. Note that spatial averaging should **not** be used for short term (acute) calculations.

In general, the method for calculating the spatial average in air toxic risk assessments includes the following steps:

1. Locate the point(s) of interest and receptor(s) (i.e., PMI, MEIW, MEIR, and any additional receptor locations of interest or concern) with a grid resolution spacing of no greater than five meters. To achieve this, two or more modeling runs with successively finer nested grid resolutions may be needed to find the final location where the nested grid that will be used for spatial averaging will be placed.

2. Center the spatial average nested grid on the each receptor's location of interest determined in step 1. Limit the nested grid to no larger than 20 meters by 20 meters or 400 square meters. Note that if a portion of the centered and nested grid falls within the facility boundary and the receptor location of interest is outside of the boundary, then adjustments to the nested grid to obtain the spatially-averaged concentration for the offsite receptor are reasonable. This may be done by either repositioning the nested grid to cover 400 square meters of off-boundary area surrounding the receptor or center the nested grid and delete any on-site grid points so that only the offsite grid points surrounding the receptor are used in the spatially averaged concentration. The grid resolution spacing should be no greater than five meters. With a five meter grid resolution, the 20 meter by 20 meter domain will result in 25 receptors. The size, shape, and placement of the domain and the resolution of points are subject to approval by the District, ARB, or other reviewing authority. See the Sections 4.7.3.1.2 and 4.7.3.1.3 below for additional discussion on domain sizing and grid spacing at worksites, pastures, gardens, and water bodies.

3. Some configurations of source activity and meteorological conditions result in a predominant downwind plume center line that is significantly askew from one of the four ordinate directions. In this case, a tilted nested grid is necessary to coincide with the dominant plume centerline. Polar receptors are easier to implement than a tilted rectangular grid. The domain of the polar receptor field should be limited to a 15 meter radius. See Appendix C of the EASA for detailed instructions on tilted polar receptors.

4. Calculate the arithmetic mean of the long term period average concentration (e.g., annual average) of the nested grid of receptors to represent the spatial average. This average is used in the risk calculations.

5. Document and include all methods, assumptions, data, maps, and files used in the spatial averaging analysis and clearly present this information in the risk assessment following the requirements of the District or reviewing authority. Note that in the update to the HARP software, functionality will be included that will assist with spatial averaging and the methodology discussed.

The following sections discuss the use of spatial averaging for various receptor types and exposure pathways.

4.7.3.1.1 Residential Receptors

Follow the steps in Section 4.7.3 outlining the spatial averaging methodology. To remain health protective when evaluating a residential receptor, spatial averaging should not take place using large nested domains. The domain used for spatial averaging should be no larger than 20 meters by 20 meters with a maximum grid spacing resolution of equal to or less than five meters. This domain represents an area

that is approximately the size of a small urban lot. The size of the domain and resolution of points shall be subject to approval by the District, ARB, or other reviewing authority.

4.7.3.1.2 Worker Receptors

Offsite worker locations (e.g. MEIW) may also be a candidate for spatial averaging. However, workers can be at the same location during almost their entire daily work shift (e.g., desk/office workers). When this is the situation, then the traditional method of using a single location and corresponding modeled concentration is appropriate. If spatial averaging is used, care should be taken to determine the proper domain size and grid resolution. Follow the steps in Section 4.7.3 outlining the spatial averaging methodology. To be consistent with the residential receptor assumptions and remain health protective, a modeling domain size no larger than 20 meters by 20 meters is recommended with a grid spacing resolution of equal to or less than five meters. However, if workers routinely and continuously move throughout the worksite over a space greater than 20 meters by 20 meters, then a larger domain may be considered.

The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation for all workers showing the area where each worker routinely performs their duties and the percentage of time spent in those areas. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain to find the concentration that will be used to calculate health impacts should be sufficient in number and detail to obtain a representative concentration across the area of interest. The size of the domain and resolution of points shall be subject to approval by the District, ARB, or other reviewing authority.

4.7.3.1.3 Pastures, Gardens, or Water Bodies

The simplified approach of using the concentration (deposition rate) at the centroid, a specific point of interest, or the PMI location for an area being evaluated for noninhalation exposures (e.g., a body of water used for fishing, a pasture used for grazing, area of a garden, etc.) is acceptable for use in HRA. However, evaluating deposition concentrations over pasture land, a garden, or a water body for multipathway exposure scenarios using spatial averaging could give more representative estimates of the overall deposition rate. Use of spatial averaging in this application is subject to approval by the District, ARB, or other reviewing authority.

If spatial averaging will be done, follow the steps in Section 4.7.3.1 outlining the spatial averaging methodology. When using spatial averaging over the deposition area, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the area of interest (e.g., pasture or water body) should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way

to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture, garden, or water body, maps, representative coordinates, grid resolution, concentration gradients, etc.). The size of the domain and grid resolution is subject to approval by the reviewing authority.

In lieu of following the details in the paragraph above, the approach used for the other receptors (e.g., MEIR, MEIW) that uses a domain size not greater than 20 meters by 20 meters, located on the PMI within the area of interest, with a maximum grid spacing resolution of five meters, can be used. This default refined approach would apply to deposition areas greater than 20 meters by 20 meters. For smaller deposition areas, the simplified approach of using the PMI for the area, the concentration at the centroid or a specific point of interest, or averaging over the actual smaller domain can be used. This again is subject to approval by the reviewing authority.

The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the water body, pasture, or garden; all data; maps; representative coordinates, and etc.), and the details clarifying how and where the averaging was done (e.g., location and magnitude of concentration gradients, the grid spacing used).

4.8 Meteorological Data

Refined air dispersion models require hourly meteorological data. The first step in obtaining meteorological data should be to check with the District and the ARB for data availability. Other sources of data include the National Weather Service (NWS), National Climatic Data Center (NCDC), Asheville, North Carolina, ARB meteorological database (METDB), military stations and private networks. Meteorological data for a subset of NWS stations are available from the U.S. EPA Support Center for Regulatory Air Models (SCRAM). The SCRAM can be accessed at www.epa.gov/scram001/main.htm. All meteorological data sources should be approved by the District. Data not obtained directly from the District or the ARB should be checked for quality, representativeness, and completeness. It should be approved by the District before use. U.S. EPA provides guidance (U.S. EPA, 1995e) for these data. Meteorological data may need further processing. Data users can consult with the District or the ARB on how to process the raw meteorological data. The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating District approval of meteorological data should be attached in an appendix. If no representative meteorological data are available, screening procedures should be used as indicated in Section 4.10.

The analyst should acquire enough meteorological data to ensure that the worst-case meteorological conditions are represented in the model results. The US-EPA Guideline on Air Quality Models (U.S. EPA 2005) prefers that the latest five years of consecutive meteorological data be used to represent long term averages (i.e., cancer and chronic impacts). Previous OEHHA guidance allowed the use of the worst-case year to save

computer time. The processing speed of modern computers has increased to the point where processing five years of data over one year is no longer burdensome. However, the District may determine that one year of representative meteorological data is sufficient to adequately characterize the facility's impact. This may especially be the case when five years of quality consecutive data are not available.

To determine long term average concentrations the data can be averaged. For calculation of the one-hour maximum concentrations needed to evaluate acute effects, the worst-case year should be used in conjunction with the maximum hourly emission rate. For example, the long term average concentration and one-hour maximum concentration at a single receptor for five years of meteorological data are calculated below:

Year	Annual Average ($\mu g/m^3$)	Maximum One-Hour ($\mu g/m^3$)
1	7	100
2	5	80
3	9	90
4	8	110
5	6	90
5-year average	7	

In the above example, the long-term average concentration over five years is 7 $\mu g/m^3$. Therefore, 7 $\mu g/m^3$ should be used to evaluate carcinogenic and chronic effects (i.e., annual average concentration). The one-hour maximum concentration is the highest one-hour concentration in the five-year period. Therefore, 110 $\mu g/m^3$ is the peak one-hour concentration that should be used to evaluate acute effects.

The higher hourly concentration usually occurs when meteorological dispersion conditions become worse, such as, calm or light wind, inversion, etc. Inversion usually happens in late afternoon through early morning. As the sun goes down, the atmospheric temperature near surface starts to fall, usually faster than the temperature in the upper atmosphere causing a temperature inversion layer to form and extend downward. This inversion layer usually sustains throughout the night, and remains until early morning. Because of the inversion (cold air sitting on warm air at the top of the inversion layer), pollutant vertical mixing is very low in the morning.

When predicted concentrations are high and the mixing height is very low for the corresponding averaging period, the modeling results deserve additional consideration. For receptors in the near field, it is within the model formulation to accept a very low mixing height for short durations. However, it would be unlikely that the very low mixing height would persist long enough for the pollutants to travel into the far field. In the

event that the analyst identifies any of these time periods, they should be discussed with the District on a case-by-case basis.

4.8.1 *Meteorological Data Formats*

Most short-term dispersion models require input of hourly meteorological data in a format which depends on the model. U.S. EPA provides software for processing meteorological data for use in U.S. EPA recommended dispersion models. U.S. EPA recommended meteorological processors include the Meteorological Processor for Regulatory Models (MPRM), PCRAMMET, and AERMET. Use of these processors will ensure that the meteorological data used in an U.S. EPA recommended dispersion model will be processed in a manner consistent with the requirements of the model.

Meteorological data for a subset of NWS stations are available on the World Wide Web at the U.S. EPA SCRAM address, http://www.epa.gov/scram001.

4.8.2 *Treatment of Calms*

Calms are hours when the wind speed is below the starting threshold of the anemometer. Gaussian plume models require a wind speed and direction to estimate plume dispersion in the downwind direction.

U.S. EPA's policy is to disregard calms until such time as an appropriate analytical approach is available. The recommended U.S. EPA models contain a routine that eliminates the effect of the calms by nullifying concentrations during calm hours and recalculating short-term and annual average concentrations. Certain models lacking this built-in feature can have their output processed by U.S. EPA's CALMPRO program (U.S. EPA, 1984a) to achieve the same effect. Because the adjustments to the concentrations for calms are made by either the models or the postprocessor, actual measured on-site wind speeds should always be input to the preprocessor. These actual wind speeds should then be adjusted as appropriate under the current U.S. EPA guidance by the preprocessor.

Following the U.S. EPA methodology, measured on-site wind speeds of less than 1.0 m/s, but above the instrument threshold, should be set equal to 1.0 m/s by the preprocessor when used as input to Gaussian models. Calms are identified in the preprocessed data file by a wind speed of 1.0 m/s and a wind direction equal to the previous hour. For input to AERMOD, no adjustment should be made to the site specific wind data. AERMOD can produce model estimates for conditions when the wind speed may be less than 1 m/s but still greater than the instrument threshold. Some air districts provide pre-processed meteorological data for use in their district that treats calms differently. Local air districts should be consulted for available meteorological data. In addition, to reduce the number of calms and missing winds in the surface data, EPA has developed a pre-processor – AERMINUTE – to process 1-minute ASOS wind data for generating hourly average wind speed and directions for input to AERMET in Stage 2. The details can be found in the EPA's AERMINUTE User's Instructions at:

http://www.epa.gov/ttn/scram/models/aermod/aerminute_userguide_v11059_draft.pdf

If the fraction of calm hours is excessive, then an alternative approach may need to be considered to characterize dispersion. The Calpuff model modeling system can simulate calm winds as well as complex wind flow and therefore is a viable alternative. The local air district should be consulted for alternative approaches.

4.8.3 *Treatment of Missing Data*

Missing data refer to those hours for which no meteorological data are available from the primary on-site source for the variable in question. When missing values arise, they should be handled in one of the following ways listed below, in the following order of preference:

(1) If there are other on-site data, such as measurements at another height, they may be used when the primary data are missing. If the height differences are significant, corrections based on established vertical profiles should be made. Site-specific vertical profiles based on historical on-site data may also be appropriate to use if their determination is approved by the reviewing authority. If there is question as to the representativeness of the other on-site data, they should not be used.

(2) If there are only one or two missing hours, then linear interpolation of missing data may be acceptable, however, caution should be used when the missing hour(s) occur(s) during day/night transition periods.

(3) If representative off-site data exist, they may be used. In many cases this approach may be acceptable for cloud cover, ceiling height, mixing height, and temperature. This approach will rarely be acceptable for wind speed and direction. The representativeness of off-site data should be discussed and agreed upon in advance with the reviewing authority.

(4) An imputation methodology may be acceptable, provided it is well-documented, sufficiently justified, and properly applied.

(5) Failing any of the above, the data field should be coded as missing using missing data codes appropriate to the applicable meteorological pre-processor.

Appropriate model options for treating missing data, if available in the model, should be employed. Substitutions for missing data should only be made in order to complete the data set for modeling applications, and should not be used to attain the “regulatory completeness” requirement of 90%. That is, the meteorological data base must be 90% complete on a monthly basis (before substitution) in order to be acceptable for use in air dispersion modeling. The use of any data substitution technique should be thoroughly documented to provide the District or reviewing authority with all the information necessary to determine its approvability.

If the recommended methods for addressing missing meteorological data cannot be achieved as described, then alternative approaches should be discussed and developed in conjunction with the District or reviewing authority.

4.8.4 *Representativeness of Meteorological Data*

The atmospheric dispersion characteristics at an emission source need to be evaluated to determine if the collected meteorological data can be used to adequately represent atmospheric dispersion for the project.

Such determinations are required when the available meteorological data are acquired at a location other than that of the proposed source. In some instances, even though meteorological data are acquired at the location of the pollutant source, they still may not correctly characterize the important atmospheric dispersion conditions.

Considerations of representativeness are always made in atmospheric dispersion modeling whether the data base is "on-site" or "off-site." These considerations call for the judgment of a meteorologist or an equivalent professional with expertise in atmospheric dispersion modeling. If in doubt, the District should be consulted.

4.8.4.1 Spatial Dependence

The location where the meteorological data are acquired should be compared to the source location for similarity of terrain features. For example, in complex terrain, the following considerations should be addressed in consultation with the District:

- Aspect ratio of terrain, i.e., ratio of:
    - Height of valley walls to width of valley;
    - Height of ridge to length of ridge; and
    - Height of isolated hill to width of hill at its base
- Slope of terrain
- Ratio of terrain height to stack/plume height
- Distance of source from terrain (i.e., how close to valley wall, ridge, isolated hill)
- Correlation of terrain feature to prevailing meteorological conditions

Likewise, if the source is located on a plateau or plain, the source of meteorological data used should be from a similar plateau or plain.

Judgments of representativeness should be made only when sites are climatologically similar. Sites in nearby, but different air sheds, often exhibit different weather patterns. For instance, meteorological data acquired along a shoreline are not normally representative of inland sites and vice versa.

Meteorological data collected need to be examined to determine if drainage, transition, and synoptic flow patterns are characteristics of the source, especially those critical to the regulatory application. Consideration of orientation, temperature, and ground cover should be included in the review.

An important aspect of space dependence is height above the ground. Where practical, meteorological data should be acquired at the release height, as well as above or below, depending on the buoyancy of the source's emissions. AERMOD at a minimum requires wind observations at a height above ground between seven times the local surface roughness height and 100 meters.

4.8.4.2 Temporal Dependence

To be representative, meteorological data must be of sufficient duration to define the range of sequential atmospheric conditions anticipated at a site. As a minimum, one full year of on-site meteorological data is necessary to prescribe this time series. Multiple years of data are used to describe variations in annual and short-term impacts. Consecutive years from the most recent, readily available 5-year period are preferred to represent these yearly variations.

4.8.4.3 Further Considerations

It may be necessary to recognize the non-homogeneity of meteorological variables in the air mass in which pollutants disperse. This non-homogeneity may be essential in correctly describing the dispersion phenomena. Therefore, measurements of meteorological variables at multiple locations and heights may be required to correctly represent these meteorological fields. Such measurements are generally required in complex terrain or near large land-water body interfaces.

It is important to recognize that, although certain meteorological variables may be considered unrepresentative of another site (for instance, wind direction or wind speed), other variables may be representative (such as temperature, dew point, cloud cover). Exclusion of one variable does not necessarily exclude all. For instance, one can argue that weather observations made at different locations are likely to be similar if the observers at each location are within sight of one another - a stronger argument can be made for some types of observations (e.g., cloud cover) than others. Although by no means a sufficient condition, the fact that two observers can “see” one another supports a conclusion that they would observe similar weather conditions.

Other factors affecting representativeness include change in surface roughness, topography and atmospheric stability. Currently there are no established analytical or statistical techniques to determine representativeness of meteorological data. The establishment and maintenance of an on-site data collection program generally fulfills the requirement for “representative” data. If in doubt, the District should be consulted.

4.8.5 *Alternative Meteorological Data Sources*

It is necessary, in the consideration of most air pollution problems, to obtain data on site-specific atmospheric dispersion. Frequently, an on-site measurement program must be initiated. As discussed in Section 4.8.3, representative off-site data may be used to substitute for missing periods of on-site data. There are also situations where current or past meteorological records from a National Weather Service station may suffice. These considerations call for the judgment of a meteorologist or an equivalent professional with expertise in atmospheric dispersion modeling. More information on Weather Stations including: National Weather Service (NWS), military observations, supplementary airways reporting stations, upper air and private networks, is provided in "On-Site Meteorological Program Guidance for Regulatory Modeling Applications" (U.S. EPA, 1995e).

4.8.5.1 Recommendations

On-site meteorological data should be processed to provide input data in a format consistent with the particular models being used. The input format for U.S. EPA short-term regulatory models is defined in U.S. EPA's MPRM. The input format for AERMOD is defined in the AERMET meteorological pre-processor. Processors are available on the SCRAM web site. The actual wind speeds should be coded on the original input data set. Wind speeds less than 1.0 m/s but above the instrument threshold should be set equal to 1.0 m/s by the preprocessor when used as input to Gaussian models. Wind speeds below the instrument threshold of the cup or vane, whichever is greater, should be considered calm, and are identified in the preprocessed data file by a wind speed of 1.0 m/s and a wind direction equal to the previous hour. For input to AERMOD, no adjustment should be made to the site specific wind data. AERMOD can produce model estimates for conditions when the wind speed may be less than 1 m/s but still greater than the instrument threshold.

If data are missing from the primary source, they should be handled as follows, in order of preference: (1) substitution of other representative on-site data; (2) linear interpolation of one or two missing hours; (3) substitution of representative off-site data; (4) use of a well-documented and justified imputation methodology; or (5) coding as a missing data field, according to the discussions in Section 4.8.3. The use of any data substitution technique should be thoroughly documented to provide the District or reviewing authority with all the information necessary to determine its approvability.

If the data processing recommendations in this section cannot be achieved, then alternative approaches should be discussed and developed in conjunction with the District or reviewing authority.

4.8.6 *Quality Assurance and Control*

The purpose of quality assurance and maintenance is the generation of a representative amount (90% of hourly values for a year on a monthly basis) of valid data. For more information on data validation consult reference U.S. EPA (1995e). Maintenance may

be considered the physical activity necessary to keep the measurement system operating as it should. Quality assurance is the management effort to achieve the goal of valid data through plans of action and documentation of compliance with the plans.

Quality assurance (QA) will be most effective when following a QA Plan which has been signed-off by appropriate project or organizational authority. The QA Plan should contain the following information (paraphrased and particularized to meteorology from Lockhart):

1. Project description - how meteorology data are to be used
2. Project organization - how data validity is supported
3. QA objective - how QA will document validity claims
4. Calibration method and frequency - for data
5. Data flow - from samples to archived valid values
6. Validation and reporting methods - for data
7. Audits - performance and system
8. Preventive maintenance
9. Procedures to implement QA objectives - details
10. Management support - corrective action and reports

It is important for the person providing the quality assurance (QA) function to be independent of the organization responsible for the collection of the data and the maintenance of the measurement systems. Ideally, the QA auditor works for a separate company.

4.9 Model Selection

There are several air dispersion models that can be used to estimate pollutant concentrations and new ones are likely to be developed. U.S. EPA added AERMOD, which incorporates the PRIME downwash algorithm, to the list of preferred models in 2005 as a replacement to ISCST3. CalPuff was added in 2003. The latest version of the U.S. EPA recommended models can be found at the SCRAM Bulletin board located at http://www.epa.gov/scram001. However, any model, whether a U.S. EPA guideline model or otherwise, must be approved for use by the local air district. Recommended models and guidelines for using alternative models are presented in this section. All air dispersion models used to estimate pollutant concentrations for risk assessment analyses must be in the public domain. Classification according to terrain, source type and level of analysis is necessary before selecting a model (see Section 4.4). The selection of averaging times in the modeling analysis is based on the health effects of concern. Annual average concentrations are required for an analysis of carcinogenic or other chronic effects. One-hour maximum concentrations are required for analysis of acute effects.

4.9.1 *Recommended Models*

Recommended air dispersion models to estimate concentrations for risk assessment analyses are generally referenced in US EPA's Guideline on Air Quality Models

available at http://www.epa.gov/scram001. Currently AERMOD is recommended for most refined risk assessments in flat or complex terrain and in rural or urban environments[1]. In addition, CalPuff is available where spatial wind fields are highly variable or transport distances are large (e.g., 50 km). AERSCREEN is a screening model based on AERMOD. AERSCREEN can be used when representative meteorological data are unavailable. CTSCREEN is available for screening risk assessments in complex terrain. The most current version of the models should be used for risk assessment analysis. Some facilities may also require models capable of special circumstances such as dispersion near coastal areas. For more information on modeling special cases see Sections 4.12 and 4.13.

Most air dispersion models contain provisions that allow the user to select among alternative algorithms to calculate pollutant concentrations. Only some of these algorithms are approved for regulatory application such as the preparation of health risk assessments. The sections in this guideline that provide a description of each recommended model contain information on the specific switches and/or algorithms that must be selected for regulatory application.

To further facilitate the model selection, the District should be consulted for additional recommendations on the appropriate model(s) or a protocol submitted for District review and approval (see Section 4.14.1).

4.9.2 *Alternative Models*

Alternative models are acceptable if applicability is demonstrated or if they produce results identical or superior to those obtained using one of the preferred models referenced in Section 4.9.1. For more information on the applicability of alternative models refer to the following documents:

- U.S. EPA (2005). "Guideline on Air Quality Models" Section 3.2.2
- U.S. EPA (1992). "Protocol for Determining the Best Performing Model"
- U.S. EPA (1985a). "Interim Procedures for Evaluating Air Quality Models – Experience with Implementation"
- U.S. EPA (1984b). "Interim Procedures for Evaluating Air Quality Models (Revised)"

4.10 Screening Air Dispersion Models

A screening model may be used to provide a maximum concentration that is biased toward overestimation of public exposure. Use of screening models in place of refined modeling procedures is optional unless the District specifically requires the use of a refined model. Screening models are normally used when no representative meteorological data are available and may be used as a preliminary estimate to determine if a more detailed assessment is warranted.

[1] AERMOD was promulgated by U.S. EPA as a replacement to ISCST3 on November 9, 2006.

Some screening models provide only 1-hour average concentration estimates. Other averaging periods can be estimated based on the maximum 1-hour average concentration in consultation and approval of the responsible air district. Because of variations in local meteorology, the exact factor selected may vary from one district to another. Table 4.2 provides guidance on the range and typical values applied. The conversion factors are designed to bias predicted longer term averaging periods towards overestimation.

Table 4.2 Recommended Factors to Convert Maximum 1-hour Avg. Concentrations to Other Averaging Periods (U.S. EPA, 2011, 1995a; ARB, 1994).

Averaging Time	Range	Typical SCREEN3 Recommended	AERSCREEN Recommended
3 hours	0.8 - 1.0	0.9	1.0
8 hours	0.5 - 0.9	0.7	0.9
24 hours	0.2 - 0.6	0.4	0.6
30 days	0.2 - 0.3	0.3	
Annual	0.06 - 0.1	0.08	0.1

AERSCREEN automatically provides the converted concentration for longer than 1-hour averaging periods. For area sources, the AERSCREEN 3, 8, and 24-hour average concentration are equal to the 1-hour concentration. No annual average concentration is calculated. SCREEN3 values are shown for comparison purposes.

4.10.1 *AERSCREEN*

The AERSCREEN (U.S. EPA, 2011) model is now available and should be used in lieu of SCREEN3 with approval of the local District. AERSCREEN is a screening level air quality model based on AERMOD. AERSCREEN does not require the gathering of hourly meteorological data. Rather, AERSCREEN requires the use of the MAKEMET program which generates a site specific matrix of meteorological conditions for input to the AERMOD model. MAKEMET generates a matrix of meteorological conditions based on local surface characteristics, ambient temperatures, minimum wind speed, and anemometer height.

AERSCREEN is currently limited to modeling a single point, capped stack, horizontal stack, rectangular area, circular area, flare, or volume source. More than one source may be modeled by consolidating the emissions into one emission source.

4.10.2 *Valley Screening*

The Valley model is designed to simulate a specific worst-case condition in complex terrain, namely that of a plume impaction on terrain under stable atmospheric conditions. The algorithms of the VALLEY model are included in other models such as SCREEN3 and their use is recommended in place of the VALLEY model. The usefulness of the VALLEY model and its algorithms is limited to pollutants for which only long-term average concentrations are required. For more information on the Valley model consult the user's guide (Burt, 1977).

4.10.2.1 Regulatory Options

Regulatory application of the Valley model requires the setting of the following values during a model run:

- Class F Stability (rural) and Class E Stability (urban)
- Wind Speed = 2.5 m/s
- 6 hours of occurrence of a single wind direction (not exceeding a 22.5 deg sector)
- 2.6 stable plume rise factor

4.10.3 *CTSCREEN*

The CTSCREEN model (Perry et al., 1990) is the screening mode of the Complex Terrain Dispersion Model (CTDMPLUS). CTSCREEN can be used to model single point sources only. It may be used in a screening mode for multiple sources on a case by case basis in consultation with the District. CTSCREEN is designed to provide conservative, yet theoretically sounder, worst-case 1-hour concentration estimates for receptors located on terrain above stack height. Internally-coded time-scaling factors are applied to obtain other averages (see Table 4.3). These factors were developed by comparing the results of simulations between CTSCREEN and CTDMPLUS for a variety of scenarios and provide conservative estimates (Perry et al., 1990). CTSCREEN produces identical results as CTDMPLUS if the same meteorology is used in both models. CTSCREEN accounts for the three-dimensional nature of the plume and terrain interaction and requires detailed terrain data representative of the modeling domain. A summary of the input parameters required to run CTSCREEN is given in Table 4.4. The input parameters are provided in three separate text files. The terrain topography file (TERRAIN) and the receptor information file (RECEPTOR) may be generated with a preprocessor that is included in the CTSCREEN package. In order to generate the terrain topography file the analyst must have digitized contour information.

Table 4.3 Time-scaling factors internally coded in CTSCREEN

Averaging Period	Scaling Factor
3 hours	0.7
24 hour	0.15
Annual	0.03

Table 4.4 Input Parameters Required to Run CTSCREEN

Parameter	File
Miscellaneous program switches	CTDM.IN
Site Latitude and Longitude (degrees)	CTDM.IN
Site TIME ZONE	CTDM.IN
Meteorology Tower Coordinates (user units)	CTDM.IN
Source Coordinates: x and y (user units)	CTDM.IN
Source Base Elevation (user units)	CTDM.IN
Stack Height (m)	CTDM.IN
Stack Diameter (m)	CTDM.IN
Stack Gas Temperature (K)	CTDM.IN
Stack Gas Exit Velocity (m/s)	CTDM.IN
Emission Rate (g/s)	CTDM.IN
Surface Roughness for each Hill (m)	CTDM.IN
Meteorology: Wind Direction (optional)	CTDM.IN
Terrain Topography	TERRAIN
Receptor Information (coordinates and associated hill number)	RECEPTOR

4.11 Refined Air Dispersion Models

Refined air dispersion models are designed to provide more representative concentration estimates than screening models. In general, the algorithms of refined models are more robust and have the capability to account for site-specific meteorological conditions. For more information regarding general aspects of model selection see Section 4.9.

4.11.1 *AERMOD*

For a wide variety of applications in all types of terrain, the recommended model is AERMOD. AERMOD is a steady-state plume dispersion model for assessment of pollutant concentrations from a variety of sources. AERMOD simulates transport and dispersion from multiple point, area, or volume sources based on an up-to-date characterization of the atmospheric boundary layer. Sources may be located in rural or urban areas and receptors may be located in simple or complex terrain. AERMOD accounts for building wake effects (i.e., plume downwash) based on the PRIME building downwash algorithms. The model employs hourly sequential preprocessed meteorological data to estimate concentrations for averaging times from one hour to one year (also multiple years). AERMOD is designed to operate in concert with two pre-processor codes: AERMET processes meteorological data for input to AERMOD, and AERMAP processes terrain elevation data and generates receptor information for input to AERMOD. Guidance on input requirements may be found in the AERMOD Users Guide.

4.11.1.1 Regulatory Options

U.S. EPA regulatory application of AERMOD requires the selection of specific switches (i.e., algorithms) during a model run. All the regulatory options can be set by selecting the DFAULT keyword. The U.S. EPA regulatory options, automatically selected when the DFAULT keyword is used, are:

- Stack-tip downwash
- Incorporates the effects of elevated terrain
- Includes calms and missing data processing routines
- Does not allow for exponential decay for applications other than a 4-hour half life for SO_2

Additional information on these options is available in the AERMOD User's Guide.

4.11.1.2 Special Cases

a. Building Downwash:
AERMOD automatically determines if the plume is affected by the wake region of buildings when their dimensions are given. The specification of building dimensions does not necessarily mean that there will be downwash. See

Section 4.13.1 for guidance on how to determine when downwash is likely to occur.

b. Area Sources:
The area source algorithm in AERMOD estimates source emission strength by integrating an area upwind of the receptor location. Receptors may be placed within the area itself, downwind of the area or adjacent to the area. However, since the vertical distribution parameter (σ_z) goes to zero as the downwind distance goes to zero, the plume function solution is infinite for a downwind receptor distance of zero. In order to avoid such singularity in the plume function solution, the AERMOD model arbitrarily sets the plume function to zero when the receptor distance is less than one meter. As a result, the area source algorithm will not provide reliable solutions for receptors located within or adjacent to very small areas, with dimensions on the order of a few meters across. In these cases, the receptor should be placed at least one meter outside of the area.

c. Volume Sources:
The volume source algorithms in AERMOD require an estimate of the initial distribution of the emission source. The initial distribution of emissions for a volume source is in the horizontal and vertical directions. When modeling volume source emissions, one needs to provide initial horizontal (σ_{y0}) and vertical (σ_{z0}) dimensions as accurate as possible so that pollutant buoyancy and dispersion are also calculated accurately. US EPA's AERMOD User Guide provides suggested procedures to estimate these initial dimensions based on source type (Table 3-1) (U.S. EPA, 2004a).

d. Line Sources:
Examples of line sources include conveyor belts or roads. Depending on the source, these can be modeled three ways; as a line source, as a series of volume sources, or as an elongated area source. Where the emission source is neutrally buoyant, such as a conveyor belt, AERMOD can be used according to the user guide. In the event that the line source is a roadway, then additional considerations are required.

At the present time, CALINE (CALINE3, CAL3QHCR, and CALINE4) is the only model dedicated to modeling the enhanced mechanical and thermal turbulence created by motor vehicles traveling on a roadway. Of these, CAL3QHCR is the only model that accepts hourly meteorological data and can estimate annual average concentrations. However, CALINE uses the Pasquill-Gifford stability categories which are used in the ISCST model. AERMOD is now the preferred plume model over ISCST3 with continuous plume dispersion calculations based on observations but AERMOD does not include the enhanced roadway turbulence. Therefore, in the case where roadway emissions dominate the risk assessment, it may be most important to simulate the enhanced thermal and mechanical turbulence from motor vehicles with the CAL3QHCR model.

In the case where roadway emissions are a subset of all emissions for the risk assessment, including roadway emissions along with facility emissions, it may be best to use AERMOD for all emissions, roadway and facility, in order to maintain continuity with one dispersion model for the risk assessment. If AERMOD is used, it is important to consider that a major freeway may act similar to a large building which can cause some mixing and therefore initial vertical dispersion. This dispersion could be estimated with sensitivity studies based on wind speed, wind angle, roadway orientation, roadway width, and etc. This could be a complex estimation and needs very adept modeling skills. Roadway modeling should be evaluated on a case-by-case basis in consultation with the District or the reviewing authority.

Line sources inputs include a composite fleetwide emission factor, roadway geometry, hourly vehicle activity (i.e., diurnal vehicle per hour pattern), hourly meteorological data, and receptor placement. For practical information on how to simulate roadway emissions using these models, see CAPCOA's website at http://www.capcoa.org or the Sacramento Metropolitan AQMD (SMAQMD) website at http://www.airquality.org/ceqa/RoadwayProtocol.shtml. The SMAQMD has a document titled, "Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways"(January, 2010).

e. Complex Terrain:
AERMOD uses the Dividing Streamline (Hc) concept for complex terrain. Above Hc, the plume is assumed to be "terrain following" in the convective boundary layer. Below Hc, the plume is assumed to be "terrain impacting" in the stable boundary layer. AERMOD computes the concentration at any receptor as a weighted function between the two plume states (U.S. EPA, 2004b).

f. Deposition:
AERMOD contains algorithms to model settling and deposition and requires additional information to do so including particle size distribution. For more information consult the AERMOD User's Guide (U.S. EPA, 2004a).

g. Diurnal Considerations:
Systematic diurnal changes in atmospheric conditions are expected along the coast (or any large body of water) or in substantially hilly terrain. The wind speed and direction are highly dependent on time of day as the sun rises and begins to heat the Earth. The sun heats the surface of the land faster than the water surface. Therefore the air above the land warms up sooner than over water. This creates a buoyant effect of warm air rising over land and the cool air from over water moves in to fill the void. Near large bodies of water (e.g., the ocean) this is known as a sea breeze. In complex terrain this is known as upslope flow as the hot air follows the terrain upwards. When the sun sets and the surface of the land begins to cool, the air above also cools and creates a draining effect. Near the water this is the land breeze; in complex terrain this is known as downslope or drainage flow. In addition, for the sea breeze, the atmospheric

conditions change rapidly from neutral or stable conditions over water to unstable conditions over land.

Near the large bodies of water the sea breeze is typical in the afternoon and the land breeze is typical for the early morning before sunrise. In complex terrain upslope flow is typical in the afternoon, while drainage flow is typical at night. Diurnal profiles need to be evaluated in conjunction with the facility emissions since sources can have varied emission profiles (e.g., some sources are continuously emitting while others are intermittent). These intermittent emission profiles may be influenced by diurnal patterns; therefore, they need to be evaluated to properly estimate potential exposures. For these reasons, it is especially important to simulate facility emissions with a hourly diurnal pattern reflective of source activity so that the risk assessment is representative of daily conditions.

h. 8-hour Modeling for the Offsite Worker's Exposure and Residential Exposure: If the ground level air concentrations from a facility operating 5 days a week, 8 hours per day have been estimated by a 24 hour per day annual average, an adjustment factor can be applied to estimate the air concentration that an offsite worker with the same schedule would be exposed to. The 24-hour annual average concentration is multiplied times 4.2.

If the meteorology during the time that the facility is emitting is used, hourly model simulations need to be post-processed to cull out the data needed for the offsite worker exposure. See Appendix M for information on how to calculate the refined offsite worker concentrations using the hourly raw results from the AERMOD air dispersion model. For more discussion on worker exposure, see Section 4.8.1.

Eight-hour exposure modeling can be used to evaluate the potential for health impacts (including effects of repeated exposures) in children and teachers exposed during school hours. Although not required in the HRA, 8-hour exposure modeling could also be performed at the discretion of the District to a residential scenario (i.e., the MEIR) where a facility operates only a portion of the day and exposure to residences are not adequately reflected by averaging concentrations over a 24 hour day.

4.11.1.3 HARP Dispersion Analysis

It is highly recommended that air dispersion analysis be performed using the HARP software. HARP can perform refined dispersion analysis by utilizing the U.S. EPA standard program AERMOD. In the future, the updated version of HARP will link the AERMOD outputs with risk assessment modules.

4.11.2 *CTDMPLUS*

CTDMPLUS is a Gaussian air quality model for use in all stability conditions in complex terrain. In comparison with other models, CTDMPLUS requires considerably more

detailed meteorological data and terrain information that must be supplied using specifically designed preprocessors. CTDMPLUS was designed to handle up to 40 point sources.

4.12 Modeling to Obtain Concentrations used for Various Health Impacts

The following section outlines how emissions and air dispersion modeling results are used or adjusted for a receptor that is exposed to either a non-continuous or continuously emitting source.

4.12.1 *Emission Rates for Cancer, Chronic, and Acute Health Impacts*

As discussed in Section 4.2.1.1, the HRA should include both annual average emissions and maximum 1-hour emissions for each pollutant emitted by the facility. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment). When applying the emission rates in the air dispersion analysis, it is important not to artificially inflate or deplete the reported emission inventory.

For annual average emissions, the emissions are spread evenly over the entire year for continuous emitting sources. However, for sources where the emission patterns vary (i.e., non-continuous emitting sources), the emission rate should also account for the facility's emission schedule. If appropriate, the variable emissions rate option (e.g., hour-of-day) should be used in the air dispersion analysis. For more information consult the AERMOD User's Guide (U.S. EPA, 2004a). Also, when calculating emission rates for acute health impacts, it is important the emission rates never exceed the reported maximum 1-hour emissions.

4.12.2 *Modeling and Adjustments for Inhalation Cancer Risk at a Worksite*

Modeled long-term averages are typically used for cancer risk assessments for residents and workers. In an inhalation cancer risk assessment for an offsite worker, the long-term average should represent what the worker breathes during their work shift. However, the long-term averages calculated from AERMOD typically represent exposures for receptors that were present 24 hours a day and seven days per week (i.e., the schedule of a residential receptor). To estimate the offsite worker's concentration, there are two approaches. The more refined, complex, and time consuming approach is to post-process the hourly raw dispersion model output and examine the hourly concentrations that fall within the offsite worker's shift. See Appendix M for information on how to simulate the long-term concentration for the offsite worker that can be used to estimate inhalation cancer risk.

In lieu of post-processing the hourly dispersion model output, the more typical approach is to obtain the long-term average concentration as you would for modeling a residential receptor and approximate the worker's inhalation exposure using an adjustment factor. The actual adjustment factor that is used to adjust the concentration may differ from the example below based on the specifics of the source and worker receptor

(e.g., work-shift overlap). Once the worker's inhalation concentration is determined, the inhalation dose is calculated using additional exposure frequency and duration adjustments. See Chapter 5 for more information on the inhalation dose equation.

4.12.2.1 Non-Continuous Sources

When modeling a non-continuously emitting source (e.g., operating for eight hours per day and five days per week), the modeled long-term average concentrations are based on 24 hours a day and seven days per week for the period of the meteorological data set. Even though the emitting source is modeled using a non-continuous emissions schedule, the long-term concentration is still based on 24 hours a day and seven days per week. Thus, this concentration includes the zero hours when the source was not operating. For the offsite worker inhalation risk, we want to determine the long-term concentration the worker is breathing during their work shift. Therefore, the long-term concentration needs to be adjusted so it is based only on the hours when the worker is present. For example, assuming the emitting source and worker's schedules are the same, the adjustment factor is 4.2 = (24 hours per day/8 hours per shift)x(7 days in a week/5 days in a work week). In this example, the long term residential exposure is adjusted upward to represent the exposure to a worker. Additional concentration adjustments may be appropriate depending on the work shift overlap. These adjustments are discussed below.

The calculation of the adjustment factor from a non-continuous emitting source is summarized in the following steps.

a. Obtain the long-term concentrations from air dispersion modeling as is typical for residential receptors (all hours of a year for the entire period of the meteorological data set).

b. Determine the coincident hours per day and days per week between the source's emission schedule and the offsite worker's schedule.

c. Calculate the worker adjustment factor (WAF) using Equation 4.1. When assessing inhalation cancer health impacts, a discount factor (*DF*) may also be applied if the offsite worker's schedule partially overlaps with the source's emission schedule. The discount factor is based on the number of coincident hours per day and days per week between the source's emission schedule and the offsite worker's schedule (see Equation 4.2). The DF is always less than or equal to one.

Please note that worker adjustment factor does not apply if the source's emission schedule and the offsite worker's schedule do not overlap. Since the worker is not present during the time that the source is emitting, the worker is not exposed to the source's emission (i.e., the DF in Equation 4.2 becomes 0).

$$WAF = \frac{H_{residentid}}{H_{source}} \times \frac{D_{residentid}}{D_{source}} \times DF \qquad \text{Eq. 4.1}$$

Where:
WAF = the worker adjustment factor
$H_{residential}$= the number of hours per day the long-term residential concentration is based on (always 24 hours)
H_{source} = the number of hours the source operates per day
$D_{residential}$ = the number of days per week the long-term residential concentration is based on (always 7 days)
D_{source}= the number of days the source operates per week
DF = a discount factor for when the offsite worker's schedule partially overlaps the source's emission schedule. Use 1 if the offsite worker's schedule occurs within the source's emission schedule. If the offsite worker's schedule partially overlaps with the source's emission schedule, then calculate the discount factor using Equation 4.2 below.

$$DF = \frac{H_{coincident}}{H_{worker}} \times \frac{D_{coincident}}{D_{worker}} \qquad \text{Eq. 4.2}$$

Where:
DF = the discount factor for assessing cancer impacts
$H_{coincident}$ = the number of hours per day the offsite worker's schedule and the source's emission schedule overlap
$D_{coincident}$= the number of days per week the offsite worker's schedule and the source's emission schedule overlap
H_{worker} = the number of hours the offsite worker works per day
D_{worker}= the number of days the offsite worker works per week

d. The final step is to estimate the offsite worker's inhalation concentration by multiplying the worker adjustment factor with the long-term residential concentration. The worker's concentration is then plugged into the dose equation and risk calculation.

The HARP software has the ability to calculate worker impacts using an approximation factor and, in the future, it will have the ability to post-process refined worker concentrations using the hourly raw results from an air dispersion analysis.

4.12.2.2 Continuous Sources

If the source is continuously emitting, then the worker is assumed to breathe the long-term annual average concentration during their work shift. Equation 4.1 becomes one and no concentration adjustments are necessary in this situation when estimating the inhalation cancer risk. Note however, if an assessor does not wish to apply the assumption the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

4.12.3 *Modeling and Adjustments for Noncancer 8-Hour RELs*

For 8-hour noncancer health impacts, we evaluate if the receptor (e.g., worker or resident) is exposed to an 8 hour average concentration, occurring daily, that exceeds the 8-hour REL. The 8 hour RELs were derived primarily for the offsite worker scenario. Although not required in an HRA, residential receptors can be evaluated with an 8-hour

REL at the discretion of the District or Reviewing authority. For ease, we use a worker receptor in this discussion and in the discussion below for a non-continuously emitting source. The daily average concentration is intended to represent the long-term average concentration the worker is breathing during the work shift. In general, there are two approaches for estimating the concentration used for the 8-hour hazard index. The more refined, complex, and time consuming approach is to post-process the hourly dispersion model output and use only the hourly concentrations that are coincident with the offsite worker hours to obtain the long-term concentration. See Appendix M for information on how to simulate the daily average concentration through air dispersion modeling.

Before proceeding through a refined analysis described in Appendix M, the assessor may wish to approximate the long-term concentration, as described below, and calculate the 8-hour hazard index. In lieu of post-processing the hourly dispersion model output described in Appendix M, the more typical approach is to obtain the long-term average concentration as you would for modeling a residential receptor and approximate the worker's inhalation concentration using an adjustment factor. The method for applying the adjustment factor is described in the section below.

The results from the 8-hour hazard index calculations should not be combined with the chronic or acute hazard indices. Each of the potential noncancer health impacts should be reported independently. See Chapter 8 for more discussion on calculating health impacts.

4.12.3.1 Non-Continuous Sources

When modeling a non-continuously emitting source (e.g., operating for eight hours per day and five days per week), the modeled long-term average concentrations are based on 24 hours a day and seven days per week for the period of the meteorological data set. Even though the emitting source is modeled using a non-continuous emissions schedule, the long-term concentration is still based on 24 hours a day and seven days per week. Thus, this concentration includes the zero hours when the source was not operating. For the offsite worker 8-hour hazard index, we want to determine the long-term average daily concentration the worker may be breathing during their work shift. This is similar to the cancer approximation adjustment method with one difference; there is no adjustment for partial overlap between the worker's schedule and the source's emission schedule. The reason for this difference in methodology is because the 8-hour REL health factors are designed for repeated 8-hour exposures and cannot readily be adjusted to other durations of exposure. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA.

When calculating the long-term average daily concentration for the 8-hour REL comparison, the long-term residential concentration needs to be adjusted so it is based only on the operating hours of the emitting source with the assumption the offsite

worker's shift falls within the emitting source's schedule. For example, assuming the emitting source operates 8 hours per day, 5 days per week and the offsite worker's schedules falls anywhere within this period of emissions, then the adjustment factor is 4.2 = (24 hours per day/8 hours of emissions per day)x(7 days in a week/5 days of emissions per week). In this example, the long term residential exposure is adjusted upward to represent the 8-hour exposure to a worker. No adjustments are applied for partial work shift overlap with the emitting source. If the source emits at night, then see Appendix N for additional recommendations.

Using the approximation factor is a screening method. If the 8-hour hazard index is above a threshold of concern with this method, the district or assessor should contact OEHHA for further guidance regarding the substance of concern. If necessary, further evaluation can be performed using the refined daily average modeling methodology discussed in Appendix M.

The calculation of the adjustment factor from a non-continuous emitting source is summarized in the following steps.

b. Obtain the long-term concentrations from air dispersion modeling as is typical for residential receptors (all hours of a year for the entire period of the meteorological data set).

c. Calculate the worker adjustment factor (WAF) using Equation 4.3. The source's emission schedule is assumed to overlap offsite worker's schedule. Note that the worker adjustment factor and the 8-hour inhalation REL do not apply if the source's emission schedule and the offsite worker's schedule do not overlap at some point.

$$WAF = \frac{H_{residentid}}{H_{source}} \times \frac{D_{residentid}}{D_{source}} \qquad \text{Eq. 4.3}$$

Where:

WAF = the worker adjustment factor
$H_{residential}$= the number of hours per day the long-term residential concentration is based on (always 24 hours)
H_{source} = the number of hours the source operates per day
$D_{residential}$ = the number of days per week the long-term residential concentration is based on (always 7 days).
D_{source}= the number of days the source operates per week.

d. The final step is to estimate the offsite worker's daily average inhalation concentration by multiplying the WAF with the long-term residential concentration. The worker's concentration is then used to calculate the 8-hour hazard index. This method using the approximation factor is a screening method. If the 8-hour hazard index is above a threshold of concern, the district or assessor should contact OEHHA for further guidance regarding the substance of concern.

In the future, the HARP software will have the ability to use 8-hour RELs, calculate worker impacts using an approximation factor, and to post-process worker concentrations using the hourly raw results from an air dispersion analysis.

4.12.3.2 Continuous Sources

If the source is continuously emitting, then the worker is assumed to breathe the long-term annual average concentration during their work shift and no concentration adjustments are made when estimating 8-hour health impacts. Note however, if an assessor does not wish to assume the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

Note that 8-hour RELs are not typically used for continuously emitting sources for residential receptors. In this situation it is only necessary to estimate a chronic Hazard Index using the annual average concentrations and chronic RELs. However, there may be situations where the District may wish to assess an 8-hour Hazard Index, for example, where there are significant differences in modeled concentration of emissions during the day due to diurnal wind patterns.

4.12.4 *Modeling and Adjustment Factors for Noncancer Chronic RELs*

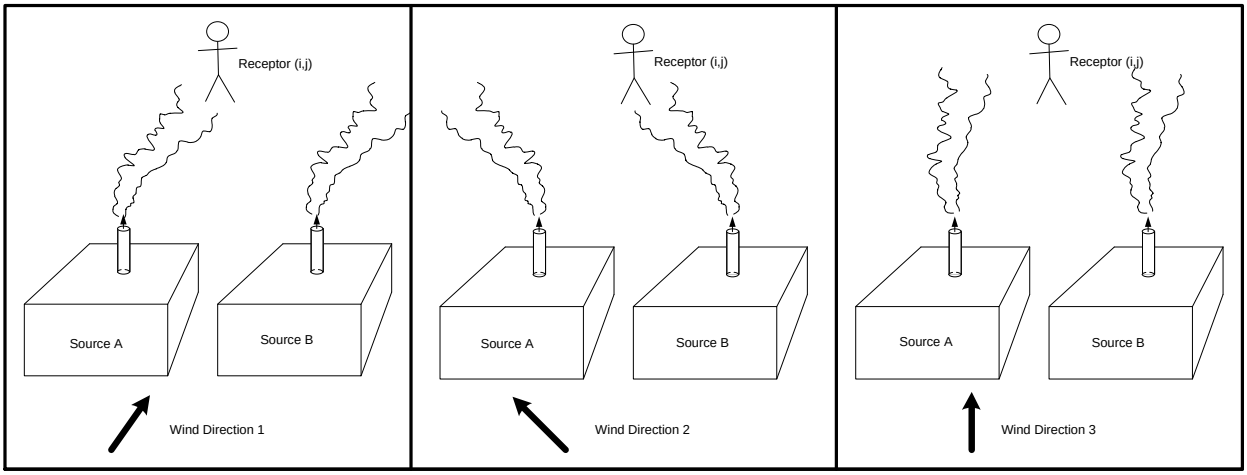
Potential chronic noncancer health impacts use the long-term annual average concentration regardless of the emitting facility's schedule. No adjustment factors should be used to adjust this concentration. Chronic RELs are used to assess not only residential health impacts, but in many cases worker health impacts as well. There are currently only a limited number of substances with an 8-hour inhalation REL, and a facility may emit only, or mostly, substances that currently have just a chronic REL. Until there are 8-hour RELs for all the Hot Spots substances emitted from a specified facility, we recommend determining the chronic HI for the MEIW to adequately protect the offsite worker.

The results from the chronic hazard index calculations are not combined with the 8-hour or acute hazard indices. All potential noncancer results should be reported independently. See Chapter 8 for more discussion on calculating health impacts.

4.12.5 *Modeling and Adjustments for Oral Cancer Potencies and Oral RELs*

When estimating the cancer risk or noncancer health impacts from noninhalation pathways, no adjustment is made to the long-term annual average concentration regardless of the emitting facility's schedule. Since the media (e.g., soil) at the receptor location where deposition takes place for noninhalation pathways is continuously present, the concentrations used for all noninhalation pathways are not adjusted (up or down) by an adjustment factor. However, some adjustments are made to the concentration once the pollutants reach the media, for example, pollutants undergo decay in soils. In addition, when the dose for each pathway is calculated, exposure adjustments may also be made. See Chapter 5 of this document and the Technical

Support Document for Exposure Assessment and Stochastic Analysis (OEHHA, 2012) to get more information on these types of adjustments. Oral cancer potencies and oral RELs are used to assess both residential or worker health impacts.



4.12.6 *Modeling One-Hour Concentrations using Simple and Refined Acute Calculations*

Modeled one-hour concentrations are needed for the acute health hazard index calculations. HARP has two methods to calculate this concentration: Simple and Refined. As an aid to understanding the differences between Simple and Refined, Figure 2 shows three possible conditions showing how wind direction may vary and impact a downwind receptor (i,j) differently from just two sources (A and B).

For the Simple calculation, HARP stores only the maximum one-hour concentration at each receptor (i,j) from each source (A and B) as the dispersion model marches down each hour of the simulation (e.g., one to five years of hourly data). At the end of the simulation period, HARP reports back only the maximum impacts at each receptor from each source regardless of which hour of the simulation period this occurred. For example, the Simple Maximum Acute Impacts would be the summation of Source A impacts from Wind Direction 1 and Source B impacts from Wind Direction 2 as shown in Figure 2.

For the Refined simulation, HARP stores each hourly concentration at each receptor (i,j) from each source. At the end of the simulation period, HARP evaluates the coincident impact at each receptor from all sources for each hour of the simulation period. In this case the maximum impacts will be identified by a particular hour of the period with associated wind speed, direction, and atmospheric conditions. For example, the Refined Maximum Acute impact from Sources A and B on receptor (i,j) could be from any wind direction (1,2, or 3) as shown in Figure 2. Since HARP stores all simulations for all sources – at all receptors – for all hours to calculate the refined impacts, there is great potential to fill large amounts of disk storage space. The Refined simulation provides a more representative picture of the maximum acute hazard index from a facility. The Simple calculation will provide an upper bound to the acute hazard index.

Figure 2 Acute Scenarios

4.13 Modeling Special Cases; Specialized Models

Special situations arise in modeling some sources that require considerable professional judgment; a few are outlined below. It is recommended that the reader consider retaining professional consultation services if the procedures are unfamiliar. The following sections, taken mostly from the document "On-Site Meteorological Program Guidance for Regulatory Modeling Applications" (U.S. EPA, 1995e), provide general information on data formats and representativeness. Some Districts may have slightly different recommendations from those given here.

4.13.1 *Building Downwash*

The entrainment of a plume in the wake of a building can result in the "downwash" of the plume to the ground. This effect can increase the maximum ground-level concentration downwind of the source. Therefore, stack sources must be evaluated to determine whether building downwash is a factor in the calculation of maximum ground-level concentrations.

The PRIME algorithm, included with AERMOD, has several advances in modeling building downwash effects including enhanced dispersion in the wake, reduced plume rise due to streamline deflection and increased turbulence, and continuous treatment of the near and far wakes (Schulman, 2000).

Complicated situations involving more than one building may necessitate the use of the Building Profile Input Program (BPIP) which can be used to generate the building dimension section of the input file of the ISC models (U.S. EPA, 1993). The BPIP program calculates each building's direction-specific projected width. The Building Profile Input Program for PRIME (BPIPPRM) is the same as BPIP but includes an algorithm for calculating downwash values for input into the PRIME algorithm which is contained in such models as AERMOD. The input structure of BPIPPRM is the same as that of BPIP.

4.13.2 *Deposition*

There are two types of deposition: wet deposition and dry deposition. Wet deposition is the incorporation of gases and particles into rain-, fog- or cloud water followed by a precipitation event and also rain scavenging of particles during a precipitation event. Wet deposition of gases is therefore more important for water soluble chemicals; particles (and hence particle-phase chemicals) are efficiently removed by precipitation events (Bidleman, 1988). Dry deposition refers to the removal of gases and particles from the atmosphere.

In the Air Toxics "Hot Spots" program, deposition is quantified for particle-bound pollutants and not gases. Wet deposition of water-soluble gas phase chemicals is thus not considered. When calculating pollutant mass deposited to surfaces without including depletion of pollutant mass from the plume, airborne concentrations remaining in the plume and deposition to surfaces can be overestimated, thereby resulting in overestimates of both the inhalation and multi-pathway risk estimates. However, neglecting deposition in the air dispersion model, while accounting for it in the multipathway health risk assessment, is a conservative, health protective approach (CAPCOA, 1987; Croes, 1988). Misapplication of plume depletion can also lead to possible underestimates of multi-pathway risk and for that reason no depletion is the default assumption. If plume depletion is incorporated, then some consideration for possible resuspension is warranted. An alternative modeling methodology accounting for plume depletion can be discussed with the Air District and used in an approved modeling protocol.

Although not generally used, several air dispersion models can provide downwind concentration estimates that take into account the upwind deposition of pollutants to surfaces and the consequential reduction of mass remaining in the plume. Air dispersion models having deposition and plume depletion algorithms require particle distribution data that are not always readily available. These variables include particle size, mass fraction, and density for input to AERMOD. In addition, the meteorological fields need to include additional parameters including relative humidity, precipitation, cloud cover, and surface pressure. Consequently, depletion of pollutant mass from the plume often is not taken into account.

In conclusion, multipathway risk assessment analyses normally incorporate deposition to surfaces in a screening mode, specifically by assigning a default deposition velocity of 2 cm/s for controlled sources and 5 cm/s for uncontrolled sources in lieu of actual measured size distributions (ARB, 1989). For particles (and particle-phase chemicals), the deposition velocity depends on particle size and is minimal for particles of diameter approximately 0.1-1 micrometer; smaller and larger particles are removed more rapidly.

4.13.3 *Short Duration Emissions*

Short-duration emissions (i.e., much less than an hour) require special consideration. In general, "puff models" provide a better characterization of the dispersion of pollutants having short-duration emissions. Continuous Gaussian plume models have traditionally

been used for averaging periods as short as about 10 minutes and are not recommended for modeling sources having shorter continuous emission duration.

4.13.4 *Fumigation*

Fumigation occurs when a plume that was originally emitted into a stable layer in the atmosphere is mixed rapidly to ground-level when unstable air below the plume reaches plume level. Fumigation can cause very high ground-level concentrations. Typical situations in which fumigation occurs are:

- Breaking up of a nocturnal radiation inversion by solar warming of the ground surface (rising warm unstable air); note that the break-up of a nocturnal radiation inversion is a short-lived event and should be modeled accordingly.

- Shoreline fumigation caused by advection of pollutants from a stable marine environment to an unstable inland environment

- Advection of pollutants from a stable rural environment to a turbulent urban environment

SCREEN3 incorporates concentrations due to inversion break-up and shoreline fumigation and is limited to maximum hourly evaluations. The Offshore and Coastal Dispersion Model incorporates overwater plume transport and dispersion as well as changes that occur as the plume crosses the shoreline – hourly meteorological data are needed from both offshore and onshore locations.

4.13.5 *Raincap on Stack*

The presence of a raincap or any obstacle at the top of the stack hinders the momentum of the exiting gas. The extent of the effect is a function of the distance from the stack exit to the obstruction and of the dimensions and shape of the obstruction.

On the conservative side, the stack could be modeled as having a non-zero, but negligible exiting velocity, effectively eliminating any momentum rise. Such an approach would result in final plume heights closer to the ground and therefore higher concentrations nearby. There are situations where such a procedure might lower the actual population-dose and a comparison with and without reduced exit velocity should be examined.

Plume buoyancy is not strongly reduced by the occurrence of a raincap. Therefore, if the plume rise is dominated by buoyancy, it is not necessary to adjust the stack conditions. (The air dispersion models determine plume rise by either buoyancy or momentum, whichever is greater.)

The stack conditions should be modified when the plume rise is dominated by momentum and in the presence of a raincap or a horizontal stack. Sensitivity studies with the SCREEN3 model, on a case-by-case basis, can be used to determine whether

plume rise is dominated by buoyancy or momentum. The District should be consulted before applying these procedures.

- Set exit velocity to 0.001 m/sec
- Turn stack tip downwash off
- Reduce stack height by 3 times the stack diameter

Stack tip downwash is a function of stack diameter, exit velocity, and wind speed. The maximum stack tip downwash is limited to three times the stack diameter in the AERMOD air dispersion model. In the event of a horizontal stack, stack tip downwash should be turned off and no stack height adjustments should be made. Note: This approach may not be valid for large (several meter) diameter stacks.

An alternative, more refined, approach could be considered for stack gas temperatures which are slightly above ambient (e.g., ten to twenty degrees Fahrenheit above ambient). In this approach, the buoyancy and the volume of the plume remain constant and the momentum is minimized.

- Turn stack tip downwash off
- Reduce stack height by 3 times the stack diameter ($3D_o$)
- Set the stack diameter (D_b) to a large value (e.g., 10 meters)
- Set the stack velocity to $V_b = V_o (D_o/D_b)^2$

Where V_o and D_o are the original stack velocity and diameter and V_b and D_b are the alternative stack velocity and diameter for constant buoyancy. This approach is advantageous when $D_b >> D_o$ and $V_b << V_o$ and should only be used with District approval.

In the presence of building downwash and in the event that PRIME downwash is being utilized in AERMOD, an alternative approach is recommended. PRIME algorithms use the stack diameter to define initial plume radius and to solve conservation laws. The user should input the actual stack diameter and exit temperature but set the exit velocity to a nominally low value (e.g., 0.001 m/s). Also since PRIME does not explicitly consider stack-tip downwash, no adjustments to stack height should be made.

Currently U.S. EPA is BETA testing options for capped and horizontal releases in AERMOD. It is expected that these options will replace the above guidance when BETA testing is complete.

4.13.6 *Landfill Sites*

Landfills should be modeled as area sources. The possibility of non-uniform emission rates throughout the landfill area should be investigated. A potential cause of non-uniform emission rates would be the existence of cracks or fissures in the landfill cap (where emissions may be much larger). If non-uniform emissions exist, the landfill should be modeled with several smaller areas assigning an appropriate emission factor to each one of them, especially if there are nearby receptors (distances on the same order as the dimensions of the landfill).

4.14 Specialized Models

Some models have been developed for application to very specific conditions. Examples include models capable of simulating sources where both land and water surfaces affect the dispersion of pollutants and models designed to simulate emissions from specific industries.

4.14.1 *Buoyant Line and Point Source Dispersion Model (BLP)*

BLP is a Gaussian plume dispersion model designed for the unique modeling problems associated with aluminum reduction plants, and other industrial sources where plume rise and downwash effects from stationary line sources are important.

4.14.1.1 Regulatory Application

Regulatory application of BLP model requires the selection of the following options:

- rural (IRU=l) mixing height option;
- default (no selection) for all of the following: plume rise wind shear (LSHEAR), transitional point source plume rise (LTRANS), vertical potential temperature gradient (DTHTA), vertical wind speed power law profile exponents (PEXP), maximum variation in number of stability classes per hour (IDELS), pollutant decay (DECFAC), the constant in Briggs' stable plume rise equation (CONST2), constant in Briggs' neutral plume rise equation (CONST3), convergence criterion for the line source calculations (CRIT), and maximum iterations allowed for line source calculations (MAXIT); and
- terrain option (TERAN) set equal to 0.0, 0.0, 0.0, 0.0, 0.0, 0.0.

For more information on the BLP model consult the user's guide (Schulman and Scire, 1980).

4.14.2 *Offshore and Coastal Dispersion Model (OCD)*

OCD (DiCristofaro and Hanna, 1989) is a straight-line Gaussian model developed to determine the impact of offshore emissions from point, area or line sources on the air quality of coastal regions. OCD incorporates "over-water" plume transport and dispersion as well as changes that occur as the plume crosses the shoreline. Hourly meteorological data are needed from both offshore and onshore locations. Additional data needed for OCD are water surface temperature, over-water air temperature, mixing height, and relative humidity.

Some of the key features include platform building downwash, partial plume penetration into elevated inversions, direct use of turbulence intensities for plume dispersion, interaction with the overland internal boundary layer, and continuous shoreline fumigation.

4.14.2.1 Regulatory Application

OCD has been recommended for use by the Minerals Management Service for emissions located on the Outer Continental Shelf (50 FR 12248; 28 March 1985). OCD is applicable for over-water sources where onshore receptors are below the lowest source height. Where onshore receptors are above the lowest source height, offshore plume transport and dispersion may be modeled on a case-by-case basis in consultation with the District.

4.14.3 *Shoreline Dispersion Model (SDM)*

SDM (PEI, 1988) is a hybrid multipoint Gaussian dispersion model that calculates source impact for those hours during the year when fumigation events are expected using a special fumigation algorithm and the MPTER regulatory model for the remaining hours.

SDM may be used on a case-by-case basis for the following applications:

- tall stationary point sources located at a shoreline of any large body of water;
- rural or urban areas;
- flat terrain;
- transport distances less than 50 km;
- 1-hour to 1-year averaging times.

4.15 Interaction with the District

The risk assessor must contact the District to determine if there are any specific requirements. Examples of such requirements may include, but are not limited to: specific receptor location guidance, specific usage of meteorological data, and specific report format (input and output). See Chapter 9 for more information on the format and content of modeling protocols and HRAs.

4.15.1 *Submittal of Modeling Protocol*

It is strongly recommended that a modeling protocol be submitted to the District for review and approval prior to extensive analysis with an air dispersion model. The modeling protocol is a plan of the steps to be taken during the air dispersion modeling process. Following is an example of the format that may be followed in the preparation of the modeling protocol. **Consult with the District to confirm format and content requirements or to determine the availability of District modeling guidelines before submitting the protocol.**

Outline for a Modeling Protocol

I. Introduction

Include the facility name, address, and a brief overview describing the facility's operations.

- Provide a description of the terrain and topography surrounding the facility and potential receptors.

- Indicate the format in which data will be provided. Ideally, the report and summary of data will be on paper and all data and model input and output files will be provided electronically (e.g., compact disk or CD).

- Identify the guidelines used to prepare the protocol (e.g., District Guidelines).

II. Emissions

For each pollutant and process whose emissions are required to be quantified in the HRA, list the annual average emissions (pounds/year and grams/second) and the maximum one-hour emissions (pounds/hour and grams/second)[2]. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).

- Identify the reference and method(s) used to determine emissions (e.g., source tests, emission factors, etc.). Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report. In this event, a revised emission inventory report will need to be submitted to the District.

- Identify if this will be a multipathway assessment based on emitted substances.

III. Models / Modeling Assumptions

Specify the model and modeling assumptions

- Identify the model(s) to be used, including the version number.

- Identify the model options that will be used in the analysis.

---

[2] Except radionuclides, for which annual and hourly emissions are reported in Curies/year and millicuries/hour, respectively.

- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all of the receptors of interest.

- Indicate complex terrain options that may be used, if applicable.

- Identify the source type(s) that will be used to represent the facility's operations (e.g., point, area, or volume sources, flare options or other).

- Indicate the preliminary source characteristics (e.g., stack height, gas temperature, exit velocity, dimensions of volume source, etc.).

- Identify and support the use of urban or rural dispersion coefficients for those models that require dispersion coefficients. For other models, identify and support the parameters required to characterize the atmospheric dispersion due to land characteristics (e.g., surface roughness, Monin-Obukhov length).

IV. Meteorological Data

Specify the type, source, and year(s) of hourly meteorological data (e.g., hourly surface data, upper air mixing height information).

- State how the data are representative for the facility site.

- Describe QA/QC procedures.

- Identify any gaps in the data; if gaps exist, describe how the data gaps are filled.

V. Deposition

- Specify the method to calculate deposition (if applicable).

VI. Receptors

Specify the type and location of receptors. Include all relevant information describing how the individual and population-related receptors will be evaluated.

- Identify and describe the location(s) of known or anticipated potential sensitive receptors, the point of maximum impact (PMI), and the maximum exposed individual residential (MEIR) and worker (MEIW) receptors. Identify any special considerations or grids that will be used to model these receptors. This information should correspond with information provided in Section III (e.g., fine receptor spacing of 20 meters at the fence line and centered on the maximum impacts; coarse receptor spacing of 100 meters out to 2,000 meters; extra coarse spacing of 1,000 meters out to 20,000 meters).

- Identify if spatial averaging will be used. Include necessary background information on each receptor including how the domain and spacing will be determined for each receptor or exposure pathway.

- Describe how the cancer burden or population impact estimates are calculated. Clarify the same information for the presentation of noncancer population impacts (e.g., centroids of the census tracts in the area within the zone of impact).

- Specify that actual UTM coordinates and the block/street locations (i.e., north side of 3,000 block of Smith Street), where possible, will be provided for specified receptor locations.

- Identify and support the use of any exposure adjustments (e.g., time a location, diurnal).

- Include the list of anticipated exposure pathways that will be included and indicate which substance will be evaluated in the multipathway assessment. Identify if sensitive receptors are present and which receptors will be evaluated in the HRA.

VII. Maps

Identify how the information will be graphically presented.

- Indicate which cancer risk isopleths will be plotted for the cancer zone of impact (e.g., 10^{-7}, 10^{-6} see Section 4.6.1).

- Indicate the hazard quotients or hazard indices to be plotted for the noncancer acute, 8 hour, and chronic zones of impact (e.g., 0.5, 1.0, etc.).

4.16 Health Risk Assessment Report

This section describes the information related to the air dispersion modeling process that needs to be reported in the risk assessment. This section is also presented in Chapter 9, Summary of the Requirements for a Modeling Protocol and a Health Risk Assessment Report, in Section 9.2. The District may have specific requirements regarding format and content (see Section 4.15). Sample calculations should be provided at each step to indicate how reported emissions data were used. Reviewing agencies must receive input, output, and supporting files of various model analyses on computer-readable media (e.g., CD).

4.16.1 *Information on the Facility and its Surroundings*

Report the following information regarding the facility and its surroundings:

- Facility Name

- Location (UTM coordinates and street address)
- Land use type (see Section 2.4)
- Local topography
- Facility plot plan identifying:
  - source locations
  - property line
  - horizontal scale
  - building heights
  - emission sources

4.16.2 *Source and Emission Inventory Information*[3]

4.16.2.1 Release Parameters

Report the following information for each release location in table format:

- Release location identification number
- Release name
- Release type (e.g., point, volume, area, line, pit, etc.)
- Source identification number(s) used by the facility that emit out of this release location
- Release location using UTM coordinates
- Release parameters by release type (e.g., shown for point source):
  - Stack height (m), stack diameter (building dimensions for downwash), exhaust gas exit velocity (m/s), exhaust gas volumetric flow rate (ACFM), exhaust gas exit temperature (K), etc.

4.16.2.2 Source Description and Operating Schedule

The description and operating schedule for each source should be reported in table form including the following information:

- Source identification number used by the facility
- Source name
- Number of operating hours per day and per year (e.g., 0800-1700, 2700 hr/yr)
- Number of operating days per week (e.g., Mon-Sat)
- Number of operating days or weeks per year (e.g., 52 wk/yr excluding major holidays)
- Release point identification number(s) for where source emissions are released

[3] Health and Safety Code section 44346 authorizes facility operators to designate certain "Hot Spots" information as trade secret. Section 44361(a) requires districts to make health risk assessments available for public review upon request. Section 44346 specifies procedures to be followed upon receipt of a request for the release of trade secret information. See also the Inventory Guidelines Report regarding the designation of trade secret information in the Inventory Reports.

- Fraction of source emissions emitted at each release point by release point ID number

4.16.2.3 Emission Control Equipment and Efficiency

Report emission control equipment and efficiency by source and by substance

4.16.2.4 Emissions Data Grouped By Source

Report emission rates for each toxic substance, grouped by source (i.e., emitting device or process identified in Inventory Report), in table form including the following information:

- Source name
- Source identification number
- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

4.16.2.5 Emissions Data Grouped by Substance

Report facility total emission rate by substance for all emitted substances listed in the Air Toxics “Hot Spots” Program including the following information:

- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

4.16.2.6 Emission Estimation Methods

Report the methods used in obtaining the emissions data indicating whether emissions were measured or estimated. Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report and submit a revised emission inventory report to the district. A reader should be able to reproduce the risk assessment without the need for clarification.

4.16.2.7 List of Substances

Include tables listing all "Hot Spots" Program substances which are emitted, plus any other substances required by the District. Indicate substances to be evaluated for cancer risks and noncancer health impacts.

4.16.3 *Exposed Population and Receptor Location*

Report the following information regarding exposed population and receptor locations. See Chapter 9 and specific sections within this chapter for more detailed information.

- Description of zone of impact including map showing the location of the facility, boundaries of zone of impact, census tracts, emission sources, sites of maximum exposure, and the location of all appropriate receptors. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5 minute maps or GIS based maps are usually the most appropriate choices. (If significant development has occurred since the user's survey, this should be indicated.)
- Separate maps for the cancer risk zone of impact and the hazard index (noncancer) zone of impact(s). The cancer zone of impact should include isopleths down to at least the 1/1,000,000 risk level. Because some districts use a level below 1/1,000,000 to define the zone of impact, the District should be consulted. Three separate maps (to represent both chronic, 8-hour, and acute HI) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 0.5. The point of maximum impact (PMI), maximum exposed individual at a residential receptor (MEIR), the maximum exposed individual worker (MEIW), and any other locations of interest for both cancer and noncancer risks should be located on the maps.
- Tables identifying population units and sensitive receptors (UTM coordinates, receptor IDs, and street addresses of specified receptors).
- Heights or elevations of the receptor points.
- For each receptor type (e.g., PMI, MEIR, MEIW, and any other location(s) of interest) that will utilize spatial averaging, the domain size and grid resolution must be clearly identified. If another domain or grid resolution other than 20 meters by 20 meters with 5-meter grid spacing will be used for a receptor, then care should be taken to determine the proper domain size and grid resolution that should be used. For a worker, the HRA shall support all assumptions used, including, but not limited to, documentation for all workers showing the area where each worker routinely performs their duties. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain should be sufficient in number and detail to obtain a representative concentration across the area of interest. When spatial averaging over the deposition area of a pasture, garden, or water body, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the pasture, garden, or water body of interest should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture or water body, maps,

representative coordinates, grid resolution, concentration gradients, etc.). The use or spatial averaging is subject to approval by the reviewing authority. This includes the size of the domain and grid resolution that is used for spatial averaging of a worksite or multipathway deposition area.

4.16.4 *Meteorological Data*

If meteorological data were not obtained directly from the District, then the report must clearly indicate the data source and time period used. Meteorological data not obtained from the District must be submitted in electronic form along with justification for their use including information regarding representativeness and quality assurance.

The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating the District's approval of meteorological data should be attached in an appendix.

4.16.5 *Model Selection and Modeling Rationale*

The report should include an explanation of the model chosen to perform the analysis and any other decisions made during the modeling process. The report should clearly indicate the name of the models that were used, the level of detail (screening or refined analysis) and the rationale behind the selection.

Also report the following information for each air dispersion model used:

- version number
- selected options and parameters in table form
- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all receptors of interest.

4.16.6 *Air Dispersion Modeling Results*

- Maximum hourly and annual average concentrations of chemicals at appropriate receptors such as the residential and worker MEI receptors
- Annual average and maximum one-hour (and 30-day average for lead only) concentrations of chemicals at appropriate receptors listed and referenced to computer printouts of model outputs
- Model printouts (numbered), annual concentrations, maximum hourly concentrations
- Disk with input/output files for air dispersion program (e.g., the AERMOD input file containing the regulatory options and emission parameters, receptor locations, meteorology, etc.)
- Include tables that summarize the annual average concentrations that are calculated for all the substances at each site. The use of tables that present the relative contribution of each emission point to the receptor concentration is recommended. (These tables should have clear reference to the computer

model which generated the data. It should be made clear to any reader how data from the computer output were transferred to these tables.) [As an alternative, the above two tables could contain just the values for sites of maximum impact (i.e., PMI, MEIR and MEIW), and sensitive receptors, if required. All the values would be found in the Appendices.]

5 - Exposure Assessment
Estimation of Concentration and Dose

5.1 Introduction

This chapter provides a summary of how toxicant ground level air concentrations estimated from air dispersion modeling or monitoring results are used to determine dose at receptors of interest. This chapter includes all the algorithms and data (e.g., point estimates, distributions, and transfer factors) that are needed to determine the substance-specific concentration in exposure media and the dose at a receptor of interest. The determination of exposure concentration and dose precedes the calculations of potential health impacts. See Chapter 8 and Appendix I for information on calculating potential health impacts.

At a minimum, three receptors are evaluated in Hot Spots health risk assessments (HRA) (see Section 4.7); these are:

- the Point of Maximum Impact (PMI),
- the Maximally Exposed Individual Resident (MEIR), and
- the Maximally Exposed Individual Worker (MEIW).

The PMI is defined as the receptor point(s) with the highest acute, 8-hour, chronic, or cancer health impact outside the facility boundary. The facility boundary is defined as the property line. Often the fence is on the property line. The MEIR is typically defined as the existing off-site residence(s) (i.e., house, apartment or other dwelling) with the highest acute, chronic, or cancer health impact. Calculating an 8-hour hazard index is not required for the MEIR, but can be performed at the discretion of the District. The MEIW is typically defined as the existing offsite workplace with the highest acute, 8-hour, chronic, or cancer health impact.

In addition, it may be necessary to determine risks at sensitive receptors (e.g., schools, day care centers, elder care centers, and hospitals). The District or reviewing authority should be consulted in order to determine the appropriate sensitive receptors for evaluation. Some situations may require that on-site receptor (worker or residential) locations be evaluated. Some examples where the health impacts of on-site receptors may be appropriate could be military base housing, prisons, universities, or locations where the public may have regular access for the appropriate exposure period (e.g., a lunch time café or museum for acute exposures). The risk assessor should contact the Air Pollution Control or Air Quality Management District (the District) for guidance about any on-site exposure situations at the emitting facility. These on-site locations should be included in the health risk assessment (HRA). If the facility emits multiple substances from two or more stacks, the acute, 8-hour, chronic, and cancer health impacts at the PMI may be located at different physical locations. The MEIR or MEIW cancer, acute, 8-hour, and chronic receptors may also be at different locations.

The process for determining dose at the receptor location, and ultimately potential health impacts, will likely include air dispersion modeling, and, with less frequency, air monitoring data. Air dispersion modeling combines the facility emissions and release parameters and uses default or site-specific meteorological conditions to estimate downwind, ground-level concentrations at various (user-defined) receptor locations. Air dispersion modeling is described in Chapter 4 and is presented in detail in the *Air Toxics Hot Spots Program Risk Assessment Guidelines; Technical Support Document for Exposure Assessment and Stochastic Analysis (OEHHA, 2012a*).

In summary, the process of using air dispersion modeling results as the basis of an HRA follows these four steps:

- Air dispersion modeling is used to estimate annual average and maximum one-hour ground level concentrations (GLC). The air dispersion modeling results are expressed as an air concentration or in terms of (Chi over Q) for each receptor point. (Chi over Q) is the modeled downwind air concentration (Chi) based on an emission rate of one gram per second (Q). (Chi over Q) is expressed in units of micrograms per cubic meter per gram per second, or ($\mu g/m^3$)/(g/s). (Chi over Q) is sometimes written as (χ/Q) and is sometimes referred to as the dilution factor.

- When multiple substances are evaluated, the χ/Q is normally utilized since it is based on an emission rate of one gram per second. The χ/Q at the receptor point of interest is multiplied by the substance-specific emission rate (in g/s) to yield the substance-specific ground-level concentration (GLC) in units of $\mu g/m^3$. The following equations illustrate this point.

$$\mathbf{GLC} = \left(\frac{\chi}{\mathbf{Q}}\right) \mathbf{x} \left(\mathbf{Q}_{\mathbf{substance}}\right)$$

$$\frac{\chi}{\mathbf{Q}} = \mathbf{(Chi\ \ over\ \ Q)\ in} \left(\frac{\frac{\mu \mathbf{g}}{\mathbf{m}^3}}{\frac{\mathbf{g}}{\mathbf{s}}} \right), \mathbf{\ from\ model\ results\ with\ unit\ emission\ rate}$$

$$\mathbf{Q}_{\mathbf{substance}} = \mathbf{\ substance\ specific\ emission\ rate} \left(\frac{\mathbf{g}}{\mathbf{s}}\right)$$

- The applicable exposure pathways (e.g., inhalation, soil contact, fish consumption) are identified for the emitted substances, and the receptor locations are identified. This determines which exposure algorithms in this chapter are ultimately used to estimate dose. After the exposure pathways are identified, the fate and transport algorithms described in this chapter are used to estimate concentrations in the applicable exposure media (e.g., soil or water) and the exposure algorithms are used to determine the substance-specific dose.

- The dose is used with cancer and noncancer health values to calculate the potential health impacts for the receptor (Chapter 8). An example calculation

using the high-end point-estimates for the inhalation (breathing) exposure pathway can be found in Appendix I. Appendix I and Chapters 5 (this Section) and 8 also contain information on how the annual average and maximum one-hour ground level concentrations are used for chronic, 8-hour, and acute health risk calculations.

The algorithms in this chapter are also used to calculate media concentrations and dose in the rare instance, for the Hot Spots program, when monitoring equipment was used rather than air dispersion modeling to obtain a receptor's substance-specific GLC. One situation that is specific to monitored data is the treatment of results below the sampling method level of detection (LOD). In short, it is standard risk assessment practice when monitoring results are reported both above and below the LOD to use one-half of the LOD for those sample concentrations reported below the LOD. If all testing or monitoring results fall below the LOD, then assessors should contact the District for appropriate procedures. For more information about reporting emissions under the Hot Spots Program, see the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5),* and the *Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007*)*.

The recommended model for calculating and presenting HRA results for the Hot Spots Program is the HARP software, available from the Air Resources Board (ARB). More information on HARP and directions for downloading the software can be found on the ARB's web site at http://www.arb.ca.gov/toxics/harp/downloads.htm.

5.2 Criteria for Exposure Pathway Evaluation

In order to determine total dose to the receptor the applicable pathways of exposure need to be identified. The inhalation pathway must be evaluated for all Hot Spots substances emitted by the facility. A small subset of Hot Spots substances is subject to deposition onto soil, plants, and water bodies. These substances need to be evaluated by the appropriate noninhalation pathways, as well as by the inhalation pathway, and the results must be presented in all HRAs. These substances include semi-volatile organic chemicals and heavy metals. Such substances are referred to as multipathway substances. Two steps are necessary to determine if a substance should be evaluated for multipathway impacts:

1. Determine whether the substance or its group (e.g., dioxins, PAHs) is listed in Table 5.1.
2. Determine if the substance has an oral reference exposure level (REL) listed in Table 6.4, or if it has an oral cancer slope factor listed in Table 7.1. Two other references for checking the presence of oral health factors are OEHHA's website (OEHHA, 2012b) and the *Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values* on the Air Resources Board website (ARB, 2012). Oral or noninhalation exposure pathways include the ingestion of soil, angler-caught fish, drinking water from surface water sources, mother's milk,

homegrown produce, beef, pork, chicken, eggs and cow's milk. The dermal pathway is also evaluated via contact with contaminated soil.

For all multipathway substances, the minimum exposure pathways that must be evaluated at every residential site (in addition to inhalation) are soil ingestion and dermal exposure. If dioxins, furans, PCBs, PAHs or lead are emitted, then the breast-milk consumption pathway also becomes mandatory. The other exposure pathways (e.g., the ingestion of homegrown produce or angler-caught fish) are evaluated on a site-by-site basis. If the resident can be exposed through an impacted exposure pathway, then it must be included in the HRA. However, if there are no vegetable gardens or fruit trees within the zone of impact for a facility, for example, then the produce pathways need not be evaluated. Note that on-site residential receptors are potentially subject to inhalation and noninhalation exposure pathways. Table 8.2 identifies the residential and worker receptor exposure pathways that are mandatory and those that are dependent on the site-specific decisions. While residents can be exposed though several exposure pathways, worker receptors are only evaluated for inhalation, soil ingestion, and dermal exposure using point estimates.

Table 5.1 shows the multipathway substances that, based on available scientific data, can be considered for each noninhalation exposure pathway. The exposure pathways that are evaluated for a substance depend on two factors: 1) whether the substance is considered a multipathway substance for the Hot Spots Program (Table 5.1), and 2) what the site-specific conditions are. A multipathway substance may be excluded from a particular exposure pathway because its physical-chemical properties can preclude significant exposure via the pathway. For example, some water-soluble substances do not appreciably bioaccumulate in fish; therefore, the fish pathway is not appropriate. In addition, if a particular exposure pathway is not impacted by the facility or is not present at the receptor site, then the pathway is not evaluated. For example, if a fishable water body is not impacted by the facility, or the water source is impacted but no receptor uses it for fishing, then the angler-caught fish pathway is not evaluated.

Table 5.1 Specific Pathways to be Analyzed for Each Multipathway Substance

Substance	Soil Ingestion	Dermal	Meat, Milk & Egg Ingestion	Fish Ingestion	Exposed Vegetable Ingestion	Leafy Vegetable Ingestion	Protected Vegetable Ingestion	Root Vegetable Ingestion	Water Ingestion	Breast Milk Ingestion
Inorganic chemicals										
Arsenic & compounds	X	X	X	X	X	X	X	X	X	
Beryllium & compounds	X	X	X	X	X	X	X	X	X	
Cadmium & compounds	X	X	X	X	X	X	X	X	X	
Chromium VI & compounds	X	X	X[a]	X	X	X	X	X	X	
Fluorides (soluble compounds)	X	X	X		X	X	X	X	X	
Lead & compounds	X	X	X	X	X	X	X	X	X	X
Mercury & compounds	X	X	X	X	X	X	X	X	X	
Nickel & compounds	X	X	X	X	X	X	X	X	X	
Selenium & compounds	X	X	X	X	X	X	X	X	X	
Organic chemicals										
Creosotes	X	X	X	X	X	X			X	X

[a] Cow's milk only; no multipathway analysis for meat and egg ingestion

[b] To be evaluated by pathway in future amendments to the Hot Spots Program

5.3 Estimation of Concentrations in Air, Soil, and Water

Once emissions exit the source, the substances emitted will be dispersed in the air. The substances in the exhaust gas with high vapor pressures will remain largely in the vapor phase, and substances with lower vapor pressures will tend to adsorb to fly ash or other particulate matter. The emission plume may contain both vapor phase substances and particulates. A semivolatile organic toxicant can partition into both vapor and particulate phases. Particulates will deposit on vegetation, on soil, and in water at a rate that is dependent on the particle size. Use the 0.02 m/s deposition rate for emission sources that have verifiable particulate matter control devices or for emission sources that may be uncontrolled but only emit particulate matter that is less than 2.5 microns (e.g., internal combustion engines). The following algorithms are used to estimate concentrations in environmental media including air, soil, water, vegetation, and animal products.

5.3.1 *Air*

The ground level concentration (GLC, or C_{air} as shown in EQ 5.3.1) of a substance in air is a function of the facility emission rate and the dilution factor (χ/Q) at the points under evaluation.

A. Equation 5.3.1: $$C_{air} = Q_{substance} \times \chi/Q$$

1. C_{air} = Ground level concentration ($\mu g/m^3$)
2. $Q_{substance}$ = Substance emission rate (g/sec)
3. χ/Q = Dilution factor provided by dispersion modeling ($\mu g/m^3$/g/sec)

a. Recommended values for EQ 5.3.1:

1. $Q_{substance}$ = Facility-specific, substance emission rate
2. χ/Q = For point of interest, site specific, from dispersion modeling

b. Assumptions for EQ 5.3.1:

1. No plume depletion
2. Emission rate is constant, i.e., assumes steady state

5.3.2 *Soil*

The average concentration of the substance in soil (C_s) is a function of the deposition, accumulation period, chemical specific soil half-life, mixing depth, and soil bulk density. For simplicity and health protection, the Tier 1 default assumes 70-year soil deposition for the accumulation period at end of 70-year facility lifetime. The risk assessor may also choose a supplemental Tier 2 approach, subject to District approval or reviewing authority approval, in which the assessor applies a soil accumulation period based on the facility's start date of operation (e.g., historical date when emissions began), or the current exposure conditions, and the expected duration of operation.

A. Equation 5.3.2 A: $$C_s = Dep \times X / (K_s \times SD \times BD \times T_t)$$

1. C_s = Average soil concentration over the evaluation period ($\mu g/kg$)
2. Dep = Deposition on the affected soil area per day ($\mu g/m^2$-d)
3. X = Integral function for soil accumulation (d), see **EQ 5.3.2 C** below
4. K_s = Soil elimination constant (d^{-1})
5. SD = Soil mixing depth (m)
6. BD = Soil bulk density (kg/m^3)
7. T_t = Soil exposure duration or soil accumulation period (d)

a: Recommended default values for EQ 5.3.2 A:

1. Dep = Calculated in EQ 5.3.2 B
2. X = Calculated in EQ 5.3.2 C
3. K_s = Calculated in EQ 5.3.2 D
4. SD = 0.01 (m) for playground setting (soil ingestion and dermal pathways) and 0.15 (m) for agricultural setting (produce and meat pathways)
5. BD = 1,333 (kg/m^3)
6. T_t = 25,550 (d) = 70 years

b: Assumptions for EQ 5.3.2 A:

1. Substances are uniformly mixed in soil.
2. Substances are not leached or washed away, except where evidence exists to the contrary.
3. It is assumed that toxicants accumulate in the soil for 70 years from deposition over the 70 year lifespan of the facility. Use 70-year soil accumulation (T_t) for Tier 1 estimation of 9-, 30- and 70-year residential exposure, and 25-year off-site worker exposure.
4. For a receptor ingesting mother's milk, the mother is exposed from birth to 25 years of age; the infant is then born and receives mother's milk for one year. Default assumes 70-year soil accumulation for mother's milk pathway. See Table 5.1 for information on which substances or groups of substances must be evaluated by the mother's milk pathway.

B. Equation 5.3.2 B: $$\mathbf{Dep = C_{air} \times Dep\text{-}rate \times 86{,}400}$$

1. C_{air} = Ground level concentration ($\mu g/m^3$)
2. Dep-rate = Vertical rate of deposition (m/sec)
3. 86,400 = Seconds per day conversion factor (sec/d)

a: Recommended default values for EQ 5.3.2 B:

1. C_{air} = Calculated above in EQ 5.3.1 A
2. Dep-rate = Use 0.02 meters/second for controlled sources, or 0.05 meters/second for uncontrolled sources.

b: Assumptions for EQ 5.3.2 B:

1. Deposition rate remains constant. A deposition rate must be used when determining potential noninhalation health impacts. In the absence of facility specific information on the size of the emitted particles, the default values for deposition rate should be used. Currently, the default value of 0.02 meters per second is used for emission sources that have verifiable particulate matter control devices or for emission sources that may be uncontrolled but only emit particulate matter that is less than 2.5 microns

(e.g., internal combustion engines). The 0.05 meters per second default value is used for risk assessment if the emissions are uncontrolled. If other deposition rate factors are used, sufficient support documentation must be included with the HRA.

C. Equation 5.3.2 C: $$X = [\{e^{-Ks * Tf} - e^{-Ks * To}\} / K_s] + T_t$$

1. e = 2.718
2. K_s = Soil elimination constant
3. T_f = End of soil accumulation evaluation period (d)
4. T_o = Beginning of soil accumulation evaluation period (d)
5. T_t = Total days of soil exposure (soil accumulation period) T_f-T_o (d)

a: Recommended default values for EQ 5.3.2 C:

1: K_s = Calculated in EQ 5.3.2 D
2: T_f = 25,550 (d) = 70 years. Total soil exposure time at end of facility operation
3: T_o = 0 (d) The initial time (start period) of soil exposure to all receptors that are impacted by the soil pathway.

Note: Under a Tier 2 scenario, the risk assessor may also adjust T_f and T_t, subject to District approval, to replicate current soil accumulation and expected accumulation at the end of facility operation.

D. Equation 5.3.2 D: $$K_s = 0.693 / t_{1/2}$$

1. 0.693 = Natural log of 2
2. $t_{1/2}$ = Chemical specific soil half-life (d)

a: Recommended default values for EQ 5.3.2 D:

1. $t_{1/2}$ = Chemical-specific. See Table 5.2

5.3.3 *Water*

The water pathway is evaluated if a standing water body (e.g., pond or lake) is impacted by facility emissions and is used as a source for drinking water by food-producing animals or humans, or is a source of angler-caught fish. The average concentration of the substance in water (C_w) is a function of direct deposition and material carried in by surface run-off. However, only the contribution from direct deposition will be considered at this time.

A. Equation 5.3.3 A: $$C_w = C_{depw}$$

1. C_w = Average concentration in water (μg/kg)
2. C_{depw} = Contribution due to direct deposition (μg/kg)

B. Equation 5.3.3 B: $C_{depw} = Dep \times SA \times 365 / (WV \times VC)$

1. Dep = Deposition on water body per day ($\mu g/m^2/d$)
2. SA = Water surface area (m^2)
3. 365 = Days per year (d/yr)
4. WV = Water volume (kg)
5. VC = Number of volume changes per year

a: Recommended default values for EQ 5.3.3 B:

1. Dep = Calculated above in EQ 5.3.2 B
2. SA = Site specific water surface area (m^2)
3. WV = Site specific water volume in (kg) (1L = 1 kg)
4. VC = Site specific number of volume changes per year (SA, WV, and VC values can be obtained from the appropriate Department of Water Resources (DWR) Regional office)

b: Assumptions for EQ 5.3.3 B:

1. With the exception of dilution via number of volume changes per year, all material deposited into the water remains suspended or dissolved in the water column and is available for bioaccumulation in fish.

5.3.4 *Estimation of Concentrations in Vegetation, Animal Products, and Mother's Milk*

Estimates of the concentration of the substance in vegetation, animal products and mother's milk require the use of the results of the air, water, and soil environmental fate evaluation. Plants, animals and nursing mothers will be exposed to the substances at the concentrations previously calculated in Section 5.31 to 5.33 above.

5.3.4.1 Vegetation

The average concentration of a substance in and on vegetation (C_v) is a function of direct deposition of the substance onto the vegetation and of root translocation or uptake from soil contaminated by the substance. We currently recommend root translocation only for the inorganic compounds.

A. Equation 5.3.4.1 A: $C_v = C_{depv} + C_{trans}$

1. C_v = Average concentration in and on specific types of vegetation ($\mu g/kg$)
2. C_{depv} = Concentration due to direct deposition ($\mu g/kg$)
3. C_{trans} = Concentration in vegetation due to root translocation or uptake ($\mu g/kg$) – see EQ 5.3.4.1 C below

B. Equation 5.3.4.1 B: $C_{depv} = [Dep \times IF / (k \times Y)] \times (1 - e^{-kT})$

1. Dep = Deposition on affected vegetation per day ($\mu g/m^2/d$)
2. IF = Interception fraction
3. k = Weathering constant (d^{-1})
4. Y = Yield (kg/m^2)
5. e = Base of natural logarithm (2.718)
6. T = Growth period (d)

a: Recommended default values for EQ 5.3.4.1 B:

1. Dep = Calculated above in EQ 5.3.2 B
2. IF = Crop specific:
    - a: Root crops = 0.0
    - b: Leafy crops = 0.2
    - c: Protected crops = 0.0
    - d: Exposed crops = 0.1
    - e: Pasture = 0.7
3. k = 0.1 (d^{-1})
4. Y = 2 (kg/m^2) for root, leafy, protected, exposed and pasture [CA Department of Food and Agriculture dot maps]
5. T = 45 (d) for leafy crops
   T = 90 (d) for exposed crops

b: Crop-type definitions for EQ 5.3.4.1 B:

1. **Leafy** crop category consists of broad-leafed vegetables in which the leaf is the edible part. Examples include spinach, lettuce, cabbage, and kale.
2. **Root** crop category includes vegetables in which the edible portion is underground. Examples are potato, radish, and carrot.
3. **Exposed** produce category consists of crops with a small surface area subject to air deposition. Examples include strawberries, tomato, cucumber, zucchini, green bean and bell pepper.
4. **Protected** produce category consists of crops in which the edible part is not exposed to air deposition (e.g., the exposed skin of the crop is removed and not eaten). Examples are corn, pea, pumpkin and oranges.

Tables H-9 through H-15 in Appendix H provide more examples of various leafy, root, exposed and protected crop types.

c: Assumptions for EQ 5.3.4.1 B:

1. No deposition on root or protected crops
2. No uptake and translocation of deposited chemicals onto crops

C. Equation 5.3.4.1 C: (for inorganic compounds)

$$C_{trans} = C_s \times UF_2$$

1. C_s = Average soil concentration (μg/kg)
2. UF_2 = Uptake factor based on soil concentration

a: Recommended default values for EQ 5.3.4.1 C:

1. C_s = Calculated above in EQ 5.3.2 A
2. UF_2 = See Table 5.2

D. Equation 5.3.4.1 D: (for organic compounds)

$$UF_2 = [(0.03 \times K_{ow}^{0.77}) + 0.82] / [(K_{oc})(F_{oc})]$$

1. 0.03 = Empirical constant
2. K_{ow} = Octanol:water partition factor
3. 0.77 = Empirical constant
4. 0.82 = Empirical constant
5. K_{oc} = Organic carbon partition coefficient
6. F_{oc} = Fraction organic carbon in soil

a: Recommended default values for EQ 5.3.4.1 D:

1. K_{ow} = Chemical specific, see Table 5.2
2. K_{oc} = Chemical specific, see Table 5.2
3. F_{oc} = 0.1

b: Assumptions for EQ 5.3.4.1 D:

1. OEHHA currently has no recommended root uptake factors for organic compounds listed in Table 5.2. Evidence suggests this route is insignificant compared to airborne deposition. Nevertheless, if it becomes necessary in specific cases to assess root uptake for an organic compound, Equation 5.3.4.1 D would be the algorithm OEHHA recommends using to assess root uptake.

5.3.4.2 Animal Products

The average concentration of the substance in animal products (C_{fa}) depends on which routes of exposure exist for the animals. Animal exposure routes include inhalation, soil ingestion, ingestion of contaminated feed and pasture, and ingestion of contaminated water.

A. Equation 5.3.4.2:

$$C_{fa} = (\text{Inhalation} + \text{Water ingestion} + \text{Feed ingestion} + \text{Pasture/Grazing ingestion} + \text{Soil ingestion}) * Tco$$

1. C_{fa} = Average concentration in farm animals and their products (μg/kg)
2. Inhalation, water ingestion, etc. = Dose through inhalation, water ingestion, etc. (μg/d)
3. Tco = Chemical-specific transfer coefficient of contaminant from diet to animal product (d/kg)

a: Recommended default values for EQ 5.3.4.2:

1. Tco = See Tables 5.3a and 5.3b

b: Assumptions for EQ 5.3.4.2:

1. The Tco for a given chemical is the same for all exposure routes

5.3.4.2.1 Inhalation

A. Equation 5.3.4.2.1: $\text{Inhalation} = BR_a \times C_{air}$

1. Inhalation = Dose through inhalation (μg/d)
2. BR_a = Breathing rate for animal (m^3/d)
3. C_{air} = Ground-level concentration (μg/m^3)

a: Recommended default values for EQ 5.3.4.2.1:

1. BR_a = See Table 5.4
2. C_{air} = Calculated above in EQ 5.3.1 A

b: Assumptions for EQ 5.3.4.2.1:

1. All material inhaled is 100% absorbed

5.3.4.2.2 Water Ingestion

The water ingestion pathway is applied if there are surface water sources of drinking water, such as springs, ponds or lakes, which are exposed to airborne deposition of facility emissions. Due to the site-specific nature for this exposure pathway, OEHHA recommends that the risk assessor conduct a survey at the site to estimate the fraction of contaminated drinking water ingested by the animals, if such sources exist.

A. Equation 5.3.4.2.2: **Water ingestion = $WI_a \times FSW \times C_w$**

1. Water ingestion = Dose through water ingestion (μg/d)
2. WI_a = Water ingestion for animal (kg/d)
3. FSW = Fraction of water ingested from a contaminated body of water (site-specific)
4. C_w = Average concentration in water (μg/kg)
   For water 1 kg = 1 L

a: Recommended default values for EQ 5.3.4.2.2:

1. WI_a = See Table 5.4
2. FSW = Site specific fraction, need to survey water ingestion practices in affected area
3. C_w = Calculated above in EQ 5.3.3 A

5.3.4.2.3 Feed Ingestion

The fraction of feed intake by cattle, pigs and poultry that is contaminated by facility emissions can vary considerably depending on the manner in which the animals are raised. Due to the site-specific nature for this exposure pathway, OEHHA recommends that the risk assessor conduct a survey at the site to estimate the fraction of contaminated feed eaten by the animals. For a Tier 1 assessment, default values are provided by OEHHA (see Table 5.4 and Table 5.4 footnotes) for estimation of exposure to the animals.

Agricultural mixing depth should be used for calculating soil concentration for feed and pasture contamination.

5.3.4.2.3.1 Feed Ingestion

A. Equation 5.3.4.2.3.1: **Feed ingestion = $(1.0 - FG) \times FI \times L \times C_v$**

1. Feed ingestion = Dose through the ingestion of feed (μg/d) that is harvested after it is impacted by source emissions
2. FG = Fraction of diet provided by grazing (site-specific)
3. FI = Feed ingestion rate (kg/d)
4. L = Fraction of locally grown (source impacted) feed that is not pasture (site-specific)
5. C_v = Concentration in feed (μg/kg)

a: Recommended default values EQ 5.3.4.2.3.1:

1. FG = Default values in Table 5.4 footnote b, although a site-specific survey for the fraction of diet provided by grazing is recommended
2. FI = See Table 5.4
3. L = Default values in Table 5.4 footnote b, although a site-specific survey for fraction of locally grown (source impacted) feed that is not pasture is recommended
4. C_v = As calculated above in EQ 5.3.4.1 A

b: Assumptions for EQ 5.3.4.2.3.1:

1. Feed (FI) transported from an off-site location (i.e., not grown locally) is not contaminated by facility emissions.

5.3.4.2.3.2 Pasture/Grazing ingestion

A. Equation 5.3.4.2.3.2: **Pasture/Grazing ingestion = FG × C_v × FI**

1. Pasture/Grazing ingestion = Dose through pasture/grazing (μg/d)
2. FG = Fraction of diet provided by grazing (site-specific)
3. C_v = Concentration in pasture/grazing material (μg/kg)
4. FI = Feed ingestion rate (kg/d)

a: Recommended default values EQ 5.3.4.2.3.2:

1. FG = Default values in Table 5.4 for fraction of diet provided by grazing, although a site-specific survey is recommended
2. C_v = As calculated above in EQ 5.3.4.1 A
3. FI = See Table 5.4

5.3.4.2.4 Soil ingestion

The feeds provided to dairy and beef cattle may contain small quantities of soil. A larger fraction of soil by weight of food is taken up during grazing. Rooting behavior by pigs with access to soil will result in soil ingestion. Likewise, poultry with free access to soil or pasture will also ingest soil. Defaults for soil ingestion are shown in Table 5.4.

A. Equation 5.3.4.2.4 A: **Soil ingestion = SI_a × C_s**

1. Soil ingestion = Dose through soil ingestion (μg/d)
2. SI_a = Soil ingestion rate for animal (kg/d)
3. C_s = Average soil concentration (μg/kg)

a: Recommended default values for EQ 5.3.4.2.4 A:

1. SI_a = Calculated below
2. C_s = Calculated above in EQ 5.3.2 A

B. Equation 5.3.4.2.4 B: $SI_a = [(1 - FG) \times FS_f \times FI] + [FG \times FS_p \times FI]$

1. FG = Fraction of diet provided by grazing
2. FS_f = Soil ingested as a fraction of feed ingested
3. FI = Feed ingestion rate (kg/d)
4. FS_p = Soil ingested as a fraction of pasture ingested

a: Recommended default values for EQ 5.3.4.2.4 B:

1. FG = Site specific fraction of diet provided by grazing
2. FS_f = See Table 5.4
3. FI = See Table 5.4
4. FS_p = See Table 5.4

b: Assumptions for EQ 5.3.4.2.4 B:

1. The transfer coefficient is the same for all exposure routes.
2. Soil ingested in feed (FS_f) transported from an off-site location (i.e., not grown locally) is assumed not to be contaminated by facility emissions.

5.3.4.3 Bioaccumulation in Angler-Caught Fish

The average concentration in fish (C_f) is based on the concentration in water and a chemical-specific bioaccumulation factor.

A. Equation 5.3.4.3: $Ct = Cw \times BAF$

1. Ct = Concentration in wet weight tissue (muscle) of fish (µg/kg)
2. Cw = Concentration in water (µg/kg)
3. BAF = Fish bioaccumulation factor (unitless)

a: Recommended default values for Equation 5.3.4.3:

1. Cw = As calculated above in Equation 5.3.3 A
2. BAF = Chemical-specific; see Table 5.2

b: Assumptions for Equation 5.3.4.3:

1. For conversion of a chemical concentration in a volume of water shown as µg/L, 1 L water = 1 kg water; thus, for concentration of chemical in water, µg/L = µg/kg.
2. For organic chemicals, BAFs lipid-normalized to adult rainbow trout with 4% lipid content in muscle tissue
3. For organic chemicals, BAFs based on the freely dissolved fraction in water under conditions of average particulate organic carbon and dissolved organic carbon in U.S. lakes and other water bodies
4. For inorganic compounds, BAFs based on wet weight muscle tissue concentration and on the total water concentration of the inorganic compound in water.
5. Contaminant concentrations are uniform in water based on dispersion

5.3.4.4 Bioaccumulation in Mother's Milk

The average concentration of a chemical in mother's milk (C_m) is a function of the mother's exposure through all exposure routes (i.e., inhalation, ingestion via food, drinking water, and soil, and dermal absorption via skin contact with soil contaminated with the chemical), the contaminant half-life in the mother's body, and transfer of absorbed chemical to mother's milk. The contaminant half-life in the body and transfer to mother's milk is incorporated in biotransfer coefficients (Tco) in Equation 5.3.4.4. See the TSD (OEHHA, 2012a), Appendix J for details on development of biotransfer factors. The substances assessed by the mother's milk pathway are shown in Table 5.1.

A. Equation 5.3.4.4: $$C_m = [(D_{inder} \times Tco_{m_inder}) + (D_{ing} \times Tco_{m_ing})] \times BW$$

1. C_m = Concentration in mother's milk (mg/kg-milk)
2. D_{inder} = The sum of DOSEair + DOSEdermal through inhalation and dermal absorption (mg/kg-BW-day)
3. D_{ing} = The sum of DOSEfood + DOSEsoil + DOSEwater through ingestion (mg/kg-BW-day)
4. Tco_{m_inder} = Biotransfer coefficient from inhalation and dermal absorption to mother's milk (d/kg-milk)
5. Tco_{m_ing} = Biotransfer coefficient from ingestion to mother's milk (d/kg-milk)
6. BW = Body weight of mother (Kg)

a: Recommended cancer risk default values for EQ 5.3.4.4:

1. D_{ing} = As calculated through ingestion of soil in EQ 5.4.3.1.1 + home-grown produce in EQ 5.4.3.2.1 + home-raised animal products in EQ 5.4.3.2.2 + drinking water in EQ 5.4.3.3.1 + angler-caught fish in EQ 5.4.3.4.1
2. D_{inder} = As calculated through inhalation in EQ 5.4.1.1 + dermal exposure in EQ 5.4.2.1
3. Tco_{m_inder} = See Table 5.5
4. Tco_{m_ing} = See Table 5.5

b: Recommended noncancer risk default values for EQ 5.3.4.4:

1. D_{ing} = As calculated through ingestion of soil in EQ 5.4.3.1.2 + home-grown produce and home-raised animal products in EQ 5.4.3.2.3 + drinking water in EQ 5.4.3.3.2 + angler-caught fish in EQ 5.4.3.4.2
2. D_{inder} = As calculated through inhalation in EQ 5.4.1.1 + dermal exposure in EQ 5.4.2.2
3. Tco_{m_inder} = See Table 5.5
4. Tco_{m_ing} = See Table 5.5

c: Assumptions for EQ 5.3.4.4:

1. Default age of mother at birth is 25 years of age, then nurses the infant for 1 year; Use 16<30 year old high-end (95^{th} percentile) daily breathing rate and intake rates for D_{ing} and D_{inder} for estimating dose to mother.
2. For inhalation dose to mother's milk, it is recommended that the EF variate in EQ 5.4.1.1 is left out for calculation of inhalation dose in the mother's milk pathway.
3. Biotransfer coefficient, Tco_{m_inder}, the same for both inhalation and dermal pathways based on lack of first-pass metabolism through the liver for both of these pathways.
4. Biotransfer coefficient, Tco_{m_ing}, the same for all ingestion pathways based on first-pass metabolism through the liver.
5. For chemicals in Table 5.5 lacking either an oral or inhalation Tco, use the oral Tco for the absent inhalation Tco (i.e., for PCDDs and PCDFs and dioxin-like PCBs), or the inhalation Tco for the absent oral Tco (i.e., for lead) in Equation 5.3.4.4.
6. The concentration in the mother's milk is determined using the derived approach to risk assessment. This method allows use of the high-end dose point estimate for driving exposure pathways and the average dose point estimates for other exposure pathways. See Sections 8.2.6 (cancer) and 8.3.3 (noncancer) for the description of the methodology on how to implement the derived methodology.

Table 5.2a Substance-Specific Default Values for Organic Multipathway Substances

				Root Uptake Factors					
Multipathway Substance	**Log K_{oc}**	**Log K_{ow}**	**Fish BAF**	**Root**	**Leafy**	**Exposed**	**Protected**	**GRAF[2]**	**Soil HalfLife (days)**
Creosotes	NA	NA	$8 \times 10^{+2}$	NA	NA	NA	NA	1.0	$4.3 \times 10^{+2}$
Diethylhexyl-phthalate	5.34[1]	7.63[1]	$4 \times 10^{+1}$	NA	NA	NA	NA	1.0	$1.5 \times 10^{+1}$
Dioxins and Furans	NA	NA	$3 \times 10^{+5}$	NA	NA	NA	NA	0.43	$7.0 \times 10^{+3}$
Hexachlorobenzene	NA	NA	$8 \times 10^{+4}$	NA	NA	NA	NA	1.0	$1.0 \times 10^{+8}$

4,4'-Methylene dianiline	2.24[3]	1.59[4]	NA	NA	NA	NA	NA	1.0	$4.6 \times 10^{+2}$
Pentachlorophenol[5]									
Polycyclic Aromatic Hydrocarbons (PAHs)	NA	NA	$8 \times 10^{+2}$	NA	NA	NA	NA	1.0	$4.3 \times 10^{+2}$
Polychlorinated Biphenyls	NA	NA	$2 \times 10^{+6}$	NA	NA	NA	NA	1.0	$3.2 \times 10^{+3}$

(1) Averaged log Kow and Koc values determined by most reliable methods (Staples et al., 1997)

(2) GRAF (Gastrointestinal Relative Absorption Factor). The guidelines allow for adjusting for bioavailability where the evidence warrants. For example, there are good data which indicate that dioxin is not as available to an organism when bound to soil or fly ash matrices relative to when it is in solution or in food. Therefore, a bioavailability factor is incorporated into the model to account for this difference. When information becomes available for other chemicals of concern, this type of bioavailability will be incorporated into the model.

(3) Measured by Hansch et al. (1985)

(4) Estimated according to methodology of Lyman et al. (1990)

(5) To be evaluated for specific default values in future amendments to the Hot Spots Program.

Selenium & compounds	NA	NA	$1 \times 10^{+3}$	7×10^{-2}	6×10^{-2}	4×10^{-2}	3×10^{-1}	1.0	$1.0 \times 10^{+8}$

(1) GRAF (Gastrointestinal Relative Absorption Factor). The guidelines allow for adjusting for bioavailability where the evidence warrants. For example, there are good data which indicate that dioxin is not as available to an organism when bound to soil or fly ash matrices relative to when it is in solution or in food. Therefore, a bioavailability factor is incorporated into the model to account for this difference. When information becomes available for other chemicals of concern, this type of bioavailability will be incorporated into the model.

(2) Methyl mercury (MeHg) is not represented in the category “mercury & inorganic compounds”. The BAF for methyl mercury is orders of magnitude higher than for inorganic mercury. Assessment of MeHg for the fish pathway is not directly applicable to the Hot Spots program, as no facilities are known to emit MeHg directly into the air (OEHHA, 2012; OEHHA, 2006), but it may be formed by action of microbes in sediment. Assessing the methylation of mercury deposited into a water body is difficult, and is also very water body-specific. At this time OEHHA cannot address this issue in the Hot Spots program, but will consider addressing this problem in future amendments of the Guidance.

NA - Data Not Available or Not Applicable.

Table 5.3a Animal Transfer Coefficients for Persistent Organic Chemicals

Organic Chemical	Tco (d/kg)[a]

Table 5.4 Point Estimates for Animal Pathway

Parameter	Beef Cattle	Lactating Dairy Cattle	Pigs	Meat Poultry	Egg-laying Poultry
BW (body weight in kg)	533	575	55	1.7	1.6
BR_a (inhalation rate in m^3/d)	107	115	7	0.4	0.4
WI_a (water consumption in kg/d)	45	110	6.6	0.16	0.23
FI (Food Intake in kg/d) DMI[a] and/or pasture grazing[b]	9	22	2.4	0.13	0.12
FS_f (soil fraction of feed)	0.01	0.01	NA	NA	NA
FS_p (soil fraction of pasture)	0.05	0.05	0.04	0.02	0.02

[a] Dry matter intake

[b] For beef and dairy cattle, pasture grazing is assumed to be leafy vegetation (grasses, including greenchop) and accounts for half of the cattle's diet (FG=0.5 in Section 5.3.4.2.3). The default assumes on-site pasture grazing contaminated by facility emissions. Fraction of feed or dry matter intake (e.g., hay, grain) grown on-site is assumed to be contaminated by facility emissions and fraction of feed that is grown off-site is not assumed to be contaminated. A default may be used that assumes all feed is grown off-site (L=0 in Section 5.3.4.2.3), but a survey is recommended to verify the fractions of feed grown on-site and off-site.

For pigs with access to soil, but usually confined to a pen, default assumes no pasture grazing (FG=0 in Section 5.3.4.2.3). For feed, estimated intake consists of equal portions of all plant types including exposed, leafy, protected and root in which 10% (L=0.1 in Section 5.3.4.2.3) of the diet is homegrown and contaminated by facility emissions. The fraction of feed that was transported from an off-site location is assumed not to be contaminated by facility emissions.

For poultry including egg-laying and broiler chickens that have access to soil, default assumes no pasture grazing (FG=0 in Section 5.3.4.2.3). Estimated feed intake is composed of equal proportions of all plant types with 5% (L=0.05 in Section 5.3.4.2.3) homegrown and contaminated by facility emissions. The fraction of feed grown off-site and transported to the receptor was not contaminated by facility emissions.

NA - Not applicable. Assume FS_f is equal to zero.

Table 5.5 Mother's Milk Transfer Coefficients (Tco_m)[a]

Chemical/chem. group	Tco_m (day/kg-milk)
PCDDs - oral[b]	3.7
PCDFs - oral[b]	1.8
Dioxin-like PCBs - oral[b]	1.7
PAHs – inhalation[c]	1.55
PAHs – oral	0.401
Lead - inhalation[d]	0.064

[a] These compound classes represent the chemicals of greatest concern for the mother's milk pathway under the Hot Spots program. It is expected that additional transfer coefficients will be developed for other multipathway chemicals in the Hot Spots Program as data becomes available and is reviewed.

[b] Use the oral Tco_m for the inhalation and dermal pathways. The PCDD, PCDF and dioxin-like PCB Tcos were derived using a Random-effects model from individual Tco_m estimates for 7 PCDDs, 9 PCDFs and 12 dioxin-like PCBs (See OEHHA, 2012, Appendix J).

[c] Use the inhalation Tco_m for the dermal pathway

[d] Use the inhalation Tco_m for the ingestion and dermal pathways

5.4 Estimation of Dose

Once the concentrations of substances are estimated in air, soil, water, plants, and animal products, they are used to evaluate estimated exposure to people. Exposure is evaluated by calculating the daily dose in milligrams per kilogram body weight per day (mg/kg/d). The following algorithms calculate this dose for exposure through inhalation, dermal absorption, and ingestion pathways. All chemicals must be assessed for exposure through inhalation. If there are emissions of one or more of the subset of semi- or non-volatile multipathway substances, the soil ingestion pathway and the dermal soil exposure pathway are also assessed. The mother's milk pathway may also be a mandatory pathway depending on the multipathway substance released (See Table 5.1). The other exposure pathways may also need to be assessed if a survey of the exposure site shows they are present (e.g., ingestion of water, home-grown crops, home-raised animal products, and angler-caught fish).

This section contains average and high-end point estimates and data distributions for adults and children for many exposure pathways. The point-estimates and data distributions for children fall within the 3rd trimester, 0<2, 2<9, and 2<16 year age groupings. The point-estimates and data distributions for adults fall within the 16<30 and 16-70 year age groupings. When evaluating 9-, 30-, and 70-year exposure durations for cancer risk assessment, assessors will use distributions starting at the third trimester.

Workers are assessed for cancer risk as adults using 8-hour breathing rate point estimates (See Table 5.8). Point estimates for workers are listed under "offsite worker." OEHHA has not developed stochastic distributions for worker exposure. Therefore, there is no Tier 3 stochastic approach for offsite worker cancer risk assessment.

5.4.1 *Estimation of Exposure through Inhalation*

The dose through the inhalation route is estimated for cancer risk assessment and noncancer hazard assessment. Both residential and offsite worker exposures are considered. Since residential exposure includes near-continuous long-term exposure at a residence and workers are exposed only during working hours (i.e., 8 hours/day), different breathing rate distributions are used.

5.4.1.1 Residential Inhalation Dose for Cancer Risk Assessment

Exposure through inhalation is a function of the breathing rate, the exposure frequency, and the concentration of a substance in the air. For residential exposure, the breathing rates are determined for specific age groups, so inhalation dose (Dose-air) is calculated for each of these age groups, 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years. OEHHA used the mother's breathing rates to estimate dose for the 3rd trimester fetus assuming the dose to the fetus during the 3rd trimester is the same as the mother's dose. These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). A Tier 1 evaluation uses the high-end point estimate (i.e., the 95th percentiles) breathing rates for the inhalation

pathway in order to avoid underestimating cancer risk to the public, including children. A possible exception for using high-end breathing rates are when there is exposure to multipathway substances and two of the non-inhalation pathways drive the risk, rather than the inhalation pathway (see Chapter 8).

A. Equation 5.4.1.1: $$\text{Dose-air} = C_{air} \times \{BR/BW\} \times A \times EF \times 10^{-6}$$

1. Dose-air = Dose through inhalation (mg/kg/d)
2. C_{air} = Concentration in air ($\mu g/m^3$)
3. {BR/BW} = Daily Breathing rate normalized to body weight (L/kg body weight - day)
4. A = Inhalation absorption factor (unitless)
5. EF = Exposure frequency (unitless), days/365 days
6. 10^{-6} = Micrograms to milligrams conversion, liters to cubic meters conversion

a: Recommended default values for EQ 5.4.1.1:

1. {BR/BW} = Daily breathing rates by age groupings, see As supplemental information, the assessor may wish to evaluate the inhalation dose by using the mean point estimates in Table 5.6 to provide a range of breathing rates for cancer risk assessment to the risk manager.
2. Table (point estimates) and Table 5.7 (parametric model distributions for Tier III stochastic risk assessment). For Tier 1 residential estimates, use 95th percentile breathing rates in Table 5.6.
3. A = 1
4. EF = 0.96 (350 days/365 days in a year for a resident)

b: Assumption for EQ 5.4.1.1:

1. The fraction of chemical absorbed (A) is the same fraction absorbed in the study on which the cancer potency or Reference Exposure Level is based.

As supplemental information, the assessor may wish to evaluate the inhalation dose by using the mean point estimates in Table 5.6 to provide a range of breathing rates for cancer risk assessment to the risk manager.

Table 5.6 Point Estimates of Residential Daily Breathing Rates for 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years (L/kg BW-day)

5.4.1.2 Offsite Worker (MEIW) Inhalation Dose for Cancer Risk Assessment

For worker exposure, the default assumes working age begins at 16 years, and that exposures to facility emissions occur during the work shift, typically up to 8 hours per day during work days. Breathing rates that occur over an 8-hour period vary depending on the intensity of the activity (See Table 5.8), and are used to estimate the inhalation dose. The 8-hour breathing rates may also be useful for cancer risk assessment of children and teachers exposed at schools during school hours.

Another risk management consideration for the offsite worker scenario for cancer assessment of a Hot Spots facility is whether there are women of child-bearing age at the MEIW location and whether the MEIW has a daycare center. Since the third trimester is only a short segment of the 25 year exposure duration used for the MEIW, the resulting risk estimate would not differ significantly. An exception to this assumption is high exposure to carcinogens over a short period, as might occur during short-term projects (see Section 8.2.10). In this case, risk assessment during the third trimester may be warranted. However, if there is onsite daycare at the MEIW, then the risks to the children will be underestimated using the offsite adult worker scenario due to increased exposure (per kg body weight) and increased sensitivity to carcinogen exposure (see Section 8.2.1). In this case, the Districts may wish to include a calculation of inhalation dose for the children in the onsite daycare, assuming they could be there from 0 to age 6 years.

Exposed workers may be engaged in activities ranging from desk work, which would reflect breathing rates of sedentary/passive or light activities, to farm worker activities, which would reflect breathing rates of moderate intensity (See Table 5.9). OEHHA recommends default (Tier 1) point estimate 8-hour breathing rates in L/kg-8-hrs based on the mean and 95th percentile of moderate intensity activities, 170 and 230 L/kg-8-hrs, respectively, for adults 16-70 years old.

Many facilities operate non-continuously, as in only 8-10 hours per day, but the air dispersion modeling is performed as if the emissions were uniformly emitted over 24 hours a day, 7 days per week. The air dispersion computer model used, including AERMOD and other models, typically calculate an annual average air concentration based on actual operating conditions but also include the hours of nonoperation in the average concentration.

Therefore, there are two components that determine the worker exposure to facility emissions:

1) What is the estimated concentration the worker is exposed to (i.e., breathes), during the work shift, and

2) What is the amount of time the offsite worker's schedule overlaps with the facility's emission schedule?

There are two approaches to estimating the modeled concentration the worker is breathing during the work shift. The first approach uses a worker adjustment factor (i.e.,

the WAF) to approximate what the worker is breathing based on the modeling run used for residential receptors. The second approach uses a special modeling run with the hourly raw results from an air dispersion analysis and is described in Appendix M.

The first and more basic approach is to obtain the long term average concentration as you would for modeling a residential receptor, then adjusting this exposure concentration using the calculated WAF (EQ 5.4.1.2 B) to estimate the concentration the offsite worker is exposed to during the work shift (shown as (C_{air} × WAF) in EQ 5.4.1.2 A). This method is characteristic of a default approach used in a Tier 1 assessment. Once the exposure concentration is determined, the worker's inhalation dose (Dose-air) can be calculated as shown in EQ 5.4.1.2 A.

The second approach for determining the air concentration the worker is exposed to uses a refined modeling run where the hourly raw dispersion model output are post processed to examine the hourly concentrations that fall within the offsite worker's shift. This method provides a more representative estimate of the air concentration, but is more complex, and time consuming than the first method. See Appendix M for information on how to simulate the long term concentration for the offsite worker that can be used to estimate inhalation cancer risk.

The HARP software has the ability to calculate worker impacts using an approximation factor and, in the future, it will have the ability to post process refined worker concentrations using the hourly raw results from an air dispersion analysis.

If the off-site worker's shift does not completely overlap the emission schedule of the facility, then a Discount Factor (DF) may be applied to the WAF. Calculation of the DF is shown in EQ 5.4.1.2 C. The default assumption is that the offsite worker's shift falls completely within the emission schedule of the facility, in which case DF=1. Use of a DF less than 1 requires a survey at the MIEW to verify that some portion of the off-site worker shift is not subject to the facility emissions.

A. Equation 5.4.1.2 A: $\textbf{Dose-air} = (C_{air} \times WAF) \times \{BR/BW\} \times A \times EF \times 10^{-6}$

1. Dose-air = Dose through inhalation (mg/kg/d)
2. C_{air} = Annual average concentration in air ($\mu g/m^3$)
3. WAF = Worker air concentration adjustment factor (unitless)
4. {BR/BW} = Eight-hour breathing rate normalized to body weight (L/kg body weight - day)
5. A = Inhalation absorption factor (unitless)
6. EF = Exposure frequency (unitless), days/365 days)
7. 10^{-6} = Micrograms to milligrams conversion, Liters to cubic meters conversion

a: Recommended default values for EQ 5.4.1.2 A:

1. WAF = See EQ. 5.4.1.2 B for formula to calculate WAF, or App. M for refined post-processing modeling to calculate WAF.
2. {BR/BW} = For workers, use age16-70 year, 95th percentile, moderate intensity 8-hour point estimate breathing rates (see Table 5.8). No worker breathing rate distributions exist for stochastic risk assessment.
3. A = 1
4. EF = 0.68 (250 days / 365 days). Equivalent to working 5 days/week, 50 weeks/year.

b: Assumption for EQ 5.4.1.2 A:

1. The fraction of chemical absorbed (A) through the lungs is the same fraction absorbed in the study on which the cancer potency factor is based.
2. The source emits during the daylight hours. Calculate WAF (EQ 5.4.1.2 B) if a special post-processing modeling run described in App. M was not completed. For nighttime emissions and exposure scenarios, see Appendix N.

B. Equation 5.4.1.2 B: $$WAF = (H_{res} / H_{source}) \times (D_{res} / D_{source}) \times DF$$

1. WAF = Worker adjustment factor (unitless)
2. H_{res} = Number of hours per day the annual average residential air concentration is based on (always 24 hours)
3. H_{source} = Number of hours the source operates per day
4. D_{res} = Number of days per week the annual average residential air concentration is based on (always 7 days)
5. D_{source} = Number of days the emitting source operates per week
6. DF = Discount factor, for when the offsite worker's schedule partially overlaps the source's emission schedule

b: Recommended default values for EQ 5.4.1.2 B:

1. DF = 1 for offsite worker's schedule occurring within the source's emission schedule. A site-specific survey may be used to adjust the DF using EQ 5.4.1.2 C.

C. Equation 5.4.1.2 C: $$DF = (H_{coincident} / H_{worker}) \times (D_{coincident} / D_{worker})$$

1. $H_{coincident}$ = Number of hours per day the offsite worker's schedule and the source's emission schedule coincide
2. H_{worker} = Number of hours the offsite worker works per day
3. $D_{coincident}$ = Number of days per week the offsite worker's schedule and the source's emission schedule coincide
4. D_{worker} = Number of days the offsite worker works per week

Tier 2 adjustments for EQ 5.4.1.2 A-C may be used for:

1. Eight-hour breathing rate. Point estimates in Table 5.8 for lower breathing rates of sedentary/passive and light intensity work activities may be substituted in site-specific Tier 2 scenarios. Table 5.9 can be used to estimate breathing rate intensities for various job activities. Use of different breathing rates requires a survey of the exposed workplace and approval by Air District, ARB and OEHHA.
2. Discount Factor (DF) in EQ 5.4.1.2 C. If a site-specific survey of the offsite worker schedule only partially overlaps with the source's emission schedule, then a DF less than 1 may be calculated. Use of a DF less than 1 requires a survey of the exposed workplace and approval by the Air District or ARB.

The 8-hour breathing rates are based on minute ventilation rates derived by U.S. EPA (2009). U.S. EPA employed a metabolic equivalent (METS) approach for estimating breathing rates. This method determines daily time-weighted averages of energy expenditure (expressed as multipliers of the basal metabolic rate) across different levels of physical activity. The 8-hour breathing rates shown in Table 5.8 are divided into three categories:

Sedentary & Passive Activities (METS $\leq$ 1.5)

Light Intensity Activities (1.5 < METs $\leq$ 3.0)

Moderate Intensity Activities (3.0 < METs $\leq$ 6.0)

For example, a METS = 1 is roughly equivalent to energy expenditure during sleep and is close to the basal metabolic rate. A METS activity that is two to three times greater (METS = 2 to 3) is characteristic of light intensity activities, such as administrative office work or sales work as shown in Table 5.9.

Under a Tier 1 scenario, the risk assessor may simply use the 95th percentile breathing rate for moderate intensity activities of 230 L/kg-8 hrs in Eq. 5.4.1.2 A to calculate the daily dose via the inhalation route to the worker. In an example of a Tier 2 scenario, the risk assessor surveys the workplace and determines that the worker(s) at the MEIW receptor are primarily sitting at a desk performing administrative-type work on a computer. Referring to Table 5.9, this activity corresponds most closely to "administrative office work" with a mean activity level of 1.7 and a SD = 0.3. This level of activity is considered "light intensity activity" (i.e., 1.5 < METs $\leq$ 3.0). With the prior approval of the Air District or ARB, the risk assessor may then use the 95th percentile breathing rate of 100 L/kg-8 hr for light intensity activities in Equation 5.4.1.2 A.

Table 5.8. Eight-Hour Breathing Rate (L/kg per 8 Hrs) Point Estimates for Males and Females Combined[a,b]

	0<2 years	2<9 years	2<16 years	16<30 years	16-70 years
	Sedentary & Passive Activities (METS $\leq$ 1.5)				
Mean	200	100	80	30	30
95th Percentile	250	140	120	40	40
	Light Intensity Activities (1.5 < METs $\leq$ 3.0)				
Mean	490	250	200	80	80
95th Percentile	600	340	270	100	100
	Moderate Intensity Activities (3.0 < METs $\leq$ 6.0)				
Mean	890	470	380	170	170
95th Percentile	1200	640	520	240	230

[a] For pregnant women, OEHHA recommends using the mean and 95th percentile 8-hour breathing rates based on moderate intensity activity of 16<30 year-olds for 3rd trimester.
[b.] Breathing rates in the table may be used for worker, school, or residential exposures

Table 5.9. METS Distributions for Workplace and Home Activities

Activity Description	Mean	Median	SD	Min	Max
Workplace Activities

Walk/bike/jog (not in transit) age 40	4.7	4.7	1.8	2.3	7.1

Table 5.10 lists some WAFs for a few typical scenarios. For example, if the source is continuously emitting, then the offsite worker is assumed to breathe the long-term annual average concentration during their work shift. The WAF then becomes one and no concentration adjustments are necessary in this situation when estimating the inhalation cancer risk. If the source is non-continuously emitting for 8 hours/day, 5 days/week and the offsite worker's shift completely overlaps the emitting facility's operating schedule, then the WAF would be 4.2:

$$(24 \text{ hrs/day} / 8 \text{ hrs/day}) \times (7 \text{ days/week} / 5 \text{ days/week}) = 4.2$$

If the offsite worker's 8 hour/day shift only overlaps the emitting facility's operation schedule for 4 hrs/day, then the WAF is 2.1 because the DF = 0.5 will reduce the WAF by half: DF = (4 hrs/day / 8 hrs/day) x (5 days/week / 5 days/week) = 0.5

Table 5.10: Example Worker Adjustment Factors (WAF) to Convert a Long-Term Daily Average Emission Concentration to an Off-Site Worker Receptor Exposure

Off-Site Workers' Shift Overlap with Facility's Emission Schedule[a]	Facility Operating Schedule	Adjustment Factor
8 hrs/day, 5 days/week	Continuous (24 hrs/7 days/week)	1.0
8 hrs/day, 5 days/week[b]	Non-continuous (8 hrs/5 days/week)	4.2
4 hrs/day, 5 days/week	Non-continuous (8 hrs/5 days/week)	2.1

[a] Worker works 8 hours per day, 5 days per week
[b] Workers' work hours completely overlap the facilities operating hours

5.4.1.3 Inhalation Dose for Children at Schools and Daycare Facilities for Cancer Risk Assessment

The 8-hour breathing rates and inhalation dose equations (EQ 5.4.1.2 A-C) may also be used to estimate risk to children when exposures occur while at school or at day care facilities. Breathing rate point estimates to use in Table 5.8 depend on the ages of the children at the exposed schools and day cares. As a Tier 1 default, moderate intensity breathing rates are recommended. Equations 5.4.1.2 A-C is used in the same way to estimate dose in children as it is for workers.

5.4.1.4 Non-Cancer Inhalation Exposure for Workers and Residents

For typical daily work shifts of 8-9 hours, acute, 8-hour and chronic Reference Exposure Levels (RELs) described in Chapter 8 are used in health risk assessments to characterize the noncancer risks using the Hazard Index approach described in Chapter 8 and in OEHHA (2008). Uncertainty factors are already incorporated into the RELs used to assess noncancer risk, as explained in Chapter 8, so all that is needed to evaluate the noncancer hazard is the air concentration that the worker is exposed to. The modeled maximum 1-hour air concentration is determined for acute hazard assessment and the annual average air concentration is determined for chronic hazard assessment. The modeled average air concentration during a work shift is determined for 8-hour hazard assessment using the adjusted annual average air concentration described below.

The 8-hour RELs are primarily designed to address offsite worker inhalation exposure at the MEIW because they better characterize the daily intermittent exposures of workers than the chronic RELs do. They are used in estimating the 8 hour Hazard Index for offsite workers. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA.

Note, however, there are only a handful of 8-hour RELs currently adopted for use in the Hot Spots program. Therefore, we also recommend performing chronic noncancer exposure assessment for the offsite worker (MEIW) based on the annual average air concentration at the MEIW. Evaluation of the chronic Hazard Index should help protect workers who routinely work longer than 8 hour shifts. Exposure to multipathway substances also requires noncancer hazard assessment for the dermal and oral soil exposure pathways for offsite workers. Because there are few 8-hour RELs currently available, hazard assessment for the noninhalation pathways for multipathway substances is only applied when estimating the chronic Hazard Index.

In addition, the Districts may wish to determine if there is an onsite daycare at the MEIW and include a calculation of the chronic and 8-hour inhalation dose for children, although onsite hazard assessment is not a requirement for a Hot Spots risk assessment.

As explained in Section 5.4.1.2 for cancer risk, the modeled annual average air concentration is adjusted to the air concentration that the worker is actually exposed to if the facility operates non-continuously. The typical method for this adjustment is by calculating the Worker Adjustment Factor (WAF) shown in EQ 5.4.1.4 B and multiplying this value by the annual average air concentration (C_{air}, in $\mu g/m^3$) in EQ 5.4.1.4 A.

Unlike cancer risk assessment, no discount factor (DF) is applied in noncancer assessment for partial overlap between the worker's schedule and the source's emission schedule. Adjustments for worker vacations, work shifts for shortened weeks (e.g., 1 - 4 days), and worker time away on weekends are also not appropriate.

An alternative refined post-processing method, described in Appendix M, may be used to estimate the air concentration the worker is exposed to during their work schedule. OEHHA may be consulted about the particular chemical involved if it is important to make a more refined analysis.

The equation to adjust the annual average air concentration to a worker 8-hour exposure concentration (i.e., the adjusted annual average ground level concentration) is expressed as:

A. Equation 5.4.1.4 A: $$\text{Adjusted } C_{air} \ (\mu g/m^3) = C_{air} \times WAF$$

Where WAF is determined as:

B. Equation 5.4.1.4 B: $$WAF = (H_{res} / H_{source}) \times (D_{res} / D_{source})$$

a: Assumptions for EQ 5.4.1.4 B:

1. No adjustment of the WAF allowed for partial overlap of the worker's schedule and the source's emission schedule.

Alternatives for calculating off-site worker Adjusted C_{air} in EQ 5.4.1.4 A-B:

1. Rather than calculate the WAF for a non-continuous emitting facility, a post-processing of the hourly raw dispersion model output and examination of the hourly concentrations that fall within the offsite worker's shift can be conducted to estimate the air concentration the worker is exposed to. This method is a more refined, complex, and time consuming approach, but should result in a more representative exposure concentration. See Appendix M for information on how to simulate the exposure concentration for the off-site worker.
2. For continuously-emitting facilities (i.e., 24 hrs/day, 7 days/week), if an assessor does not wish to assume the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can also be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

For residential exposure to non-continuously operating facilities, the modeled maximum 1-hour and chronic air concentrations at the MEIR are determined for noncancer hazard assessment. Hazard assessment for repeated 8-hour exposure at the MEIR is not required. Chronic exposure assessment based on the annual average air concentration should adequately protect individuals, in part because residents are considered to be present at the MEIR at or near 24 hrs per day. Many facilities operate for periods longer than 8 hours per day and the hazards are better characterized based on chronic exposure. Nevertheless, differences between 8-hour and chronic exposures (i.e., higher daily 8-hour exposures vs. lower longer daily exposure 24 hrs/day) may result in different toxicological responses including potentially greater toxicological responses with either 8-hour or chronic exposure. There may also be cases such as special meteorological situations (e.g., significant diurnal-nocturnal meteorological differences) where the 8-hour REL will be more protective than the chronic REL. Thus, the air districts may also elect to have an 8-hour hazard assessment performed at the MEIR, using daily 8 hour exposures and the 8 hr RELs.

Eight-hour exposure assessment is not recommended for continuously emitting sources for residential receptors. In this situation it is only necessary to estimate chronic exposure based on the annual average concentration. However, there may be situations where the air district may wish to assess an 8-hour residential exposure to continuously operating facilities, for example, where there are significant differences in modeled concentration of emissions during the day due to diurnal wind patterns.

For estimating the air concentration from non-continuously operating facilities, EQ 5.4.1.4.A is also used to adjust the annual average concentration to what the residents are exposed to. This is the air concentration that the 8-hour REL will be compared to as discussed in Chapter 8. The alternative refined post-processing method described in Appendix M may also be used to estimate residential exposure.

In summary, the requirements for noncancer hazard assessment using the Hazard Index approach at the MEIW and MEIR are as follows.

For offsite worker exposure:

- Acute hazard assessment based on the maximum 1-hour air concentrations and 1-hour RELs
- Eight-hour hazard assessment based on daily average 8-hour exposure (estimated using adjusted annual average air concentration in EQ 5.4.1.4 A and B or by post-processing method in App. M) for those substances with 8-hour RELs
- Chronic hazard assessment based on annual average exposure and chronic RELs, and oral chronic RELs for noninhalation routes of multipathway substances

For residential exposure:

- Acute hazard assessment based on the maximum 1-hour air concentration and 1-hour RELs
- Eight-hour hazard assessment based on daily average 8-hour exposure not required, but can be performed at the discretion of the air districts for exposure to non-continuously operating facilities based on the adjusted annual average air concentration (EQ 5.4.1.4 A and B or method in App. M). Eight-hour assessments not recommended for exposure to continuously operating facilities
- Chronic hazard assessment based on annual average exposure and chronic RELs, and oral chronic RELs for noninhalation routes of multipathway substances

5.4.1.5 Exposure Frequency and Age Groupings for Noncancer Hazard Assessment

For cancer risk, the basic assumption is that risk is associated with cumulative dose of carcinogen. Thus, the dose used to estimate cancer risk can be adjusted for exposure frequency, as well as time spent within the MEIR or MEIW location. Chronic RELs are not necessarily related to cumulative dose. Thus, adjusting the estimated dose used to calculate hazard index for exposure frequency or time away from the MEIR or MEIW is not appropriate.

The average daily dose for chronic noncancer assessment is based on exposure beginning at birth to 70 years of age, necessitating calculation of a time-weighted average for age 0-2, 2-16 and 16-70 years. Since we are not applying Age Sensitivity Factors for assessing non-cancer hazard, the 3rd trimester is not explicitly called out for determining dose, as it is for cancer risk assessment. Rather adult exposure is considered, which would include pregnant women in any trimester. Both inhalation and oral RELs incorporate safety factors to protect sensitive human populations.

5.4.2 *Estimation of Exposure through Dermal Absorption*

Exposure through dermal absorption (dose-dermal) is a function of the soil or dust loading of the exposed skin surface, the amount of skin surface area exposed, and the concentration and availability of the substance. In the previous edition of OEHHA's

exposure guidelines document (OEHHA, 2000), we recommended using specified average and high-end point estimate values for four of the variates (body weight, exposed surface area of skin, soil load on skin and frequency of exposure) in the stochastic analysis for dermal dose. This equation required multiplying values together, which could lead to overly conservative exposure estimates when high-end values were used. By combining information from the four variates into one composite distribution, over-conservatism may be avoided.

To this end, OEHHA created a new variate, "annual dermal load", or ADL, which is a composite of the body surface area (BSA) per kg body weight, exposure frequency, and soil adherence variates. Point estimates from the composite "annual dermal load" can be used for point estimate assessments while parameters and information on the type of distribution (e.g., lognormal) can be used for Tier III stochastic risk assessments. For details on the development of the ADL, refer to the Technical Support Document for Exposure and Stochastic Analysis (OEHHA, 2012).

5.4.2.1 Dermal Dose for Cancer Risk Assessment

The dose through residential dermal exposure to contaminated soil varies by age and is calculated for each age group (e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). This pathway is also assessed for exposure to offsite workers; a separate ADL for offsite workers is presented in Table 5.11. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable.

A. Equation 5.4.2.1: $$\mathbf{Dose_{dermal} = ADL \times Cs \times ABS \times 10^{-9} / 365}$$

1. $Dose_{dermal}$ = Exposure dose through dermal absorption (mg/kg-d)
2. ADL = Annual dermal load (mg soil/kg BW-yr)
3. C_s = Average soil concentration (μg/kg)
4. ABS = Fraction absorbed across skin (unitless)
5. 10^{-9} = Conversion factor for chemical & soil (μg to mg, mg to kg)
6. 1/365 = Conversion factor for ADL from yrs to days

a: Recommended default values for EQ 5.4.2.1:

1. ADL = See Table 5.11 (point estimates) & Table 5.12 a-d (distributions)
2. C_s = Calculated above in EQ 5.3.2 A
3. ABS = See Table 5.13

b: Assumption for EQ 5.4.2.1:

1. The ADL for the third trimester of the fetus is based on the ADL of the mother; when normalized to body weight, we assume that exposure to the

mother and the fetus will be the same. The mother's exposure is based on that of adults 16-30 years of age in Table 5.11 and 5.12d.

2. Exposure frequency (EF) for vacation time spent away from exposure does not appear as a variate in EQ 5.4.2.1, as it is incorporated in the ADL and includes a 2-week vacation per year away from dermal soil exposure for both residents and offsite workers.

Climate will strongly influence people's choice of clothing. Due to California's varied climatic regions and existing data on clothing choices at different temperatures, three levels of climatic conditions, warm, mixed, and cold, are used to describe California's climate regions:

1. A warm climate is characteristic of Southern California areas such as Los Angeles, which can have warm to hot temperatures throughout the year.
2. A "mixed" climate is one that has warm-to-hot temperatures during much of the year (daily highs over 80 degrees are common), roughly from April to October, and cold temperatures (lows near or below freezing) during the remainder of the year. The mountains and central valley are examples of a mixed climate.
3. A cold climate is representative of San Francisco, Eureka, and other northern coastal communities, which have cool temperatures (daily highs of less than 65 degrees) for the majority of the year and can receive a considerable amount of fog and rainfall.

OEHHA recommends consulting the local air district for assistance on selecting the most appropriate climate.

Table 5.11 Recommended Annual Dermal Load Point Estimates (in mg/kg-yr) for Dermal Exposure

	3rd Trimester[a]	Children 0<2 yrs	Children 2<9 yrs	Children 2<16 yrs	Adults[b]	Offsite Worker[c]
Warm climate						
Mean	1.2×10^3	3.6×10^3	7.5×10^3	6.4×10^3	1.2×10^3	2.6×10^3
95th percentile	2.6×10^3	4.3×10^3	9.1×10^3	8.5×10^3	2.6×10^3	5.0×10^3
Mixed climate						
Mean	1.1×10^3	2.2×10^3	6.6×10^3	5.7×10^3	1.1×10^3	2.6×10^3
95th percentile	2.4×10^3	2.9×10^3	8.7×10^3	8.1×10^3	2.4×10^3	5.0×10^3
Cold climate						
Mean	0.7×10^3	1.2×10^3	3.1×10^3	2.8×10^3	0.7×10^3	2.6×10^3
95th percentile	2.1×10^3	1.9×10^3	5.2×10^3	5.1×10^3	2.1×10^3	5.0×10^3

[a] The ADL for the 3rd trimester of the fetus is based on the ADL of the mother; when normalized to body weight, we assume that exposure to the mother and the fetus will be the same

[b] Residential adult ADLs are for both 16<30 and 16-70 year age groups

[c] Assumes exposure only to face, hands and forearms regardless of climate region

Pentachlorophenol	[a]
Polychlorinated biphenyls	14
Polychlorinated dibenzo-p-dioxins and dibenzofurans	3
Polycyclic aromatic hydrocarbons	13

[a] To be determined in future amendments to the Hot Spots Program

Skin permeability is related to the solubility or strength of binding of the chemical in the delivery matrix (soil or other particles) versus the receptor matrix, the skin's stratum corneum. Fractional dermal absorption point estimate values were derived by OEHHA from available literature sources for the semi-volatile and nonvolatile chemicals in the "Hot Spots" program. The rationale for the chemical-specific dermal absorption fraction values, and the use of default values in cases where sufficient data are lacking, can be found in Appendix F of the Technical Support Document for Exposure and Stochastic Analysis (OEHHA, 2012).

5.4.2.2 Chronic Noncancer Dermal Dose

Dermal exposure, and thus annual dermal load (ADL), varies by age group. Therefore, a time-weighted average ADL for age 0-70 years (0-2, 2-16, and 16-70 years) is estimated for chronic residential exposure using ADL values in Table 5.12. This exposure pathway is also assessed for offsite workers using the offsite worker ADL values in Table 5.12d. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The contribution to the dermal dose is determined for each age group in EQ 5.4.2.2:

A. Equation 5.4.2.2: $\mathbf{Dose_{dermal} = ADL \times Cs \times ABS \times 10^{-9} \times ED/AT \times (1/350)}$

1. $Dose_{dermal}$ = Exposure dose through dermal absorption (mg/kg/d)
2. ADL = Annual dermal load (mg/kg-yr), age-specific
3. Cs = Average soil concentration (μg/kg)
4. ABS = Fraction absorbed across skin (unitless)
5. 10^{-9} = Conversion factor for chemical & soil (μg to mg, mg to kg)
6. 1/350 = Conversion factor for ADL from yrs to days (Note: this conversion is needed to remove EF, expressed as 350 days/365 days, from the ADLs in Table 5.12a-d)
7. ED = Exposure duration for specified age groups: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70 for residential exposure,
8. AT = Averaging time for residential exposure – 70 yrs

a: Recommended default values for EQ 5.4.2.2:

1. ADL = See Table 5.11 for point estimates by age group, climate region and receptor type (resident or worker)
2. Cs = Calculated above in EQ 5.3.2 A
3. ABS = See Table 5.13

b: Recommended off-site worker default modifications to EQ 5.4.2.2:

1. Chronic dermal dose to the off-site worker assumes only adult exposure and is incorporated into the off-site worker ADL in Table 5.12d.
2. A time-weighted average estimate of dose is not necessary and the ED and AT variates are left out of EQ 5.4.2.2 for dermal dose to the worker.

c: Recommended nursing mother default modifications to EQ 5.4.2.2:

1. For dermal dose to mother's milk, use the ADL for age 16-30 years in Table 5.12d.
2. The ED and AT variates in EQ 5.4.2.2 are left out for dermal dose in the mother's milk pathway.

d: Assumptions for EQ 5.4.2.2:

1. For cancer risk assessment, Exposure Frequency (EF) for vacation time away from exposure is incorporated into the ADLs shown in Tables 5.11 and 5.12 using the basic assumption that cancer risk is associated with cumulative dose of carcinogen. The dose used to estimate cancer risk can be adjusted for EF, and for time spent within the MEIR or MEIW location. Chronic RELs are not necessarily related to cumulative dose. Thus, adjusting the estimated dose for EF at the MEIR or MEIW is not appropriate, and the unadjusted daily rate is used in EQ 5.4.2.2.
2. For worker exposure, the annual average concentration should not be adjusted to account for worker and facility emission schedules, as done for

inhalation cancer risk assessment. The pollutant will be deposited and accumulate in the soil in the absence or presence of the worker; therefore, the total deposition and soil concentration will be dependent on the annual average air concentration.

For residential chronic exposure, the dermal dose contribution for each age group is summed together to obtain the time-weighted average daily dermal dose for chronic hazard assessment:

(ADL age 0<2 × Cs × ABS × 10^{-9} × 2 / 70 × (1/350)) +

(ADL age 2<16 × Cs × ABS × 10^{-9} × 14 / 70 × (1/350)) +

(ADL age 16-70 × Cs × ABS × 10^{-9} × 54 / 70 × (1/350)) = Chronic $Dose_{dermal}$

5.4.3 *Estimation of Exposure through Ingestion*

Exposure through ingestion is a function of the concentration of the substance in the ingested soil, water, and food, the gastrointestinal absorption of the substance, and the amount ingested.

5.4.3.1 Exposure through Ingestion of Soil

There are no distributions for soil ingestion currently recommended. Tier III stochastic risk assessments should include a high-end point estimate of soil ingestion, soil loading, exposure frequency and soil area.

5.4.3.1.1 Soil Ingestion Dose for Cancer Risk

The exposure dose through residential soil ingestion varies by age and is calculated for each age group ((e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). This pathway is also assessed for exposure to off-site workers. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The dose from inadvertent soil ingestion can be estimated by the point estimate approach using the following general equation:

A. Equation 5.4.3.1.1: $DOSE_{soil} = C_{soil} \times GRAF \times SIR \times 10^{-9} \times EF$

1. $DOSE_{soil}$ = Dose from soil ingestion (mg/kg BW-day)
2. 10^{-9} = Conversion factor (μg to mg, mg to kg)
3. C_{soil} = Concentration of contaminant in soil (μg/kg)
4. GRAF = Gastrointestinal relative absorption fraction, chemical-specific (unitless)
5. SIR = Soil ingestion rate (mg/kg BW-day)
6. EF = Exposure frequency (unitless), (days/365 days)

a: Recommended default values for EQ 5.4.3.1.1:

1. C_{soil} = Calculated above in EQ 5.3.2 A
2. GRAF = See Table 5.2
3. SIR = See Table 5.14
4. EF = 350 d/year resident, 250 d/year worker

In this approach, it is assumed that the soil ingested contains a representative concentration of the contaminant(s) and the concentration is constant over the exposure period.

The term **GRAF**, or gastrointestinal relative absorption factor, is defined as the fraction of contaminant absorbed by the GI tract relative to the fraction of contaminant absorbed from the matrix (feed, water, other) used in the study(ies) that is the basis of either the cancer potency factor (CPF) or the Reference Exposure Level (REL). If no data are available to distinguish absorption in the toxicity study from absorption from the environmental matrix in question (i.e., soil), then GRAF = 1. The GRAF allows for adjustment for absorption from a soil matrix if it is known to be different from absorption across the GI tract in the study used to calculate the CPF or REL. In most instances, the GRAF will be 1.

Table 5.14 Recommended Soil Ingestion Rate (SIR) Estimates for Adults and Children (mg/kg-day)*

Age Groups (years)	Mean (mg/kg-day)	95th % (mg/kg-day)
3rd Trimester[a]	0.7	3
0<2	20	40
2<9	5	20
2<16	3	10
16<30	0.7	3
16 to 70	0.6	3
PICA adult	NR	-

[a] Assumed to be the mother's soil ingestion rate (adult age 16 <30)
* Soil includes outdoor settled dust
NR = No recommendation

5.4.3.1.2 Chronic Noncancer Dose for Soil Ingestion

The soil ingestion rate varies by age. A time-weighted average approach is used to combine soil intake rates of the age groupings (i.e., 0<2 yrs, 2<16 yrs, and 16-70 yrs) to determine the residential soil ingestion dose for chronic noncancer hazard assessment. This pathway is also assessed for exposure to offsite workers using the adult intake values for age 16-70 years in Table 5.14. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The contribution to the soil ingestion dose by each age group is determined in EQ 5.4.3.1.2:

A. Equation 5.4.3.1.2: $$DOSE_{soil} = C_{soil} \times GRAF \times SIR \times 10^{-9} \times ED/AT$$

1. $DOSE_{soil}$ = Dose from soil ingestion (mg/kg BW-day)
2. 10^{-9} = Conversion factor (μg to mg, mg to kg)
3. C_{soil} = Concentration of contaminant in soil (μg/kg)
4. GRAF = Gastrointestinal relative absorption fraction, unitless; chemical-specific
5. SIR = Soil ingestion rate (mg/kg BW-day)
6. ED = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70
7. AT = Averaging time for lifetime exposure – 70 yrs

a: Recommended default values for EQ 5.4.3.1.2:

1. C_{soil} = Calculated above in EQ 5.3.2 A
2. GRAF = See Table 5.2
3. SIR = See Table 5.14; use 16-70 age group SIR for workers

b: Recommended off-site worker default modifications to EQ 5.4.3.1.2:

1. A time-weighted average estimate of dose is not necessary and the ED and AT variates are left out of EQ 5.4.3.1.2 for oral soil dose to the worker.

c: Recommended nursing mother default modifications to EQ 5.4.3.1.2:

1. For mother's ingested soil dose to milk, use the SIR for age 16-30 years in Table 5.14.
2. The ED and AT variates in EQ 5.4.3.1.2 are left out for soil ingestion dose in the mother's milk pathway.

d: Assumptions for EQ 5.4.3.1.2:

1. For worker exposure, the annual average concentration should not be adjusted to account for overlap of worker and facility emission schedules. The pollutant will be deposited and accumulate in the soil in the absence or presence of the worker; therefore, the total deposition and soil concentration will be dependent on the annual average air concentration.

For residential exposure, the soil ingestion dose contribution for each age group is summed together to obtain the time-weighted average daily soil intake dose for chronic hazard assessment:

(SIR for age 0<2 yrs × C_{soil} × GRAF × 10^{-9} × 2 / 70) +

(SIR for age 2<16 yrs × C_{soil} × GRAF × 10^{-9} × 14 / 70) +

(SIR for age 16-70 yrs × C_{soil} × GRAF × 10^{-9} × 54 / 70) = Chronic $Dose_{soil}$

5.4.3.2 Exposure through Ingestion of Food

The exposure through food ingestion can be through ingestion of home-grown plant products (categorized as leafy, protected, exposed and root produce), home-raised animals (categorized as meat, cow's milk and eggs), angler-caught fish and mother's milk. When a specific food pathway is a dominant pathway (e.g., homegrown produce), and multiple pathways such as home raised meat, milk, and eggs categories all need to be assessed, the 95th percentile default consumption rate for the driving exposure pathway is used, while the mean consumption values for the remaining exposure pathways (i.e., food categories) are used. See Section 8.2.6 for a complete discussion of the methodology on how to implement the derived methodology.

5.4.3.2.1 Dose for Cancer Risk from Home-Grown Produce

Exposure through ingesting home-grown produce (DOSEp) is a function of the type of crop (i.e., exposed, leafy, protected, root), gastrointestinal relative absorption factor, bioavailability and the fraction of plant ingested that is homegrown. The calculation is done for each type of crop, then summed to get total dose for this pathway. The

exposure dose through ingestion of home-grown produce varies by age and is calculated for each age group (e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8).

A. Equation 5.4.3.2.1: $$DOSEp = C_v \times IP \times GRAF \times L \times EF \times 10^{-6}$$

1. DOSEp = Exposure dose through ingestion of home-grown produce (mg/kg/d)
2. C_v = Concentration in specific type of crop, i.e., exposed, leafy, protected, root (μg/kg)
3. IP = Consumption of specific type of crop (g/kg BW*day)
4. GRAF = Gastrointestinal relative absorption factor (unitless)
5. L = Fraction of plant type consumed that is home-grown or locally grown (unitless)
6. EF = Exposure frequency (unitless, days/365 days)
7. 10^{-6} = Conversion factors (μg/kg to mg/g)

a: Recommended default values for Equation 5.4.3.2.1:

1. C_v = Calculated above in EQ 5.3.4.1 A
2. IP = See Table 5.15 (point estimates) and 5.16a-e (distributions)
3. GRAF = See Table 5.2
4. L = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values
5. EF = 0.96 (350 d/365 d in a yr)

Once the dose for each type of crop that applies is calculated (See Section 5.3.4.1 for definition of crops types), the doses are summed to get the total dose for the home-grown produce pathway:

Total DOSEp = DOSEp (leafy) + DOSEp (root) + DOSEp (exposed) + DOSEp (protected)

The total home-grown produce dose will need to be calculated for each age group that applies.

5.4.3.2.2 Dose for cancer risk from home-raised meat, eggs, and cow's milk

Exposure through ingesting home-raised or farm animal products ($DOSE_{fa}$) is a function of the type of food (meat, eggs and cow's milk), gastrointestinal relative absorption factor, bioavailability and the fraction of food ingested that is home-raised. The only meat sources considered here are beef, pork and poultry. Unlike the home-grown produce pathway, the dose is calculated and presented separately for each type of home-raised food. The age-specific groupings to determine dose (3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs or 16-70 yrs) is needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8).

A. Equation 5.4.3.2.2: $DOSE_{fa} = C_{fa} \times I_{fa} \times GRAF \times L \times EF \times 10^{-6}$

1. $DOSE_{fa}$ = Exposure dose through ingestion of home-raised animal product (mg/kg/d)
2. C_{fa} = Concentration in animal product, e.g., beef, pork, poultry, dairy, eggs (μg/kg)
3. I_{fa} = Consumption of animal product (g/kg BW-day)
4. GRAF = Gastrointestinal relative absorption factor (unitless)
5. L = Fraction of animal product consumed that is home-raised or locally produced (unitless)
6. EF = Exposure frequency (unitless, days/365 days)
7. 10^{-6} = Conversion factors (μg/kg to mg/g)

a: Recommended default values for EQ 5.4.3.2.2:

1. C_{fa} = Calculated above in EQ 5.3.4.2 A
2. I_{fa} = See Table 5.15 (point estimates) and Table 5.16a-e (distributions)
3. GRAF = See Table 5.2
4. L = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values
5. EF = 0.96 (350 days / 365 days in a year)

5.4.3.2.3 Chronic Noncancer Dose for Ingestion of Food

For oral noncancer hazard assessment, a time-weighted average approach is used to combine food ingestion rates for the age groups (i.e., 0<2, 2<16 and 16-70 yrs) to estimate the chronic dose for residential exposure. The equation used to estimate dose through home-grown produce and home-raised meat/eggs/cow's milk is similar and is shown below in one equation. Similar to the cancer risk dose calculation, home-grown produce is presented as a total dose for all types of crops (See Section 5.4.3.2.1) and home-raised animal product dose is presented separately for each type of animal product that applies (See Section 5.4.3.2.2).

The contribution to the food intake dose is determined for each age group in EQ 5.4.3.2.3:

A. Equation 5.4.3.2.3: $\mathbf{DOSE_{food} = C_{food} \times I_{food} \times GRAF \times L \times 10^{-6} \times ED/AT}$

1. $DOSE_{food}$ = Exposure dose through ingestion of home-grown produce or home-raised animal product (mg/kg/d)
2. C_{food} = Concentration (μg/kg) in produce (e.g., exposed, leafy, protected, root) or animal product (e.g., beef, pork, poultry, dairy, eggs)
3. I_{food} = Consumption of produce or animal product (g/kg BW-day)
4. GRAF = Gastrointestinal relative absorption factor (unitless)
5. L = Fraction of produce or animal product consumed that is home-grown (unitless)
6. 10^{-6} = Conversion factors (μg/kg to mg/g)
7. ED = Exposure duration for a specified age group (2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70
8. AT = Averaging time for lifetime exposure: 70 yrs

a: Recommended default values for EQ 5.4.3.2.3:

1. C_{food} = Calculated above in EQ 5.3.4.1 A (for home-grown produce) or EQ 5.3.4.2 A (for home-raised animal products)
2. I_{food} = Age-specific, see Table 5.15 for point estimates
3. GRAF = See Table 5.2
4. L = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values

b: Recommended nursing mother default modifications to EQ 5.4.3.2.3:

1. For the mother's dose to milk through ingested food, use the food intake rates for age 16-30 years in Table 5.15 and 5.16d.
2. The ED and AT variates in EQ 5.4.3.2.3 are left out for ingested food dose in the mother's milk pathway.

Following calculation of the intake dose contributions for each age group, the intake rates for home-grown produce and the intake rates for home-raised animal products are summed separately to obtain the residential time-weighted average intake dose for chronic residential exposure to home-grown produce and to home-raised animal products:

(I_{food} for age 0<2 yrs × C_{food} × GRAF × L × 10^{-6} × 2 / 70) +

(I_{food} for age 2<16 yrs × C_{food} × GRAF × L × 10^{-6} × 14 / 70) +

(I_{food} for age 16-70 yrs × C_{food} × GRAF × L × 10^{-6} × 54 / 70) = Chronic $Dose_{food}$

Table 5.15 Recommended Average and High End Point Estimate Values for Home Produced Food Consumption (g/kg-day)

Food Category	Third Trimester		Ages 0<2		Ages 2<9

Table 5.17 Default Values for L in EQs 5.4.3.2.1., 5.4.3.2.2 and 5.4.3.2.3: Fraction of Food Intake that is Home-Produced

Food Type	Households that Garden[a]	Households that Farm[a]
Avg. Total Veg & Fruits	0.137	0.235
	Households that Garden/Hunt[b]	**Households that Farm[b]**
Beef	0.485	0.478
Pork	0.242	0.239
Poultry	0.156	0.151
Eggs	0.146	0.214
Total Dairy (Cow's milk)	0.207	0.254

[a] As a default for home-produced leafy, exposed, protected and root produce, OEHHA recommends 0.137 as the fraction of produce that is home-grown. The households that grow their own vegetables and fruits are the population of concern. In rural situations where the receptor is engaged in farming, OEHHA recommends 0.235 as the default value for fraction of leafy, exposed, protected and root produce that is home-grown.

[b] OEHHA recommends the fraction home-raised under "Households that raise animals/hunt" (for beef, pork, poultry (chicken), eggs and dairy (cow's milk), with the exception of rural household receptors engaged in farming. OEHHA recommends that the fractions listed under "Households that farm" be used for the rural household receptors.

5.4.3.3 Exposure through Ingestion of Water

Intake of drinking water varies by age on a ml per kg body weight per day basis resulting in differences in exposure dose by age. The age-specific groupings to determine dose are needed in order to properly use the age sensitivity factors for

cancer risk assessment (see Chapter 8) and to calculate a time-weighted average dose for chronic noncancer assessment.

5.4.3.3.1 Dose for Cancer Risk through Ingestion of Water

$DOSE_{water}$ is calculated for each age group (i.e., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs and 16-70 yrs), then incorporated into EQ 8.2.5 in Chapter 8 to determine cancer risk through exposure in drinking water.

A. Equation 5.4.3.3.1: $$\mathbf{DOSE_{water} = C_w \times WIR \times ABS_{wa} \times Fdw \times EF \times 10^{-6}}$$

1. $DOSE_{water}$ = Exposure dose through ingestion of water (mg/kg BW/d)
2. C_w = Water concentration (μg/L)
3. WIR = Water ingestion rate (ml/kg BW-day)
4. ABS_{wa} = Gastrointestinal relative absorption factor (unitless)
5. Fdw = Fraction of drinking water from contaminated source
6. EF = Exposure frequency (unitless, days/365 days)
7. 10^{-6} = Conversion factors (mg/μg)(L/ml)

a: Recommended default values for EQ 5.4.3.3.1:

1. C_w = Calculated above 5.3.3 A
2. WIR = See 5.18 (point estimates) and Table 5.19 (distributions)
3. ABS_{wa} = Default set to 1
4. Fdw = Default set to 1, although a site-specific survey is recommended for this variate
5. EF = 0.96 (350 days/365 days in a year)

5.4.3.3.2 Chronic Noncancer Dose through Ingestion of Water

Because water intake varies by age group, a time-weighted average intake approach is used to determine the daily water ingestion dose for chronic residential exposure. The contribution to the water ingestion dose is determined for each age group (i.e., 0<2, 2<16 and 16-70 yrs) in EQ 5.4.3.3.2.

A. Equation 5.4.3.3.2:

$$\mathbf{DOSE_{water} = C_w \times WIR \times ABS_{wa} \times Fdw \times 10^{-6} \times ED/AT}$$

1. $DOSE_{water}$ = Exposure dose through ingestion of water (mg/kg BW/d)
2. C_w = Water concentration (μg/L)
3. WIR = Water ingestion rate (ml/kg BW-day)
4. ABS_{wa} = Gastrointestinal absorption factor
5. Fdw = Fraction of drinking water from contaminated source (site-specific)
6. 10^{-6} = Conversion factors (mg/μg)(L/ml)
7. ED = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70
8. AT = Averaging time for residential exposure: 70 yrs

a: Recommended default values for EQ 5.4.3.3.2:

1. C_w = Calculated above in 5.3.3 A
2. WIR = See 5.18 (point estimates)
3. ABS_{wa} = Default set to 1
4. Fdw = Default set to 1, although a site-specific survey is recommended for this variate

b: Recommended nursing mother default modifications to EQ 5.4.3.3.2:

1. For the dose to mother's milk through water ingestion, use the WIR for age 16-30 years in Table 5.18.
2. The ED and AT variates in EQ 5.4.3.3.2 are left out for ingested water dose in the mother's milk pathway.

The water intake dose contribution for each age group is summed together to obtain the time-weighted average daily residential water ingestion dose:

(WIR for age 0<2 yrs × C_w × ABS_{wa} × Fdw × 10^{-6} × 2 / 70) +

(WIR for age 2<16 yrs × C_w × ABS_{wa} × Fdw × 10^{-6} × 14 / 70) +

(WIR for age 16-70 yrs × C_w × ABS_{wa} × Fdw × 10^{-6} × 54 / 70) = Chronic $Dose_{water}$

Table 5.18 Recommended Point Estimate Tap Water Intake Rates (ml/kg-day)

5.4.3.4 Exposure through Ingestion of Angler-caught Fish

Exposure through ingestion of angler-caught fish ($DOSE_{fish}$) is a function of the fraction of fish ingested that is caught in the exposed water body, which differs for each age grouping, and the gastrointestinal absorption factor. Ingestion of angler-caught fish on a mg/kg body weight per day basis varies by age resulting in differences in exposure dose by age. The age-specific groupings to determine dose is needed primarily to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8) and to calculate a time-weighted average dose for chronic noncancer assessment.

5.4.3.4.1 Cancer Risk Dose via Ingestion of Angler-Caught Fish

$DOSE_{fish}$ is calculated for each age group separately (i.e., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs and 16-70 yrs), then incorporated into EQ 8.2.5 in Chapter 8 to determine cancer risk through exposure to angler-caught fish.

A. Equation 5.4.3.4.1: $$DOSE_{fish} = C_t \times I_{fish} \times Gf \times L \times EF \times 10^{-6}$$

1. $DOSE_{fish}$ = Dose via ingestion of angler-caught fish (mg/kg BW-day)
2. C_t = Concentration in fish muscle tissue (μg/kg)
3. I_{fish} = Angler-caught fish ingestion rate (g/kg BW per day)
4. Gf = Gastrointestinal absorption factor (unitless)
5. L = Fraction of fish caught at exposed site (unitless)
6. EF = Exposure frequency (days/365 days)
7. 10^{-6} = Conversion factor (mg/μg, kg/g)

a: Recommended default values for Equation 5.4.3.4.1:

1. C_t = Calculated above in Equation 5.3.4.7
2. I_{fish} = See Table 5.20 (point estimates) and Table 5.21 (distributions)
3. Gf = Default set to 1
4. L = Default set to 1 for fraction of fish caught locally, although a site-specific survey is recommended for this variate
5. EF = 0.96 (350 days/365 days in a yr)

5.4.3.4.2 Chronic Noncancer Dose via Ingestion of Angler-Caught Fish

Angler-caught fish consumption varies by age group. A time-weighted average intake for residential consumption over 70 years is used to determine dose for average and high-end exposure. The contribution to the angler-caught fish consumption dose is determined for each age group in EQ 5.4.3.4.2:

A. Equation 5.4.3.4.2: $\mathbf{DOSE_{fish} = C_t \times I_{fish} \times Gf \times L \times 10^{-6} \times ED/AT}$

1. $DOSE_{fish}$ = Dose via ingestion of angler-caught fish (mg/kg BW-day)
2. C_t = Concentration in fish muscle tissue (μg/kg)
3. I_{fish} = Angler-caught fish ingestion rate (g/kg BW per day)
4. Gf = Gastrointestinal absorption factor (unitless)
5. L = Fraction of fish caught at exposed site (unitless)
6. 10^{-6} = Conversion factor (mg/μg, kg/g)
7. ED = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16 and 54 yrs for 16-70
8. AT = Averaging time for chronic exposure – 70 yrs

a: Recommended default values for Equation 5.4.3.4.2:

1. C_t = Calculated above in Equation 5.3.4.7
2. I_{fish} = See Table 5.20 (point estimates)
3. Gf = Default set to 1
4. L = Default set to 1 for fraction of fish caught locally, although a site-specific survey is recommended for this variate

b: Recommended nursing mother default modifications to EQ 5.4.3.4.2:

1. For the dose to mother's milk through fish consumption, use the I_{fish} for age 16-30 years in Table 5.20.
2. The ED and AT variates in EQ 5.4.3.4.2 are left out for the dose via fish consumption in the mother's milk pathway.

Following calculation of the angler-caught fish consumption dose contribution for each age group, 0<2 yr, 2<16 yr and 16-70 yr fish consumption doses are summed together to obtain the residential chronic dose:

(I_{fish} for age 0<2 yrs × C_t × Gf × L × 10^{-6} × 2 / 70) +

(I_{fish} for age 2<16 yrs × C_t × Gf × L × 10^{-6} × 14 / 70) +

(I_{fish} for age 16-70 yrs × C_t × Gf × L × 10^{-6} × 54 / 70) = Chronic $Dose_{fish}$

Table 5.20 Point Estimate Values for Angler-Caught Fish Consumption (g/kg-day) by Age Group

	Third Trimester	0 <2 Years	2<9 Years	2<16 Years	16<30 Years	16-70 Years

5.4.3.5 Mother's Milk

Exposure through mother's milk ingestion (Dose-Im) is a function of the average concentration of the substance in mother's milk and the amount of mother's milk ingested. The minimum pathways that the nursing mother is exposed to include inhalation, soil ingestion, and dermal, since the chemicals evaluated by the mother's milk pathway are multipathway chemicals. Other pathways may be appropriate depending on site conditions (e.g., the presence of vegetable gardens or home grown chickens). The compounds currently considered for the mother's milk pathway are:

1. Dioxins and Furans (PCDDS and PCDFs)
2. Polychlorinated biphenyls (PCBs)
3. Polycyclic Aromatic Hydrocarbons (PAHs), including creosotes
4. Lead

These compound classes represent the chemicals of greatest concern for the mother's milk pathway under the Hot Spots program, and for which data are available to estimate transfer coefficients. It is expected that additional transfer coefficients will be developed for other multipathway chemicals in the Hot Spots Program as data becomes available and is reviewed. The nursing mother in the mother's milk pathway is not herself subject to the mother's milk pathway. The summed average daily dose (mg/kg BW-day) from all pathways is calculated for the nursing mother using the equations that follow.

5.4.3.5.1 Cancer Risk Dose to Infant via Mother's Milk

A. Equation 5.4.3.5.1: $$\textbf{Dose-Im} = C_m \times BMI_{bw} \times EF \times 10^{-3}$$

1. Dose-Im = Dose to infant through ingestion of mother's milk (mg/kg BW per day)
2. C_m = Concentration of contaminant in mother's milk (mg/kg milk)
3. BMI_{bw} = Daily breast-milk ingestion rate (g/kg BW-day)
4. EF = Frequency of exposure (days / 365 days)
5. 10^{-3} = Conversion factor (kg to g)

a: Recommended default values for EQ 5.4.3.5.1:

1. C_m = See EQ 5.3.4.8
2. BMI_{bw} = See Table 5.22 for point estimates. For distribution (parametric model) for Tier 3 stochastic risk assessments see Table 5.23.
3. EF = 1 (all 365 days of the first year of birth)

b: Assumptions for EQ 5.4.3.5.1:

1. For the MEIR, mother is exposed from birth up to 25 years of age when the infant is born. The exposed infant is then fully breastfed only during the first year of life.
2. For cancer risk assessment, exposure of breast-feeding infants to contaminants in breast milk applies only to the first year of the 0<2 yr age group for calculation of risk to this group, which then can be summed with the risk calculated for the other age groups (See Chapter 8).

5.4.3.5.2 Chronic Noncancer Dose to Infant via Mother's Milk

For oral noncancer hazard assessment, exposure of the infant through mother's milk ingestion occurs during the first year of life. After one year of age, the mother's milk pathway is not a factor for noncancer assessment.

A. Equation 5.4.3.5.2: $\text{Dose-Im} = C_m \times BMI_{bw} \times 10^{-3}$

1. Dose-Im = Dose to infant through ingestion of mother's milk (mg/kg BW/d)
2. C_m = Concentration of contaminant in mother's milk (mg/kg milk)
3. BMI_{bw} = Daily breast-milk ingestion rate (g/kg BW-day)
4. 10^{-3} = Conversion factor (kg to g)

a: Recommended default values for EQ 5.4.3.5.2:

1. C_m = See EQ 5.3.4.8
2. BMI_{bw} = See Table 5.22 for point estimates

Table 5.22 Default Point Estimates for Breast Milk Intake (BMI_{bw}) for Breastfed Infants

Infant Group	Intake (g/kg-day)
Fully breastfed over the first year (i.e., fed in accordance with AAP recommendations)	
Mean	101
95th percentile	139

Table 5.23 Recommended Distribution of Breast Milk Intake Rates Among Breastfed Infants for Stochastic Assessment* (Averaged Over an Individual's First Year of Life)

	Mean (SD)	Percentile							
		5	10	25	50	75	90	95	99
Intake (g/kg-day)	101 (23)	62	71	85	101	116	130	139	154

* For stochastic analysis, the mother's milk data are normally distributed.

6 - Dose-Response Assessment for Noncarcinogenic Endpoints

6.1 Derivation of Toxicity Criteria for Noncancer Health Effects

Dose-response assessment describes the quantitative relationship between the amount of exposure to a substance (the dose) and the incidence or occurrence of an adverse health impact (the response). Dose-response information for noncancer health effects is used to determine Reference Exposure Levels (RELs). Inhalation RELs are air concentrations or doses at or below which adverse noncancer health effects are not expected even in sensitive members of the general population under specified exposure scenarios. The acute RELs are for infrequent 1 hour exposures that occur no more than once every two weeks in a given year, although this time frame of exposure does not necessarily apply to chemicals that can bioaccumulate (e.g., dioxins and furans, PCBs, and various metals). The chronic RELs are for 24 hour per day exposures for at least a significant fraction of a lifetime, defined as about 8 years (≥12 percent of a 70-year lifespan). The 8-hour RELs are for repeated 8-hour exposures for a significant fraction of a lifetime such as the exposures that offsite workers might typically receive. Eight-hour RELs are only available for 10 chemicals at present, but OEHHA will develop 8-hour RELs as we re-evaluate our existing RELs to ensure they are protective of children's health, and as we develop RELs for new chemicals. There are oral chronic RELs for some chemicals in the Hot Spots program that are semivolatile or nonvolatile and thus subject to deposition and oral ingestion or dermal exposure. The methodology for developing RELs is similar to that used by U.S. EPA in developing the inhalation Reference Concentrations (RfCs) and oral Reference Doses (RfDs).

Review and revision of RELs to take into account new information and sensitive subpopulations including infants and children is an ongoing process. All draft RELs for individual chemicals revised under the current noncancer methodology will undergo public comment and peer review, as mandated by the Hot Spots Act. .

The first step in determining an acute, 8-hour, or chronic REL is to determine a point of departure. The point of departure is preferably determined by the benchmark concentration procedure applied to human or animal studies, but if this method of calculation cannot be used with a particular data set, a no observed adverse effect level (NOAEL) or lowest observed adverse effect level (LOAEL) may be used as the point of departure. The benchmark concentration method (also referred to as the benchmark dose method for oral exposures) is a preferred method to estimate a point of departure because it takes all of the available dose-response data into account to statistically estimate, typically, a 5 percent response rate.

Dosimetric or toxicokinetic adjustments are often made to the point of departure to adjust for differences in dosimetry or kinetics across species or among humans. Time adjustments are generally applied to adjust experimental exposure to the exposure of

interest for the REL (e.g., 1 hour for acute, continuous for chronic). A modified Haber's equation is used where needed to adjust studies with different exposure times to the one-hour period needed for acute RELs. A simple Haber's law (C x T) adjustment for exposure period duration is used for most 8-hour and chronic RELs.

The time and dosimetry adjusted point of departure is divided by uncertainty factors that reflect the limitations in the current toxicology of the chemical. For example, an interspecies uncertainty factor is applied to account for the differences between humans and animals when an animal study is used. An intraspecies uncertainty factor is usually included to account for differences in susceptibility among the human population. In addition, where benchmark dose modeling is not suitable and a NOAEL is not available, a LOAEL to NOAEL uncertainty factor may be applied when the LOAEL serves as the point of departure. If a chronic study is not available to serve as a basis for a chronic REL, then a subchronic uncertainty factor (for chronic and 8-hour RELs only) may also be applied. Finally, if there are data deficiencies, for example, lack of a developmental toxicity study for a chemical, then a database deficiency factor may be applied. The individual uncertainty factors, which range from 2 to 10 depending on the limitations in the data, are multiplied together for a total uncertainty factor. The point of departure is then divided by the total UF to obtain the REL.

The most sensitive toxicological end point is selected as the basis for the REL when there are multiple adverse health effects. The selection of the most sensitive endpoint as the basis for a REL helps ensure that the REL is protective for all health effects. The use of uncertainty factors helps ensure that the REL is protective for nearly all individuals, including sensitive subpopulations, within the limitations of current scientific knowledge. For detailed information on the methodology and derivations for RELs, including guidance on selection of uncertainty factors, see the Air Toxics Hot Spots Risk Assessment Guidelines Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (OEHHA, 2008).

It should be emphasized that exceeding the acute or chronic REL does not necessarily indicate that an adverse health impact will occur. The REL is not the threshold where population health effects would first be seen. However, levels of exposure above the REL have an increasing but undefined probability of resulting in an adverse health impact, particularly in sensitive individuals (e.g., depending on the toxicant, the very young, the elderly, pregnant women, and those with acute or chronic illnesses). The significance of exceeding the REL is dependent on the seriousness of the health endpoint, the strength and interpretation of the health studies, the magnitude of combined safety factors, and other considerations. In addition, there is a possibility that a REL may not be protective of certain small, unusually sensitive human subpopulations. Such subpopulations can be difficult to identify and study because of their small numbers, lack of knowledge about toxic mechanisms, and other factors. It may be useful to consult OEHHA staff when a REL is exceeded (hazard quotient or hazard index is greater than 1.0). Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a hazard quotient (HQ) and hazard indices (HI).

Tables 6.1 through 6.3 list the currently adopted acute, 8-hour, and chronic inhalation RELs. Some substances that pose a long-term inhalation hazard may also present a chronic hazard via non-inhalation (oral, dermal) routes of exposure. The oral RELs for these substances are presented in Table 6.3. Appendix L provides a consolidated listing of all the acute, 8-hour, and chronic RELs with the respective target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA and these guidelines will be updated to reflect those changes. See OEHHA's web site at *www.oehha.ca.gov* (look under "Air", then select "Hot Spots Guidelines") to determine if any new or updated RELs have been adopted since the last guideline update.

6.2 Acute Reference Exposure Levels

OEHHA developed acute RELs for assessing potential noncancer health impacts for short-term, one-hour peak exposures to facility emissions (OEHHA, 2008; http://www.oehha.ca.gov/air/allrels.html). By definition, an acute REL is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration (in units of micrograms per cubic meter or $\mu g/m^3$) for the specified exposure duration on an intermittent basis.

The target organ systems and the acute RELs for each substance are presented in Table 6.1. Many acute RELs are based on mild adverse effects, such as mild irritation of the eyes, nose, or throat, or may result in other mild adverse physiological changes. For most individuals, it is expected that the mild irritation and other adverse physiological changes will not persist after exposure ceases. For RELs that have been recently developed or revised, the notation "sensory irritation" has been added in parenthesis in Table 6.1 for those chemicals that have an acute REL based on sensory irritation of the respiratory system (i.e., nose , throat) and/or eyes.

Other acute RELs are based on reproductive/developmental endpoints, such as teratogenicity or fetotoxicity, which are considered severe adverse effects. The inhalation pathway is the only pathway to assess for acute exposure. Other non-inhalation pathways of exposure are evaluated for worker and residential scenarios where the exposures are chronic or repeated daily in nature. The oral RELs are used to evaluate the non-inhalation pathways of exposure. Noninhalation (oral) RELs are discussed in Section 6.5. Chapter 8 discusses the methods used for determining noncancer acute health impacts. Appendix I presents an example calculation used to determine an HQ and HI.

Table 6.1 Acute Inhalation Reference Exposure Levels (RELs) and Acute Hazard Index Target Organ System(s)

Substance	Chemical Abstract Service Number (CAS)	Acute Inhalation REL ($\mu g/m^3$)	Acute Hazard Index Target Organ Systems(s)
Acetaldehyde	75-07-0	$4.7 \times 10^{+2}$	Eyes; Respiratory System (sensory irritation)

6.3 8-hour Reference Exposure Levels

OEHHA has developed 8-hour RELs for assessing potential noncancer health impacts for exposures to the general public that occur on a recurrent basis, but only during a portion of each day (OEHHA, 2008; http://www.oehha.ca.gov/air/allrels.html). Eight-hour RELs are compared to air concentrations that represent an average (daily) 8-hour exposure. They were designed to address off-site worker exposure at the MEIW, but may also be used at the Districts' discretion to characterize 8-hour residential noncancer exposures, particularly for non-continuous facility operations where exposure is based on air concentrations during facility operation (i.e., the zero emission hours are not included) rather than averaged over 24-hours/day, 7 days/week as assessed for chronic exposure. The 8-hour RELs can also be used to assess exposure of students and teachers while at school (OEHHA, 2008). These RELs were developed because of concerns that applying the chronic REL in some scenarios was

overly conservative. By definition, an 8-hour REL is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration (in units of micrograms per cubic meter or $\mu g/m^3$) for an 8-hour exposure duration on a regular (including daily) basis.

The RELs, target organ systems, and the averaging time for substances that can present a potential hazard from inhalation for 8 hours on a daily basis are presented in Table 6.2. Chapter 8 discusses the methods used for determining noncancer 8-hour health impacts. Appendix I presents an example calculation used to determine an HQ and HI.

Any substances in Table 6.2 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development".

Table 6.2 Eight-Hour Inhalation Reference Exposure Levels (RELs) and 8-Hour Hazard Index Target Organ System(s)

Substance	Chemical Abstract Service Number (CAS)	Chronic Inhalation REL ($\mu g/m^3$)	Chronic Inhalation Hazard Index Target Organ System(s)
Acetaldehyde	75-07-0	$3.0 \times 10^{+2}$	Respiratory System
Acrolein	107-02-8	7.0×10^{-1}	Respiratory System

Nickel & Nickel Compounds	7440-02-0	6.0×10^{-2}	Respiratory System; Immune System

6.4 Chronic Reference Exposure Levels

OEHHA has developed chronic RELs for assessing noncancer health impacts from long-term exposure. (OEHHA, 2008; see also http://www.oehha.ca.gov/air/allrels.html) A chronic REL is a concentration level (expressed in units of micrograms per cubic meter ($\mu g/m^3$) for inhalation exposure and in a dose expressed in units of milligrams per kilogram-day (mg/kg-day) for oral exposures) at or below which no adverse health effects are anticipated following long-term exposure. Long-term exposure for these purposes has been defined by U.S. EPA as at least 12% of a lifetime, or about eight years for humans. Table 6.3 lists the chronic noncancer RELs that should be used in

the assessment of chronic health effects from inhalation exposure. Appendix L provides a consolidated listing of all the acute, 8-hour and chronic RELs and target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA. See OEHHA's web site http://www.oehha.ca.gov/air/allrels.html to determine if any new or updated RELs have been adopted since the last guideline update.

The organ system(s) associated with each chronic REL are also presented in Table 6.3. Any substances in Table 6.3 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development". Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a HQ and HI.

Table 6.3 Chronic Inhalation Reference Exposure Levels (RELs) and Chronic Hazard Index Target Organ System(s)

Substance	Chemical Abstract Service Number (CAS)	Chronic Inhalation REL ($\mu g/m^3$)	Chronic Inhalation Hazard Index Target Organ System(s)
Acetaldehyde [a]	75-07-0	$1.4 \times 10^{+2}$	Respiratory System
Acrolein	107-02-8	3.5×10^{-1}	Respiratory System
Acrylonitrile	107-13-1	$5.0 \times 10^{+0}$	Respiratory System
Ammonia	7664-41-7	$2.0 \times 10^{+2}$	Respiratory System
Arsenic & Inorganic Arsenic Compounds	7440-38-2	1.5×10^{-2}	Cardiovascular System; Development; Nervous System; Respiratory System; Skin

[a] These peer-reviewed values were developed under the Toxic Air Contaminant (TAC) Program mandated by AB1807 (California Health and Safety Code Sec. 39650 *et seq*.).

[b] The OEHHA has adopted the World Health Organization Toxicity Equivalency Factor (TEF) scheme for evaluating the cancer risk and noncancer hazard due to exposure to samples containing mixtures of polychlorinated dibenzo-*p*-dioxins (PCDD) (also referred to as chlorinated dioxins and dibenzofurans), polychlorinated dibenzofurans (PCDF) and polychlorinated biphenyls (PCBs). The TEF values are revised from time to time to reflect new data and increased scientific knowledge. Currently OEHHA recommends use of the 2005 revision to the WHO TEF values (WHO_{05}-TEF). See Appendix E for more information about the scheme and for the methodology for calculating 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD) equivalents for PCDD and PCDFs. For

convenience, OEHHA has calculated chronic REL values for speciated PCDDs, PCDFs and PCBs based on the WHO_{05} TEF values and the chronic REL for 2,3,7,8-TCDD using the procedure discussed in Appendix E. The chronic REL values can be used to calculate a hazard index when the mixtures are speciated from individual congener ground level concentrations. In those cases where speciation of dioxins and furans has not been performed, then 2,3,7,8-TCDD serves as the surrogate for dioxin and furan emissions.

N/A Not Applicable

6.5 Chronic Oral (Noninhalation) Reference Exposure Levels

As specified throughout the guidelines, estimates of long-term exposure resulting from facility air emissions of specific compounds must be analyzed for both inhalation and noninhalation (multipathway) pathways of exposure for humans. Facilities often emit substances under high temperature and pressure in the presence of particulate matter. While some of these substances are expected to remain in the vapor phase, other substances such as metals and semi-volatile organics can be either emitted as particles, form particles after emission from the facility, or adhere to existing particles. Some substances will partition between vapor and particulate phases. Substances in the particulate phase can be removed from the atmosphere by settling and, thus, potentially present a significant hazard via noninhalation pathways.

Particulate-associated chemicals can be deposited directly onto soil, onto the leaves or fruits of crops, or onto surface waters. Exposure via the oral route is the predominant noninhalation pathway, resulting in the noninhalation RELs being referred to as 'oral RELs' in this document. The oral RELs are used for both ingestion and dermal exposures, and are applied using the chronic non-inhalation exposures in the residential scenario and the worker scenarios. The oral RELs are expressed as doses in milligrams of substance (consumed and dermally absorbed) per kilogram body weight per day (mg/kg-day).

Table 6.4 lists the chronic noncancer RELs to be used in the assessment of chronic health effects from noninhalation pathways of exposure. Any substances in Table 6.4 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development". Appendix L provides a consolidated listing of all chronic RELs and target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA and these guidelines will be updated to reflect those changes. See OEHHA's web page at http://www.oehha.ca.gov/air/allrels.html to determine if any new or updated RELs have been adopted since the last guideline update. Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a HQ and HI.

Table 6.4 Chronic Noninhalation 'Oral' Reference Exposure Levels (RELs) and Chronic Hazard Index Target Organ System(s)

Substance	Chemical Abstract Service No. (CAS)	Chronic Oral REL (mg/kg-day)	Chronic Oral Hazard Index Target Organ System(s)

7 - Dose-Response Assessment for Carcinogens

7.1 Introduction

Dose-response assessment characterizes the quantitative relationship between the amount of exposure to a substance (the dose) and the incidence or occurrence of injury (the response). The process often involves establishing a toxicity value or criterion to use in assessing potential health risk. The toxicity criterion, or health guidance value, for carcinogens is the cancer potency slope (potency factor), which describes the potential risk of developing cancer per unit of average daily dose over a 70-year lifetime. Cancer inhalation and oral potency factors have been derived by the Office of Environmental Health Hazard Assessment (OEHHA) or by the United States Environmental Protection Agency (U.S. EPA) and approved by the State's Scientific Review Panel on Toxic Air Contaminants. They are available for many of the substances listed in Appendix A (List of Substances) as carcinogens. Table 7.1 and Appendix L list the inhalation and oral cancer potency factors that should be used in multipathway health risk assessments (HRAs) for the Hot Spots Program.

The details on the methodology of dose-response assessment for carcinogens and the approved cancer potency factors are provided in the Air Toxics Hot Spots Risk Assessment Guidelines. Part II. Technical Support Document for Cancer Potency Factors: Methodologies for derivation, listing of available values, and adjustments to allow for early life stage exposures. May, 2009. (OEHHA, 2009; see http://www.oehha.ca.gov/air/hot_spots/tsd052909.html).

7.2 Carcinogenic Potency

Cancer potency factors used for both the inhalation and oral routes in the Hot Spots program are generally the 95% upper confidence limits (UCL) on the modeled dose-response slope at the low dose range. The cancer slope factor assumes continuous lifetime exposure to a substance, and is expressed in units of inverse dose [i.e., $(mg/kg/day)^{-1}$]. Another common potency expression is in units of inverse concentration [$(\mu g/m^3)^{-1}$)] when the slope is based on exposure concentration rather than dose; this is termed the unit risk factor. To accommodate the use of age-specific exposure variates, the Hot Spots program has translated the unit risk factors based on concentration to units of inverse dose. This allows calculation of risk for age groupings, as exposure varies with age. It also allows for application of Age Sensitivity Factors for early life exposures.

It is assumed in cancer risk assessments that risk is directly proportional to dose and that, for most carcinogens, there is no threshold for carcinogenesis. The derivation of inhalation and oral cancer potency factors takes into account information on pharmacokinetics, when available, and on the mechanism of carcinogenic action.

Table 7.1 and Appendix L list inhalation and oral cancer potency factors that should be used in risk assessments for the Hot Spots Program. Chapter 8 describes procedures for use of potency factors in estimating potential cancer risk.

7.2.1 *Inhalation Cancer Potency Factors*

The risk assessment methodology and algorithms presented in Chapter 8 express the inhalation cancer slope factors in units of inverse dose (i.e., $(mg/kg/day)^{-1}$). Breathing rates, expressed in units of liters per kilogram of body weight-day (L/kg-day), are multiplied with the air concentrations, coupled with the appropriate unit conversion factor, to estimate dose in mg/kg-day. This allows estimation of average and high-end cancer risk point estimates. Estimation of a distribution of cancer risk based on variability in breathing rate can be obtained by Monte Carlo methods using the distributions of breathing rates in L/kg-day, which can then be converted to a dose distribution in mg/kg BW based on the intake rate. Unit risk factors [in the units of inverse concentration (i.e., $(\mu g/m^3)^{-1}$], which were used in previous guidelines for the Hot Spots program, are still listed in the TSD (OEHHA, 2009) and may prove useful in other risk assessment applications.

The average daily inhalation dose (mg/kg-day) multiplied by the cancer potency factor $(mg/kg\text{-}day)^{-1}$ will give the inhalation cancer risk (unitless), which is an expression of the chemical's cancer risk during a 70-year lifespan of exposure. For example, an inhalation cancer risk of 5×10^{-6} is the same as stating that an individual has an estimated probability of developing cancer from their exposure of 5 chances per million people exposed. A more complete description of how potential cancer risk is calculated from the exposure dose and cancer potency factors is provided in Chapter 8. Appendix I presents an example calculation for determining cancer risk.

A list of current inhalation potency factors is provided in Table 7.1. Periodically, new or revised cancer potency factors will be peer reviewed by the State's Scientific Review Panel on Toxic Air Contaminants (SRP) and adopted by the Director of OEHHA. For new or updated numbers, consult the OEHHA web site at (http://www.oehha.ca.gov/air/hot_spots/tsd052909.html) to determine if any new or updated cancer potency factors have been adopted since this guideline update. New cancer potency factors that have been approved by the SRP and adopted by the Director of OEHHA should be incorporated into Hot Spots risk assessment for facilities that emit those chemicals.

7.2.2 *Oral Cancer Potency Factors*

Under the Hot Spots Program, a few substances are evaluated for exposure and risk from non-inhalation pathways – these are referred to as multipathway substances. Multipathway substances have the potential to impact a receptor through inhalation and noninhalation (oral and dermal) exposure routes. These substances include heavy metals and semi-volatile organic substances such as dioxins, furans, and polycyclic aromatic hydrocarbons (PAHs). These substances commonly exist in the particle

phase or partially in the particle phase when emitted into the air. They can therefore be deposited onto soil, vegetation, and water. Noninhalation exposure pathways considered under the Hot Spots Program include the ingestion of soil, homegrown produce, meat, milk, surface water, breast milk, and fish as well as dermal exposure to contaminants deposited in the soil. See Table 5.1 for a list of the multipathway substances.

Table 7.1 and Appendix L list oral cancer potency factors in units of $(mg/kg\text{-}day)^{-1}$ that should be used for assessing the potential cancer risk for these substances through noninhalation exposure pathways. The cancer risk from these individual pathways is calculated by multiplying the dose (mg/kg-day) times the oral cancer potency factor $(mg/kg\text{-}day)^{-1}$ to yield the potential cancer risk (unitless) from non-inhalation exposures. Chapter 5 provides all of the algorithms to calculate exposure dose through all of the individual exposure pathways. Appendix I provides a sample calculation for dose and cancer risk using the inhalation exposure pathway.

Three carcinogens (cadmium, beryllium, and nickel), although subject to deposition, are only treated as carcinogenic by the inhalation route and not by the oral route. Therefore, there are no oral cancer potency factors for these substances. However, the oral doses of these substances need to be estimated because of their noncancer toxicity. See Chapters 6 and 8, and Appendices I and L for dose-response factors, and calculations to address these substances.

Table 7.1 Inhalation and Oral Cancer Potency Factors

Substance	Chemical Abstract Service Number (CAS)	Inhalation Potency Factor $(mg/kg\text{-}day)^{-1}$	Oral Slope Factor $(mg/kg\text{-}day)^{-1}$
Acetaldehyde	75-07-0	1.0×10^{-2}	
Acetamide	60-35-5	7.0×10^{-2}	
Acrylamide	79-06-1	$4.5 \times 10^{+0}$	
Acrylonitrile	107-13-1	$1.0 \times 10^{+0}$	
Allyl chloride	107-05-1	2.1×10^{-2}	
2-Aminoanthraquinone	117-79-3	3.3×10^{-2}	
Aniline	62-53-3	5.7×10^{-3}	
Arsenic (inorganic)	7440-38-2	$1.2 \times 10^{+1}$	$1.5 \times 10^{+0}$
Asbestos [#]	1332-21-4	$2.2 \times 10^{+2}$ [#]	
Benz[*a*]anthracene [BaP]	56-55-3	3.9×10^{-1}	$1.2 \times 10^{+0}$
Benzene	71-43-2	1.0×10^{-1}	
Benzidine	92-87-5	$5.0 \times 10^{+2}$	
Benzo[*a*]pyrene	50-32-8	$3.9 \times 10^{+0}$	$1.2 \times 10^{+1}$
Benzo[*b*]fluoranthrene [BaP]	205-99-2	3.9×10^{-1}	$1.2 \times 10^{+0}$
Benzo[*j*]fluoranthrene [BaP]	205-82-3	3.9×10^{-1}	$1.2 \times 10^{+0}$
Benzo[*k*]fluoranthrene [BaP]	207-08-9	3.9×10^{-1}	$1.2 \times 10^{+0}$
Benzyl chloride	100-44-7	1.7×10^{-1}	
Beryllium	7440-41-7	$8.4 \times 10^{+0}$	
Bis(2-chloroethyl) ether	111-44-4	$2.5 \times 10^{+0}$	
Bis(chloromethyl)ether	542-88-1	$4.6 \times 10^{+1}$	
1,3-Butadiene	106-99-0	6.0×10^{-1}	
Cadmium (and compounds)	7440-43-9	$1.5 \times 10^{+1}$	
Carbon tetrachloride	56-23-5	1.5×10^{-1}	
Chlorinated Dibenzo-p-dioxins [A]			
2,3,7,8-Tetrachlorodibenzo-*p*-dioxin	1746-01-6	$1.3 \times 10^{+5}$	$1.3 \times 10^{+5}$
1,2,3,7,8-Pentachlorodibenzo-*p*-dioxin	40321-76-4	$1.3 \times 10^{+5}$	$1.3 \times 10^{+5}$
1,2,3,4,7,8-Hexachlorodibenzo-*p*-dioxin	39227-28-6	$1.3 \times 10^{+4}$	$1.3 \times 10^{+4}$
1,2,3,6,7,8-Hexachlorodibenzo-*p*-dioxin	57653-85-7	$1.3 \times 10^{+4}$	$1.3 \times 10^{+4}$
1,2,3,7,8,9-Hexachlorodibenzo-*p*-dioxin	19408-74-3	$1.3 \times 10^{+4}$	$1.3 \times 10^{+4}$

2,3,3'4,4',5,5'- Heptachlorobiphenyl (189)	39635-31-9	$3.9 \times 10^{+0}$	$3.9 \times 10^{+0}$
Potassium bromate	7758-01-2	4.9×10^{-1}	
1,3-Propane sultone	1120-71-4	$2.4 \times 10^{+0}$	
Propylene oxide	75-56-9	1.3×10^{-2}	2.4×10^{-1}
1,1,2,2-Tetrachloroethane	79-34-5	2.0×10^{-1}	
Thioacetamide	62-55-5	$6.1 \times 10^{+0}$	
2,4-Toluene diisocyanate	584-84-9	3.9×10^{-2}	
2,6-Toluene diisocyanate	91-08-7	3.9×10^{-2}	
1,1,2-Trichloroethane (vinyl trichloride)	79-00-5	5.7×10^{-2}	
Trichloroethylene	79-01-6	7.0×10^{-3}	1.5×10^{-2}
2,4,6-Trichlorophenol	88-06-2	7.0×10^{-2}	
Urethane	51-79-6	$1.0 \times 10^{+0}$	
Vinyl chloride	75-01-4	2.7×10^{-1}	

Notes for Table 7.1

Asbestos: [100 PCM fibers/m^3]$^{-1}$ A unit risk factor of 2.7 x 10^{-6} ($\mu g/m^3$)$^{-1}$ and an inhalation cancer potency factor of 2.2 x 10^{+2} (mg/kg BW*day)$^{-1}$ are available (see Appendix C for explanation).

BaP PAHs and PAH Derivatives: Many have potency equivalency factors relative to benzo[*a*]pyrene (see Appendix G). For multipathway chemicals, including PAHs, the oral slope factor is considered the same as the inhalation potency factor unless otherwise noted in the Table.

A Polychlorinated Dibenzo-*p*-dioxins, Polychlorinated Dibenzofurans and speciated poly chlorinated biphenyls: (see Appendix E). For convenience, OEHHA has calculated cancer potency factors for speciated polychlorinated dibenzo-*p*-dioxin, polychlorinated dibenzofuran and polychlorinated biphenyl congeners using the procedure in Appendix E.

B Diesel Exhaust is listed as a Toxic Air Contaminant by the Air Resources Board as "Particulate Matter from Diesel-Fueled Engines". (See Appendix D)

***** Creosote: Can be calculated using Potency Equivalency Factors contained in the benzo[*a*]pyrene Toxic Air Contaminant document and in Appendix G of these guidelines.

P1 Polychlorinated Biphenyls (PCBs): High Risk is for use in cases where congeners with more than four chlorines do not comprise less (are greater) than one-half percent of total PCBs. The high risk number is the default for unspeciated PCB mixtures.

P2 The low risk number is generally not applicable to the Hot Spots program. The Hot Spots program addresses PCBs emitted by stationary facilities. It cannot be assumed that such emissions would occur by simple evaporation. There is a dermal absorption factor applied in evaluation of the dermal pathway for PCBs so the medium risk would not apply to dermal exposure (OEHHA, 2009). The water pathway does not include an assumption that PCB isomers are water soluble, so the medium number would not apply to the water pathway.

P3 Polychlorinated Biphenyls (PCBs): Lowest Risk is for use in cases where congeners with more than four chlorines comprise less than one-half percent of total PCBs. In order for the low number to be used, scientific justification needs to be presented.

P4 Number in parentheses is the IUPAC #, the PCB nomenclature is IUPAC. For multipathway chemicals, including PCBs, the oral slope factor is considered the same as the inhalation potency factor unless otherwise noted in the Table.

8 - Risk Characterization for Carcinogens and Noncarcinogens and the Requirements for Hot Spots Risk Assessments

8.1 Introduction

Risk characterization is the final step of the health risk assessment (HRA). In this step, information developed through the exposure assessment is combined with information from the dose-response assessment to characterize risks to the general public from emissions. In the Hot Spots program, OEHHA conducts the dose-response assessment during the development of cancer potency factors and Reference Exposure Levels. These are used in conjunction with the exposure estimates to estimate cancer risk and evaluate hazard from noncancer toxicity of emitted chemicals. Under the Air Toxics Hot Spots (Hot Spots) Act, risk characterizations should present both individual and population-wide health risks (Health and Safety Code Section (HSC) 44306). Persons preparing HRAs for the Hot Spots Program should consult the local Air Pollution Control or Air Quality Management District (District) to determine if the District has special guidelines to assist with HRA format or other requirements of the Hot Spots Program.

OEHHA is recommending that a 30-year exposure duration be used as the basis for estimating cancer risk at the maximum exposed individual resident (MEIR) in the Hot Spots Program. This exposure duration represents the time of residency for 90 to 95% of Californians at a single location and should provide adequate public health protection against individual risk. We also recommend including the 9 and 70-year cancer risk at the MEIR as supplemental information. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk.

This chapter provides guidance on how to evaluate the risk characterization component of risk assessments required by the Hot Spots Program. A general summary of the risk characterization components includes the following items and information.

- The locations of the point of maximum impact (PMI), the MEIR, and the maximum exposed individual worker (MEIW) are to be identified. The PMI, MEIW, and MEIR for cancer risk and for noncancer hazard indices (averaging times for acute 1-hour, repeated 8-hour, and chronic hazard indices) may not be the same location; all should be identified.

- The location of any specified sensitive receptors (e.g., schools, hospitals, daycare, or eldercare facilities - contact the District or reviewing authority for more information) should be identified

- Estimates of population-wide cancer risk and noncancer hazard

This information must be clearly presented in cross-referenced text, tables, figures, and maps. Chapter 9 provides an outline that specifies the content and recommended format of HRA results. The HARP software is the recommended model for calculating HRA results for the Hot Spots Program. Information on obtaining the HARP software can be found under the Air Toxics Program on the ARB's web site at *www.arb.ca.gov*.

8.1.1 *Tiered Approach to Risk Assessment*

The tiered approach for risk assessment that is presented in detail in the TSD (OEHHA, 2012) and summarized here should be reviewed prior to conducting the health risk assessment. The tiered approach to risk assessment and the health impacts evaluation described here are included in the HARP software.

The tiered approach provides a risk assessor with flexibility and allows consideration of site-specific differences (Table 8.1). The four-tiered approach to risk assessment is intended to primarily apply to residential cancer risk assessment, both for inhalation and noninhalation pathways. Risk assessors can tailor the level of effort and refinement of an HRA by using either the point estimate exposure assumptions as the basis of the exposure and risk assessment, or both the point estimate and a stochastic treatment of exposure factor distributions.

Table 8.1 The Tiered Approach to Risk Assessment

Tier	Description	When Applied
Tier 1	Utilizes OEHHA default point estimates of exposure variates	All risk assessments must include a Tier 1 assessment
Tier 2	Utilizes site-specific point estimates for exposure variates (justified, and approved by OEHHA)	A Tier 2 approach may be presented in addition to Tier 1
Tier 3	Utilizes OEHHA distributions of exposure variates	A Tier 3 approach may be presented in addition to Tier 1
Tier 4	Utilizes site-specific distributions of exposure variates (justified, and approved by OEHHA)	A Tier 4 approach may be presented in addition to Tier 1

Tier 1 is a standard point estimate approach that uses the recommended exposure variate (e.g., breathing or water ingestion rate) point estimates presented in this document. Derivations of these values are described in detail in OEHHA (2012). The results of the Tier 1 evaluations are required to be presented in the risk characterization section for all HRAs prepared for the Hot Spots Program. Thus, persons preparing an HRA using Tier 2 through Tier 4 evaluations must also include the risk characterization results of a Tier 1 evaluation in the HRA.

As discussed in OEHHA (2012), if the risk characterization results from a Tier 1 assessment are above a regulatory level of concern, the risk assessor may want to proceed with more site-specific analysis as described in Tier 2, or use a more resource-intensive stochastic modeling effort described in Tier 3 and Tier 4 (for cancer risk). While further evaluation may provide more information to the risk manager on which to base decisions, the Tier 1 evaluation is useful in comparing risks among a large number of facilities and must be included in all HRAs.

Tier 2 analysis allows the use of available and justifiable site-specific exposure variates (e.g., fish consumption), when presenting the potential health impacts. The site-specific information applied in a Tier 2 assessment must be adequately justified and approved by OEHHA and the District. In Tier 3, a stochastic approach to exposure assessment is taken using the distributions for the exposure pathways presented in the TSD (OEHHA, 2012) and in Chapter 5 of this Guidance Manual. The exposure distributions apply only to a residential receptor and are used only for the determination of cancer risk. OEHHA has not developed exposure intake distributions for workers to use in the offsite worker exposure scenario. Tier 4 is also a stochastic approach for the residential exposure scenario but allows for utilization of site-specific exposure variate distributions if they are justifiable and more appropriate for the site under evaluation than those derived in OEHHA (2012). Alternative site-specific distributions must be approved by OEHHA and the District. For an off-site worker cancer risk evaluation, Tiers 3 and 4 do not apply. Tier 3 and Tier 4 analyses show what a distribution of potential cancer risk may be to an individual or population based on a distribution of exposure inputs (e.g., water ingestion rate) rather than specific point estimates of exposure.

Table 8.2 summarizes OEHHA's recommendations for use of the four Tiers in cancer and noncancer risk assessment.

Table 8.2 Tiers for Residential and Offsite Worker Cancer and Noncancer Hot Spots Risk Assessments

Tier	Cancer		Non Cancer Chronic and 8-Hour	
	Inhalation	Noninhalation	Inhalation	Noninhalation
Tier-1	X	X	X	X
Tier-2	X	X		X[b]
Tier-3	X[a]	X[a]		
Tier-4	X[a]	X[a]		

[a] Applies to residential exposure scenario only
[b] Applies to chronic noncancer exposure only

OEHHA has not developed a stochastic approach (Tier 3 or 4) for estimating noncancer health impacts using acute, 8-hour, and chronic Reference Exposure Levels (RELs). Tier 1 is the only option for determining noncancer health impacts from inhalation exposure since calculating the hazard quotient involves dividing the ground level air concentrations for the specified exposure duration by the appropriate RELs. However, chronic noninhalation noncancer risks involve a calculation of dose from oral or dermal pathways to which site-specific evaluations could be considered under a Tier 2 approach.

Small foot-print facilities – Tier 2 or Tier 4

Some facilities subject to the Air Toxics Hot Spots Act (e.g., some in the industry-wide categories such as gas stations or dry cleaners) have very small zones of impact. In some of these instances, there will be very few receptors within the zone of impact. It isn't possible to develop special recommendations for exposure variates for all possible exposure scenarios. Alternative breathing rates (point estimates or distributions) may be used as part of Tier 2 or Tier 4 risk assessments with appropriate supporting justification in the case of a very small zone of impact. OEHHA is willing to work with risk managers at ARB and the Districts on this issue.

8.2 Risk Characterization for Carcinogens

Cancer risk is calculated by multiplying the daily inhalation or oral dose (calculated in Chapter 5), by a cancer potency factor, the age sensitivity factor, the frequency of time spent at home (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk (see section 8.2.4). As described below, the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location. A brief description of the age sensitivity factors, exposure duration, and frequency of time spent at home are included in Sections 8.2.1 to 8.2.3 below. These factors are discussed in detail in OEHHA (2009) and OEHHA (2012).

8.2.1 *Adjustment for Early Life Stage Exposures to Carcinogens*

Studies have shown that young animals are more sensitive than adult animals to exposure to many carcinogens (OEHHA, 2009). Therefore, OEHHA developed age sensitivity factors (ASFs) to take into account the increased sensitivity to carcinogens during early-in-life exposure (Table 8.3). These factors were developed and described in detail in OEHHA (2009). In the absence of chemical-specific data, OEHHA recommends a default ASF of 10 for the third trimester to age 2 years, and an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood.

Table 8.3 Age Sensitivity Factors by Age Group for Cancer Risk Assessment

Age Group	Age Sensitivity Factor (unitless)
3rd Trimester	10
0<2 years	10
2<9 years	3
2<16 years	3
16<30 years	1
16-70 years	1

For specific carcinogens where data indicate enhanced sensitivity during life stages other than the immediate postnatal and juvenile periods, or for which data demonstrate ASFs different from the default ASFs, the chemical-specific data should be used in order to adequately protect public health.

The risk assessments generated under the Air Toxics Hot Spots Act are reviewed by OEHHA. If a risk assessor had data indicating there are no windows of susceptibility early in life or that a different ASF should be used for a specific carcinogen and wanted to use these data, OEHHA would review the material as part of the review of the risk assessment.

8.2.2 *Fraction of Time Spent at Home for Cancer Risk Assessment*

OEHHA and ARB evaluated information from activity patterns databases to estimate the fraction of time at home (FAH) during the day (OEHHA, 2012). This information can be used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. From the third trimester to age <2 years, 85% of time is spent at home (Table 8.4). From age 2 through <16 years, 72% of time is spent at home. From age 16 years and greater, 73% of time is spent at home. Facilities with any school within the 1×10^{-6} (or greater) isopleth should use FAH = 1 for the child age groups (3rd Trimester, 0<2 years, and 2<16 years). See Appendix I for an example calculation using the FAH.

Table 8.4 Recommendations for Fraction of Time at Home (FAH) for Evaluating Residential Cancer Risk

Age Range	Fraction of Time at Residence
3rd Trimester, and 0<2 years	0.85[1]
2<16 years[2]	0.72[1]
16-70 years[3]	0.73

[1] Use FAH = 1 if a school is within the 1×10^{-6} (or greater) cancer risk isopleth

[2] Also use FAH = 0.72 for 2<9 yr age group.
[3] Also use FAH = 0.73 for 16<30 yr age group.

The FAH is calculated based on a diary of trips taken over a 24-hour period on the survey day. Ninety-five percent of the diary days were on weekdays. Participants can select "vacation" as one of their trips. However, vacation time represented only a fraction (0.68%) of the over 175,000 trips recorded in the survey. Because much of these vacation trips were presumed to be within-day trips and were only a small fraction of total trips, there is likely little overlap with the Exposure Frequency (EF) variate used in the dose equations in Chapter 5.

8.2.3 *Exposure Duration for Estimating Cancer Risk to Residents and Off-Site Workers*

OEHHA recommends that an exposure duration (residency time) of 30 years be used to estimate individual cancer risk for the maximally exposed individual resident (MEIR) (Table 8.5). OEHHA also recommends that the 30-year exposure duration be used as the basis for public notification and risk reduction audits and plans. The Districts, however, may opt to use the 70 year cancer risk for notification and risk reduction audits and plans.

Note that the 30-year exposure duration starts in the third trimester to accommodate the increased susceptibility of exposures in early life (OEHHA, 2009), and would apply to both the point estimate and stochastic approaches.

Table 8.5 Summary of Recommendations for Exposure Duration for Individual Cancer Risk at the MEIR and MEIW

Receptor	***Recommendation***
Resident (MEIR)	30 years
Resident (supplemental Information)	9 years for central tendency; 70 years for maximum (lifetime)
Worker (MEIW)	25 years

Exposure durations of 9-years and 70-years are also recommended to be evaluated for the MEIR to show the range of cancer risk based on residency periods. If a facility is notifying the public regarding cancer risk, the 9- and 70-year cancer risk estimates are useful for people who have resided in their current residence for periods shorter and longer than 30 years.

The 9-, 30-, and 70-year exposures are chosen to coincide with U.S. EPA's estimates of the average (9 years), high-end estimates (30-years) of residence time, and a lifetime residency (70 years). These estimates are also consistent with what is known about residence time in California. Together, the 9-, 30-, and 70-year cancer risk calculations provide a useful presentation of cancer risk and the relationship to duration of residency and, thus, exposure to a facility's emissions.

For the maximally exposed individual worker (MEIW), OEHHA recommends using an exposure duration of 25 years to estimate individual cancer risk for the off-site worker scenario (Table 8.5). This duration represents approximately the 95th percentile of job tenure with the same employer in the U.S.

8.2.4 *Calculating Residential and Offsite Worker Inhalation Cancer Risk*

Residential Receptors

For residential inhalation exposure, cancer risk must be separately calculated for specified age groups (Eq. 8.2.4A, see Section 8.2.1), because of age differences in sensitivity to carcinogens and age differences in intake rates (per kg body weight). Separate risk estimates for these age groups provide a health-protective estimate of cancer risk by accounting for greater susceptibility in early life, including both age-related sensitivity and amount of exposure. The following equation illustrates the formula for calculating residential inhalation cancer risk. See Appendix I for a detailed example calculation.

A. Equation 8.2.4 A: $$RISK_{inh\text{-}res} = DOSE_{air} \times CPF \times ASF \times ED/AT \times FAH$$

7. $RISK_{inh\text{-}res}$ = Residential inhalation cancer risk
8. $DOSE_{air}$ = Daily inhalation dose (mg/kg-day)
9. CPF = Inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
10. ASF = Age sensitivity factor for a specified age group (unitless)
11. ED = Exposure duration (in years) for a specified age group
12. AT = Averaging time for lifetime cancer risk (years)
13. FAH = Fraction of time spent at home (unitless)

a: Recommended default values for EQ 8.2.4 A:

5. $DOSE_{air}$ = Calculated for each age group from Eq. 5.4.1
6. CPF = Substance-specific (see Table 7.1)
7. ASF = See Section 8.2.1
8. ED = 0.25 years for 3rd trimester, 2 years for 0<2, 7 years for 2<9, 14 years for 2<16, 14 years for 16<30, 54 years for 16-70
9. AT = 70 years*
10. FAH = See Table 8.4

*Although AT actually sums to 70.25 years when the 3rd trimester (0.25 years) is included, OEHHA recommends rounding AT = 70 years (and rounding residential exposure durations at 9- and 30-years rather than 9.25- and 30.25-years) to simplify the calculation without causing a significant adjustment. Note that the dose for the 3rd trimester is based on the breathing rate of pregnant women using the assumption that the dose to the fetus during the 3rd trimester is the same as that to the mother.

Cancer risks calculated above for individual age groups are summed to estimate cancer risk for 9-, 30- and 70-year exposures as shown below. Note that this example includes the Fraction of Time Spent at Home (FAH) for each age grouping.

Calculation of Inhalation Cancer Risk from the Third Trimester to Age Nine:

$$RISK_{inh\text{-}res} = (DOSE_{air}\ third\ trimester \times CPF \times 10 \times 0.25/70\ years \times FAH_{3rd\ tri\ <2}) + (DOSE_{air}\ age\ 0<2 \times CPF \times 10 \times 2/70 \times FAH_{3rd\ tri\ <2}) + (DOSE_{air}\ age\ 2<9 \times CPF \times 3 \times 7/70\ years \times FAH_{2<9})$$

Calculation of Inhalation Cancer Risk from Third Trimester to Age 30:

$$RISK_{inh\text{-}res} = (DOSE_{air}\ third\ trimester \times CPF \times 10 \times 0.25/70\ years \times FAH_{3rd\ tri\ <2}) + (DOSE_{air}\ age\ 0<2 \times CPF \times 10 \times 2/70 \times FAH_{3rd\ tri\ <2}) + (DOSE_{air}\ age\ 2<16 \times CPF \times 3 \times 14/70 \times FAH_{2<16}) + (DOSE_{air}\ age\ 16<30 \times CPF \times 1 \times 14/70\ years \times FAH_{16\text{-}30})$$

Calculation of Inhalation Cancer Risk from Third Trimester to Age 70:

$$RISK_{inh\text{-}res} = (DOSE_{air}\ third\ trimester \times CPF \times 10 \times 0.25/70\ years \times FAH_{3rd\ tri\ <2}) + (DOSE_{air}\ age\ 0<2 \times CPF \times 10 \times 2/70 \times FAH_{3rd\ tri\ <2}) + (DOSE_{air}\ age\ 2<16 \times CPF \times 3 \times 14/70 \times FAH_{2<16}) + (DOSE_{air}\ age\ 16<70 \times CPF \times 1 \times 54/70\ years \times FAH_{16\text{-}70})$$

Expressing cancer risk in "chances per million" is useful as a risk communication tool for the public, but cancer risk can also be expressed in other ways, such as "chances per 100,000" (cancer risk × 10^5) or "chances per 10 million" (cancer risk × 10^7). To convert the resulting cancer risk estimate to chances of developing cancer per million individuals exposed, multiply the cancer risk by 10^6:

$$Cancer\ risk \times 10^6 = chances\ per\ million$$

For exposure to multiple carcinogenic substances, Table 8.7 and Table I.5 in Appendix I are examples of how cancer risks of individual substances are summed to determine the total cancer risk.

Worker Receptors

For assessment of off-site worker cancer risk at the MEIW, the default assumes working age begins at 16 years. Note that the residential FAH factor in Eq. 8.2.4.A above does not apply for workers. The daily inhalation dose ($DOSE_{air}$) (as calculated in Chapter 5, EQ 5.4.1.2) is based on the adjusted 8-hour concentration at the MEIW (for non-continuous sources) and amount of time the offsite worker's schedule overlaps with the facility's emission schedule. The duration of exposure at the MEIW receptor is 25 years, as discussed in the TSD (OEHHA, 2012).

B. Equation 8.2.4 B: $RISK_{inh\text{-}work} = DOSE_{air} \times CPF \times ASF \times ED/AT$

1. $RISK_{inh\text{-}work}$ = Worker inhalation cancer risk

a: Recommended default values for EQ 8.2.4 B:

1. $DOSE_{air}$ = Calculated for workers in Eq. 5.4.1.2
2. CPF = Substance specific (see Table 7.1)
3. ASF = 1 for working age 16-70 yrs (See Section 8.2.1)
4. ED = 25 years
5. AT = 70 yrs for lifetime cancer risk

Work Locations with Daycare Facilities:

An additional risk management consideration for offsite worker cancer risk assessment of a Hot Spots facility is whether there are women of child bearing age at the MEIW location and whether the MEIW has a daycare center. In the case of women of child-bearing age at the MEIW, the Districts may wish to treat the off-site MEIW in the same way as the residential scenario to account for the higher susceptibility during the third trimester of pregnancy (i.e., use of an ASF=10 for third trimester exposure). If there is onsite daycare at the MEIW, then the risks to the children will be underestimated using the offsite adult worker scenario. In this case, the Districts may wish to include a cancer risk assessment for the children in the onsite daycare, assuming they could be there from 0 to age 6 years (ED = 6 years) and using the appropriate exposure factors to calculate $DOSE_{air}$, fraction of time at worksite (e.g., hrs at daycare per 24 hrs), and ASFs in EQ 8.2.4 B to account for the higher susceptibility of infants and children to carcinogens.

Children at a MEIW daycare may also be assessed for noninhalation exposures. Typically, soil ingestion and dermal exposure will be the most common noninhalation pathways. However, all pathways that are present at the daycare should be included. See section 8.2.6 for more discussion of multipathway risk assessment methods.

8.2.5 *Calculation of Noninhalation Cancer Risk*

A small subset of Hot Spots substances is subject to deposition onto the soil, plants, and water bodies (see Table 5.1). These substances need to be evaluated by the appropriate noninhalation pathways, as well as by the inhalation pathway, and the risk characterization results must be presented in all HRAs. These substances include semi-volatile organic chemicals and heavy metals.

For all multipathway substances, the exposure pathways that must be evaluated at every residential and worker site (in addition to inhalation) are soil ingestion and dermal exposure. If PAHs (and creosotes), lead, dioxins, furans, or PCBs are emitted, then the breast-milk consumption pathway becomes mandatory for residential receptors. OEHHA has developed transfer coefficients for these chemicals from the mother to breast milk (see OEHHA, 2012 for details). The other exposure pathways (e.g.,

ingestion of homegrown produce or fish) are only evaluated for residential receptors if the facility impacts that exposure medium and the receptor under evaluation can be exposed to that medium or pathway. For example, if the facility does not impact a fishable body of water within the isopleth of the facility, or the impacted water body does not sustain fish that are consumed by fishers, then the fish pathway will not be considered for that facility or receptor.

Table 8.6 identifies the residential receptor exposure pathways that are mandatory and those that are dependent on the available routes of exposure. Table 8.6 also identifies the three exposure pathways that are relevant for a worker receptor. The cancer risk estimates should be presented in the risk characterization section of the risk assessment for all the appropriate pathways.

Table 8.6 Mandatory and Site/Route Dependent Exposure Pathways

Mandatory Exposure Pathways	Site/Route Dependent Exposure Pathways
• Inhalation[w] • Soil Ingestion[w] • Dermal Exposure to Contaminated Soil[w] • Breast Milk Consumption[*]	• Homegrown Produce Ingestion • Angler-Caught Fish Ingestion • Drinking Water Ingestion • Home-Raised Animal Product Ingestion (Dairy (Cow's) Milk, Meat (Beef, Pork, Chicken) and Egg).

(w) Identifies the appropriate exposure pathways that should be evaluated for a worker. These pathways are inhalation, dermal exposure, and the soil ingestion pathway.

(*) If PAHs (including creosotes), lead, dioxins, furans, or PCBs are emitted, then the breast-milk consumption pathway becomes mandatory.

The noninhalation residential cancer risk is calculated using the same steps as inhalation cancer risk described in Section 8.2.4. A dose (see Chapters 4 and 5) from the pathway under evaluation (e.g., soil ingestion) is multiplied by the substance-specific oral slope factor, expressed in units of inverse dose (i.e., $(mg/kg/day)^{-1}$) (Table 7.1), the appropriate age sensitivity factor (ASF), and exposure duration divided by averaging time to yield the cancer risk for a specified age grouping. Cancer risk for each age group is summed as appropriate for the exposure duration. The FAH factor is relevant only to the inhalation pathway and is not appropriate to use in the noninhalation pathways.

Equation 8.2.5 illustrates the formula for calculating noninhalation cancer risk. Details (data, algorithms, and guidance) for each exposure pathway are presented in Chapter 5 and in OEHHA (2012).

A. Equation 8.2.5: $RISK_{noninh} = DOSE_{noninh} \times CPF_{oral} \times ASF \times ED/AT$

1. $RISK_{noninh}$ = Noninhalation pathway cancer risk
2. $DOSE_{noninh}$ = Daily dose (mg/kg-day) for a specified non-inhalation pathway for each age group
3. CPF_{oral} = Oral cancer potency (slope) factor (mg/kg-day^{-1})
4. ASF = Age sensitivity factor for a specified age group (unitless)
5. ED = Exposure duration (in years) for a specified age group
6. AT = Averaging time for lifetime cancer risk

a: Recommended default values for EQ 8.2.5:

1. $DOSE_{noninh}$ = Calculated in Chapter 5 dose algorithms for each age group and for each noninhalation route in Table 8.6 the receptor is exposed to
2. CPF_{oral} = Substance-specific (see Table 7.1)
3. ASF = See Section 8.2.1
4. ED = Residents: 0.25 years for 3rd trimester, 2 years for 0<2, 7 years for 2<9, 14 years for 2<16, 14 years for 16<30, 54 years for 16-70
   = Offsite worker: 25 yrs
5. AT = 70 years

Estimating cancer risk for 9-, 30- and 70-years by summing the individual age-group cancer risks is the same as that shown for the inhalation route in Section 8.2.4. The exception is that the FAH variate is only appropriate for the residential inhalation pathway and is not a factor for oral and dermal exposure pathways.

Calculation of Noninhalation Cancer Risk from Third Trimester to Age 30:

$RISK_{noninh\text{-}res}$ = ($DOSE_{noninh}$ third trimester × CPF × 10 × 0.25/70 years) + ($DOSE_{noninh}$ age 0<2 × CPF × 10 × 2/70) + ($DOSE_{noninh}$ age 2<16 × CPF × 3 × 14/70) + ($DOSE_{noninh}$ age 16<30 × CPF × 1 × 14/70 years)

To convert this estimated probability of risk to chances per million of developing cancer, multiply the estimated cancer risk for each noninhalation exposure route by 10^6. This result is useful communication tool to compare risks for each pathway of exposure.

$$\text{Cancer risk} \times 10^6 = \text{cancer risk expressed as chances per million}$$

For assessment of the offsite worker the typical noninhalation pathways that apply for worker cancer risk are the dermal exposure pathway and the soil ingestion pathway.

Children at a MEIW daycare may also be assessed for noninhalation exposures. Typically, soil ingestion and dermal exposure will be the most common noninhalation pathways. However, all pathways that are present at the daycare should be included.

8.2.6 *Multipathway Cancer Risk Methodology*

Under a Tier 1 assessment, it is necessary to calculate the total cancer risk from both inhalation and noninhalation exposures if multipathway substances are emitted from the facility. The calculation of cancer risk that includes exposure to a multipathway substance or substances has three steps:

1) Calculate cancer risk for the inhalation pathway (EQ 8.2.4 A for residents, EQ 8.2.4 B for off-site workers) for all substances, and the noninhalation pathways that apply (EQ 8.2.5) for all multipathway substances, using high-end point estimates of intake rates.
2) For each multipathway substance, identify the two exposure pathways with the highest risk. These are the dominant pathways that are to be assessed using high-end point estimates of intake rates for the total cancer risk. For all other pathways, the average point estimate of intake rates may be used to calculate the pathway cancer risk (See OEHHA (2012) for more information).
3) To calculate total cancer risk, all inhalation and noninhalation pathways are summed together for all substances.

The final cancer risk calculation using a combination of high-end and average exposure parameters is referred to as the derived risk in the HARP software. This is described in Chapter 1, Section 1.4.1 of OEHHA (2012). The inhalation route is almost always one of the two dominant pathways in a multipathway cancer risk assessment. Therefore, in most cases only one noninhalation pathway would be calculated using a high-end dose point estimate. For all other pathways, the average point estimate may be used to calculate the pathway cancer risk.

For example, if dermal exposure and soil ingestion risks are calculated, then the cancer risks from these pathways would be summed along with the inhalation cancer risks to give the total cancer risk for the single multipathway substance:

Cancer Risk (inhalation) + Cancer Risk (dermal) + Cancer Risk (soil) = Total Risk

The mother's milk pathway also becomes a mandatory pathway to assess risk in nursing infants if the mother is exposed to specific substances (see Table 5.1).

Many facilities will emit multiple carcinogenic substances. If multiple substances are emitted, the substance-specific cancer risks for all exposure pathways are summed to give the (total) multipathway cancer risk at the receptor location. The HARP software will display not only the multipathway risk for each carcinogenic substance, but also show a breakdown of the cancer risk from each exposure pathway. Table 8.7 shows the results of a multipathway risk assessment for a hypothetical facility. While not presented in the following table, it is critical to identify the driving exposure pathways and the driving substances in a multipathway cancer risk assessment when summarizing and presenting the HRA results. See Chapter 9 for more information.

Table 8.7 Multipathway Assessment of a Hypothetical Facility 30-Year Cancer Risk

Substance	Cancer Risk[a]	Cancer risk[b] (chances per million)
Arsenic	1.1×10^{-5} (i) 3×10^{-7} (ni)	11 (i) 0.3 (ni)
Benzene	2.92×10^{-4} (i)	292 (i)
2,3,7,8-TCDD (dioxin)	1.06×10^{-4} (i) 5.7×10^{-5} (ni)	106 (i) 57 (ni)
1,3-Butadiene	6.0×10^{-6} (i)	6 (i)
Total Facility Cancer Risk	**4.723×10^{-4}**	**472**

[a] As calculated in EQ 8.2.4 A or EQ 8.2.5
[b] Calculated as: cancer risk × 10^6 = chances per million
i = inhalation pathway contribution
ni = noninhalation pathway contribution

Cancer risk in Table 8.7 for the multipathway substances, arsenic and 2,3,7,8-TCDD, is arranged by the inhalation pathway risk and the sum of all noninhalation pathway risks. The total facility multipathway cancer risk is the sum of all inhalation and noninhalation pathways.

Cancer risks from different substances are treated additively in risk assessment generally, and in the Hot Spots Program in part because many carcinogens act through the common mechanism of DNA damage. The additive assumption is reasonable from a public health point of view. Other possible interactions of multiple carcinogens include synergism (effects are greater than additive) or antagonism (effects are less than additive). The type of interaction is both chemical and dose dependent and in most cases the data are not available to adequately characterize these interactions.

8.2.7 *Multipathway Cancer Risk for Infant Exposure to Mother's Milk*

The mother' milk pathway becomes mandatory if the nursing mother is exposed to one or more of the following multipathway substances: dioxins and furans, PCBs, PAHs including creosotes, and lead. The default assumption inherent in the intake rate is that the infant's only source of food is breast for the first year (e.g., is fully breastfed, see OEHHA, 2012, for details), which is one-half of the 0<2 year age group used in the Hot Spots program. Thus, the cancer risk by the mother's milk pathway will need to be calculated with a modified cancer risk equation using a different exposure duration:

A. Equation 8.2.7: $\mathbf{RISK_{mm} =}$ Dose-Im $\mathbf{\times CPF_{oral} \times ASF \times ED/AT}$

1. $RISK_{mm}$ = Infant cancer risk via mother's milk pathway
2. Dose-Im = Daily dose (mg/kg-day) to infant from mother's milk
3. CPF_{oral} = Oral cancer slope factor (mg/kg-day^{-1})
4. ASF = Age sensitivity factor for infant (unitless)
5. ED = Exposure duration (in years) for infant
6. AT = Averaging time for lifetime cancer risk

a: Recommended default values for EQ 8.2.7:

6. Dose-Im = Calculated from EQ 5.4.3.5.2, dose to infant via mother's milk
7. CPF_{oral} = Substance-specific (see Table 7.1)
8. ASF = 10 (See Section 8.2.1)
9. ED = 1 yr (1st yr of 0<2 yr age group)
10. AT = 70 years

Once the cancer risk is determined for the mother's milk pathway for each applicable substance, the pathway risk is summed with other pathway risks.

For Tier 1, the derived approach for cancer risk assessment should be used if the mother's milk pathway applies. As outlined in Section 8.2.6, the two dominant pathways will be calculated using high-end point estimates of intake rates; all additional pathways may be calculated using average point estimates of intake rates. There will be four mandatory pathways to assess (inhalation, mother's milk, soil ingestion and dermal exposure) for cancer risk when exposure to dioxins/furans, PCBs, PAHs including creosotes, and/or lead occurs. Therefore, if the infant is exposed to no other additional site-specific noninhalation pathway(s), only the two dominant pathways among the four will be assessed for cancer risk using high-end point estimates of intake rates; and the others would be assessed using the average point estimate of intake rate.

In short, multipathway cancer risk for a substance is estimated by summing the potential inhalation and noninhalation cancer risks for the receptor location of interest. See the discussion of Tier 1 in Section 8.2.6 or the TSD for more information on the method used to determine the multipathway cancer risk.

8.2.8 *Cancer Risk Characterization for Stochastic Risk Assessment*

Risk characterization for a stochastic risk assessment is similar to that described for the point-estimate approach. However, the stochastic risk assessment produces a distribution of risk that accounts for some of the natural variability in exposure-related factors, such as breathing rates or water intake. The cancer risk distribution for inhalation cancer risk, for example, is generated by multiplying randomly selected values from the breathing rate distribution by the ground level air concentration, and the cancer potency factor. A variation of the Monte Carlo method called Latin hypercube sampling is the method by which the values from the breathing rate distribution are

selected. If noninhalation pathways need to be evaluated, the same process is followed for each pathway and the risk is summed to give an overall inhalation and noninhalation cancer risk distribution. Further, the specification of Age Sensitivity Factors and the need to separately calculate risks require that a Monte Carlo sampling be conducted for each age group and the cancer risk distributions are then summed across age groups.

The HARP software will perform an HRA using a Monte Carlo analysis with either OEHHA-provided or user-provided data distributions and will include the statistics for the distributions. In risk assessments that have chosen to use the distribution of exposure variates, the cancer risk distribution for a 30-year residential exposure duration (MEIR) should be presented in the risk characterization section We also recommend including the 9 and 70-year cancer risk at the MEIR as supplemental information. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk. A stochastic approach has not been developed for acute, 8-hour, and chronic noncancer health impacts or worker (MEIW) exposures.

8.2.9 *Use of Individual Cancer Risk and Population-wide Cancer Risk*

Cancer risk for an individual receptor and a representation of population-wide cancer risk are both important components of a risk assessment. The individual receptor approach reflects the exposures that may occur to an individual receptor over a period of time at a specific location. The individual cancer risk approach has some inherent limitations in terms of illustrating and potentially protecting population-based public health. For example, a facility with a small emissions footprint may impact a few individuals with a high individual potential cancer risk; whereas, a facility with a larger emission footprint may have a lower potential cancer risk for an individual receptor but expose many more people to those levels. Since this larger emitting facility can impact many more people, the population-wide health impacts are magnified due to the larger number of people exposed to the facility's emissions. This potential for higher population impacts is not captured by the individual receptor risk methodology. Therefore, the individual and population-wide heath impacts should be presented for all facilities to provide a more complete illustration of the facility's health impacts.

8.2.9.1 Population Risk

For facilities with large emission footprints (e.g., refineries, ports, or rail yards, etc.), population-based health impacts are critical to provide a better illustration of the potential impacts of emissions since large numbers of people may be exposed to the emissions. The individual cancer risk approach has some inherent limitations in terms of protecting public health. A small facility with a single stack can impact a few individuals with an individual cancer risk that is unacceptable, whereas a large facility may have an individual cancer risk that is below the acceptable limit for individual risk but exposes many more people. Thus, the population-wide impacts are larger for the large facility. Population-wide risk is independent of individual risk, and assumes that a population (not necessarily the same individuals) will live in the impacted zone over a

70-year period. Thus, a 70-year exposure duration is required for estimates of population-wide risks.

To evaluate population risk, one method that regulatory agencies have used is the cancer burden method to account for the number of excess cancer cases that could occur in a population.

Cancer Burden

The cancer burden can be calculated by multiplying the cancer risk at a census block centroid by the number of people who live in the census block, and adding up the estimated number of potential cancer cases across the zone of impact. The result of this calculation is a single number that is intended to estimate of the number of potential cancer cases within the population that was exposed to the emissions for a lifetime (70 years).

The cancer burden is calculated on the basis of lifetime (70-year) risks (whereas individual cancer risk at the MEIR is based on 30-year residential exposure). Cancer burden is independent of how many people move in or out of the vicinity of an individual facility. For example, if 10,000 people are exposed to a carcinogen at a concentration with a 1×10^{-5} cancer risk for a lifetime the cancer burden is 0.1, and if 100,000 people are exposed to a 1×10^{-5} risk the cancer burden is 1.

Estimate of Population Wide Risk

An estimate of the number of people exposed at various cancer risk levels can provide perspective on the magnitude of the potential public health threat posed by a facility. This approach is intended as a replacement for or addition to the cancer burden calculation used by some Districts in the past. The new approach provides a much easier way for the general public to interpret results when compared to cancer burden estimates. A facility in a sparsely populated area can have a public health impact different from the same facility in a highly populated area; however, under the cancer burden method, those differences may not be seen. Some suggested approaches and methods for performance of a screening or refined population exposure analyses are provided in Section 4.6.

The District or reviewing authority should be consulted before beginning the population exposure estimates and, as results are generated, further consultation may be necessary. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk.

The zone of impact for estimating the number of persons exposed to a cancer risk from facility emissions should be set at a minimum of a 10^{-6} cancer risk level (see Section 4.6.1). Some Districts may prefer to use a cancer risk of 10^{-7} to define the carcinogenic zone of impact. The total number of persons exposed to a series of potential risk levels can be presented to aid risk managers in understanding the magnitude of the potential public health impacts.

The HARP software can provide population-level risk estimates as cancer burden or as the number of persons exposed to a selected (user-identified) cancer risk level at block level centroids.

8.2.9.2 Population Estimates for Noncancer Health Impacts

A noncancer chronic, 8-hour, and acute population estimate of the number of people exposed to acute, 8-hour, and chronic HQs or HIs exceeding 0.5 or 1.0, in increments of 1.0, should also be presented. For example, a facility with a maximum chronic HI of 4.0 would present the number of people exposed to a chronic HI of 0.5, 1.0, 2.0, 3.0, and 4.0. The isopleths used in this determination should be drawn using the smallest feasible grid size. The same methods that are described in Chapter 4 and Section 8.2.9 (for the population exposure estimate for cancer risk) should be used in the chronic, 8-hour and acute population estimates. Population estimates for acute, 8-hour, and chronic health impacts should be presented separately.

8.2.9.3 Factors That Can Impact Population Risk – Cumulative Impacts

Although the Hot Spots program is designed to address the impacts of single facilities and not aggregate or cumulative impacts, there are a number of known factors that influence the susceptibility of the exposed population and thus may influence population risk. Socioeconomic status influences access to health care, nutrition, and outcome after cancer diagnosis. Community unemployment can affect exposure and residency time near a facility. Factors that affect the vulnerability of the population are discussed in the report *Cumulative Impacts: Building a Scientific Foundation* (OEHHA, 2010). Information on many of these factors is relatively easy to obtain at the census tract level. The OEHHA recommends that these types of factors be considered by the risk manager, along with the quantitative measures of population risk. OEHHA is in the process of developing guidance on quantification of the impact of these factors.

8.2.10 *Cancer Risk Evaluation of Short Term Projects*

The local air pollution control districts sometimes use the risk assessment guidelines for the Hot Spots program in permitting decisions for short-term projects such as construction or waste site remediation. Frequently, the issue of how to address cancer risks from short-term projects arises.

Cancer potency factors are based on animal lifetime studies or worker studies where there is long-term exposure to the carcinogenic agent. There is considerable uncertainty in trying to evaluate the cancer risk from projects that will only last a small fraction of a lifetime. There are some studies indicating that dose rate changes the potency of a given dose of a carcinogenic chemical. In others words, a dose delivered over a short time period may have a different potency than the same dose delivered over a lifetime.

The OEHHA's evaluation of the impact of early-in-life exposure has reduced some of the uncertainty in evaluating the cancer risk to the general population for shorter-term exposures, as it helps account for susceptibility to carcinogens by age at exposure (OEHHA, 2009).

Due to the uncertainty in assessing cancer risk from very short-term exposures, we do not recommend assessing cancer risk for projects lasting less than two months at the MEIR. We recommend that exposure from projects longer than 2 months but less than 6 months be assumed to last 6 months (e.g., a 2-month project would be evaluated as if it lasted 6 months). Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. In all cases, for assessing risk to residential receptors, the exposure should be assumed to start in the third trimester to allow for the use of the ASFs (OEHHA, 2009). Thus, for example, if the District is evaluating a proposed 5-year mitigation project at a hazardous waste site, the cancer risks for the residents would be calculated based on exposures starting in the third trimester through the first five years of life.

For the MEIW, we recommend using the same minimum exposure requirements used for the residential receptor (i.e., no evaluation for projects less than 2 months; projects longer than 2 months but less than 6 months are assumed to last 6 months; projects longer than 6 months would be evaluated for the duration of the project). Although the off-site worker scenario assumes that the workers are 16 years of age or older with an Age-Sensitivity Factor of 1, another risk management consideration for short-term project cancer assessment is whether there are women of child bearing age at the worksite and whether the MEIW receptor has a daycare center. In this case, the Districts may wish to treat the off-site MEIW in the same way as the residential scenario to account for the higher susceptibility during the third trimester of pregnancy, and for higher susceptibility of infants and children.

Finally, the risk manager may want to consider a lower cancer risk threshold for risk management for very short-term projects. Typical District guidelines for evaluating risk management of Hot Spots facilities range around a cancer risk of 1 per 100,000 exposed persons as a trigger for risk management. Permitting thresholds also vary for each District. There is valid scientific concern that the rate of exposure may influence the risk – in other words, a higher exposure to a carcinogen over a short period of time may be a greater risk than the same total exposure spread over a much longer time period. In addition, it is inappropriate from a public health perspective to allow a lifetime acceptable risk to accrue in a short period of time (e.g., a very high exposure to a carcinogen over a short period of time resulting in a 1×10^{-5} cancer risk). Thus, consideration should be given for very short term projects to using a lower cancer risk trigger for permitting decisions.

8.3 Noncancer Acute, 8-Hour, and Chronic Inhalation Health Impacts – the Hazard Index Approach

All substances in the Hot Spots Program that have noncancer health impacts at a receptor must be evaluated through the inhalation pathway. Estimates of noncancer inhalation health impacts are determined by dividing an airborne concentration at the receptor by the appropriate Reference Exposure Level (REL). This is termed the Hazard Index Approach. A REL is used as an indicator of potential noncancer health impacts and is defined as the concentration at which no adverse noncancer health effects are anticipated. When a health impact calculation is performed for a single substance, then it is called the hazard quotient (HQ). Each REL for a substance will have one or more target organ systems (e.g., respiratory system, nervous system, etc.) where the substance can have a noncancer health impact. Thus, all HQs have specified target organ systems associated with them. The sum of the Hazard Quotients of all chemicals emitted that impact the same target organ is termed the Hazard Index. Inhalation RELs for noncancer health impacts have been developed for acute, 8-hour, and chronic exposures to a number of Hot Spots substances. Acute RELs are designed to protect against the maximum 1-hour ground level concentration at the receptor. Eight-hour RELs are designed to protect people with daily 8-hour schedules, such as offsite workers, in an impacted zone. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA. Chronic RELs protect against long-term exposure to the annual average air concentration spread over 24 hours/day, 7 days/week.

OEHHA has added 8-hour RELs to the set of noncancer RELs that were previously comprised of acute and chronic RELs (OEHHA, 2008). Specifically, 8-hour RELs are air concentrations at or below which health impacts would not be expected even for sensitive subpopulations in the general population with repeated daily 8-hour exposures over a significant fraction of a lifetime. The 8-hour RELs can be used to evaluate the potential for health impacts (including effects of repeated exposures) in offsite workers, and to children and teachers exposed during school hours. Although not required in the HRA, they could also be applied by the Districts to a residential scenario where a facility operates only a portion of the day and exposure to residences is not adequately reflected by averaging concentrations over a 24 hour day. The number of chemicals with 8-hour RELs will increase as OEHHA re-evaluates RELs for chemicals under SB-25 to ensure that they are protective of children's health.

Acute, 8-hour, and chronic RELs are needed because the dose metrics and even the health impact endpoints may be different with the different exposure durations of acute, daily 8-hour, and chronic exposures. Also, although chronic REL values are lower or set the same as 8-hour RELs, there are some cases such as special meteorological situations (e.g., significant diurnal-nocturnal meteorological differences) or intermittent exposures where the 8-hour REL may be more protective than the chronic REL.

Chapter 4 describes air dispersion modeling and both Chapter 6 and Appendix L list the needed dose-response information to evaluate non-cancer hazards. Appendix I presents sample calculations for determining acute HQs and HIs, 8-hour HQs and HIs, and chronic multipathway HQs and HIs. Chapter 9 provides an outline of information required for risk characterization. The HARP software will calculate the HQ and HI for Hot Spots risk assessments.

8.3.1 *Calculation of Noncancer Inhalation Hazard Quotient and Hazard Index*

To calculate the acute HQ, the maximum 1-hour ground level concentration (in $\mu g/m^3$) of a substance at a receptor is divided by the acute 1-hour REL (in $\mu g/m^3$) for the substance:

$$\text{Acute Hazard Quotient} = \frac{\text{1-Hour Max Concentration } (\mu g/m^3)}{\text{Acute REL } (\mu g/m^3)}$$

To calculate the chronic HQ, the annual average ground level concentration of a substance is divided by the chronic REL for the substance:

$$\text{Chronic Hazard Quotient} = \frac{\text{Annual Average Concentration } (\mu g/m^3)}{\text{Chronic REL } (\mu g/m^3)}$$

To calculate the 8-hour HQ, the adjusted annual average ground level concentration of a substance (represented as "Adjusted C_{air}" in EQ 5.4.1.4 A) is divided by the 8-hour REL for the substance:

$$\text{8-hour Hazard Quotient} = \frac{\text{Adjusted Annual Average Concentration } (\mu g/m^3)}{\text{8-hour REL } (\mu g/m^3)}$$

The daily 8-hour average ground level concentrations used for calculating the 8-hour HQs are derived as described in Chapter 4.

An HQ of 1.0 or less indicates that adverse health effects are not expected to result from exposure to emissions of that substance. As the HQ increases above one, the probability of human health effects increases by an undefined amount. However, it should be noted that a HQ above one is not necessarily indicative of health impacts due to the application of uncertainty factors in deriving the RELs.

If a receptor is exposed to multiple substances that target the same organ system, then the HQs for the individual substances are summed to obtain a Hazard Index (HI) for that target organ.

Table 8.8 is an example of an HRA spreadsheet showing acute inhalation HQs arranged by target organ system for several substances. The bottom row shows the summed HQs by target organ system to derive the HIs.

Table 8.8 Individual Hazard Quotients and Total Hazard Index for Acute Inhalation Exposure

Substance	Reproductive/ Developmental	Nervous System	Cardiovascular System	Respiratory System	Eye
Ammonia				0.6	0.6
Arsenic	0.2	0.2	0.2		
Benzene	0.02				
Chlorine				0.7	0.7
Total Hazard Index	**0.22**	**0.2**	**0.2**	**1.3**	**1.3**

A more detailed example of calculating HQs and HIs and of determining noncancer health impacts is shown in Appendix I.

Hazard quotients or HIs for different target organs are not summed together (e.g., do not add the impacts for the eye to the cardiovascular system). Chapter 6 and Appendix L have lists of the organ systems affected by each substance. Unlike the cancer risk algorithms, no exposure duration adjustment (e.g., 9 yrs / 70 yrs) should be made for noncancer assessments.

There are limitations to this method of assessing cumulative noncancer health impacts. The impact on organ systems may not be additive if health effects occur by different mechanisms. However, the impact on organ systems could also be synergistic. An analysis by a trained health professional familiar with the substance's toxicological literature is usually needed to determine the public health significance of an HQ or HI above one. It is recommended that the Air District contact OEHHA if this situation presents itself. For assessing the noncancer health impacts of lead, different procedures are used; please see Appendix F.

8.3.2 *Calculating Noninhalation (oral) Noncancer Hazard Quotient and Hazard Index*

Similar to the situation with multipathway carcinogenic substances, multipathway substances that present a noncancer hazard are assessed by noninhalation routes of exposure (see Table 8.6). Noninhalation routes of exposure are assessed only for chronic exposure. There are no oral acute RELs since it is generally anticipated that health effects from a single exposure via the oral route at typical environmental levels resulting from deposition of facility emissions would be insignificant relative to the inhalation route. The multipathway substances with noninhalation RELs, called chronic oral RELs, are shown in Table 6.4. Similar to inhalation exposure, the hazard quotient

for a noninhalation pathway is obtained by dividing the dose in milligrams per kilogram-day (mg/kg-day) by the oral REL also expressed in units of mg/kg-day:

$$\text{Chronic Non-inhalation HQ} = \frac{\text{Chronic Noninhalation Dose (mg/kg-day)}}{\text{Chronic Oral REL (mg/kg-day)}}$$

The calculated chronic oral HQs are combined with the chronic inhalation HQs for determining the chronic HIs for each affected target organ (see Section 8.3.4). The point estimates and algorithms for calculating the oral dose for all applicable exposure pathways and receptors (e.g., workers or residents) are explained in Chapter 5.

The chronic oral dose calculated in mg/kg-day is based on a time-weighted average 70-year residential exposure combining the 0<2, 2<16 and 16-70 year age groups. Unlike the assessment of cancer risk, no exposure duration adjustment should be made when estimating HQs. In other words, the variates ED and AT in the cancer risk EQ 8.2.5 in Section 8.2.5 are not used for estimating the noncancer HQs. See Appendix I for an example calculation.

8.3.3 *Multipathway Noncancer Risk Methodology*

To determine multipathway chronic noncancer health impacts, it is necessary to calculate the total hazard index from both inhalation and noninhalation exposures. The calculation of HIs has several steps:

1) First, the inhalation HQ is calculated for each substance emitted (Section 8.3.1).
2) Second, if the substance has an oral REL, then the non-inhalation HQ is calculated as shown above using high-end point-estimates for intake rates for each noninhalation pathway that applies.
3) Third, if there are more than two noninhalation pathways to consider for a multipathway substance, then the oral HQ is calculated using high-end point estimates in the dose equation for the two dominant pathways. For any additional noninhalation pathways, the HQs are calculated using average point estimates in the dose equation. This step applies only to residential receptors.
4) Fourth, all noninhalation pathway HQs for a multipathway substance are then summed together by target organ to obtain the total noninhalation HQ for a multipathway substance.
5) The final step is to sum the inhalation and noninhalation HQs together by target organ to determine the HIs. This step is displayed in Table 8.9. If there is only one substance, then the multipathway HQ is the same as the HI.

Table 8.9 Substance-Specific Chronic Inhalation and Noninhalation Hazard Quotients and the Hazard Index by Target Organ System

Substance	Respiratory System	Hematologic System	Alimentary System	Endocrine System	Development	Reproductive System	Nervous System	Cardiovascular System	Skin
Ammonia	0.8								
Arsenic					0.04(i) 0.1(ni)		0.04(i) 0.1(ni)	0.04(i) 0.1(ni)	0.04(i) 0.1(ni)
Benzene		0.08			0.08		0.08		
2,3,7,8-TCDD (dioxin)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)			
Nickel	0.4(i)	0.4(i)	0.1(ni)						
Hazard Index	**1.50**	**0.78**	**0.40**	**0.3**	**0.52**	**0.30**	**0.22**	**0.14**	**0.14**

i = inhalation pathway contribution

ni = noninhalation pathway contribution

Table 8.9 shows the calculated chronic HIs by combining the chronic inhalation HQs and chronic oral HQs. The HQs or HIs for different target organs are not added together (e.g., do not add the impacts for the respiratory system to the nervous system). The noninhalation pathways for TCDD and arsenic in Table 8.9 have all the noninhalation pathways that apply incorporated into their HQ values. For example, the noninhalation value for arsenic (HQs = 0.1) includes at least the soil ingestion and dermal soil pathways in the HQs because these are the mandatory noninhalation pathways to take into account with exposure to a multipathway substance. For TCDD, the mother's milk pathway is an additional mandatory noninhalation pathway to take into account (See Table 5.1). If there are exposures to any of the site-specific pathways, then these would be included too. A more detailed example calculation of HIs is shown in Appendix I.

When exposure to more than two noninhalation pathways occur, using the high-end point estimates of intake rates for only the two dominant noninhalation pathways will lessen the issue of compounding high-end exposure estimates, while retaining a health-protective approach for the more important exposure pathways. It is unlikely that an individual receptor would be on the high-end of exposure for all the non-inhalation intake parameters (exposure pathways).

8.3.4 *Summary - Acute, 8-Hour and Chronic Hazard Index Calculation at the MEIR and MEIW*

Eight-hour RELs were developed principally for exposure of individuals during 8-hour work schedules. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA. There are currently only a limited number of substances with an 8-hour inhalation REL. Over time as the science supporting REL values for individual substances is reviewed and the RELs are revised by OEHHA, more 8-hour RELs will be developed.

Therefore, for the MEIR, we recommend:

- Estimating the acute Hazard Index based on the maximum 1-hour air concentration and 1-hour RELs
- Estimating the chronic Hazard Index based on the annual average air concentration and the chronic RELs, and the oral RELs for multipathway substances

An 8-hour hazard index based on the daily average 8-hour exposure is not required for the MEIR, but can be performed at the discretion of the District for exposure to non-continuously operating facilities using the adjusted annual average air concentration (See EQ 5.4.1.4 A and B or method in App. M). Eight-hour hazard assessments are not recommended for exposure to continuously operating facilities.

For the MEIW, we recommend:

- Estimating the acute Hazard Index based on the maximum 1-hour air concentration and 1-hour RELs
- Estimating the 8-hour Hazard Index based on daily average 8-hour exposure for those chemicals with 8-hour RELs
- Estimating the chronic Hazard Index based on the annual average air concentration and chronic RELs, and oral RELs for multipathway substances

Until there are 8-hour RELs for many of the Hot Spots substances that have a chronic REL value, we recommend determining the chronic HI for the MEIW to adequately protect the offsite worker.

8.3.5 *Evaluation of Background Criteria Pollutants*

The District should be contacted to determine if the contribution of background criteria pollutants to respiratory health effects is required to be included in an HRA for the Hot Spots Program. If inclusion is required, the methods for calculating the health impact from acute and chronic exposure (respiratory endpoint) is the standard HI approach (see Sections 8.3.1 and 8.3.4). There are currently no 8-hour RELs for criteria

pollutants, so 8-hour health impacts from criteria pollutants are not assessed in HRAs. The background criteria pollutant contribution should be calculated if the HI from the facility's emissions exceeds 0.5 in either the acute or chronic assessment for the respiratory endpoint.

The most recent criteria pollutant concentration data should be obtained from the ARB's ambient air monitoring network and can be found in the *California Almanac of Emissions and Air Quality* on their web site at www.arb.ca.gov. For determining the criteria pollutant contribution in HI calculations, the annual average concentration data should be taken from a monitoring site near the facility. If background contributions are unavailable, the District may direct the risk assessor to make an alternative assumption. The criteria pollutants that should be included in acute and chronic assessments for the respiratory endpoint are ozone, nitrogen dioxide, sulfur dioxide, sulfates, and hydrogen sulfide.

8.4 Uses of Exposure Duration Adjustments for Onsite Receptors

Onsite workers are protected by CAL OSHA and typically are not evaluated under the Hot Spots program. Exceptions may include a worker who also lives on the facility property such as at prisons, military bases, and universities that have worker housing within the facility. Another scenario where the District may require assessment of on-site worker exposure and risk is when a facility (e.g., airport) has multiple businesses owned by different entities within the facility/property (e.g., rental car agencies, restaurants, etc.). In these situations the evaluation of onsite cancer risks, and/or acute, 8-hour, and chronic noncancer hazard indices is appropriate under the Hot Spots program. If the onsite receptor under evaluation can be exposed through a noninhalation exposure pathway, then that exposure pathway must also be included. When a receptor lives and works on the facility, site, or property, then these receptors should be evaluated and reported under both residential and worker scenarios and the one that is most health-protective should be used for risk management decisions.

The cancer risk estimates for the on-site residents may use a 30-year exposure duration while the 25-year exposure duration is used for a worker. Under a Tier 2 analysis, alternate exposure durations may be evaluated and presented with all assumptions supported. See section 8.2.10 for more discussion of short-term exposures.

Other situations that may require on-site receptor assessment include the presence of locations where the public may have regular access for the appropriate exposure period (e.g., a lunchtime café, store, or museum for acute exposures). The District or reviewing authority should be consulted on the appropriate evaluations for the risk for all onsite receptors.

9 - Summary of the Requirements for a Modeling Protocol and a Health Risk Assessment Report

The AB 2588 program is a community right-to-know act. Although risk assessment is a technical field, AB 2588 risk assessments need to be clear and understandable to the educated lay person. An Executive Summary that explains the process and the results of the risk assessment in lay terms is necessary. Clear risk communication is imperative in situations where the facility is required to notify the surrounding community. In addition, the risk assessment is by law reviewed by the local Air Pollution Control or Air Quality Management District (District) and OEHHA in order to ensure that AB 2588 risk assessment procedures have been followed. This chapter clarifies the type of information that is needed for District and OEHHA review of modeling protocols and health risk assessments (HRAs).

The material presented here is intended to promote transparent, consistent presentation and efficient review of the modeling protocol and the health risk assessment report (products). We recommend that persons preparing these products consult with the local District to determine if the District has modeling or HRA guidelines that supersede these products. If the District does not have guidelines for these products, then we recommend Section 9.1 be used for modeling protocols and Section 9.2 be used for the presentation of HRAs. Persons preparing modeling protocols and HRAs should specify the guidelines that were used to prepare their products.

9.1 Submittal of a Modeling Protocol

It is strongly recommended that a modeling protocol be submitted to the District for review and approval prior to extensive analysis with an air dispersion model. The modeling protocol is a plan of the steps to be taken during the air dispersion modeling and risk assessment process. We encourage people who are preparing protocols to take advantage of the protocol step and fully discuss anticipated methodologies for any portion of your project that may need special consideration. Below, we have provided an example of the format that may be followed in the preparation of the modeling protocol. **Consult with the District to confirm format and content requirements or to determine the availability of District modeling guidelines before submitting the protocol.**

9.1.1 *Outline for a Modeling Protocol*

I. Introduction

Include the facility name, address, and a brief overview describing the facility's operations.

- Provide a description of the terrain and topography surrounding the facility and potential receptors.

- Indicate the format in which data will be provided. Ideally, the report and summary of data will be on paper and all data and model input and output files will be provided electronically (e.g., compact disk or CD).

- Identify the guidelines used to prepare the protocol (e.g., District Guidelines).

II. Emissions

For each pollutant and process whose emissions are required to be quantified in the HRA, list the annual average emissions (pounds/year and grams/second) and the maximum one-hour emissions (pounds/hour and grams/second)[1]. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).

- Identify the reference and method(s) used to determine emissions (e.g., source tests, emission factors, etc.). Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report. In this event, a revised emission inventory report will need to be submitted to the District.

- Identify if this will be a multipathway assessment based on emitted substances.

[1] Except radionuclides, for which annual and hourly emissions are reported in Curies/year and millicuries/hour, respectively.

III. Models / Modeling Assumptions

Specify the model and modeling assumptions

- Identify the model(s) to be used, including the version number.
- Identify the model options that will be used in the analysis.
- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all of the receptors of interest.
- Indicate complex terrain options that may be used, if applicable.
- Identify the source type(s) that will be used to represent the facility's operations (e.g., point, area, or volume sources, flare options or other).
- Indicate the preliminary source characteristics (e.g., stack height, gas temperature, exit velocity, dimensions of volume source, etc.).
- Identify and support the use of urban or rural dispersion coefficients for those models that require dispersion coefficients. For other models, identify and support the parameters required to characterize the atmospheric dispersion due to land characteristics (e.g., surface roughness, Monin-Obukhov length).

IV. Meteorological Data

Specify the type, source, and year(s) of hourly meteorological data (e.g., hourly surface data, upper air mixing height information).

- State how the data are representative for the facility site.
- Describe QA/QC procedures.
- Identify any gaps in the data; if gaps exist, describe how the data gaps are filled.

V. Deposition

- Specify the method to calculate deposition (if applicable).

VI. Receptors

Specify the type and location of receptors. Include all relevant information describing how the individual and population-related receptors will be evaluated.

- Identify and describe the location(s) of known or anticipated potential sensitive receptors, the point of maximum impact (PMI), the maximum exposed individual residential (MEIR), and worker (MEIW) receptors. Identify any special considerations or grids that will be used to model these receptors. This information should correspond with information provided in Section III (e.g., fine receptor spacing of 20 meters at the fence line and centered on the maximum impacts; coarse receptor spacing of 100 meters out to 2,000 meters; extra coarse spacing of 1,000 meters out to 20,000 meters).

- Identify if spatial averaging will be used. Include necessary background information on each receptor including how the domain and spacing will be determined for each receptor or exposure pathway.

- Describe how the cancer burden or population impact estimates are calculated. Clarify the same information for the presentation of noncancer population impacts (e.g., centroids of the census tracts in the area within the zone of impact).

- Specify that actual UTM coordinates and the block/street locations (i.e., north side of 3,000 block of Smith Street), where possible, will be provided for specified receptor locations.

- Identify and support the use of any exposure adjustments (e.g., time at location, diurnal).

- Include the list of anticipated exposure pathways that will be included and indicate which substance will be evaluated in the multipathway assessment. Identify if sensitive receptors are present and which receptors will be evaluated in the HRA.

VII. Maps

Identify how the information will be graphically presented.

- Indicate which cancer risk isopleths will be plotted for the cancer zone of impact (e.g., 10^{-7}, 10^{-6} see Section 4.6.1).

- Indicate the hazard quotients or hazard indices to be plotted for the noncancer acute, 8 hour, and chronic zones of impact (e.g., 0.5, 1.0, etc.).

9.2 Health Risk Assessment Report

The purpose of this section is to provide an outline to assist with the preparation and review of HRAs. This outline specifies the key components that should be included in HRAs. All information used for the report must be presented in the HRA. Ideally, the HRA report and a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD). Persons preparing HRAs for the Hot Spots Program should consult the District to determine if HRA guidelines or special formats are to be followed when preparing and presenting the HRA's results.

If District guidelines or formats do not exist that supersede this outline, then the HRA should follow the format presented here. If the HRA is prepared for other programs, the reviewing authority should be consulted for clarification of format and content. We recommend that those persons preparing HRAs specify the guidelines that were used to prepare their product. **The HRA may be considered deficient by the reviewing authority if components that are listed here are not included**.

9.2.1 *Outline for the Health Risk Assessment Report*

I. Table of Contents

- Section headings with page numbers indicated.
- Tables of tables and Table of figures with page numbers indicated.
- Appendices with page numbers indicated.

II. Executive Summary

Overview of all relevant information regarding the project or facility.

- Facility identifier number (consult the District).

- Description of facility operations and a list identifying emitted substances including table of maximum 1-hour emissions, and annual average emissions.

- Provide a brief description of acute, 8-hour, chronic, and cancer health impacts of the emitted substances, based on OEHHA's descriptions in the appropriate Technical Support Documents.

- Text presenting overview of dispersion modeling and exposure assessment.

- Text describing estimated cancer risk for carcinogens, noncancer Hazard Quotients and Hazard Indices and a table showing target organ systems by substance for noncancer impacts.

- Summarize the individual and population-wide health impacts including the driving substance(s) and the driving exposure pathways:

    - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of the off-site point of maximum impact (PMI), maximum exposed individual resident (MEIR), and maximum exposed individual worker (MEIW).

    - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of any on-site receptors that were evaluated at the facility (consult District or agency).

    - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of any sensitive receptors that are required by the district or reviewing authorities (consult District or agency).

      NOTE: When presenting information described in the following bullets, cancer risk should be presented separately for a residential 30-year, Tier–1 analysis. Results of other exposure assumptions (e.g., 9 or 70-year) or other tier evaluations should also be presented, and must be clearly labeled. For the Hot Spots Program, while the 30-year exposure duration is recommended as the basis for public notification and risk reduction audits and plans, the District has discretion to use the 70 year exposure scenario for its decisions. In addition, the 70 year cancer risk must be calculated to estimate population-wide impacts.

    - Text presenting an overview of the total cancer risk (including multipathway substances, if present) at the PMI, MEIR, MEIW, and sensitive receptors. Provide a table of cancer risk by substance for the MEIR and MEIW (if applicable). Include a statement indicating which of the substances appear to contribute most to (drive) the potential health impacts. In addition, identify the exposure pathways evaluated in the HRA.

    - Provide a map of the facility and surroundings and identify the location of the MEIR, MEIW, PMI, and other locations or receptors of interest.

    - Provide a map of 30-year and 70-year cancer risk zone of impact(s), if applicable.

    - Text presenting an overview of the acute and chronic noncancer hazard quotients and the (total) hazard indices for the PMI, MEIR, MEIW, and sensitive receptors. Additionally, include 8-hour hazard quotients and hazard indices for the MEIW. Include separate statements (for acute, 8-hour, and chronic exposures) indicating which

of the substances appear to drive the potential health impacts. In addition, clearly identify the primary target organ(s) that are impacted from acute, 8-hour, and chronic exposures.

- Identify any sensitive subpopulations (e.g., child daycare facilities, schools, nursing homes) of concern.

- Table and text presenting an overview of estimates of population exposure (e.g., cancer burden or population estimates from HARP) (consult District or agency) (see Section 8.4).

- Version of the Risk Assessment Guidelines and computer program(s) used to prepare the risk assessment (e.g., HARP).

III. Risk Assessment Procedures

A. Hazard identification

- Table and text identifying all substances emitted from the facility, plus any other substances required by the District or reviewing authority. Include the CAS number of the substance and the physical form of the substance if possible. [The Hot Spots substances are listed in Appendix A, and also in the ARB's Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5), and the Emission Inventory Criteria and Guidelines Report (EICG Report), which is incorporated by reference therein (ARB, 1997)].

- Table and text identifying all substances that are evaluated for cancer risk and/or noncancer acute, 8-hour, and chronic health impacts. In addition, identify any multipathway substances that present a cancer risk or chronic noncancer hazard via noninhalation routes of exposure.

- Describe the types and amounts of continuous or intermittent predictable emissions from the facility that occurred during the reporting year. As required by statute, releases from a facility include spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping (fugitive), leaching, dumping, or disposing of a substance into ambient air. Include the substance(s) released and a description of the processes that resulted in long-term and continuous releases.

B. Exposure Assessment

This section describes the information related to the air dispersion modeling process that needs to be reported in the risk assessment; the information is also presented in Chapter 4 (see Section 4.15). The District may have specific requirements regarding format and content (see Section 4.14). Sample calculations should be provided at each step to indicate how reported emissions

data were used. Reviewing agencies must receive input, output, and supporting files of various model analyses on computer-readable media (e.g., CD).

1. Information on the Facility and its Surroundings

Report the following information regarding the facility and its surroundings:

- Facility Name
- Location (UTM coordinates and street address)
- Land use type (see Section 2.4)
- Local topography
- Facility plot plan identifying:
  - source locations
  - property line
  - horizontal scale
  - building heights
  - emission sources

2. Source and Emission Inventory Information

a. Release Parameters

Report the following information for each release location in table format:

- Release location identification number
- Release name
- Release type (e.g., point, volume, area, line, pit, etc.)
- Source identification number(s) used by the facility for sources that emit out of this release location
- Release location using UTM coordinates
- Release parameters by release type (e.g., shown for point source):
- Stack height (m), stack diameter (building dimensions for downwash, exhaust gas exit velocity (m/s), exhaust gas volumetric flow rate (ACFM), exhaust gas exit temperature (K), etc.

b. Source Description and Operating Schedule

The description and operating schedule for each source should be reported in table form including the following information:

- Source identification number used by the facility
- Source name
- Number of operating hours per day and per year (e.g., 0800-1700, 2700 hr/yr)
- Number of operating days per week (e.g., Mon-Sat)

- Number of operating days or weeks per year (e.g., 52 wk/yr excluding major holidays)
- Release point identification number(s) for where source emissions are released
- Fraction of source emissions emitted at each release point by release point ID number

c. *Emission Control Equipment and Efficiency*

- Report emission control equipment and efficiency by source and by substance

d. *Emissions Data Grouped By Source*

Report emission rates for each toxic substance, grouped by source (i.e., emitting device or process identified in Inventory Report), in table form including the following information:

- Source name
- Source identification number
- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

e. *Emissions Data Grouped by Substance*

Report facility total emission rate by substance for all emitted substances listed in the Air Toxics “Hot Spots” Program including the following information:

- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

f. *Emission Estimation Methods*

Report the methods used in obtaining the emissions data indicating whether emissions were measured or estimated. Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report and submit a revised emission inventory report to the district. A reader should be able to reproduce the risk assessment without the need for clarification.

g. List of Substances

Include tables listing all "Hot Spots" Program substances which are emitted, plus any other substances required by the District. Indicate substances to be evaluated for cancer risks and noncancer effects.

h. Exposed Population and Receptor Location

Report the following information regarding exposed population and receptor locations:

- Description of zone of impact including map showing the location of the facility, boundaries of zone of impact, census tracts, emission sources, sites of maximum exposure, and the location of all appropriate receptors. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5 minute maps or GIS based maps are usually the most appropriate choices. (If significant development has occurred since the user's survey, this should be indicated.)

- Separate maps for the cancer risk zone of impact and the hazard index (noncancer) zone of impact(s). The cancer zone of impact should include isopleths down to at least the 1/1,000,000 risk level. Because some districts use a level below 1/1,000,000 to define the zone of impact, the District should be consulted. For the noncancer zone of impact, three separate isopleths (to represent chronic, 8-hour, and acute HI) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 0.5. The point of maximum impact (PMI), maximum exposed individual at a residential receptor (MEIR), and maximum exposed individual worker (MEIW) for both cancer and noncancer risks should be located on the maps.

- Tables identifying population units and sensitive receptors (UTM coordinates, receptor IDs or index from the modeling, and street addresses of specified receptors)

- Heights or elevations of the receptor points.

- **Spatial averaging**: For each receptor type (e.g., PMI, MEIR, and MEIW, or other location of interest) that will utilize spatial averaging, the domain size and grid resolution must be clearly identified. If another domain or grid resolution other than 20 meters by 20 meters with 5-meter grid spacing will be used for a receptor, then care should be taken to determine the proper domain size and grid resolution that should be used. For a worker, the HRA shall support all assumptions used, including, but not limited to, documentation for all workers

showing the area where each worker routinely performs their duties. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain should be sufficient in number and detail to obtain a representative concentration across the area of interest. When spatial averaging over the deposition area of a pasture, garden, or water body, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the pasture, garden, or water body of interest should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture or water body, maps, representative coordinates, grid resolution, concentration gradients, etc.). The use or spatial averaging is subject to approval by the reviewing authority. This includes the size of the domain and grid resolution that is used for spatial averaging of a worksite or multipathway deposition area.

3. Meteorological Data

If meteorological data were not obtained directly from the District, then the report must clearly indicate the data source and time period used. Meteorological data not obtained from the District must be submitted in electronic form along with justification for their use including information regarding representativeness and quality assurance.

The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating the District's approval of meteorological data should be attached in an appendix.

4. Model Selection and Modeling Rationale

The report should include an explanation of the model chosen to perform the analysis and any other decisions made during the modeling process. The report should clearly indicate the name of the models that were used, the level of detail (screening or refined analysis) and the rationale behind the selection.

Also report the following information for each air dispersion model used:

- Version number
- Selected options and parameters in table form

- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all receptors of interest.

5. Air Dispersion Modeling Results

The report should include tables, text, and appendices that clearly present all of the following information

- Maximum hourly and annual average concentrations of chemicals at appropriate receptors such as the residential and worker MEI receptors

- Annual average and maximum one-hour (and 30-day average for lead only) concentrations of chemicals at appropriate receptors listed and referenced to computer printouts of model outputs

- Model printouts (numbered), annual concentrations, maximum hourly concentrations

- Disk with input/output files for air dispersion program (e.g., the AERMOD input file containing the regulatory options and emission parameters, receptor locations, meteorology, etc.)

- Include tables that summarize the annual average concentrations that are calculated for all the substances at each site. The use of tables that present the relative contribution of each emission point to the receptor concentration is recommended. (These tables should have clear reference to the computer model which generated the data. It should be made clear to any reader how data from the computer output were transferred to these tables.) [As an alternative, the above two tables could contain just the values for sites of maximum impact (i.e., PMI, MEIR and MEIW), and sensitive receptors, if required. All the values would be found in the Appendices.]

C. ***Health Values Used in Dose-Response and Dose Estimates***

- Provide tables of the acute, 8-hour and chronic inhalation RELs, chronic oral RELs (if applicable), and cancer potency factors for each substance that is quantified in the HRA.

- Identify the guidelines (title and date) that were used to obtain these factors, or indicate whether newly approved values obtained from the OEHHA website were used.

- Provide a table of target organ systems for each noncancer substance, including acute (1 hour), 8-hour, and chronic inhalation, and chronic oral (if applicable).

- Include tables of the estimated dose for each substance by each exposure pathway at the PMI, MEIR, MEIW, and at any sensitive receptor locations (required by the District).

D. ***Risk Characterization***

The Hot Spots Analysis and Reporting Program (HARP) will generate the risk characterization data needed for the outline below. Any data needed to support the risk characterization findings should be clearly presented and referenced in the text and appendices. A listing of HARP output files that meet these HRA requirements is provided in this outline under the section entitled "Appendices". All HARP files should be included in the HRA. Ideally, the HRA report and a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD). Information on obtaining copies of HARP is available on the California Air Resources Board's Internet web site under the Air Toxics Program at *www.arb.ca.gov.*

NOTE: The cancer risk for the PMI, MEIR, and sensitive receptors of interest must be presented in the HRA's text, tables, and maps. OEHHA recommends that cancer risk for a 30-year exposure duration be presented for the MEIR, and that cancer risk for 9-year and 70-year exposure durations for the MEIR be presented to provide the risk managers with supplemental information. Note that the assessment of population impacts must be based on a 70-year exposure duration; thus all risk assessments need to estimate cancer risk for a 70-year exposure duration in order to report the number of individuals residing in the risk isopleths, or to calculate cancer burden if the District so requires. In addition, some Districts may opt to make risk management decisions based on a 70-year exposure duration. The MEIW location should use a 25-year exposure period.

All HRAs must include the results of a Tier-1 exposure assessment (see Chapter 2 and 8, or the 2012 TSD). If the reviewing authority specifies that additional exposure periods should be presented, or if persons preparing the HRA would like to present additional information (i.e., exposure duration adjustments or the inclusions of risk characterizations using Tier-2 through Tier-4 exposure data), then this information should be presented in separate, clearly titled, sections, tables, and text.

The following information should be presented in this section of the HRA. If not fully presented here, then by topic, clearly identify the section(s) and pages within the HRA where this information is presented.

- Description of receptors to be quantified.

- Table and text providing the location [UTM coordinates, receptor ID number or index from the modeling, and the block/street address

(e.g., north side of 3,000 block of Smith Street)] and description of the PMI, MEIR, and MEIW for both cancer and noncancer risks.

- Separate tables and text providing description of the PMI and MEIR for 30-year cancer risk, and 9- or 70-year cancer risk.

- Tables and text describing MEIW 25-year cancer risk.

- Table and text providing the location [UTM coordinates, receptor ID number or index from the modeling, and the block/street address (e.g., north side of 3,000 block of Smith Street)] and description of any sensitive receptor that is of interest to the District or reviewing authorities (consult District or agency).

- Provide any exposure information that is used for risk characterization (e.g., concentrations at receptors, emissions information, census information, figures, zone of impact maps, etc.). If multipathway substances are emitted, identify the site/route dependent exposure pathways (e.g., water ingestion) for the receptor(s), where appropriate (e.g., MEIR).

- Provide a summary of the site-specific inputs used for each exposure pathway (e.g., water or grazing intake assumptions). This information may be presented in an appendix with the information clearly presented and cross-referenced to the text. In addition, provide reference to the appendix (section and page number) that contains the modeling (i.e., HARP/dispersion modeling) files that show the same information.

- If any exposure parameters were used other than those provided in the Air Toxics Risk Assessment Guidelines: Technical Support Document for Exposure Assessment and Stochastic Analysis (2012), they must be presented in detail. The derivation and data used must be presented so that it is clear to the reviewer. The justification for using site-specific exposure parameters must be clearly presented.

- Table and text presenting the potential multipathway cancer risk by substance, by pathway, and total, at the PMI, MEIR, MEIW, and sensitive receptor locations (required by the District).

- Table and text presenting the acute (inhalation only) and chronic noncancer (inhalation and oral) hazard quotients (by substance, exposure pathways, and target organs) and the (total) hazard indices by substance and target organs for the PMI, MEIR, MEIW, and sensitive receptors. For 8-hour exposure at the MEIW (inhalation only), table and text presenting hazard quotients (by substance, exposure pathways, and target organs) and the (total) hazard indices by substance and target organs. Note:

Chronic noncancer results should be shown with inhalation and oral contributions (shown separately) and for the combined (multipathway) impact.

- Identify any sensitive subpopulations (e.g., child daycare facilities, schools, nursing homes) of concern.

- Table and text presenting estimates of population exposure (e.g., population exposure estimates or cancer burden from HARP) (consult District or agency). Tables should indicate the number of persons exposed to a (total) cancer risk greater than 10^{-7}, 10^{-6}, 10^{-5}, 10^{-4}, etc., and total hazard quotient or hazard index greater than 0.5, 1.0, 2.0, and 3.0, etc. Provide a table that shows excess cancer burden for each population unit and the total excess cancer burden, if cancer burden calculation is required.

- Provide maps that illustrate the HRA results for the three sub-bullet points below. These maps should be an actual street map of the area impacted by the facility with elevation contours and actual UTM coordinates, and the facility boundaries clearly labeled. In some cases the elevation contours will make the map too crowded and should therefore not appear. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5-minute maps are usually the most appropriate choice (see Section 4.6).

    - The facility (emission points and boundaries), the locations of the PMI, MEIR, MEIW, and sensitive receptors.

    - Maps of the cancer zone of impacts (e.g., 10^{-6} or 10^{-7} levels - consult District or Agency). The map should clearly identify the zone of impact for the inhalation pathway, the minimum exposure pathways (soil ingestion, dermal exposure, and breast-milk consumption) if multipathway substances are emitted, and the zone of impact for all the applicable exposure pathways (minimum exposure pathways plus any additional site/route specific pathways) for multipathway analyses. Two maps may be needed to accomplish this. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways that were included in the assessment.

    - Maps of the noncancer hazard index (HI) zone of impacts (e.g., 0.5 or 1.0 - consult District or Agency). The noncancer maps should clearly identify the noncancer zones of impact. These include the acute (inhalation), 8-hour (inhalation), chronic (inhalation), and chronic (multipathway) zones of impact. For clarity, presentation of the noncancer zones of impact may require two or more maps. The

legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways.

- The risk assessor may want to include a discussion of the strengths and weaknesses of the risk analyses and associated uncertainty directly related to the facility HRA.

- If appropriate, comment on the possible alternatives for control or remedial measures. How do the risks compare?

- If possible, identify any community concerns that influence public perception of risk.

- Sample calculations may be needed for all analyses in the HRA if proprietary software other than HARP was used. The District should be consulted. These calculations should be clearly presented and referenced to the findings they are supporting in the HRA text.

- Version of the Risk Assessment Guidelines and computer program used to prepare the risk assessment.

- If software other than HARP is used for the health assessment modeling, all supporting material must be included with the HRA (e.g., all algorithms and parameters used in a clear, easy to review format).

E. ***References***

Include any references used for the HRA in this section.

F. ***Appendices***

The appendices should contain all data, sample calculations, assumptions, and all modeling and risk assessment files that are needed to reproduce the HRA results. Ideally, a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD), unless otherwise specified by the district or reviewing authority. All appendices and the information they contain should be referenced, clearly titled, and paginated.

Potential Appendix Topics (if not presented elsewhere in the HRA report):

- List of all receptors locations (UTM coordinates, receptor ID number or index from the modeling, and the block/street address (e.g., north side of 3,000 block of Smith Street)) for the PMI, MEIR, MEIW, and sensitive receptors.
- List of all emitted substances.
- All emissions files.

- List of dose-response factors (Reference Exposure Levels and cancer potency factors).
- All air dispersion modeling input and output files. Detailed discussions of meteorological data, regulatory options, emission parameters, receptor locations, etc.
- Census data.
- Maps.
- Identify the site/route dependent exposure pathways for the receptor(s), where appropriate (e.g., MEIR). Provide a summary of the site-specific inputs used for each pathway (e.g., water or grazing intake assumptions) and the data to support them.
- All calculations used to determine emissions, concentrations, and potential health impacts at the PMI, MEIR, MEIW, and sensitive receptors.
- All HRA model input and output (HARP) files for receptors of concern.
- (Total) cancer and noncancer impacts by receptor, substance, and exposure pathway (by endpoint for noncancer) at all receptors.
- Presentation of alternate risk assessment methods (e.g., alternate exposure durations, or Tier-2 to Tier-4 evaluations with supporting information).

Page Intentionally Left Blank

List of Abbreviations

A - Area
AB2588 - Air Toxics “Hot Spots” Information and Assessment Act, 1987
ACFM - Actual Cubic Feet per Minute
ADL - Annual Dermal Load
AQMD - Air Quality Management District (District)
ARB - Air Resources Board
ASF - Age Sensitivity Factor
AT - Average Time for Lifetime Cancer Risk
BAF - Bioaccumulation Factor
BG - Urban Block Groups
BLP - Buoyant Line and Point Source Dispersion Model
BMI - Breast Milk Intake
BPIP - Building Profile Input Program
BPIPPRM - Building Profile Input Program for PRIME
BSA - Body Surface Area
BW - Bodyweight
C_{air} - annual average air concentration
CALMPRO - Calms processor program
CAPCOA - California Air Pollution Control Officer’s Association
CAS - Chemical Abstracts Service
CERCLA - Comprehensive Environmental Response, Compensation and Liability Act
C_f - Average concentration of a substance in fish
C_m - Average concentration of a substance in mother’s milk (mislabeled on 114 as Cf)
C_{fa} - Average concentration of a substance in animal products
CONST2 - Constant in the Briggs’ stable plume rise equation using BLP
CONST3 - Constant in the Briggs’ neutral plume rise equation using BLP
CPF - Cancer Potency Factor
CRIT - Convergence criterion for the line source calculations using BLP
Cs - Concentration of Substance in the Soil
CTDMPLUS - Complex Terrain Dispersion Model
CTSCREEN - Complex Terrain Screening Model
Cv - Average concentration of a substance in and on vegetation
Cw - Concentration of a Substance in the Water
DECFAC - Pollutant decay factor for use with BLP
DF - Discount Factor
$DOSE_{air}$ - Daily inhaled dose
$DOSE_{fa}$ - Exposure through ingesting home-raised or farm animal products
$DOSE_{fish}$ - Exposure through ingestion of angler-caught fish
Dose-Im - Exposure through mother’s milk ingestion
$DOSE_p$ - Exposure through ingesting home-grown produce
$DOSE_{water}$ - Exposure through ingesting water

DTHTA - Vertical potential temperature gradient
DTSC - Department of Toxic Substance Control
EASA - Exposure Assessment and Stochastic Analysis
ED - Rural Enumeration Districts or Exposure Duration (in years)
EF - Exposure Frequency
EICG - Emission Inventory Criteria and Guidelines
EPA - Environmental Protection Agency
EQ - Equation
F - Fahrenheit
FAH - Fraction of Time at Home
FG - Fraction of diet provided by grazing
GIS - Geographic Information Systems
GLC - Ground-Level Concentrations
GRAF - Gastrointestinal Relative Absorption Factor
HARP - Hot Spots Analysis and Reporting Program
HESIS - Hazard Evaluation System and Information Service
HI - Hazard Index
HQ - Hazard Quotient
HRA - Health Risk Assessment
HSC - Health and Safety Code
IARC - International Agency for Research on Cancer
IDELS - Maximum variation in number of stability classes per hour (BLP option)
ISCST3 - Industrial Source Complex Short Term
IUPAC - International Union of Pure and Applied Chemistry
K - Kelvin
L - Fraction of locally-grown (source-impacted) feed that is not pasture (site-specific)
LOAEL - Lowest Observed Adverse Effects Level
LOD - Level of Detection
LSHEAR - Plume rise wind shear (BLP option)
LTRANS - Transitional point source plume rise (BLP option)
MAXIT - Maximum iterations allowed for line source calculations (BLP option)
MEIR - Maximally Exposed Individual Resident
MEIW - Maximally Exposed Individual Worker
METDB - Meteorological Database
METS - Metabolic Equivalents
MPRM - Meteorological Processor for Regulatory Models

Update of Environmental Activities
6701, 6705, and 6707 Shellmound Street
Emeryville, California
Fuel leak Case No. RO0000548
Geotracker Global Id T0600100894

This summary has been prepared on behalf of Anton Emeryville, LLC (Anton) by PES Environmental, Inc. (PES) to provide an update on historic and planned environmental activities for the property located at 6701, 6705, and 6707 Shellmound Street, Emeryville, California (collectively, the subject property or site). The site is under the regulatory oversight by the Alameda County Department of Environmental Health (ACDEH) for the investigation and cleanup related to unauthorized releases from underground storage tanks. Anton and PES are working with ACDEH to further assess the site with respect to historic site uses and fill material and develop appropriate mitigation measures to be utilized during redevelopment of the property and to ensure post-redevelopment conditions do not pose unacceptable conditions to future occupants and workers.

A list of environmental activities conducted by Anton and PES during 2015 to facilitate site redevelopment activities at the subject property is provided below:

Conceptual Site Model, 6701 – 6707 Shellmound Street, Emeryville, California, Fuel leak Case No. RO0000548, Geotracker Global Id T0600100894, dated February 6, 2015.

Site Mitigation and Contingency Plan for Redevelopment Construction, 6701 – 6707 Shellmound Street, Emeryville, California, dated May 19, 2015.

The Site Mitigation and Contingency Plan for Redevelopment Construction contained:

- The 2015 Soil Vapor Investigation (Appendix B);
- *Human Health Risk Assessment Report, 6701 – 6707 Shellmound Street, Emeryville, California* prepared by SLR International Corporation (Appendix C); and
- Health and Safety Plan, 6701 – 6707 Shellmound Street, Emeryville, California (Appendix D).

Revised Work Plan for Pre-Construction Subsurface Investigation, 6701 – 6707 Shellmound Street, Emeryville, California, *Fuel leak Case No. RO0000548, Geotracker Global Id T0600100894*, dated August 28, 2015.

Additional environmental activities that will be conducted by PES and Anton at the subject property in 2015 and 2016 prior to closure of the site by ACDEH include:

- Conduct Pre-Construction Subsurface Investigation;
- Update Human Health Risk Assessment;

- Update Conceptual Site Model;
- Update Site Mitigation and Contingency Plan;
- Prepare and Record Land Use Covenant;
- Develop Vapor Intrusion Mitigation Plans;
- Construct Project Development and Vapor Intrusion Mitigation System; and
- Prepare As-Built Vapor Intrusion Mitigation System Plans.

Upon review and approval of the above listed documents that verify that there is a low risk to human health and the environment due to residual contamination remaining and implementation of appropriate mitigation measures, ACDEH will issue a public notification of potential case closure. During the 30-day public comment period the public will be provided a link to the electronic case file and invited to review and comment on the potential closure of the site.

A summary of the above-referenced environmental activities is provided below.

2015 Soil Vapor and Sub-Slab Vapor Survey

In April 2015, a limited soil vapor and sub-slab investigation was conducted by PES to further evaluate subsurface conditions in the vicinity of the former underground storage tanks (USTs) and beneath concrete slab of the existing warehouse building. The additional investigation included conducting soil gas and sub-slab vapor sampling for volatile organic compounds (VOCs), methane, carbon dioxide, and oxygen in order to advance the open Spills, Leaks, Investigation and Cleanup (SLIC) case towards closure and assess the site for potential vapor intrusion concerns. Accordingly, PES and its subcontractor collected soil gas samples from three exterior locations at approximate depths of 5 and 10 feet bgs and sub-slab vapor samples from four interior locations at the site for analysis of VOCs (including methyl ethyl ketone [MEK] and methyl isobutyl ketone [MIBK]), methane, carbon dioxide, and oxygen. Samples of vapor within the shroud and soil vapor samples were also analyzed for the leak detection compound, 1,1-difluoroethane (1,1-DFA).

Soil Vapor Sampling and Analysis Results

The soil vapor analytical results indicate residual levels of VOCs, including benzene, toluene, ethylbenzene, and xylenes (collectively, BTEX compounds), MEK, and MIBK, are present in soil gas at approximate depths of 5 and 10 feet bgs in the vicinity of the former USTs. Benzene was detected in one soil gas sample (location SV2 at a depth of 5 feet bgs) at a concentration above applicable ESLs developed for a residential setting, but well below the respective ESLs developed for commercial/industrial settings. Other VOCs detected in soil gas were below applicable residential ESLs. Although vinyl chloride was not detected above laboratory reporting limits, the reporting limit for vinyl chloride for sample SV3 at 10 feet bgs was above the applicable residential ESL. Methane was not detected in the soil vapor samples at or above the laboratory reporting limit, carbon dioxide was detected at levels ranging

from 4.52 percent by volume (%volume) to 13.6 %volume, and oxygen levels ranged from 6.53 %volume to 15.9 %volume. The leak detection compound, 1,1-DFA, was not detected at or above the laboratory reporting limit in any of the soil gas samples.

Sub-Slab Vapor Sampling and Analysis Results

Low levels of VOCs, including tetrachloroethene (PCE), 1,1,1-trichloroethane (1,1,1-TCA), styrene, and MEK were detected in sub-slab vapor samples collected beneath the warehouse building. Using the California Department of Toxic Substances Control (DTSC) recommended attenuation factor of 0.05 for estimation of indoor air concentrations based on sub-slab vapor analytical results, PCE reported in sample SSV1 is above the concentration which would theoretically result in an indoor air concentration above the applicable residential ESL. The result is also slightly above the concentration which would theoretically result in an indoor air concentration above the applicable commercial/industrial ESL. The reported results for other VOCs are well below the concentrations which would theoretically result in indoor air concentrations above applicable ESLs. Methane was not detected in the sub-slab vapor samples at or above the laboratory reporting limit, carbon dioxide was detected in three of the four samples at levels ranging from 0.272 % volume to 4.25 %volume, and oxygen levels ranged from 8.97 %volume to 19.1 %volume. The leak detection compound, 1,1-DFA, was not detected at, or above, the laboratory reporting limit in any of the sub-slab vapor samples.

Pre-Construction Subsurface Investigation

On August 28, 2015, PES prepared a *Revised Work Plan for Pre-Construction Subsurface Investigation* (Revised Work Plan) at the request of ACDEH. ACDEH had requested additional characterization of soil gas and soil which may remain in-place beneath future landscaped areas or be disturbed by future intrusive earthwork activities conducted during proposed redevelopment activities at the site. The Revised Work Plan supersedes the *Work Plan for Additional Soil Gas Investigation* dated July 14, 2015, prepared by PES. ACDEH conditionally approved the Revised Work Plan in correspondence dated September 4, 2015. A copy of the ACDEH letter providing conditional approval of the Revised Work Plan is attached.

The objective of the proposed pre-construction subsurface investigation is to evaluate the subsurface for the presence of VOCs, total petroleum hydrocarbons (TPH), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), metals, and/or asbestos-containing material (ACM) related to historical deposition of fill material beneath the site or previous industrial activities conducted at the site. The primary components of the proposed investigation include:

- A soil gas survey to further address potential vapor intrusion concerns beneath former industrial features, existing buildings, and proposed future building areas including first-floor residential units and common areas;

- Additional confirmation soil gas sampling to assess conditions associated with VOCs or elevated laboratory detection limits for VOCs reported for soil gas and sub-slab vapor samples collected in April 2015;

- Shallow soil sampling to assess the condition of soil anticipated to be disturbed during site redevelopment, including: (1) soil to be excavated to accommodate the future building foundation, pavement sections, landscape and surface water infiltration features; and (2) soil within proposed utility trenches. Assessment of soil in these areas will provide additional data to facilitate future construction worker safety and proper management of disturbed soil;

- Shallow soil sampling to assess the condition of soil beneath proposed exterior landscaped and play areas to confirm no concerns exist with respect to potential future residential occupant exposure; and

- Confirmation soil sampling within the former UST area to assess soil conditions associated with benzene reported in one soil gas sample collected in April 2015.

A description of the methods and procedures of the subsurface investigation will be presented in the pre-construction subsurface investigation report along with the results of the sampling activities. The report will also provide tabulated data, illustrations showing select contaminant concentrations, laboratory reports, findings of the completed scope of work, and recommendations, as appropriate. Additionally, the report will include revised geologic cross-sections showing the results of the additional soil gas and soil sampling and the proposed development, including locations of the building foundation, residential units, and utility trenches, to the extent practicable based on available information.

Update Human Health Risk Assessment

The results of the pre-construction subsurface investigation will be evaluated along with the results of previous investigations and remediation in a revised human health risk assessment (Revised HHRA) for the subject property to support case closure and planned site residential redevelopment as multi-story apartments and associated parking. The Revised HHRA will be conducted using a two-step process and will evaluate potential exposure to future site users (e.g., residents, commercial workers, and maintenance workers) and construction workers. The HHRA will include a screening evaluation where chemical concentrations from the subject property in three media (soil, soil gas, and groundwater) are compared with relevant California Regional Water Quality Control Board, San Francisco Bay Region, Environmental Screening Levels (ESLs). Chemicals with maximum detected concentrations above relevant ESLs will then be further evaluated in a second step, which includes toxicity assessment, dose estimation, and risk characterization. A report will be prepared documenting the methods, assumptions, and results of the Revised HHRA. The report will include a discussion of the proposed requirements for future invasive work that will be included in the land use covenant and Site Management and Contingency Plan for the subject property. The Revised HHRA will be

submitted to ACDEH and submitted for peer review and approval by a qualified toxicologist . The final Revised HHRA will be submitted to ACDEH for review and approval.

Update Conceptual Site Model

The results of the pre-construction subsurface investigation will be utilized to update the conceptual site model (Revised CSM) that was previously prepared for the subject property. The Revised CSM will identify potential human receptors and potentially complete exposure pathways at the site. The Revised CSM will schematically present the relationship between chemical sources and receptors at the site, and identify potentially complete pathways through which receptors may be exposed to the analytes present in soil, soil gas, and groundwater. This will be accomplished by considering the site characteristics, as well as the fate and transport characteristics of analytes identified in soil, soil gas, and groundwater at the site. The Revised CSM will be submitted to ACDEH for review and approval.

Update Site Management and Contingency Plan

The results of the pre-construction subsurface investigation, the Revised HHRA, and Revised CSM will be used to update the Site Management and Contingency Plan (Revised SMP). The Revised SMP will also reference a land use covenant to be recorded on the subject property. The Revised SMP will be submitted to ACDEH for review and approval. The purpose of the Revised SMP is to summarize existing and new soil and groundwater data for the site, identify safety and training requirements for construction workers, establish procedures for assessing and managing contaminated soil and groundwater that could be encountered during construction activities (e.g., demolition, grading, and excavation), and identify mitigation and contingency measures to be implemented post-construction. The SMP will contain the following information:

A detailed description of the site and summary of previous investigations, inclusive of the proposed pre-construction subsurface investigation, and previous remedial activities, including information on areas and contaminants subject to soil management requirements;

Provisions for site redevelopment activities (e.g., building demolition and foundation slab removal, asphalt parking lot removal/installation, site grading/excavation activities, building and parking structure foundation construction, and roadway and utility trench construction);

A Health and Safety Plan (HASP) for use by contractors performing demolition and construction activities (exclusive of asbestos-containing materials or other hazardous materials in existing building materials);

Field screening protocols;

Soil matrix sampling/characterization protocols;

Soil and groundwater management practices (e.g., segregation/storage/transportation of soils and groundwater, dust control, and decontamination procedures);

A soil and groundwater management and contingency plan;

A Post-Construction Operations & Management Plan; and

A schedule of future activities.

Land Use Covenant

A land use covenant (LUC) will be prepared using a Model Alameda County Covenant and Environmental Restriction in accordance with ACDEH requirements. The LUC will identify the contamination encapsulated at the site, restrictions on development and use of the site, restrictions on use of underlying groundwater, and requirements for maintenance of the site cover and vapor intrusion mitigation system, and required notifications to ACDEH. The LUC will be submitted to ACDEH for review and approval. The final approved LUC will be recorded at the Alameda County Recorder's Office and will be a part of closure documentation.

Public Comment Period

Following ACDEH approval of the Revised SMP, a Public Notice will be submitted to the surrounding community and required mailing list developed by ACDEH. The Public Notice will notify recipients that the SLIC case is being considered for closure and that a Revised SMP has been developed and is available for review and comment. Upon approval by ACDEH, the Public Notice will be distributed to the surrounding community located within a 750 foot radius of the subject property and the required mailing list. Following a 30-day public comment period, responses to comments will be prepared, if needed.

Conditional Case Closure

Following completion of the 30-day public comment period, ACDEH will conditionally close the open SLIC and LUST cases on the subject property. Final case closure will be contingent upon successful development, approval of the vapor intrusion mitigation plan, and installation and acceptance of the vapor intrusion mitigation system.

Develop Vapor Intrusion Mitigation Plan

If warranted on the basis of the previous investigations and the proposed and approved pre-construction subsurface investigation, PES will design, and prepare plans and specifications for the subsurface vapor intrusion mitigation system to be installed at the planned new multi-story residential building. The vapor mitigation system would be installed to mitigate the potential for intrusion of volatile organic vapors into the ground floor residential, common, and amenity areas. The method for subsurface vapor intrusion mitigation is anticipated to consist of

installing a vapor barrier membrane system and a passive vent system beneath the building slab at the ground floor residential, common and amenity areas. These systems are commonly employed to mitigate vapor intrusion in new building construction. The combined installation of the systems will provide a continuous vapor intrusion barrier beneath the ground floor residential, common and amenity areas of the building, providing a low resistance mechanism to passively vent soil gas from beneath those portions of the building, and offer increased flexibility should additional mitigation measures become necessary in the future (e.g., active subslab depressurization or active venting).

The vapor barrier is anticipated to consist of an impermeable membrane that is installed beneath the building slab to reduce the potential for subsurface vapors entering the building. The membrane is anticipated to consist of a sprayed-in-place continuous bituminous barrier system, such as the Geo-Seal system by Land Science Technologies. Use of a sprayed flexible membrane provides the ability to adhere to concrete footings and utility penetrations, and to create a seamless membrane layer beneath the concrete slab. A sub-slab vent system is anticipated to be installed beneath the vapor barrier. The vent system is anticipated to be passive (i.e., venting will occur via natural processes, without powered blowers). The anticipated sub-slab vent system will consist of a connected array of low profile vent piping installed in a high permeability layer (i.e., crushed rock or gravel) beneath the building slab. The purpose of sub-slab venting is to provide a low resistance pathway for any accumulated subsurface vapors beneath the barrier to escape to the atmosphere. The vent piping will be connected to vent exhaust stacks. The passive venting system is anticipated to be constructed such that it can be converted to an active system, if necessary in the future, with the addition of a vacuum blower.

The plans will include: (1) physical specifications of the vapor barrier membrane and sub-slab vent system; (2) plan view of the first floor showing vapor intrusion mitigation system components; (3) design details including the location and depth of the membrane with respect to the foundation slab, protective layers above and below the membrane, and interior and perimeter penetration seals; (4) quality control testing procedures to demonstrate that the system has been properly constructed, will function as intended, and is eligible for available manufacturer's warranty, as applicable; and (5) contingency plans for restoring the barrier integrity in the event that future tenant improvements require penetration of the sub-slab vapor barrier, or in the event of any suspected vapor barrier failure. The plans will be submitted to ACDEH for review and approval prior to construction.

Final Case Closure

Following approval and installation of the vapor intrusion mitigation plan, ACDEH will issue final case closure for the SLIC case on the subject property.

Construct Project Development and Vapor Intrusion Mitigation System

Following acquisition of necessary permits and agency approvals, construction of the planned redevelopment project will be initiated. During construction, PES, along with the selected

contractor, will work with Anton's architect and general contractor to install the vapor intrusion mitigation system. The vapor intrusion mitigation system will be constructed in accordance with the approved plans, to the extent practicable. The construction of the vapor intrusion mitigation system will be documented by PES staff and any deviation from the plan will be recorded and submitted to ACDEH prior to case closure. Quality control testing of the vapor intrusion mitigation system, such as smoke testing during installation of the membrane, will be conducted by the selected contractor during the installation to verify proper construction and operation of the system. The results of the testing will be documented by PES staff and submitted to ACDEH prior to case closure.

Prepare As-Built Vapor Intrusion Mitigation System Plans

Following construction of the vapor intrusion mitigation system, as-built vapor intrusion mitigation system plans (As-Built Plans) will be prepared by PES to document the actual construction of the system. Any deviations from the approved plans and specifications for the vapor intrusion mitigation system will be documented in the As-Built Plans. The As-Built Plans will be submitted to ACDEH for review and approval prior to case closure.

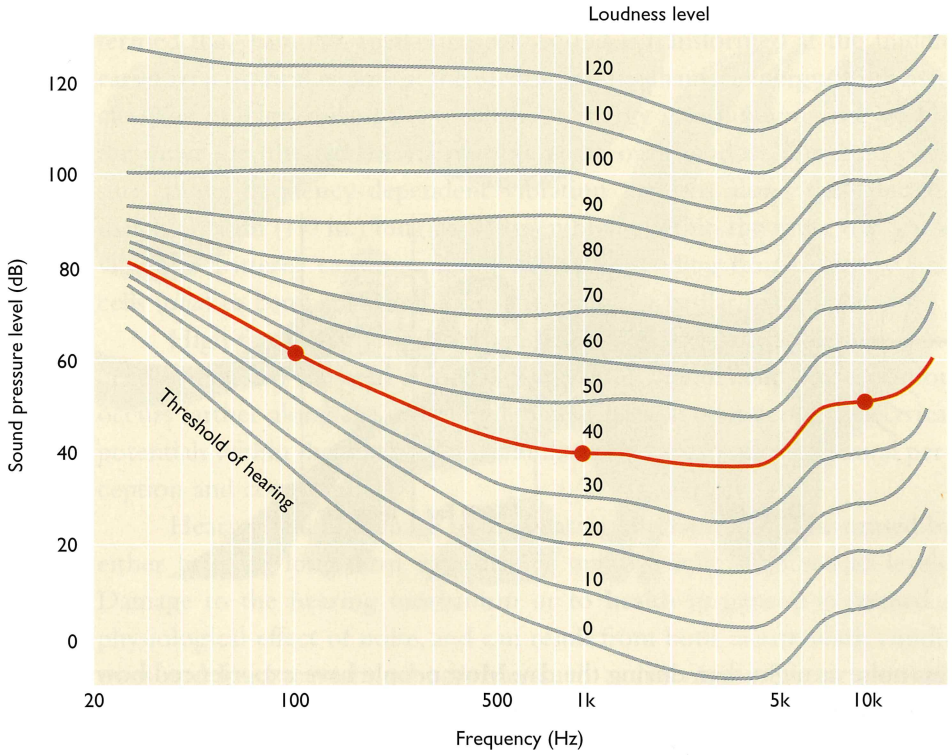

Figure 3.3 Equal-loudness contours for pure tones (Fletcher-Munson Graph). The contour lines indicate equal loudness levels (phons) relative to a 1 kHz frequency. Refer to text for discussion of red dots on the 40 phon contour line.

The equivalence between pitch and frequency becomes more complicated with real sound sources. For example, musicians commonly modulate frequency over time using a technique known as vibrato. Although the frequency is varied as much as a semitone at a rate of 5 to 8 Hz, a single pitch is perceived.

100 Hz sounds equally loud as 40 dB at 1 kHz, and 50 dB at 10 kHz. The frequency weighting filters built into sound level meters described in Chapter 4 physically approximate these contours.

Not surprisingly, the contours that exhibit maximal sensitivity are at those frequencies associated with speech (approximately 200 Hz to 5 kHz). At medium and high sound levels, the contours are relatively linear, while at lower levels, the contours indicate that sensitivity to low frequencies is less than at high frequencies. Thus, the relationship between physical and perceptual scales is dependent on both frequency and sound pressure level. Another measurement of loudness is the *sone* scale. A sound with a loudness of 40 phons is equal to 1 sone. This is an arithmetic scale such that a doubling in sones is equivalent to a doubling of loudness. The formula for relating sones and phons is: $\text{sones} = 2^{(\text{phons} - 40)/10}$.

For community noise assessment, certain sound sources that are considered to be noisy by one group of people may not be a problem for another group. A general procedure in such assessments is that the average person's level of annoyance needs to be considered. About 10 percent of any population can be expected to object to any noise not of their own making. This group is referred to as hypersensitive. About 25 percent are practically imperturbable. This group is insensitive to noise. The remaining two-thirds group are considered people who have what is called normal sensitivity. Some people will object to certain noises through association; for example, the fear of having an aircraft crash into one's house can motivate objection to aircraft sound, while another type of sound at the same sound level may not be perceived as disturbing.

One type of psychoacoustic measure is known as a *just noticeable difference* (JND). An example of a JND as applied to environmental acoustics is in Table 3.2, which shows the expected response to an increase in noise level.

Increase in noise level (dB)	Expected response
1	Possibly detectable under laboratory conditions
6	Some individual comment and reaction is expected but no group action is likely
10	Perceived as twice as loud
20	Perceived as four times as loud

Table 3.2 Expected response to increase in noise level.

Timbre and Spatial Location

The spectrum of a sound source is largely responsible for the perceptual quality of *timbre,* or "tone color." Timbre is sometimes defined in terms of what it is not, for example, "the quality of sound that distinguishes it from other sounds of the same pitch and loudness." Our ability to discriminate between different timbres is very complicated and not fully understood, but the main cues seem to involve the change in a sound's spectrum over time.

Spatial location is also an important perceptual quality of sound. The audible difference in level between the ears as the location of a sound moves relative to a listener is termed an *interaural level difference*, and is the same cue manipulated by a stereo sound system. For instance, if you snap your fingers to the right of your head, the level will be louder at the right ear than at the left ear. High frequencies above 1.5 kHz are shielded from the opposite ear by the head. Another cue for spatial hearing is the *interaural time difference.* The wave reaches the right ear before the left ear, since the path length to that ear is shorter. This time difference cue is most effective for frequencies below 1.5 kHz.

Besides level and time differences, another cue for localization is the spectral modification caused by the outer ears (the pinnae). For every sound source position relative to a listener, the pinnae cause a unique spectral modification that acts as an acoustic signature, as shown in Figure 3.4. These spectral modifications are especially important in perceiving the up/down and front/back locations of a sound source.

The Precedence Effect

The *precedence effect* (also called the "Haas effect") explains an important inhibitory mechanism of the auditory system that allows one to hear

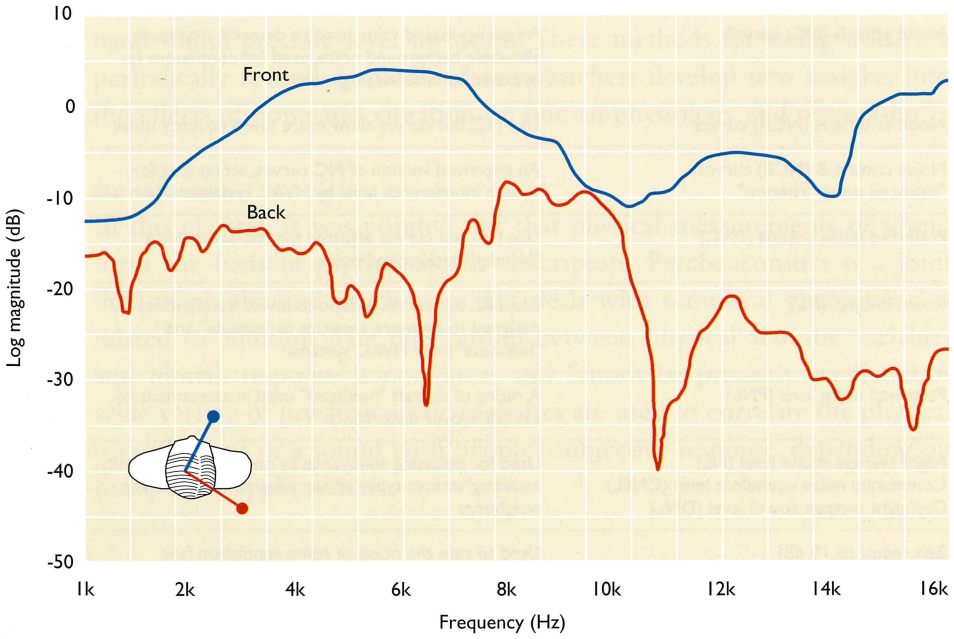

Figure 3.4 Spectral modification caused by the pinnae for two positions. Notice how the sound is brighter in front and more attenuated in back. *Inset:* overhead view showing sound source positions.

In the 1980s, jet engine manufacturers began building turbofan Stage 3 aircraft, which are about 10 dB quieter than Stage 2 aircraft. With Stage 3 aircraft, the jet exhaust noise is minimal and the primary sources are turbomachinery associated with the various rotating components of the engines. Stage 3 noise reduction also comes from increased power, which allows for steeper climbs during departure.

Aircraft noise prediction models are periodically modified as aircraft designs change. These models require the following input: aircraft volume, time of day/night, flight tracks, climb profiles, and meteorological data. The computer programs establish a grid system, calculate the composite noise exposure at grid locations, and extrapolate from the data to draw noise contours.

Trains (Heavy Rail and Rapid Transit). Heavy rail consists of large diesel-electric locomotives and freight or passenger cars. These trains have three main noise sources: the engine, cars, and whistle. The locomotive engine is usually the dominant source. Noise emanates from both the engine casing and the exhaust stack. The noise output of the engine is virtually independent of the train speed but is affected by grade.

Freight and passenger car noise comes from the wheel/rail interaction. Factors affecting the wheel/rail noise are jointed versus welded tracks, presence of grade crossings, wheel irregularities, passage over bridges, and short radius curves.[4] Figure 5.5 shows a time history of a train passby.

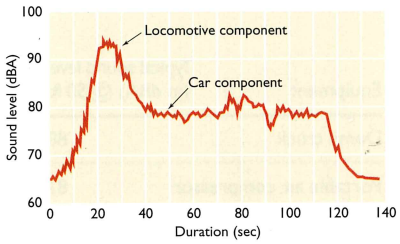

Figure 5.5 A-weighted time history of heavy rail passby, measured 100 ft. from track.

Rapid rail and light rail refer to urban and interurban transportation systems that use electric engines. Rapid rail includes transit systems such as the Bay Area Rapid Transit (BART) in northern California, the Chicago Transit Authority (CTA), and the New York City Transit Authority (NYCTA). Light rail refers to street cars or traditional trolley systems such as the Municipal Railway System (MUNI) in San Francisco.

For rapid rail and light rail vehicles, the noise during travel is primarily from the wheel/rail interaction. Other sources are the engines, brakes, and horns. Noise levels increase with speed. At a stop, the dominant source is auxiliary equipment such as air conditioning systems.[5]

In addition to airborne noise, rail activity generates vibration in the ground. This vibration creates low-frequency rumbling noise and is usually felt as shaking in buildings.

There are several models available to predict train noise. The models generally use the following input: number of engines, number of cars, grade, speed, rail construction (jointed or continuously welded), grade crossings (horn blasts), and presence of elevated structures. Table 5.4 shows the noise levels for various rail transit components.

Transit sources	Typical sound level (in dBA) @ 50 ft.
Rail cars	80
Locomotives, diesel	88
Locomotives, electric	86
Monorail	80
Locomotive horns	105
Transit car horns	90
Auxiliary equipment	65
Locomotive idling	80
Rail transit idling	70
Buses idling	75
Curve squeal	100
Crossing signals	73
Substations	63

Table 5.4 Sound levels for various transit sources.

Construction. Construction is often recognized as a disturbance and assessed as a part of environmental impact studies. Common sources of construction noise are bulldozers, trucks, pile drivers, and compressors. Table 5.5 lists the noise levels of construction equipment.

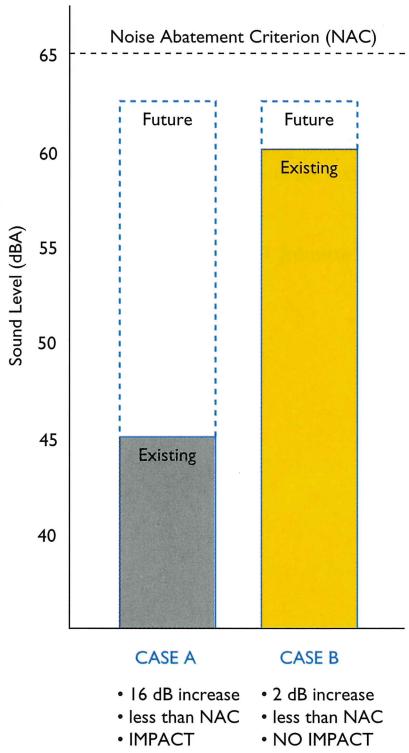

Figure 5.8 How "substantial increase" criterion affects noise impact assessment.

The FHWA "substantial increase" criteria allows individual states to interpret the criterion as they see fit. The information in Table 5.7 shows that some states consider a substantial increase to be 6 dBA, while for others the increase must be at least 15 dBA. On a local level, changes of 3 to 5 dBA may be deemed significant by a city or county.

Schultz performed studies that synthesized the response of people to varying levels of environmental noise.[16] Although he endeavored to create models that accurately estimate human response to noise, one of his reports about aircraft noise states: "even in quiet zones...about 10 percent of the people interviewed complained about aircraft noise; these same people complain about other aspects of their environment in general and may be habitual complainers. We recall, too, that about 25 to 30 percent of the people never complain even in extremely noisy environments."[17] Thus, a wide variety of responses can be expected due to changes in a community's acoustical environment.

How to Determine Which Criteria Apply to a Project. Each project may have one or more applicable criteria. Knowing the criteria in the early phases of a project is vital to formulating a correct approach and minimizing unnecessary measurements or analyses. A good starting point would be the planning code of the governing agency, which usually contains criteria for land use compatibility. Criteria are also contained in the municipal or zoning code as a noise ordinance. Noise ordinances often address mechanical noise, construction noise, or amplified sound systems.

Noise Impact Studies

Noise impact studies typically follow a fairly uniform format. First, applicable acoustic criteria are identified. Second, the noise at the project site is quantified. The next step is to predict future noise levels of the project. The future levels are then compared to the applicable criteria, which are based on: (1) "Land Use Compatibility"—how a project will be affected by the environment at a proposed location. These criteria are typically in terms of absolute levels such as DNL; and (2) "Impacts of the Project on Adjacent Land Uses"—these impacts can be both in terms of absolute levels and change in noise levels.

If the predicted levels exceed the criteria, then there is an impact. If an impact is identified, then feasible ways to reduce or eliminate the impact (mitigation) are specified.

One technique that can help with impact assessment is preparation of noise contours. These contours, usually in terms of DNL, are plotted on a site map. The contours are then compared with various land uses in the study area. Noise contours are shown in Case Study No. 13, Chapter 17.

EIS and EIR. Federal and state environmental laws require noise studies. The National Environmental Policy Act (NEPA) specifies that an Environmental Impact Statement (EIS) be prepared if a federally funded project has the potential to significantly affect the environment. The California Environ-

mental Quality Act (CEQA) requires that an Environmental Impact Report (EIR) be prepared for most new building projects.[18] An EIS is similar to an EIR and tends to follow the typical format for impact studies. In cases where a project has federal funding and is in California, both documents can be combined to form an EIS/EIR.

In general, these impact reports must answer the following two questions: (1) will the project significantly increase existing noise levels? and (2) will the project expose people to severe noise or vibration?

The EIS/EIR must assess future levels with respect to applicable absolute standards as well as determine any significant changes that the project would create. The NEPA and CEQA guidelines, however, along with many governmental planning codes, do not provide specific numerical goals for "significant increase." It leaves room for interpretation.

In the absence of specific governmental criteria, one approach to determine whether an increase is significant can be found in a document from the Urban Mass Transit Administration (UMTA).[19] UMTA adopts the commonly accepted notion that a 3 dBA increase is barely noticeable, a 5 dBA increase is noticeable but not dramatic, and a 10 dBA increase is perceived as a doubling of loudness. Table 5.8 contains the UMTA noise impact criteria.

One aspect of an EIS/EIR that can be confusing is the assessment of alternatives to the project and "no build" scenario. This assessment is accomplished by calculating noise levels for all future scenarios, including alternatives, and then comparing them with the existing conditions. The differences are then compared to the "increase" standards shown in Table 5.8 to determine impact.

1.	Generally not significant
a.	No noise sensitive sites are located in the project area
b.	Increases in noise levels with implementation of the project are projected to be 3 dBA (L_{eq}) or less at noise sensitive sites and proposed project would not result in violations of noise ordinances or standards.
2.	Possibly significant
	Increases in noise levels with implementation of the project are expected to be no greater than 5dBA (L_{eq}). Determination of significance must consider existing noise levels and the presence of noise-sensitive sites.
3.	Generally significant
a.	Proposed project would cause noise standards / ordinances to be exceeded.
b.	Proposed project would cause an increase in noise levels of 6–10 dBA (L_{eq}) in built up areas.

Table 5.8 Significance of noise impact based upon change in noise levels.

Mitigation Measures

If impacts are identified in a noise study, mitigation measures must be presented. Individual mitigation measures are provided so that the project will meet specific acoustic criteria. For example, if an existing roadway generates excessive noise at the site of a proposed project, the developer of the project may be required to provide a noise barrier to control outdoor sound levels to meet acoustic criteria.

Since a project's design is usually at a schematic level during the environmental review phase, it may not be feasible to provide detailed recommendations for all mitigation measures. For environmental studies, it is usually sufficient to determine a range of possible mitigation measures that will allow the project to meet the criterion. For example, a study may recommend that sound-rated windows be specified to meet a criterion. Although the specific rating of each window is not specified, the study should make it clear to decision makers that the project can feasibly meet the criterion with sound-rated windows.

Enough information should be provided to the decision makers so they can determine if the mitigation is commensurate with the community goals. The developer must then decide if the mitigation will still allow the project to be economically viable.

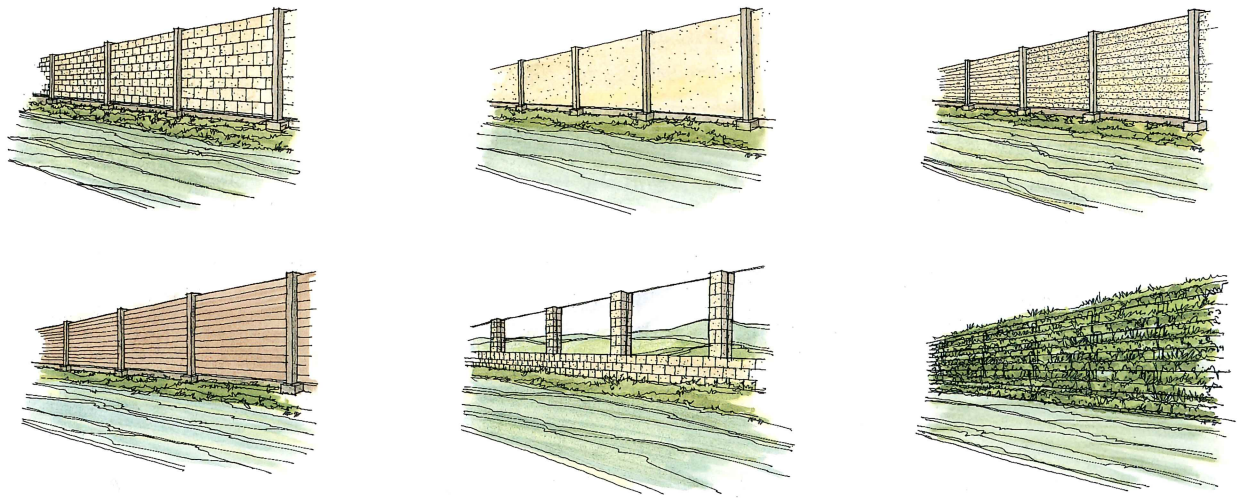

Figure 5.11 Alternate barrier designs: (*top: left to right*) concrete; plaster; steel; wood; glass; earthen wall.

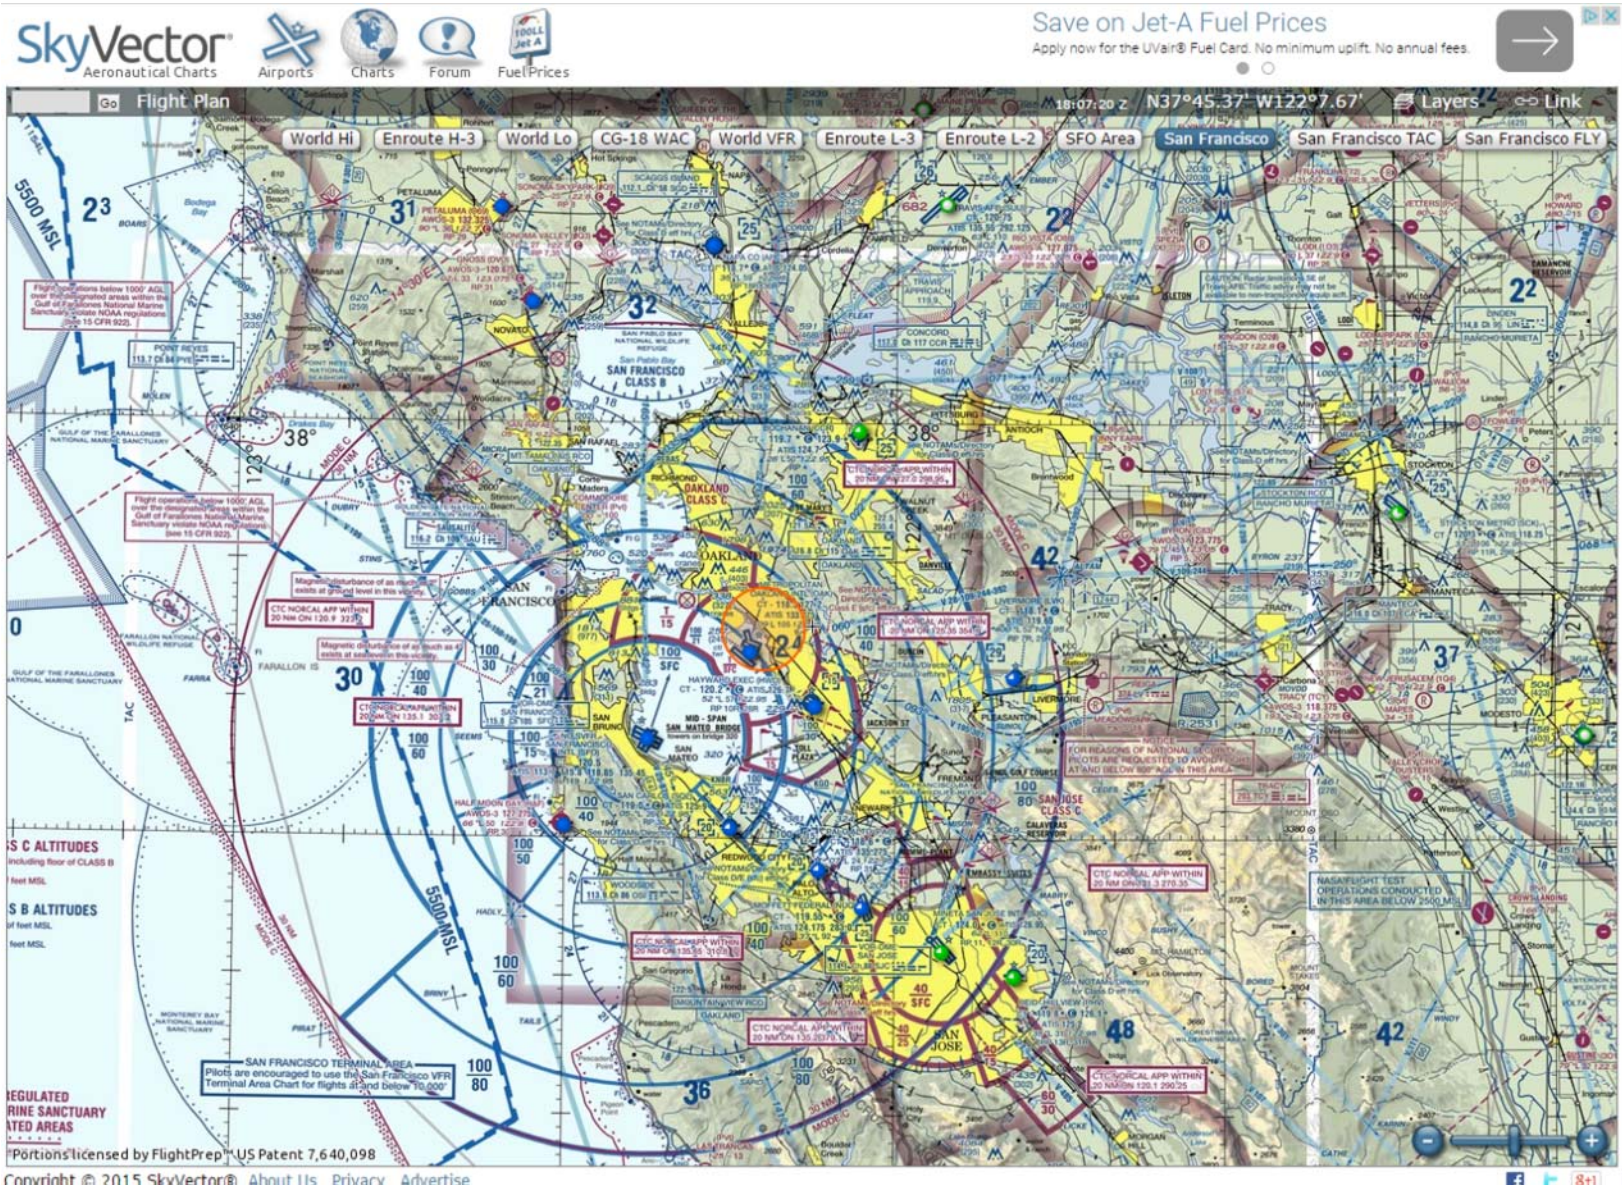
Indoor Noise Control

The reduction provided by a building facade is a composite of the individual components. Indoor noise control is usually accomplished by improving the windows since they are acoustically the weakest link in an exterior wall. Roofs, doors, and attic vents are also important when designing for aircraft flyovers.



Windows. Sound travels both through the glass and around the window frame. A typical facade will reduce noise by approximately 25 dBA with the windows closed; when opened, the facade reduces the sound entering a building by 10 to 15 dBA. The acoustical performance of the window can be improved by increasing the glass thickness and airtightness of the weather-stripping.

Exterior Walls. Many buildings have single stud exterior walls with one layer of gypsum board on the interior and wood siding or stucco on the exterior. This wall reduces noise by about 40 dBA. If more reduction is needed, alternatives such as additional layers of gypsum board, resilient channels, staggered or double-stud construction can be incorporated. Heavier and thicker wall constructions may be required near rail lines or major roadways.

Roof Vents and Other Considerations. Roof vents and air intakes for mechanical ventilation systems can be significant sources of sound leaks. Internally lined ducts at air intakes and discharges may be needed to limit exterior noise intrusion.

Conclusion

As people live closer to noise sources, and each other, control of environmental noise has become increasingly important. With proper planning considerations for environmental noise, our acoustic environment can be improved.

Site History

From 1963 to 1979 the site was occupied by Dymo Industries, a lable tape and lable tape punch manufacturer. Dymo used and stored MIBK and MEK in six USTs at the site. From 1979 to 1989 Mike Roberts Color Production occupied the site and manufactured and printed color postcards and expanded to color printing, lithography, and off-set printing using inks, solvents cleaning compounds and color pigments. Beginning in 1990 Nady Systems occupied the site, largely using it as a warehouse. Six areas of environmental concern were identified and investigated at the site Up to 10 wells and 15 soil bores have been installed at the site.

Not all historic documents for the fuel leak case may be available on GeoTracker. A more complete historic case file for this site is located on the Alameda County Environmental Health website at: http://ehgis.acgov.org/dehpublic/dehpublic.jsp.

*Diversion rates calculated based on data submitted to CalRecycle by jurisdictions

a. Unincorporated area includes Castro Valley Sanitary District and Oro Loma Sanitary District.

b. The County-wide rate prior to 2007 was derived using a calculated diversion rate equal to total tons disposed in Alameda County divided by tons generated in Alameda County, based on data from each jurisdiction's annual reports submitted to the CIWMB. Beginning 2007, the County-wide rate was calculated using a different methodology, with a weighted average diversion rate based on the population of each jurisdiction and its target disposal per capita.

Not computed	137	+/-83	(X)	(X)

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see Accuracy of the Data). The effect of nonsampling error is not represented in these tables.

The median gross rent excludes no cash renters.

In prior years, the universe included all owner-occupied units with a mortgage. It is now restricted to include only those units where SMOCAPI is computed, that is, SMOC and household income are valid values.

In prior years, the universe included all owner-occupied units without a mortgage. It is now restricted to include only those units where SMOCAPI is computed, that is, SMOC and household income are valid values.

In prior years, the universe included all renter-occupied units. It is now restricted to include only those units where GRAPI is computed, that is, gross rent and household Income are valid values.

Median calculations for base table sourcing VAL, MHC, SMOC, and TAX should exclude zero values.

The 2007, 2008, 2009, 2010, 2011, 2012, and 2013 plumbing data for Puerto Rico will not be shown. Research indicates that the questions on plumbing facilities that were introduced in 2008 in the stateside American Community Survey and the 2008 Puerto Rico Community Survey may not have been appropriate for Puerto Rico.

Telephone service data are not available for certain geographic areas due to problems with data collection. See Errata Note #93 for details.

While the 2009-2013 American Community Survey (ACS) data generally reflect the February 2013 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas; in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.

Estimates of urban and rural population, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Source: U.S. Census Bureau, 2009-2013 5-Year American Community Survey

Explanation of Symbols:

1. An '**' entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.
2. An '-' entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution.
3. An '-' following a median estimate means the median falls in the lowest interval of an open-ended distribution.
4. An '+' following a median estimate means the median falls in the upper interval of an open-ended distribution.
5. An '***' entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.
6. An '*****' entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.
7. An 'N' entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.
8. An '(X)' means that the estimate is not applicable or not available.

California Regional Water Quality Control Board
San Francisco Bay Region
Municipal Regional Stormwater NPDES Permit

Order R2-2009-0074
NPDES Permit No. CAS612008
October 14, 2009

California Regional Water Quality Control Board
San Francisco Bay Region
Municipal Regional Stormwater NPDES Permit

ORDER R2-2009-0074
NPDES PERMIT NO. CAS612008

Issuing Waste Discharge Requirements and National Pollutant Discharge Elimination System (NPDES) Permit for the discharge of stormwater runoff from the municipal separate storm sewer systems (MS4s) of the following jurisdictions and entities, which are permitted under this San Francisco Bay Municipal Regional Stormwater Permit (MRP):

The cities of Alameda, Albany, Berkeley, Dublin, Emeryville, Fremont, Hayward, Livermore, Newark, Oakland, Piedmont, Pleasanton, San Leandro, and Union City, Alameda County, the Alameda County Flood Control and Water Conservation District, and Zone 7 of the Alameda County Flood Control and Water Conservation District, which have joined together to form the Alameda Countywide Clean Water Program (Alameda Permittees)

The cities of Clayton, Concord, El Cerrito, Hercules, Lafayette, Martinez, Orinda, Pinole, Pittsburg, Pleasant Hill, Richmond, San Pablo, San Ramon, and Walnut Creek, the towns of Danville and Moraga, Contra Costa County, the Contra Costa County Flood Control and Water Conservation District, which have joined together to form the Contra Costa Clean Water Program (Contra Costa Permittees)

The cities of Campbell, Cupertino, Los Altos, Milpitas, Monte Sereno, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga, and Sunnyvale, the towns of Los Altos Hills and Los Gatos, the Santa Clara Valley Water District, and Santa Clara County, which have joined together to form the Santa Clara Valley Urban Runoff Pollution Prevention Program (Santa Clara Permittees)

The cities of Belmont, Brisbane, Burlingame, Daly City, East Palo Alto, Foster City, Half Moon Bay, Menlo Park, Millbrae, Pacifica, Redwood City, San Bruno, San Carlos, San Mateo, and South San Francisco, the towns of Atherton, Colma, Hillsborough, Portola Valley, and Woodside, the San Mateo County Flood Control District, and San Mateo County, which have joined together to form the San Mateo Countywide Water Pollution Prevention Program (San Mateo Permittees)

The cities of Fairfield and Suisun City, which have joined together to form the Fairfield-Suisun Urban Runoff Management Program (Fairfield-Suisun Permittees)

The City of Vallejo and the Vallejo Sanitation and Flood Control District (Vallejo Permittees)

The California Regional Water Quality Control Board, San Francisco Bay Region, (hereinafter referred to as the Water Board) finds that:

FINDINGS

Incorporation of Fact Sheet

1. The Fact Sheet for the San Francisco Bay Municipal Regional Stormwater National Pollutant Discharge Elimination System (NPDES) Permit (Appendix I) includes cited regulatory and legal references and additional explanatory information in support of the requirements of this Permit. This information, including any supplements thereto, and any response to comments on the Tentative Orders, is hereby incorporated by reference.

Existing Permits

2. **Alameda County—**The cities of Alameda, Albany, Berkeley, Dublin, Emeryville, Fremont, Hayward, Livermore, Newark, Oakland, Piedmont, Pleasanton, San Leandro, and Union City, Alameda County (Unincorporated area), the Alameda County Flood Control and Water Conservation District, and Zone 7 of the Alameda County Flood Control and Water Conservation District have joined together to form the Alameda Countywide Clean Water Program (hereinafter collectively referred to as the Alameda Permittees) and have submitted a permit application (Report of Waste Discharge), dated July 26, 2007, for reissuance of their waste discharge requirements under the NPDES permit to discharge stormwater runoff from storm drains and watercourses within the Alameda Permittees' jurisdictions. The Alameda Permittees are currently subject to NPDES Permit No. CAS0029831 issued by Order No. R2-2003-0021 on February 19, 2003, and amended by Order No. R2-2007-0025 on March 14, 2007, to the Alameda Permittees to discharge stormwater runoff from storm drains and watercourses within their jurisdictions.

3. **Contra Costa County—**The cities of Clayton, Concord, El Cerrito, Hercules, Lafayette, Martinez, Orinda, Pinole, Pittsburg, Pleasant Hill, Richmond, San Pablo, San Ramon, and Walnut Creek, the towns of Danville and Moraga, Contra Costa County, and the Contra Costa County Flood Control and Water Conservation District have joined together to form the Contra Costa Clean Water Program (hereinafter collectively referred to as the Contra Costa Permittees) and have submitted a permit application (Report of Waste Discharge), dated September 30, 2003, for reissuance of their waste discharge requirements under the NPDES permit to discharge stormwater runoff from storm drains and watercourses within the Contra Costa Permittees' jurisdictions. The Contra Costa Permittees are currently subject to NPDES Permit No. CAS0029912 issued by Order No. 99-058 on July 21, 1999, amended by Order No. R2-2003-0022 on February 9, 2003, amended by Order Nos. R2-2004-059 and R2-2004-0061 on July 21, 2004, and amended by Order No. R2-2006-0050 on July 12, 2006, to the Contra Costa Permittees to discharge stormwater runoff from storm drains and watercourses within their jurisdictions.

4. **San Mateo County—**The cities of Belmont, Brisbane, Burlingame, Daly City, East Palo Alto, Foster City, Half Moon Bay, Menlo Park, Millbrae, Pacifica, Redwood City, San Bruno, San Carlos, San Mateo, and South San Francisco, the towns of Atherton, Colma, Hillsborough, Portola Valley, and Woodside, the San Mateo County Flood Control District and San Mateo County have joined together to form the San Mateo Countywide Water Pollution Prevention

Program (hereinafter collectively referred to as the San Mateo Permittees) and have submitted a permit application (Report of Waste Discharge), dated January 23, 2004, for reissuance of their waste discharge requirements under the NPDES permit to discharge stormwater runoff from storm drains and watercourses within the San Mateo Permittees' jurisdictions. The San Mateo Permittees are currently subject to NPDES Permit No. CAS0029921 issued by Order No. 99-059 on July 21, 1999, amended by Order No. R2-2003-0023 on February 19, 2003, amended by Order Nos. R2-2004-0060 and R2-2004-0062 on July 21, 2004, and amended by Order R2-2007-0027 on March 14, 2007, to the San Mateo Permittees to discharge stormwater runoff from storm drains and watercourses within their jurisdictions.

5. **Santa Clara County—**The cities of Campbell, Cupertino, Los Altos, Milpitas, Monte Sereno, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga, and Sunnyvale, the towns of Los Altos Hills and Los Gatos, the Santa Clara Valley Water District, and the County of Santa Clara have joined together to form the Santa Clara Valley Urban Runoff Pollution Prevention Program (hereinafter collectively referred to as the Santa Clara Permittees) and have submitted a permit application (Report of Waste Discharge), dated February 25, 2005, for reissuance of their waste discharge requirements under the NPDES permit to discharge stormwater runoff from storm drains and watercourses within the Santa Clara Permittees' jurisdictions. The Santa Clara Permittees are currently subject to NPDES Permit No. CAS029718 issued by Order No. 01-024 on April 21, 2001, amended by Order No. 01-119 on October 17, 2001, and Order No. R2-2005-0035 on July 20, 2005, to the Santa Clara Permittees to discharge stormwater runoff from storm drains and watercourses within their jurisdictions.

6. **Fairfield-Suisun—**The cities of Fairfield and Suisun City have joined together to form the Fairfield-Suisun Urban Runoff Management Program (hereinafter referred to as the Fairfield-Suisun Permittees) and have submitted a permit application (Report of Waste Discharge), dated October 17, 2007, for reissuance of their waste discharge requirements under the NPDES permit to discharge stormwater runoff from storm drains and watercourses within the Fairfield-Suisun Permittees' jurisdictions. The Fairfield-Suisun Permittees are currently subject to NPDES Permit No. CAS0612005 issued by Order No. R2-2003-0034 on April 16, 2003, and amended by Order R2-2007-0026 on March 14, 2007, to the Fairfield-Suisun Permittees to discharge stormwater runoff from storm drains and watercourses within their jurisdictions.

7. **Vallejo—**The City of Vallejo and the Vallejo Sanitary District (hereinafter referred to as the Vallejo Permittees) are currently subject to NPDES Permit No. CAS612006 issued by the United States Environmental Protection Agency (USEPA) on April 27, 1999, and that became effective on May 30, 1999, for the discharge of stormwater runoff from storm drains and watercourses within the Vallejo Permittees' jurisdictions.

8. The Alameda, Contra Costa, San Mateo, Santa Clara, Fairfield-Suisun, and Vallejo Permittees are hereinafter referred to in this Order as the Permittees.

Applicable Federal, State and Regional Regulations

9. Section 402(p) of the federal Clean Water Act (CWA), as amended by the Water Quality Act of 1987, requires NPDES permits for stormwater discharges from municipal separate storm sewer systems (MS4s), stormwater discharges associated with industrial activity (including construction activities), and designated stormwater discharges, which are considered significant contributors of pollutants to waters of the United States. On November 16, 1990, USEPA published regulations (40 CFR Part 122), which prescribe permit application requirements for MS4s pursuant to CWA 402(p). On May 17, 1996, USEPA published an Interpretive Policy

Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems, which provided guidance on permit application requirements for regulated MS4s.

10. The Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) is the Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Water Board and approved by the State Water Resources Control Board (State Board), Office of Administrative Law and the USEPA, where required.

11. The Water Board finds stormwater discharges from urban and developing areas in the San Francisco Bay Region to be significant sources of certain pollutants that cause or may be causing or threatening to cause or contribute to water quality impairment in waters of the Region. Furthermore, as delineated in the CWA section 303(d) list, the Water Board has found that there is a reasonable potential that municipal stormwater discharges cause or may cause or contribute to an excursion above water quality standards for the following pollutants: mercury, PCBs, furans, dieldrin, chlordane, DDT, and selenium in San Francisco Bay segments; pesticide associated toxicity in all urban creeks; and trash and low dissolved oxygen in Lake Merritt, in Alameda County. In accordance with CWA section 303(d), the Water Board is required to establish TMDLs for these pollutants to these waters to gradually eliminate impairment and attain water quality standards. Therefore, certain early pollutant control actions and further pollutant impact assessments by the Permittees are warranted and required pursuant to this Order.

12. The San Francisco Estuary Project, established pursuant to CWA Section 320, culminated in June 1993 with completion of its Comprehensive Conservation and Management Plan (CCMP) for the preservation, restoration, and enhancement of the San Francisco Bay-Delta Estuary. The 2007 update of the CCMP includes new and revised actions, while retaining many of the original plan's actions. The CCMP includes recommended actions in the areas of aquatic resources, wildlife, wetlands, water use, pollution prevention and reduction, dredging and waterway modification, land use, public involvement and education, and research and monitoring. Recommended actions which may, in part, be addressed through implementation of this Permit include, but are not limited to, the following:

    (1) ACTION AR-9.1 (New 2007)
    Improve understanding of sources, types, and impacts of marine debris in the Estuary.

    (5) ACTION AR-9.2 (New 2007)
    Expand existing marine debris prevention and cleanup programs and develop new initiatives to reduce discharge of debris to waterways.

    (10) ACTION PO-1.2 (Revised 2007)
    Recommend institutional and financial changes needed to place more focus on pollution prevention.

    (12) ACTION PO-1.6 (Revised 2007)
    Implement a comprehensive strategy to reduce pesticides coming into the Estuary.

    (13) ACTION PO-1.7.1 (New 2007)
    Develop product stewardship program for new commercial products to minimize future pollutant releases.

(14) ACTION PO-1.8 (New 2007)
Develop and implement programs to prevent pollution of the Estuary by other harmful pollutants like trash, bacteria, sediments, and nutrients.

(15) ACTION PO-2.1 (Revised 2007)
Pursue a mass emissions strategy to reduce pollutant discharges into the Estuary from point and nonpoint sources and to address the accumulation of pollutants in estuarine organisms and sediments.

(16) ACTION PO-2.4 (Revised 2007)
Improve the management and control of urban runoff from public and private sources.

(18) ACTION PO-3.3 (New 2007)
Accomplish large-scale improvements to Bay-Delta area infrastructure and implement pollution prevention strategies to prevent pollution threats to public health and wildlife.

(19) ACTION PO-4.1 (New 2007)
Increase regulatory incentives for municipalities, through urban runoff and other programs, to invest in projects that restore or enhance stream and wetland functions.

(20) ACTION LU-1.1 (Revised 2007)
Local land use jurisdiction's General Plans should incorporate watershed protection goals for wetlands and stream environments and to reduce pollutants in runoff.

(21) ACTION LU-1.1.1 (New 2007): Provide assistance to local agencies to ensure that applicable nonpoint source control elements are incorporated into local government and business practices.

(22) ACTION LU-1.5 (LU-3.2 in 1993 CCMP; Revised 2007)
Provide incentives and promote the use of building, planning, and maintenance guidelines for site planning and implementation of best management practices (BMPs) as related to stormwater and encourage local jurisdictions to adopt these guidelines as local ordinances.

(23) ACTION LU-1.6 (New 2007)
Continue and enhance training and certification for planners, public works departments, consultants, and builders on sustainable design and building practices with the goal of preventing or minimizing alteration of watershed functions (e.g., flood water conveyance, groundwater infiltration, stream channel and floodplain maintenance), and preventing construction-related erosion and post-construction pollution.

(24) ACTION LU-2.7 (New 2007)
Adopt and implement policies and plans that protect and restore water quality, flood water storage, and other natural functions of stream and wetland systems.

(25) ACTION LU-3.1 (New 2007)
Promote, encourage, and support collaborative partnerships with broad stakeholder representation, such as watershed councils, in order to develop diverse community-based approaches to long-term stewardship.

(26) ACTION LU-4.1 (Revised 2007)
Educate the public about how human actions impact the Estuary and its watersheds.

(28) ACTION PI-2.5 (Revised 2007)
Assist in the development of long-term educational programs designed to prevent pollution to the Estuary's ecosystem and provide assistance to other programs as needed.

13. Under section 13389 of the California Water Code, this action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA).

Nature of Discharges and Sources of Pollutants

14. Stormwater runoff is generated from various land uses in all the hydrologic sub basins in the Basin and discharges into watercourses, which in turn flow into Central, Lower and South San Francisco Bay.

15. The quality and quantity of runoff discharges vary considerably and are affected by hydrology, geology, land use, season, and sequence and duration of hydrologic events. Pollutants of concern in these discharges are certain heavy metals; excessive sediment production from erosion due to anthropogenic activities; petroleum hydrocarbons from sources such as used motor oil; microbial pathogens of domestic sewage origin from illicit discharges; certain pesticides associated with acute aquatic toxicity; excessive nutrient loads, which can cause or contribute to the depletion of dissolved oxygen and/or toxic concentrations of dissolved ammonia; trash, which impairs beneficial uses including, but not limited to, support for aquatic life; and other pollutants which can cause aquatic toxicity in the receiving waters.

16. Federal, State or regional entities within the Permittees' boundaries, not currently named in this Order, operate storm drain facilities and/or discharge stormwater to the storm drains and watercourses covered by this Order. The Permittees may lack jurisdiction over these entities. Consequently, the Water Board recognizes that the Permittees should not be held responsible for such facilities and/or discharges. The Water Board will consider such facilities for coverage under its NPDES permitting scheme pursuant to US EPA Phase II stormwater regulations. Under Phase II, the Water Board can permit these federal, State, and regional entities through use of the Statewide Phase II NPDES General Permit.

17. Certain pollutants present in stormwater and/or urban runoff can be derived from extraneous sources over which the Permittees have limited or no direct jurisdiction. Examples of such pollutants and their respective sources are polycyclic aromatic hydrocarbons (PAHs), which are products of internal combustion engine operation and other sources; heavy metals, such as copper from vehicle brake pad wear and zinc from vehicle tire wear; dioxins as products of combustion; polybrominated diphenyl ethers that are incorporated in many household products as flame retardants; mercury resulting from atmospheric deposition; and naturally occurring minerals from local geology. All these pollutants, and others, can be deposited on paved surfaces, rooftops, and other impervious surfaces as fine airborne particles—thus yielding stormwater runoff pollution that is unrelated to the activity associated with a given project site.

18. The Water Board will notify interested agencies and interested persons of the availability of reports, plans, and schedules, including Annual Reports, and will provide interested persons with an opportunity for a public hearing and/or an opportunity to submit their written views and recommendations. The Water Board will consider all comments and may modify the reports, plans, or schedules or may modify this Order in accordance with applicable law. All submittals required by this Order conditioned with acceptance by the Water Board will be subject to these notification, comment, and public hearing procedures.

19. This Order supersedes and rescinds Order Nos. 99-058, 99-059, 01-024, R2-2003-0021, R2-2003-0034, and supersedes NPDES Permit Nos. CAS0029831, CAS0029912, CAS0029921, CAS029718, CAS0612005, and CAS612006.

    This Order serves as a NPDES permit, pursuant to CWA section 402, or amendments thereto, and shall become effective December 1, 2009, provided the Regional Administrator, USEPA, Region 9, has no objections.

IT IS HEREBY ORDERED that the Permittees, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted hereunder and the provisions of the Clean Water Act as amended and regulations and guidelines adopted hereunder, shall comply with the following:

A. DISCHARGE PROHIBITIONS

A.1. The Permittees shall, within their respective jurisdictions, effectively prohibit the discharge of non-stormwater (materials other than stormwater) into, storm drain systems and watercourses. NPDES-permitted discharges are exempt from this prohibition. Provision C.15 describes a tiered categorization of non-stormwater discharges based on potential for pollutant content that may be discharged upon adequate assurance that the discharge contains no pollutants of concern at concentrations that will impact beneficial uses or cause exceedances of water quality standards.

A.2. It shall be prohibited to discharge rubbish, refuse, bark, sawdust, or other solid wastes into surface waters or at any place where they would contact or where they would be eventually transported to surface waters, including flood plain areas.

B. RECEIVING WATER LIMITATIONS

B.1. The discharge shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:

- **a.** Floating, suspended, or deposited macroscopic particulate matter, or foam;
- **b.** Bottom deposits or aquatic growths;
- **c.** Alteration of temperature, turbidity, or apparent color beyond present natural background levels;
- **d.** Visible, floating, suspended, or deposited oil or other products of petroleum origin; and
- **e.** Substances present in concentrations or quantities that would cause deleterious effects on aquatic biota, wildlife, or waterfowl, or that render any of these unfit for human consumption.

B.2. The discharge shall not cause or contribute to a violation of any applicable water quality standard for receiving waters. If applicable water quality objectives are adopted and approved by the State Board after the date of the adoption of this Order, the Water Board may revise and modify this Order as appropriate.

C.1. Compliance with Discharge Prohibitions and Receiving Water Limitations

The Permittees shall comply with Discharge Prohibitions A.1 and A.2 and Receiving Water Limitations B.1 and B.2 through the timely implementation of control measures and other actions as specified in Provisions C.2 through C.15.

If exceedance(s) of water quality standards or water quality objectives (collectively, WQSs) persist in receiving waters, the Permittees shall comply with the following procedure:

C.1.a. Upon a determination by either the Permittee(s) or the Water Board that discharges are causing or contributing to an exceedance of an applicable WQS, the Permittee(s) shall notify, within no more than 30 days, and thereafter, except for any exceedances of WQSs for pesticides, trash, mercury, polychlorinated biphenols, copper, polybrominated diphenyl ethers, and selenium that are addressed pursuant to Provisions C.8 through C.14 of this Order, submit a report to the Water Board that describes BMPs that are currently being implemented, and the current level of implementation, and additional BMPs that will be implemented, and/or an increased level of implementation, to prevent or reduce the discharge of pollutants that are causing or contributing to the exceedance of WQSs. The report may be submitted in conjunction with the Annual Report, unless the Water Board directs an earlier submittal, and shall constitute a request to the Water Board for amendment of this NPDES Permit. The report and application for amendment shall include an implementation schedule. The Water Board may require modifications to the report and application for amendment; and

C.1.b. Submit any modifications to the report required by the Water Board within 30 days of notification.

As long as the Permittees have complied with the procedures set forth above, they do not have to repeat the same procedure for continuing or recurring exceedances of the same WQSs unless directed by the Water Board to develop additional control measures and BMPs and reinitiate the Permit amendment process.

C.2. Municipal Operations

The purpose of this provision is to ensure development and implementation of appropriate BMPs by all Permittees to control and reduce non-stormwater discharges and polluted stormwater to storm drains and watercourses during operation, inspection, and routine repair and maintenance activities of municipal facilities and infrastructure.

C.2.a. Street and Road Repair and Maintenance

i. Task Description – Asphalt/Concrete Removal, Cutting, Installation and Repair - The Permittees shall develop and implement appropriate BMPs at street and road repair and/or maintenance sites to control debris and waste materials during road and parking lot installation, repaving or repair maintenance activities, such as those described in the California Stormwater Quality Association's Handbook for Municipal Operations.

ii. Implementation Levels

(1) The Permittees shall require proper management of concrete slurry and wastewater, asphalt, pavement cutting, and other street and road maintenance materials and wastewater to avoid discharge to storm drains from such work sites. The Permittees shall coordinate with sanitary sewer agencies to determine if disposal to the sanitary sewer system is available for the wastewater generated from these activities provided that appropriate approvals and pretreatment standards are met.

(2) The Permittees shall require sweeping and/or vacuuming to remove debris, concrete, or sediment residues from such work sites upon completion of work. The Permittees shall require cleanup of all construction remains, spills and leaks using dry methods (e.g., absorbent materials, rags, pads, and vacuuming), as described in the Bay Area Stormwater Management Agencies Association's (BASMAA's) Blueprint for a Clean Bay.

iii. Reporting – The Permittees shall report on implementation of and compliance with these BMPs in the Annual Report

C.2.b. Sidewalk/Plaza Maintenance and Pavement Washing

i. Task Description – The Permittees shall implement, and require to be implemented, BMPs for pavement washing, mobile cleaning, pressure wash operations in such locations as parking lots and garages, trash areas, gas station fueling areas, and sidewalk and plaza cleaning, which prohibit the discharge of polluted wash water and non-stormwater to storm drains. The Permittees shall implement the BMPs included in BASMAA's Mobile Surface Cleaner Program. The Permittees shall coordinate with sanitary sewer agencies to determine if disposal to the sanitary sewer is available for the wastewater generated from these activities provided that appropriate approvals and pretreatment standards are met.

ii. Reporting – The Permittees shall report on implementation of and compliance with these BMPs in their Annual Report.

C.2.c. Bridge and Structure Maintenance and Graffiti Removal

i. Task Description

(1) The Permittees shall implement appropriate BMPs to prevent polluted stormwater and non-stormwater discharges from bridges and structural maintenance activities directly over water or into storm drains.

(2) The Permittees shall implement BMPs for graffiti removal that prevent non-stormwater and wash water discharges into storm drains.

ii. Implementation Levels

(1) The Permittees shall prevent all debris, including structural materials and coating debris, such as paint chips, or other debris and pollutants generated in bridge and structure maintenance or graffiti removal from entering storm drains or water courses.

(2) The Permittees shall protect nearby storm drain inlets before removing graffiti from walls, signs, sidewalks or other structures. The Permittees shall prevent any discharge of debris, cleaning compound waste, paint waste or wash water due to graffiti removal from entering storm drains or watercourses.

(3) The Permittees shall determine the proper disposal method for wastes generated from these activities. The Permittees shall train their employees and/or specify in contracts about these proper capture and disposal methods for the wastes generated.

iii. Reporting – The Permittees shall report on implementation of and compliance with these BMPs in their Annual Report.

C.2.d. Stormwater Pump Stations

The objective of this sub-provision is to prevent the discharge of water with low dissolved oxygen (DO) from pump stations, and to explore the use of pump stations for trash capture and removal from waters to protect beneficial uses of receiving waters.

i. Task Description – Operation and Maintenance of Stormwater Pump Stations – The Permittees shall develop and implement measures to operate, inspect, and maintain these facilities to eliminate non-stormwater discharges containing pollutants, and to reduce pollutant loads in the stormwater discharges to comply with WQSs.

ii. Implementation Levels – The Permittees shall comply with the following implementation measures to reduce polluted water discharges from Permittee-owned or operated pump stations:

(1) Complete an inventory of pump stations within each Permittee's jurisdiction, including locations, and key characteristics[1] by March 1, 2010.

(2) Inspect and collect DO data from all pump stations twice a year during the dry season after July 1, starting in 2010. DO monitoring is exempted where all discharge from a pump station remains in the stormwater collection system or infiltrates into a dry creek immediately downstream.

(3) If DO levels are at or below 3 milligrams per liter (3 mg/L), apply corrective actions, such as continuous pumping at a low flow rate, aeration, or other appropriate methods to maintain DO concentrations of the discharge above 3 mg/L. Verify corrective actions are effective by increasing DO monitoring interval to weekly until two weekly samples are above 3 mg/L.

(4) Starting in fall 2010, inspect pump stations a minimum of two times during the wet season in the first business day after ¼-inch and larger storm events after a minimum of a two week antecedent period with no precipitation. Post-storm inspections shall collect and report presence and quantity estimates of trash, including presence of odor, color, turbidity, and floating hydrocarbons. Remove debris and trash and replace any oil absorbent booms, as needed.

iii. Reporting – The Permittees shall report information resulting from C.2.d.ii.(2)-(4), including DO monitoring data and subsequent corrective actions taken to verify compliance with the 3 mg/L implementation level, in their Annual Report, and maintain records of inspection and maintenance activities and volume or mass of waste materials removed from pump stations.

C.2.e. Rural Public Works Construction and Maintenance

i. Task Description – Rural Road and Public Works Construction and Maintenance - For the purpose of this provision, rural means any watershed or portion thereof that is developed with large lot home-sites, such as one acre or larger, or with primarily agricultural, grazing or open space uses. The Permittees shall implement and require contractors to implement BMPs for erosion and sediment control during and after construction for maintenance activities on rural roads, particularly in or adjacent to stream channels or wetlands. The Permittees shall notify the Water Board, the California Department of Fish and Game and the U.S. Army Corps of Engineers, where applicable, and obtain appropriate agency permits for rural public works activities before work in or near creeks and wetlands.

[1] Characteristics include name of pump station, latitude and longitude in WGS 84, number of pumps, drainage area in acres, dominant land use(s), first receiving water body, maximum pumping capacity of station in gallons per minute (gpm), flow measurement capability (Y or N), flow measurement method, average wet season discharge rate in gpm, dry season discharge (Y, N, or unknown), nearest municipal wastewater treatment plant, wet well storage capacity in gallons, trash control (Y or N), trash control measure, and date built or last updated.

ii. Implementation Level

(1) The Permittees shall develop, where they do not already exist, and implement BMPs for erosion and sediment control measures during construction and maintenance activities on rural roads, including developing and implementing appropriate training and technical assistance resources for rural public works activities, by April 1, 2010.

(2) The Permittees shall develop and implement appropriate BMPs for the following activities, which minimize impacts on streams and wetlands in the course of rural road and public works maintenance and construction activities:

(a) Road design, construction, maintenance, and repairs in rural areas that prevent and control road-related erosion and sediment transport;

(b) Identification and prioritization of rural road maintenance on the basis of soil erosion potential, slope steepness, and stream habitat resources;

(c) Construction of roads and culverts that do not impact creek functions. New or replaced culverts shall not create a migratory fish passage barrier, where migratory fish are present, or lead to stream instability;

(d) Development and implementation of an inspection program to maintain rural roads' structural integrity and prevent impacts on water quality;

(e) Maintenance of rural roads adjacent to streams and riparian habitat to reduce erosion, replace damaging shotgun culverts and excessive erosion;

(f) Re-grading of unpaved rural roads to slope outward where consistent with road engineering safety standards, and installation of water bars as appropriate; and

(g) Replacement of existing culverts or design of new culverts or bridge crossings shall use measures to reduce erosion, provide fish passage and maintain natural stream geomorphology in a stable manner.

(3) The Permittees shall develop or incorporate existing training and guidance on permitting requirements for rural public works activities so as to stress the importance of proper planning and construction to avoid water quality impacts.

(4) The Permittees shall provide training incorporating these BMPs to rural public works maintenance staff at least twice within this Permit term.

iii. Reporting – The Permittees shall report on the implementation of and compliance with BMPs for the rural public works construction and maintenance activities in their Annual Report, including reporting on increased maintenance in priority areas.

C.2.f. Corporation Yard BMP Implementation

i. Task Description – Corporation Yard Maintenance

(1) The Permittees shall prepare, implement, and maintain a site specific Stormwater Pollution Prevention Plan (SWPPP) for corporation yards, including municipal vehicle maintenance, heavy equipment and maintenance vehicle parking areas, and material storage facilities to comply with water quality standards. Each SWPPP shall incorporate all applicable BMPs that are described in the California Stormwater Quality Association's Handbook for Municipal Operations and the Caltrans Storm Water Quality Handbook Maintenance Staff Guide, May 2003, and its addenda, as appropriate.

(2) The requirements in this provision shall apply only to facilities that are not already covered under the State Board's Industrial Stormwater NPDES General Permit.

(3) The site specific SWPPPs for corporation yards shall be completed by July 1, 2010.

ii. Implementation Level

(1) Implement BMPs to minimize pollutant discharges in stormwater and prohibit non-stormwater discharges, such as wash waters and street sweeper, vactor, and other related equipment cleaning wash water. Pollution control actions shall include, but not be limited to, good housekeeping practices, material and waste storage control, and vehicle leak and spill control.

(2) Routinely inspect corporation yards to ensure that no non-stormwater discharges are entering the storm drain system and, during storms, pollutant discharges are prevented to the maximum extent practicable. At a minimum, an inspection shall occur before the start of the rainy season.

(3) Plumb all vehicle and equipment wash areas to the sanitary sewer after coordination with the local sanitary sewer agency and equip with a pretreatment device (if necessary) in accordance with the requirements of the local sanitary sewer agency.

(4) Use dry cleanup methods when cleaning debris and spills from corporation yards. If wet cleaning methods must be used (e.g., pressure washing), the Permittee shall ensure that wash water is collected and disposed in the sanitary sewer after coordination with the local sanitary sewer agency and in accordance with the requirements of the local sanitary sewer agency. Any private companies hired by the Permittee to perform cleaning activities on Permittee-owned property shall follow the same requirements. In areas where sanitary sewer connection is not available, the Permittees shall collect and haul the wash water to a municipal

wastewater treatment plant, or implement appropriate BMPs and dispose of the wastewater to land in a manner that does not adversely impact surface water or groundwater.

(5) Outdoor storage areas containing waste pollutants shall be covered and/or bermed to prevent discharges of polluted stormwater runoff or run-on to storm drain inlets.

iii. Reporting – The Permittees shall report on implementation of SWPPPs, the results of inspections, and any follow-up actions in their Annual Report.

C.3. New Development and Redevelopment

The goal of Provision C.3 is for the Permittees to use their planning authorities to include appropriate source control, site design, and stormwater treatment measures in new development and redevelopment projects to address both soluble and insoluble stormwater runoff pollutant discharges and prevent increases in runoff flows from new development and redevelopment projects. This goal is to be accomplished primarily through the implementation of low impact development (LID) techniques.

C.3.a. New Development and Redevelopment Performance Standard Implementation

i. Task Description – At a minimum each Permittee shall:

(1) Have adequate legal authority to implement all requirements of Provision C.3;

(2) Have adequate development review and permitting procedures to impose conditions of approval or other enforceable mechanisms to implement the requirements of Provision C.3. For projects discharging directly to CWA section 303(d)-listed waterbodies, conditions of approval must require that post-development runoff not exceed pre-development levels for such pollutants that are listed;

(3) Evaluate potential water quality effects and identify appropriate mitigation measures when conducting environmental reviews, such as under CEQA;

(4) Provide training adequate to implement the requirements of Provision C.3 for staff, including interdepartmental training;

(5) Provide outreach adequate to implement the requirements of Provision C.3, including providing education materials to municipal staff, developers, contractors, construction site operators, and owner/builders, early in the planning process and as appropriate;

(6) For all new development and redevelopment projects that are subject to the Permittee's planning, building, development, or other comparable review, but not regulated by Provision C.3, encourage the inclusion of adequate site design measures that may include minimizing land disturbance and impervious surfaces (especially parking lots); clustering of structures and pavement; directing roof runoff to vegetated areas; use of micro-detention, including distributed landscape-based detention; preservation of open space; protection and/or restoration of riparian areas and wetlands as project amenities;

(7) For all new development and redevelopment projects that are subject to the Permittee's planning, building, development, or other comparable review, but not regulated by Provision C.3, encourage the inclusion of adequate source control measures to limit pollutant generation, discharge, and runoff. These source control measures should include:

- Storm drain stenciling.

- Landscaping that minimizes irrigation and runoff, promotes surface infiltration where possible, minimizes the use of pesticides and fertilizers, and incorporates appropriate sustainable landscaping practices and programs such as Bay-Friendly Landscaping.
- Appropriate covers, drains, and storage precautions for outdoor material storage areas, loading docks, repair/maintenance bays, and fueling areas.
- Covered trash, food waste, and compactor enclosures.
- Plumbing of the following discharges to the sanitary sewer, subject to the local sanitary sewer agency's authority and standards:
  - Discharges from indoor floor mat/equipment/hood filter wash racks or covered outdoor wash racks for restaurants.
  - Dumpster drips from covered trash and food compactor enclosures.
  - Discharges from outdoor covered wash areas for vehicles, equipment, and accessories.
  - Swimming pool water, if discharge to onsite vegetated areas is not a feasible option.
  - Fire sprinkler test water, if discharge to onsite vegetated areas is not a feasible option.

(8) Revise, as necessary, General Plans to integrate water quality and watershed protection with water supply, flood control, habitat protection, groundwater recharge, and other sustainable development principles and policies (e.g., referencing the Bay-Friendly Landscape Guidelines).

ii. Implementation Level – Most of the elements of this task should already be fully implemented because they are required in the Permittees' existing stormwater permits.

Due Dates for Full Implementation – Immediate for C.3.a.i.(1)-(5), May 1, 2010 for C.3.a.i.(6)-(7), and December 1, 2010 for C.3.a.i.(8). For Vallejo Permittees: December 1, 2010 for C.3.a.i.(1)-(8)

iii. Reporting – Provide a brief summary of the method(s) of implementation of Provisions C.3.a.i.(1)–(8) in the 2011 Annual Report.

C.3.b. Regulated Projects

i. Task Description – The Permittees shall require all projects fitting the category descriptions listed in Provision C.3.b.ii below (hereinafter called Regulated Projects) to implement LID source control, site design, and stormwater treatment onsite or at a joint stormwater treatment facility[2] in accordance with Provisions C.3.c and C.3.d, unless the Provision C.3.e alternate compliance options are evoked. For adjacent Regulated Projects that will discharge runoff to a joint stormwater treatment facility, the treatment facility must be completed by

[2] **Joint stormwater treatment facility** – Stormwater treatment facility built to treat the combined runoff from two or more Regulated Projects located adjacent to each other,

the end of construction of the first Regulated Project that will be discharging runoff to the joint stormwater treatment facility.

Regulated Projects, as they are defined in this Provision, do not include detached single-family home projects that are not part of a larger plan of development.

ii. Regulated Projects are defined in the following categories:

(1) **Special Land Use Categories**

(a) **New Development or redevelopment projects** that fall into one of the categories listed below and that create and/or replace 10,000 square feet or more of impervious surface (collectively over the entire project site). This category includes development projects of the following four types on public or private land that fall under the planning and building authority of a Permittee:

(i) Auto service facilities, described by the following Standard Industrial Classification (SIC) Codes: 5013, 5014, 5541, 7532-7534, and 7536-7539;

(ii) Retail gasoline outlets;

(iii) Restaurants (SIC Code 5812); or

(iv) Uncovered parking lots that are stand-alone or part of any other development project. This category includes the top uncovered portion of parking structures unless drainage from the uncovered portion is connected to the sanitary sewer along with the covered portions of the parking structure.

(b) For redevelopment projects in the categories specified in Provision C.3.b.ii.(1)(a)(i)-(iv), specific exclusions are:

(i) Interior remodels;

(ii) Routine maintenance or repair such as:

- roof or exterior wall surface replacement,
- pavement resurfacing within the existing footprint.

(c) Where a redevelopment project in the categories specified in Provision C.3.b.ii.(1)(a)(i)-(iv) results in an alteration of **more than 50 percent** of the impervious surface of a previously existing development that was not subject to Provision C.3, the entire project, consisting of all existing, new, and/or replaced impervious surfaces, must be included in the treatment system design (i.e., stormwater treatment systems must be designed and sized to treat stormwater runoff from the entire redevelopment project).

(d) Where a redevelopment project in the categories specified in Provision C.3.b.ii.(1)(a)(i)-(iv) results in an alteration of **less than 50 percent** of the impervious surface of a previously existing development that was not subject to Provision C.3, only the new and/or replaced impervious surface of the project must be included in the treatment system design (i.e., stormwater treatment systems must be designed and sized to treat stormwater runoff from the new and/or replaced impervious surface of the project).

(e) For any private development project in the categories specified in Provisions C.3.b.ii.(1)(a)(i)-(iv) for which a planning application has been deemed complete by a Permittee on or before the Permit effective date, the lower 5000 square feet impervious surface threshold (for classification as a Regulated Project) shall not apply so long as the project applicant is diligently pursuing the project. Diligent pursuance may be demonstrated by the project applicant's submittal of supplemental information to the original application, plans, or other documents required for any necessary approvals of the project by the Permittee. If during the time period between the Permit effective date and the required implementation date of December 1, 2011, for the 5000 square feet threshold, the project applicant has not taken any action to obtain the necessary approvals from the Permittee, the project will then be subject to the lower 5000 square feet impervious surface threshold specified in Provision C.3.b.ii.(1).

(f) For any private development project in the categories specified in Provisions C.3.b.ii.(1)(a)(i)-(iv) with an application deemed complete after the Permit effective date, the lower 5000 square feet impervious surface threshold (for classification as a Regulated Project) shall not apply if the project applicant has received final discretionary approval for the project before the required implementation date of December 1, 2011, for the 5000 square feet threshold.

(g) For public projects for which funding has been committed and construction is scheduled to begin by December 1, 2012, the lower 5000 square feet of impervious surface threshold (for classification as a Regulated Project) shall not apply.

Effective Date – Immediate, except December 1, 2010, for Vallejo Permittees.

Beginning December 1, 2011, all references to 10,000 square feet in Provision C.3.b.ii.(1) change to 5,000 square feet.

(2) **Other Development Projects**

New development projects that create 10,000 square feet or more of impervious surface (collectively over the entire project site) including commercial, industrial, residential housing subdivisions (i.e., detached single-family home subdivisions, multi-family attached subdivisions (town homes), condominiums, and apartments), mixed-use, and public projects. This category includes development projects on public or private land that fall under the planning and building authority of a Permittee. Detached single-family home projects that are not part of a larger plan of development are specifically excluded.

Effective Date – Immediate, except December 1, 2010, for Vallejo Permittees.

(3) **Other Redevelopment Projects**

Redevelopment projects that create and/or replace 10,000 square feet or more of impervious surface (collectively over the entire project site) including commercial, industrial, residential housing subdivisions (i.e., detached single-family home subdivisions, multi-family attached subdivisions (town homes), condominiums, and apartments), mixed-use, and public projects. Redevelopment is any land-disturbing activity that results in the creation, addition, or replacement of exterior impervious surface area on a site on which some past development has occurred. This category includes redevelopment projects on public or private land that fall under the planning and building authority of a Permittee.

Specific exclusions to this category are:

- Interior remodels.
- Routine maintenance or repair such as:
  - roof or exterior wall surface replacement, or
  - pavement resurfacing within the existing footprint.

(a) Where a redevelopment project results in an alteration of **more than 50 percent** of the impervious surface of a previously existing development that was not subject to Provision C.3, the entire project, consisting of all existing, new, and/or replaced impervious surfaces, must be included in the treatment system design (i.e., stormwater treatment systems must be designed and sized to treat stormwater runoff from the entire redevelopment project).

(b) Where a redevelopment results in an alteration **of less than 50 percent** of the impervious surface of a previously existing development that was not subject to Provision C.3, only the new and/or replaced impervious surface of the project must be included in the treatment system design (i.e., stormwater treatment systems must be designed and sized to treat stormwater runoff from the new and/or replaced impervious surface of the project).

Effective Date – Immediate, except December 1, 2010, for Vallejo Permittees.

(4) **Road Projects**

Any of the following types of road projects that create 10,000 square feet or more of newly constructed contiguous impervious surface and that fall under the building and planning authority of a Permittee:

(a) Construction of new streets or roads, including sidewalks and bicycle lanes built as part of the new streets or roads.

(b) Widening of existing streets or roads with additional traffic lanes.

(i) Where the addition of traffic lanes results in an alteration of **more than 50 percent** of the impervious surface of an existing street or road that was not subject to Provision C.3, **the entire project, consisting of all existing, new, and/or replaced impervious surfaces, must be included in the treatment system design** (i.e.,

stormwater treatment systems must be designed and sized to treat stormwater runoff from the entire street or road that had additional traffic lanes added).

(ii) Where the addition of traffic lanes results in an alteration **of less than 50 percent** of the impervious surface of an existing street or road that was not subject to Provision C.3, **only the new and/or replaced impervious surface of the project must be included in the treatment system design** (i.e., stormwater treatment systems must be designed and sized to treat stormwater runoff from only the new traffic lanes). However, if the stormwater runoff from the existing traffic lanes and the added traffic lanes cannot be separated, any onsite treatment system must be designed and sized to treat stormwater runoff from the entire street or road. If an offsite treatment system is installed or in-lieu fees paid in accordance with Provision C.3.e, the offsite treatment system or in-lieu fees must address only the stormwater runoff from the added traffic lanes.

(c) Construction of impervious trails that are greater than 10 feet wide or are creek-side (within 50 feet of the top of bank).

(d) Specific exclusions to Provisions C.3.b.ii.(4)(a)-(c) are:

- Sidewalks built as part of new streets or roads and built to direct stormwater runoff to adjacent vegetated areas.
- Bicycle lanes that are built as part of new streets or roads but are not hydraulically connected to the new streets or roads and that direct stormwater runoff to adjacent vegetated areas.
- Impervious trails built to direct stormwater runoff to adjacent vegetated areas, or other non-erodible permeable areas, preferably away from creeks or towards the outboard side of levees.
- Sidewalks, bicycle lanes, or trails constructed with permeable surfaces.[3]
- Caltrans highway projects and associated facilities.

(e) For any private road or trail project described by Provisions C.3.b.ii.(4)(b) or (c) for which a planning application has been deemed complete by a Permittee on or before the Permit effective date, the requirements of Provisions C.3.b.ii.(4)(b) or (c) to classify the project as a Regulated Project shall not apply so long as the project applicant is diligently pursuing the project. Diligent pursuance may be demonstrated by the project applicant's submittal of supplemental information to the original application, plans, or other documents required for any necessary approvals of the project by the Permittee. If during the time period between the Permit effective date and the required implementation date of December 1, 2011, for Provisions C.3.b.ii.(4)(b) and (c), the project applicant has not taken

[3] **Permeable surfaces** include pervious concrete, porous asphalt, unit pavers, and granular materials.

any action to obtain the necessary approvals from the Permittee, the project will then be classified as a Regulated Project under Provisions C.3.b.ii.(4)(b) or (c).

(f) For any private road or trail project with an application deemed complete after the Permit effective date, the requirements of Provisions C.3.b.i.(4)(b) or (c) to classify the project as a Regulated Project shall not apply if the project applicant has received final discretionary approval for the project before the required implementation date of December 1, 2011, for Provisions C.3.b.ii.(4)(b) and (c).

(g) For any public road or trail project for which funding has been committed and construction is scheduled to begin by December 1, 2012, the requirements of Provisions C.3.b.i.(4)(b) or (c) to classify the project as a Regulated Project shall not apply.

Effective Date – Immediate for C.3.b.ii.(4)(a) and (d)-(g), and December 1, 2011, for C.3.b.ii.(4)(b) and (c). For Vallejo Permittees: Immediate for C.3.b.ii.(4)(d)-(g), and December 1, 2011 for C.3.b.ii.(4)(a)-(c).

iii. Green Street Pilot Projects

The Permittees shall cumulatively complete ten pilot green street projects that incorporate LID techniques for site design and treatment in accordance with Provision C.3.c and that provide stormwater treatment sized in accordance with Provision C.3.d. It is also desirable that they meet or exceed the Bay-Friendly Landscape Scorecard minimum requirements (see www.BayFriendly.org).

(1) Parking lot projects that provide LID treatment in accordance with Provisions C.3.c and Provision C.3.d. for stormwater runoff from the parking lot and street may be considered pilot green street projects.

(2) A Regulated Project (as defined in Provision C.3.b.ii) may not be counted as one of the ten pilot green street projects.

(3) At least two pilot green street projects must be located in each of the following counties: Alameda, Contra Costa, San Mateo, and Santa Clara.

(4) The Permittees shall construct the ten pilot green street projects in such a manner that they, as a whole:

(a) Are representative of the various types of streets: arterial, collector, and local; and

(b) Contain the following key elements:

(i) Stormwater storage for landscaping reuse or stormwater treatment and/or infiltration for groundwater replenishment through the use of natural feature systems;

(ii) Creation of attractive streetscapes that enhance neighborhood livability by enhancing the pedestrian environment and introducing park-like elements into neighborhoods;

(iii) Service as an urban greenway segment that connects neighborhoods, parks, recreation facilities, schools, mainstreets, and wildlife habitats;

(iv) Parking management that includes maximum parking space requirements as opposed to minimum parking space requirements, parking requirement credits for subsidized transit or shuttle service, parking structures, shared parking, car sharing, or on-street diagonal parking;

(v) Meets broader community goals by providing pedestrian and, where appropriate, bicycle access; and

(vi) Located in a Priority Development Area as designated under the Association of Bay Area Government's and Metropolitan Transportation Commission's FOCUS[4] program.

(5) The Permittees shall conduct appropriate monitoring of these projects to document the water quality benefits achieved. Appropriate monitoring may include modeling using the design specifications and specific site conditions.

Due Date – All pilot green street projects shall be completed by December 1, 2014.

iv. Implementation Level – All elements of Provision C.3.b.i.-iii shall be fully implemented by the effective/due dates set forth in their respective sub-provision, and a database or equivalent tabular format shall be developed and maintained that contains all the information listed under Reporting (Provision C.3.b.v.).

Due Dates for Full Implementation – See specific Effective Dates listed under Provisions C.3.b.ii& iii. .The database or equivalent tabular format required by Provision C.3.b.iv shall be developed by December 1, 2010. (For Vallejo Permittees: December 1, 2011)

v. Reporting

(1) **Annual Reporting – C.3.b.ii. Regulated Projects**

For each Regulated Project approved during the fiscal year reporting period, the following information shall be reported electronically in the fiscal year Annual Report, in tabular form (as set forth in the attached Provision C.3.b. Sample Reporting Table):

(a) Project Name, Number, Location (cross streets), and Street Address;

(b) Name of Developer, Phase No. (if project is being constructed in phases, each phase should have a separate entry), Project Type (e.g., commercial, industrial, multiunit residential, mixed-use, public), and description;

(c) Project watershed;

(d) Total project site area and total area of land disturbed;

[4] FOCUS is a regional incentive-based development and conservation strategy for the Bay Area.

(e) Total new impervious surface area and/or total replaced impervious surface area;

(f) If redevelopment or road widening project, total pre-project impervious surface area and total post-project impervious surface area;

(g) Status of project (e.g., application date, application deemed complete date, project approval date);

(h) Source control measures;

(i) Site design measures;

(j) All post-construction stormwater treatment systems installed onsite, at a joint stormwater treatment facility, and/or at an offsite location;

(k) Operation and maintenance responsibility mechanism for the life of the project.

(l) Hydraulic Sizing Criteria used;

(m) Alternative compliance measures for Regulated Project (if applicable)

(i) If alternative compliance will be provided at an offsite location in accordance with Provision C.3.e.i.(1), include information required in Provision C.3.b.v.(a) – (l) for the offsite project; and

(ii) If alternative compliance will be provided by paying in-lieu fees in accordance with Provision C.3.e.i.(2), provide information required in Provision C.3.b.v.(a) – (l) for the Regional Project. Additionally, provide a summary of the Regional Project's goals, duration, estimated completion date, total estimated cost of the Regional Project, and estimated monetary contribution from the Regulated Project to the Regional Project; and

(n) Hydromodification (HM) Controls (see Provision C.3.g.) – If not required, state why not. If required, state control method used.

(2) **Pilot Green Streets Project Reporting - Provision C.3.b.iii.**

(a) On an annual basis, the Permittees shall report on the status of the pilot green street projects.

(b) For each completed project, the Permittees shall report the capital costs, operation and maintenance costs, legal and procedural arrangements in place to address operation and maintenance and its associated costs, and the sustainable landscape measures incorporated in the project including, if relevant, the score from the Bay-Friendly Landscape Scorecard.

(c) The 2013 Annual Report shall contain a summary of all green street projects completed by January 1, 2013. The summary shall include for each completed project the following information:

(i) Location of project

(ii) Size of project, including total impervious surface treated

(iii) Map(s) of project showing areas where stormwater runoff will be treated by LID measures

(iv) Specific type(s) of LID treatment measures included

(v) Total and specific costs of project

(vi) Specific funding sources for project and breakdown of percentage paid by each funding source

(vii) Lessons learned, including recommendations to facilitate funding and building of future projects

(viii) Identification of responsible party and funding source for operation and maintenance.

C.3.c. Low Impact Development (LID)

The goal of LID is to reduce runoff and mimic a site's predevelopment hydrology by minimizing disturbed areas and impervious cover and then infiltrating, storing, detaining, evapotranspiring, and/or biotreating stormwater runoff close to its source. LID employs principles such as preserving and recreating natural landscape features and minimizing imperviousness to create functional and appealing site drainage that treats stormwater as a resource, rather than a waste product. Practices used to adhere to these LID principles include measures such as rain barrels and cisterns, green roofs, permeable pavement, preserving undeveloped open space, and biotreatment through rain gardens, bioretention units, bioswales, and planter/tree boxes.

Task Description

i. The Permittees shall, at a minimum, implement the following LID requirements:

(1) **Source Control Requirements**

Require all Regulated Projects to implement source control measures onsite that at a minimum, shall include the following:

(a) Minimization of stormwater pollutants of concern in urban runoff through measures that may include plumbing of the following discharges to the sanitary sewer, subject to the local sanitary sewer agency's authority and standards:

- Discharges from indoor floor mat/equipment/hood filter wash racks or covered outdoor wash racks for restaurants;
- Dumpster drips from covered trash, food waste and compactor enclosures;
- Discharges from covered outdoor wash areas for vehicles, equipment, and accessories;
- Swimming pool water, if discharge to onsite vegetated areas is not a feasible option; and
- Fire sprinkler test water, if discharge to onsite vegetated areas is not a feasible option;

(b) Properly designed covers, drains, and storage precautions for outdoor material storage areas, loading docks, repair/maintenance bays, and fueling areas;

(c) Properly designed trash storage areas;

(d) Landscaping that minimizes irrigation and runoff, promotes surface infiltration, minimizes the use of pesticides and fertilizers, and incorporates other appropriate sustainable landscaping practices and programs such as Bay-Friendly Landscaping;

(e) Efficient irrigation systems; and

(f) Storm drain system stenciling or signage.

(2) **Site Design and Stormwater Treatment Requirements**

(a) Require each Regulated Project to implement at least the following design strategies onsite:

(i) Limit disturbance of natural water bodies and drainage systems; minimize compaction of highly permeable soils; protect slopes and channels; and minimize impacts from stormwater and urban runoff on the biological integrity of natural drainage systems and water bodies;

(ii) Conserve natural areas, including existing trees, other vegetation, and soils;

(iii) Minimize impervious surfaces;

(iv) Minimize disturbances to natural drainages; and

(v) Minimize stormwater runoff by implementing one or more of the following site design measures:

- Direct roof runoff into cisterns or rain barrels for reuse.
- Direct roof runoff onto vegetated areas.
- Direct runoff from sidewalks, walkways, and/or patios onto vegetated areas.
- Direct runoff from driveways and/or uncovered parking lots onto vegetated areas.
- Construct sidewalks, walkways, and/or patios with permeable surfaces.[3]
- Construct driveways, bike lanes, and/or uncovered parking lots with permeable surfaces.[3]

(b) Require each Regulated Project to treat 100% of the amount of runoff identified in Provision C.3.d for the Regulated Project's drainage area with LID treatment measures onsite or with LID treatment measures at a joint stormwater treatment facility.

(i) LID treatment measures are harvesting and re-use, infiltration, evapotranspiration, or biotreatment.

(ii) A properly engineered and maintained biotreatment system may be considered only if it is infeasible to implement harvesting and re-use, infiltration, or evapotranspiration at a project site.

(iii) Infeasibility to implement harvesting and re-use, infiltration, or evapotranspiration at a project site may result from conditions including the following:

- Locations where seasonal high groundwater would be within 10 feet of the base of the LID treatment measure.
- Locations within 100 feet of a groundwater well used for drinking water.
- Development sites where pollutant mobilization in the soil or groundwater is a documented concern.
- Locations with potential geotechnical hazards.
- Smart growth and infill or redevelopment sites where the density and/or nature of the project would create significant difficulty for compliance with the onsite volume retention requirement.
- Locations with tight clay soils that significantly limit the infiltration of stormwater.

(iv) By May 1, 2011, the Permittees, collaboratively or individually, shall submit a report on the criteria and procedures the Permittees shall employ to determine when harvesting and re-use, infiltration, or evapotranspiration is feasible and infeasible at a Regulated Project site. This report shall, at a minimum, contain the information required in Provision C.3.c.iii.(1).

(v) By December 1, 2013, the Permittees, collaboratively or individually, shall submit a report on their experience with determining infeasibility of harvesting and re-use, infiltration, or evapotranspiration at Regulated Project sites. This report shall, at a minimum, contain the information required in Provision C.3.iii.(2).

(vi) Biotreatment systems shall be designed to have a surface area no smaller than what is required to accommodate a 5 inches/hour stormwater runoff surface loading rate. The planting and soil media for biotreatment systems shall be designed to sustain plant growth and maximize stormwater runoff retention and pollutant removal. By December 1, 2010, the Permittees, working collaboratively or individually, shall submit for Water Board approval, a proposed set of model biotreatment soil media specifications and soil infiltration testing methods to verify a long-term infiltration rate of 5 to 10 inches/hour. This submittal to the Water Board shall, at a minimum, contain the information required in Provision C.3.c.iii.(3). Once the Water Board approves biotreatment soil media specifications and soil infiltration testing methods, the Permittees shall ensure that biotreatment systems installed to meet the requirements of Provision C.3.c and d comply with the Water Board-approved minimum specifications and soil infiltration testing methods.

(vii) Green roofs may be considered biotreatment systems that treat roof runoff only if they meet certain minimum specifications. By May 1, 2011, the Permittees shall submit for Water Board approval, proposed minimum specifications for green roofs.

This submittal to the Water Board shall, at a minimum, contain the information required in Provision C.3.c.iii.(4). Once the Water Board approves green roof minimum specifications, the Permittees shall ensure that green roofs installed to meet the requirements of Provision C.3.c and d comply with the Water Board-approved minimum specifications.

(c) Require any Regulated Project that does not comply with Provision C.3.c.i.(2)(b) above to meet the requirements established in Provision C.3.e for alternative compliance.

ii. Implementation Level – All elements of the tasks described in Provision C.3.c.i shall be fully implemented.

Due Date for Full Implementation – December 1, 2011

(1) For any private development project for which a planning application has been deemed complete by a Permittee on or before the Permit effective date, Provision C.3.c.i shall not apply so long as the project applicant is diligently pursuing the project. Diligent pursuance may be demonstrated by the project applicant's submittal of supplemental information to the original application, plans, or other documents required for any necessary approvals of the project by the Permittee. If during the time period between the Permit effective date and the required implementation date of December 1, 2011, the project applicant has not taken any action to obtain the necessary approvals from the Permittee, the project will then be subject to the requirements of Provision C.3.c.i.

(2) For any private development project with an application deemed complete after the Permit effective date, the requirements of Provision C.3.c.i shall not apply if the project applicant has received final discretionary approval for the project before the required implementation date of December 1, 2011.

(3) For public projects for which funding has been committed and construction is scheduled to begin by December 1, 2012, the requirements of Provision C.3.c.i shall not apply.

iii. Reporting

(1) Feasibility/Infeasibility Criteria Report - By May 1, 2011, the Permittees, collaboratively or individually, shall submit a report to the Water Board containing the following information:

- Literature review and discussion of documented cases/sites, particularly in the Bay Area and California, where infiltration, harvesting and reuse, or evapotranspiration have been demonstrated to be feasible and/or infeasible.
- Discussion of proposed feasibility and infeasibility criteria and procedures the Permittees shall employ to make a determination of when biotreatment will be allowed at a Regulated Project site.

(2) Status Report on Application of Feasibility/Infeasibility Criteria – By December 1, 2013, the Permittees shall submit a report to the Water Board containing the following information:

- Discussion of the most common feasibility and infeasibility criteria employed since implementation of Provision C.3.c requirements, including site-specific examples;
- Discussion of barriers, including institutional and technical site specific constraints, to implementation of harvesting and reuse, infiltration, or evapotranspiration, and proposed strategies for removing these identified barriers;
- If applicable, discussion of proposed changes to feasibility and infeasibility criteria and rationale for the changes; and
- Guidance for the Permittees to make a consistent and appropriate determination of the feasibility of harvesting and reuse, infiltration, or evapotranspiration for each Regulated Project.

(3) Model Biotreatment Soil Media Specifications - By December 1, 2010, the Permittees, collaboratively or individually, shall submit a report to the Water Board containing the following information:

- Proposed soil media specifications for biotreatment systems;
- Proposed soil testing methods to verify a long-term infiltration rate of 5-10 inches/hour;
- Relevant literature and field data showing the feasibility of the minimum design specifications;
- Relevant literature, field, and analytical data showing adequate pollutant removal and compliance with the Provision C.3.d hydraulic sizing criteria; and
- Guidance for the Permittees to apply the minimum specifications in a consistent and appropriate manner.

(4) Green Roof Minimum Specifications - By May 1, 2011, the Permittees, collaboratively or individually, shall submit a report to the Water Board containing the following information:

- Proposed minimum design specifications for green roofs;
- Relevant literature and field data showing the feasibility of the minimum design specifications;
- Relevant literature, field, and analytical data showing adequate pollutant removal and compliance with the Provision C.3.d hydraulic sizing criteria;
- Discussion of data and lessons learned from already installed green roofs;
- Discussion of barriers, including institutional and technical site specific constraints, to installation of green roofs and proposed strategies for removing these identified barriers; and

- Guidance for the Permittees to apply the minimum specifications in a consistent and appropriate manner.

(5) Report the method(s) of implementation of Provisions C.3.c.i above in the 2012 Annual Report. For specific tasks listed above that are reported using the reporting tables required for Provision C.3.b.v, a reference to those tables will suffice.

C.3.d. Numeric Sizing Criteria for Stormwater Treatment Systems

i. Task Description – The Permittees shall require that stormwater treatment systems constructed for Regulated Projects meet at least one of the following hydraulic sizing design criteria:

(1) **Volume Hydraulic Design Basis** – Treatment systems whose primary mode of action depends on volume capacity shall be designed to treat stormwater runoff equal to:

(a) The maximized stormwater capture volume for the area, on the basis of historical rainfall records, determined using the formula and volume capture coefficients set forth in Urban Runoff Quality Management, WEF Manual of Practice No. 23/ASCE Manual of Practice No. 87, (1998), pages 175–178 (e.g., approximately the 85th percentile 24-hour storm runoff event); or

(b) The volume of annual runoff required to achieve 80 percent or more capture, determined in accordance with the methodology set forth in Section 5 of the California Stormwater Quality Association's Stormwater Best Management Practice Handbook, New Development and Redevelopment (2003), using local rainfall data.

(2) **Flow Hydraulic Design Basis** – Treatment systems whose primary mode of action depends on flow capacity shall be sized to treat:

(a) 10 percent of the 50-year peak flowrate;

(b) The flow of runoff produced by a rain event equal to at least two times the 85th percentile hourly rainfall intensity for the applicable area, based on historical records of hourly rainfall depths; or

(c) The flow of runoff resulting from a rain event equal to at least 0.2 inches per hour intensity.

(3) **Combination Flow and Volume Design Basis** – Treatment systems that use a combination of flow and volume capacity shall be sized to treat at least 80 percent of the total runoff over the life of the project, using local rainfall data.

ii. Implementation Level – The Permittees shall immediately require the controls in this task.

Due Date for Full Implementation – Immediate, except December 1, 2010, for Vallejo Permittees.

iii. Reporting – Permittees shall use the reporting tables required in Provision C.3.b.v.

iv. Limitations on Use of Infiltration Devices in Stormwater Treatment Systems

(1) For Regulated Projects, each Permittee shall review planned land use and proposed treatment design to verify that installed stormwater treatment systems with no under-drain, and that function primarily as infiltration devices, should not cause or contribute to the degradation of groundwater quality at project sites. An infiltration device is any structure that is deeper than wide and designed to infiltrate stormwater into the subsurface and, as designed, bypass the natural groundwater protection afforded by surface soil. Infiltration devices include dry wells, injection wells, and infiltration trenches (includes french drains).

(2) For any Regulated Project that includes plans to install stormwater treatment systems which function primarily as infiltration devices, the Permittee shall require that:

(a) Appropriate pollution prevention and source control measures are implemented to protect groundwater at the project site, including the inclusion of a minimum of two feet of suitable soil to achieve a maximum 5 inches/hour infiltration rate for the infiltration system;

(b) Adequate maintenance is provided to maximize pollutant removal capabilities;

(c) The vertical distance from the base of any infiltration device to the seasonal high groundwater mark is at least 10 feet. (Note that some locations within the Permittees' jurisdictions are characterized by highly porous soils and/or high groundwater tables. In these areas, a greater vertical distance from the base of the infiltration device to the seasonal high groundwater mark may be appropriate, and treatment system approvals should be subject to a higher level of analysis that considers the potential for pollutants (such as from onsite chemical use), the level of pretreatment to be achieved, and other similar factors in the overall analysis of groundwater safety);

(d) Unless stormwater is first treated by a method other than infiltration, infiltration devices are not approved as treatment measures for runoff from areas of industrial or light industrial activity; areas subject to high vehicular traffic (i.e., 25,000 or greater average daily traffic on a main roadway or 15,000 or more average daily traffic on any intersecting roadway); automotive repair shops; car washes; fleet storage areas (e.g., bus, truck); nurseries; and other land uses that pose a high threat to water quality;

(e) Infiltration devices are not placed in the vicinity of known contamination sites unless it has been demonstrated that increased infiltration will not increase leaching of contaminants from soil, alter groundwater flow conditions affecting contaminant migration in groundwater, or adversely affect remedial activities; and

(f) Infiltration devices are located a minimum of 100 feet horizontally away from any known water supply wells, septic systems, and

underground storage tanks with hazardous materials. (Note that some locations within the Permittees' jurisdictions are characterized by highly porous soils and/or high groundwater tables. In these areas, a greater horizontal distance from the infiltration device to known water supply wells, septic systems, or underground storage tanks with hazardous materials may be appropriate, and treatment system approvals should be subject to a higher level of analysis that considers the potential for pollutants (such as from onsite chemical use), the level of pretreatment to be achieved, and other similar factors in the overall analysis of groundwater safety).

C.3.e. Alternative or In-Lieu Compliance with Provision C.3.c.

i. The Permittees may allow a Regulated Project to provide alternative compliance with Provision C.3.c in accordance with one of the two options listed below:

(1) **Option 1: LID Treatment at an Offsite Location**
Treat a portion of the amount of runoff identified in Provision C.3.d for the Regulated Project's drainage area with LID treatment measures onsite or with LID treatment measures at a joint stormwater treatment facility **and** treat the remaining portion of the Provision C.3.d runoff with LID treatment measures at an offsite project in the same watershed. The offsite LID treatment measures must provide hydraulically-sized treatment (in accordance with Provision C.3.d) of an equivalent quantity of both stormwater runoff and pollutant loading and achieve a net environmental benefit.

(2) **Option 2: Payment of In-Lieu Fees**
Treat a portion of the amount of runoff identified in Provision C.3.d for the Regulated Project's drainage area with LID treatment measures onsite or with LID treatment measures at a joint stormwater treatment facility **and** pay equivalent in-lieu fees[5] to treat the remaining portion of the Provision C.3.d runoff with LID treatment measures at a Regional Project.[6] The Regional Project must achieve a net environmental benefit.

(3) For the alternative compliance options described in Provision C.3.e.i.(1) and (2) above, offsite projects must be constructed by the end of construction of the Regulated Project. If more time is needed to construct the offsite project, for each additional year, up to three years, after the construction of the Regulated Project, the offsite project must provide an additional 10% of the calculated equivalent quantity of both stormwater runoff and pollutant loading. Regional Projects must be completed within three years after the end of construction of the Regulated Project. However, the timeline for completion of the Regional Project may be

[5] **In-lieu fees** – Monetary amount necessary to provide both hydraulically-sized treatment (in accordance with Provision C.3.d) with LID treatment measures of an equivalent quantity of stormwater runoff and pollutant loading, and a proportional share of the operation and maintenance costs of the Regional Project.

[6] **Regional Project –** A regional or municipal stormwater treatment facility that discharges into the same watershed that the Regulated Project does.

extended, up to five years after the completion of the Regulated Project, with prior Executive Officer approval. Executive Officer approval will be granted contingent upon a demonstration of good faith efforts to implement the Regional Project, such as having funds encumbered and applying for the appropriate regulatory permits.

ii. Special Projects

(1) When considered at the watershed scale, certain types of smart growth, high density, and transit-oriented development can either reduce existing impervious surfaces, or create less "accessory" impervious areas and automobile-related pollutant impacts. Incentive LID treatment reduction credits approved by the Water Board may be applied to these types of Special Projects.

(2) By December 1, 2010, the Permittees shall submit a proposal to the Water Board containing the following information:

- Identification of the types of projects proposed for consideration of LID treatment reduction credits and an estimate of the number and cumulative area of potential projects during the remaining term of this Permit for each type of project;
- Identification of institutional barriers and/or technical site-specific constraints to providing 100% LID treatment onsite that justify the allowance for non-LID treatment measures onsite;
- Specific criteria for each type of Special Project proposed, including size, location, minimum densities, minimum floor area ratios, or other appropriate limitations;
- Identification of specific water quality and environmental benefits provided by these types of projects that justify the allowance for non-LID treatment measures onsite;
- Proposed LID treatment reduction credit for each type of Special Project and justification for the proposed credits. The justification shall include identification and an estimate of the specific water quality benefit provided by each type of Special Project proposed for LID treatment reduction credit; and
- Proposed total treatment reduction credit for Special Projects that may be characterized by more than one category and justification for the proposed total credit.

iii. Effective Date – December 1, 2011.

iv. Implementation Level

(1) For any private development project for which a planning application has been deemed complete by a Permittee on or before the Permit effective date, Provisions C.3.e.i-ii shall not apply so long as the project applicant is diligently pursuing the project. Diligent pursuance may be demonstrated by the project applicant's submittal of supplemental information to the original application, plans, or other documents required for any necessary

approvals of the project by the Permittee. If during the time period between the Permit effective date and the required implementation date of December 1, 2011, the project applicant has not taken any action to obtain the necessary approvals from the Permittee, the project will then be subject to the requirements of Provision C.3.e.i-ii.

(2) For public projects for which funding has been committed and construction is scheduled to begin by December 1, 2012, the requirements of Provisions C.3.e.i-ii shall not apply.

(3) Provisions C.3.e.i-ii supersede any Alternative Compliance Policies previously approved by the Executive Officer

(4) For all offsite projects and Regional Projects installed in accordance with Provision C.3.e.i-ii, the Permittees shall meet the Operation & Maintenance (O&M) requirements of Provision C.3.h.

v. Reporting –The Permittees shall submit the ordinance/legal authority and procedural changes made, if any, to implement Provision C.3.e with their 2012 Annual Report. Annual reporting thereafter shall be done in conjunction with reporting requirements under Provision C.3.b.v.

Any Permittee choosing to require 100% LID treatment onsite for all Regulated Projects and not allow alternative compliance under Provision C.3.e, shall include a statement to that effect in the 2012 Annual Report and all subsequent Annual Reports.

C.3.f. Alternative Certification of Stormwater Treatment Systems

i. Task Description – In lieu of reviewing a Regulated Project's adherence to Provision C.3.d, a Permittee may elect to have a third party conduct detailed review and certify the Regulated Project's adherence to Provision C.3.d. The third party reviewer must be a Civil Engineer or a Licensed Architect or Landscape Architect registered in the State of California, or staff of another Permittee subject to the requirements of this Permit.

ii. Implementation Level – Any Permittee accepting third-party reviews must make a reasonable effort to ensure that the third party has no conflict of interest with regard to the Regulated Project in question. That is, any consultant or contractor (or his/her employees) hired to design and/or construct a stormwater treatment system for a Regulated Project shall not also be the certifying third party. The Permittee must verify that the third party certifying any Regulated Project has current training on stormwater treatment system design (within three years of the certification signature date) for water quality and understands the groundwater protection principles applicable to Regulated Project sites.

Training conducted by an organization with stormwater treatment system design expertise (such as a college or university, the American Society of Civil Engineers, American Society of Landscape Architects, American Public Works Association, California Water Environment Association (CWEA), BASMAA, National Association of Flood & Stormwater Management Agencies, California

Stormwater Quality Association (CASQA), or the equivalent, may be considered qualifying training.

iii. Reporting – Projects reviewed by third parties shall be noted in reporting tables for Provision C.3.b.

C.3.g. Hydromodification Management

i. Hydromodification Management (HM) Projects are Regulated Projects that create and/or replace one acre or more of impervious surface and are not specifically excluded within the requirements of Attachments B–F. A project that does not increase impervious surface area over the pre-project condition is not an HM Project. All HM Projects shall meet the Hydromodification Management Standard of Provision C.3.g.ii.

ii. HM Standard

Stormwater discharges from HM Projects shall not cause an increase in the erosion potential of the receiving stream over the pre-project (existing) condition. Increases in runoff flow and volume shall be managed so that post-project runoff shall not exceed estimated pre-project rates and durations, where such increased flow and/or volume is likely to cause increased potential for erosion of creek beds and banks, silt pollutant generation, or other adverse impacts on beneficial uses due to increased erosive force. The demonstration that post-project stormwater runoff does not exceed estimated pre-project runoff rates and durations shall include the following:

(1) **Range of Flows to Control:** For Alameda, Contra Costa, San Mateo, and Santa Clara Permittees, HM controls shall be designed such that post-project stormwater discharge rates and durations match pre-project discharge rates and durations from 10 % of the pre-project 2-year peak flow[7] up to the pre-project 10-year peak flow. For Fairfield-Suisun Permittees, HM controls shall be designed such that post-project stormwater discharge rates and durations shall match from 20 percent of the 2-year peak flow up to the pre-project 10-year peak flow. Contra Costa Permittees, when using pre-sized and pre-designed Integrated Management Practices (IMPs) per Attachment C of this Order, are not required to meet the low-flow criterion of 10% of the 2-year peak flow. These IMPs are designed to control 20% of the 2-year peak flow. After the Contra Costa Permittees conduct the required monitoring specified in Attachment C, the design of these IMPs will be reviewed.

(2) **Goodness of Fit Criteria:** The post-project flow duration curve shall not deviate above the pre-project flow duration curve by more than 10 percent

[7] Where referred to in this Order, the 2-year peak flow is determined using a flood frequency analysis based on USGS Bulletin 17 B to obtain the peak flow statistically expected to occur at a 2-year recurrence interval. In this analysis, the appropriate record of hourly rainfall data (e.g., 35-50 years of data) is run through a continuous simulation hydrologic model, the annual peak flows are identified, rank ordered, and the 2-year peak flow is estimated. Such models include USEPA's Hydrologic Simulation Program—Fortran (HSPF), U.S. Army Corps of Engineers' Hydrologic Engineering Center-Hydrologic Modeling System (HEC-HMS), and USEPA's Storm Water Management Model (SWMM).

over more than 10 percent of the length of the curve corresponding to the range of flows to control.

(3) **Precipitation Data:** Precipitation data used in the modeling of HM controls shall, at a minimum, be 30 years of hourly rainfall data representative of the area being modeled. Where a longer rainfall record is available, the longer record shall be used.

(4) **Calculating Post-Project Runoff:** Retention and detention basins shall be considered impervious surfaces for purposes of calculating post-project runoff. Pre- and post-project runoff shall be calculated and compared for the entire site, without separating or excluding areas that may be considered self-retaining.

(5) **Existing HM Control Requirements:** The Water Board has adopted HM control requirements for all Permittees (except for the Vallejo Permittees), and these adopted requirements are attached to this Order as listed below. The Permittees shall comply with all requirements in their own Permittee-specific Attachment, unless otherwise specified by this Order. In all cases, the HM Standard shall be achieved.

- Attachment B for Alameda Permittees
- Attachment C for Contra Costa Permittees
- Attachment D for Fairfield-Suisun Permittees
- Attachment E for San Mateo Permittees
- Attachment F for Santa Clara Permittees

iii. Types of HM Controls

Projects shall meet the HM Standard using any of the following HM controls or a combination thereof.

(1) **Onsite HM controls** are flow duration control structures and hydrologic source controls that collectively result in the HM Standard being met at the point(s) where stormwater runoff discharges from the project site.

(2) **Regional HM controls** are flow duration control structures that collect stormwater runoff discharge from multiple projects (each of which shall incorporate hydrologic source control measures as well) and are designed such that the HM Standard is met for all the projects at the point where the regional HM control discharges.

(3) **In-stream measures** shall be an option only where the stream, which receives runoff from the project, is already impacted by erosive flows and shows evidence of excessive sediment, erosion, deposition, or is a hardened channel.

In-stream measures involve modifying the receiving stream channel slope and geometry so that the stream can convey the new flow regime without increasing the potential for erosion and aggradation. In-stream measures are intended to improve long-term channel stability and prevent erosion by reducing the erosive forces imposed on the channel boundary.

In-stream measures, or a combination of in-stream and onsite controls, shall be designed to achieve the HM Standard from the point where the project(s) discharge(s) to the stream to the mouth of the stream or to achieve an equivalent degree of flow control mitigation (based on amount of impervious surface mitigated) as part of an in-stream project located in the same watershed. Designing in-stream controls requires a hydrologic and geomorphic evaluation (including a longitudinal profile) of the stream system downstream and upstream of the project. As with all in-stream activities, other regulatory permits must be obtained by the project proponent.[8]

iv. Reporting

For each HM Project approved during the reporting period, the following information shall be reported electronically in tabular form. This information shall be added to the required reporting information specified in Provision C.3.b.v.

(1) Device(s) or method(s) used to meet the HM Standard, such as detention basin(s), biodetention unit(s), regional detention basin, or in-stream control;

(2) Method used by the project proponent to design and size the device or method used to meet the HM Standard; and

(3) Other information as required in the Permittee's existing HM requirements, as shown in Attachments B–F.

v. Vallejo Permittees shall complete the following tasks in lieu of complying with Provisions C.3.g.i-iv.

(1) Develop a Hydrograph Modification Management Plan (HMP) for meeting the requirements of Provisions C.3.g.i–iv. The Vallejo Permittees' HMP shall be subject to approval by the Water Board.

(2) Vallejo Permittees shall include the following in their HMP:

(a) A map of the City of Vallejo, delineating areas where the HM Standard applies. The HM Standard shall apply in all areas except where a project:

- discharges stormwater runoff into creeks or storm drains that are concrete-lined or significantly hardened (e.g., with rip-rap, sackrete) downstream to their outfall in San Francisco Bay;
- discharges to an underground storm drain discharging to the Bay; or
- is located in a highly developed watershed.[9]

[8] In-stream control projects require a Stream Alteration Agreement from the California Department of Fish & Game, a CWA section 404 permit from the U.S. Army Corps of Engineers, and a section 401 certification from the Water Board. Early discussions with these agencies on the acceptability of an in-stream modification are necessary to avoid project delays or redesign.

[9] Within the context of Provision C.3.g., "highly developed watersheds" refers to catchments or subcatchments that are 65% impervious or more.

However, plans to restore a creek reach may reintroduce the applicability of HM controls, and would need to be addressed in the HMP;

(b) A thorough technical description of the methods project proponents may use to meet the HM Standard. Vallejo Permittees shall use the same methodologies, or similar methodologies, to those already in use in the Bay Area to meet the HM Standard. Contra Costa sizing charts may be used on projects up to ten acres after any necessary modifications are made to the sizes to control runoff rates and durations from ten percent of the pre-project 2-year peak flow to the pre-project 10-year peak flow, and adjustments are made for local rainfall and soil types;

(c) A description of any land use planning measures the City of Vallejo will take (e.g., stream buffers and stream restoration activities, including restoration-in-advance of floodplains, revegetation, and use of less-impacting facilities at points of discharge) to allow expected changes in stream channel cross sections, stream vegetation, and discharge rates, velocities, and/or durations without adverse impacts on stream beneficial uses;

(d) A description of how the Vallejo Permittees will incorporate these requirements into their local approval processes, and a schedule for doing so; and

(e) Guidance for City of Vallejo project proponents explaining how to meet the HM Standard.

(3) Vallejo Permittees shall complete the HMP according to the schedule below. All required documents shall be submitted acceptable to the Executive Officer, except the HMP, which shall be submitted to the Water Board for approval. Vallejo Permittees shall report on the status of HMP development and implementation in each Annual Report and shall also provide a summary of projects incorporating measures to address Provision C.3.g and the measures used.

- By April 1, 2011, submit a detailed workplan and schedule for completion of the information required in Provision C.3.g.v.(2).
- By December 1, 2011, submit the map required in Provision C.3.g.v.(2)(a).
- By April 1, 2012, submit a draft HMP.
- By December 1, 2012, provide responses to Water Board comments on the draft HMP so that the final HMP is submitted for Water Board approval by July 1, 2013.
- Upon adoption by the Water Board, implement the HMP, which shall include the requirements of this measure. Before approval of the HMP by the Water Board, Vallejo Permittees shall encourage early implementation of measures likely to be included in the HMP.

C.3.h. Operation and Maintenance of Stormwater Treatment Systems

i. Task Description – Each Permittee shall implement an Operation and Maintenance (O&M) Verification Program.

ii. Implementation Level – At a minimum, the O&M Verification Program shall include the following elements:

(1) Conditions of approval or other legally enforceable agreements or mechanisms for all Regulated Projects that, at a minimum, require at least one of the following from all project proponents and their successors in control of the Project or successors in fee title:

(a) The project proponent's signed statement accepting responsibility for the O&M of the installed onsite, joint, and/or offsite stormwater treatment system(s) and HM control(s) (if any) until such responsibility is legally transferred to another entity;

(b) Written conditions in the sales or lease agreements or deed for the project that requires the buyer or lessee to assume responsibility for the O&M of the onsite, joint, and/or offsite installed stormwater treatment system(s) and HM control(s) (if any) until such responsibility is legally transferred to another entity;

(c) Written text in project deeds, or conditions, covenants and restrictions (CCRs) for multi-unit residential projects that require the homeowners association or, if there is no association, each individual owner to assume responsibility for the O&M of the installed onsite, joint, and/or offsite stormwater treatment system(s) and HM control(s) (if any) until such responsibility is legally transferred to another entity; or

(d) Any other legally enforceable agreement or mechanism, such as recordation in the property deed, that assigns the O&M responsibility for the installed onsite, joint, and/or offsite treatment system(s) and HM control(s) (if any) to the project owner(s) or the Permittee.

(2) Coordination with the appropriate mosquito and vector control agency with jurisdiction to establish a protocol for notification of installed stormwater treatment systems and HM controls.

(3) Conditions of approval or other legally enforceable agreements or mechanisms for all Regulated Projects that require the granting of site access to all representatives of the Permittee, local mosquito and vector control agency staff, and Water Board staff, for the sole purpose of performing O&M inspections of the installed stormwater treatment system(s) and HM control(s) (if any).

(4) A written plan and implementation of the plan that describes O&M (including inspection) of all Regional Projects and regional HM controls that are Permittee-owned and/or operated.

(5) A database or equivalent tabular format of all Regulated Projects (public and private) that have installed onsite, joint, and/or offsite stormwater

treatment systems. This database or equivalent tabular format shall include the following information for each Regulated Project:

(a) Name and address of the Regulated Project;

(b) Specific description of the location (or a map showing the location) of the installed stormwater treatment system(s) and HM control(s) (if any);

(c) Date(s) that the treatment system(s) and HM controls (if any) is/are installed;

(d) Description of the type and size of the treatment system(s) and HM control(s) (if any) installed;

(e) Responsible operator(s) of each treatment system and HM control (if any);

(f) Dates and findings of inspections (routine and follow-up) of the treatment system(s) and HM control(s) (if any) by the Permittee; and

(g) Any problems and corrective or enforcement actions taken.

(6) A prioritized plan for inspecting all installed stormwater treatment systems and HM controls. At a minimum, this prioritized plan must specify the following for each fiscal year:

(a) Inspection by the Permittee of all newly installed stormwater treatment systems and HM controls within 45 days of installation to ensure approved plans have been followed;

(b) Inspection by the Permittee of at least 20 percent of the total number (at the end of the preceding fiscal year) of installed stormwater treatment systems and HM controls;

(c) Inspection by the Permittee of at least 20 percent of the total number (at the end of the preceding fiscal year) of installed vault-based systems; and

(d) Inspection by the Permittee of all installed stormwater treatment systems subject to Provision C.3, at least once every five years.

iii. Maintenance Approvals: The Permittees shall ensure that onsite, joint, and offsite stormwater treatment systems and HM controls installed by Regulated Projects are properly operated and maintained for the life of the projects. In cases where the responsible party for a stormwater treatment system or HM control has worked diligently and in good faith with the appropriate State and federal agencies to obtain approvals necessary to complete maintenance activities for the treatment system or HM control, but these approvals are not granted, the Permittees shall be deemed to be in compliance with this Provision. Permittees shall ensure that constructed wetlands installed by Regulated Projects and used for urban runoff treatment shall abide by the Water Board's Resolution No. 94-102: Policy on the Use of Constructed Wetlands for Urban Runoff Pollution Control and the O&M requirements contained therein.

Due Date for Full Implementation: Immediate for Provisions C.3.h.i, C.3.h.ii.(1), and C.3.h.iii, and December 1, 2010, for Provisions C.3.h.ii.(2)-(6). For Vallejo Permittees: December 1, 2010, for Provisions C.3.h.i-iii.

iv. Reporting: Beginning with the 2010 Annual Report

(1) For each Regulated Project inspected during the reporting period (fiscal year) the following information shall be reported to the Water Board electronically in tabular form as part of the Annual Report (as set forth in the Provision C.3.h. Sample Reporting Table attached):

- Name of facility/site inspected.
- Location (street address) of facility/site inspected.
- Name of responsible operator for installed stormwater treatment systems and HM controls.
- For each inspection:
  - Date of inspection.
  - Type of inspection (e.g., initial, annual, follow-up, spot).
  - Type(s) of stormwater treatment systems inspected (e.g., swale, bioretention unit, tree well, etc.) and an indication of whether the treatment system is an onsite, joint, or offsite system.
  - Type of HM controls inspected.
  - Inspection findings or results (e.g., proper installation, proper operation and maintenance, system not operating properly because of plugging, bypass of stormwater because of improper installation, maintenance required immediately, etc.).
  - Enforcement action(s) taken, if any (e.g., verbal warning, notice of violation, administrative citation, administrative order).

(2) On an annual basis, before the wet season, provide a list of newly installed (installed within the reporting period) stormwater treatment systems and HM controls to the local mosquito and vector control agency and the Water Board. This list shall include the facility locations and a description of the stormwater treatment measures and HM controls installed.

(3) Each Permittee shall report the following information in the Annual Report each year:

(a) A discussion of the inspection findings for the year and any common problems encountered with various types of treatment systems and/or HM controls. This discussion should include a general comparison to the inspection findings from the previous year.

(b) A discussion of the effectiveness of the Permittee's O&M Program and any proposed changes to improve the O&M Program (e.g., changes in prioritization plan or frequency of O&M inspections, other changes to improve effectiveness of program).

C.3.i. Required Site Design Measures for Small Projects and Detached Single-Family Home Projects

i. Task Description – The Permittees shall require all development projects, which create and/or replace $\geq$ 2500 ft^2 to < 10,000 ft^2 of impervious surface, and

detached single-family home projects,[10] which create and/or replace 2,500 square feet or more of impervious surface, to install one or more of the following site design measures:

- Direct roof runoff into cisterns or rain barrels for reuse.
- Direct roof runoff onto vegetated areas.
- Direct runoff from sidewalks, walkways, and/or patios onto vegetated areas.
- Direct runoff from driveways and/or uncovered parking lots onto vegetated areas.
- Construct sidewalks, walkways, and/or patios with permeable surfaces.[3]
- Construct bike lanes, driveways, and/or uncovered parking lots with permeable surfaces.[3]

This provision applies to all development projects that require approvals and/or permits issued under the Permittee's' planning, building, or other comparable authority.

ii. **Implementation Level** – All elements of this task shall be fully implemented by December 1, 2012.

iii. **Reporting** – On an annual basis, discuss the implementation of the requirements of Provision C.3.i, including ordinance revisions, permit conditions, development of standard specifications and/or guidance materials, and staff training.

iv. **Task Description** – The Permittees shall develop standard specifications for lot-scale site design and treatment measures (e.g., for roof runoff and paved areas) as a resource for single-family homes and small development projects.

v. **Implementation Level** – This task may be fulfilled by the Permittees cooperating on a countywide or regional basis.

Due Date for Full Implementation – December 1, 2012.

vi. **Reporting** – A report containing the standard specifications for lot-scale treatment BMPs shall be submitted by December 1, 2012.

[10] **Detached single-family home project** – The building of one single new house or the addition and/or replacement of impervious surface to one single existing house, which is not part of a larger plan of development.

C.4. Industrial and Commercial Site Controls

Each Permittee shall implement an industrial and commercial site control program at all sites which could reasonably be considered to cause or contribute to pollution of stormwater runoff, with inspections and effective follow-up and enforcement to abate actual or potential pollution sources consistent with each Permittee's respective Enforcement Response Plan (ERP), to prevent discharge of pollutants and impacts on beneficial uses of receiving waters. Inspections shall confirm implementation of appropriate and effective BMPs and other pollutant controls by industrial and commercial site operators.

C.4.a. Legal Authority for Effective Site Management

i. Task Description – Permittees shall have sufficient legal enforcement authority to obtain effective stormwater pollutant control on industrial sites. Permittees shall have the ability to inspect and require effective stormwater pollutant control and to escalate progressively stricter enforcement to achieve expedient compliance and pollutant abatement at commercial and industrial sites within their jurisdiction.

ii. Implementation Level

(1) Permittees shall have the legal authority to oversee, inspect, and require expedient compliance and pollution abatement at all industrial and commercial sites which may be reasonably considered to cause or contribute to pollution of stormwater runoff. Permittees shall have the legal authority to require implementation of appropriate BMPs at industrial and commercial to address pollutant sources associated with outdoor process and manufacturing areas, outdoor material storage areas, outdoor waste storage and disposal areas, outdoor vehicle and equipment storage and maintenance areas, outdoor parking areas and access roads, outdoor wash areas, outdoor drainage from indoor areas, rooftop equipment, and contaminated and erodible surface areas, and other sources determined by the Permittees or Water Board Executive Officer to have a reasonable potential to contribute to pollution of stormwater runoff.

(2) Permittees shall notify the discharger of any actual or potential pollutant sources and violations and require problem correction within a reasonably short and expedient time frame commensurate with the threat to water quality. Permittees shall require timely correction of problems involving rapid temporary repair, and may allow longer time periods for implementation of more permanent solutions, if these require significant capital expenditure or construction. Violations shall be corrected prior to the next rain event or within 10 business days after the violations are noted. If more than 10 business days are required for correction, a rationale shall be given in the tabulated sheets.

C.4.b. Industrial and Commercial Business Inspection Plan (Inspection Plan)

i. Task Description – Permittees shall develop and implement an inspection plan that will serve as a prioritized inspection workplan. This inspection plan will allow inspection staff to categorize the commercial and industrial sites within the Permittee's jurisdiction by pollutant threat and inspection frequency, change inspection frequency based on site performance, and add and remove sites as businesses open and close.

The Inspection Plan shall contain the following information:

(1) Total number and a list of industrial and commercial facilities requiring inspection, within each Permittee's jurisdiction, to be determined on the basis of a prioritization criteria designed to assign a more frequent inspection schedule to the highest priority facilities per Section C.4.b.ii. below.

(2) A description of the process for prioritizing inspections and frequency of inspections. If any geographical areas are to be targeted for inspections due to high potential for stormwater pollution, these areas should be indicated in the Inspection Plan. A mechanism to include newly opened businesses that warrant inspection shall be included.

ii. Implementation Level – Each Permittee shall annually update and maintain a list of industrial and commercial facilities in the Inspection Plan to inspect that could reasonably be considered to cause or contribute to pollution of stormwater runoff. The following are some of the functional aspects of businesses and types of businesses that shall be included in the Inspection Plans:

(1) Sites that include the following types of functions that may produce pollutants when exposed to stormwater include, but are not limited to:
   (a) Outdoor process and manufacturing areas
   (b) Outdoor material storage areas
   (c) Outdoor waste storage and disposal areas
   (d) Outdoor vehicle and equipment storage and maintenance areas
   (e) Outdoor wash areas
   (f) Outdoor drainage from indoor areas
   (g) Rooftop equipment
   (h) Other sources determined by the Permittee or Water Board to have a reasonable potential to contribute to pollution of stormwater runoff

(2) The following types of Industrial and Commercial businesses that have a reasonable likelihood to be sources of pollutants to stormwater and non-stormwater discharges:
   (a) Industrial facilities, as defined at 40 CFR 122.26(b)(14), including those subject to the State General NPDES Permit for Stormwater Discharges Associated with Industrial Activity (hereinafter the Industrial General Permit);

(b) Vehicle Salvage yards;

(c) Metal and other recycled materials collection facilities, waste transfer facilities;

(d) Vehicle mechanical repair, maintenance, fueling, or cleaning;

(e) Building trades central facilities or yards, corporation yards;

(f) Nurseries and greenhouses;

(g) Building material retailers and storage;

(h) Plastic manufacturers; and

(i) Other facilities designated by the Permittee or Water Board to have a reasonable potential to contribute to pollution of stormwater runoff.

(3) **Prioritization of Facilities**

Facilities of the types described in Provision 4.b.ii.(2) above and identified by the Permittees as having the reasonable potential to contribute to pollution of stormwater runoff shall be prioritized on the basis of the potential for water quality impact using criteria such as pollutant sources on site, pollutants of concern, proximity to a waterbody, violation history of the facility, and other relevant factors.

(4) **Types/Contents of Inspections**

Each Permittee shall conduct inspections to determine compliance with its ordinances and this Permit. Inspections shall include but not be limited to the following:

(a) Prevention of stormwater runoff pollution or illicit discharge by implementing appropriate BMPs;

(b) Visual observations for evidence of unauthorized discharges, illicit connections, and potential discharge of pollutants to stormwater;

(c) Noncompliance with Permittee ordinances and other local requirements; and

(d) Verification of coverage under the Industrial General Permit, if applicable.

(5) **Inspection Frequency** – Permittees shall establish appropriate inspection frequencies for facilities based on Provision 4.b.ii (3) priority, potential for contributing pollution to stormwater runoff, and commensurate with the threat to water quality.

(6) **Record Keeping** – For each facility identified in Provision 4.b.ii, the Permittee shall maintain a database or equivalent of the following information at a minimum:

(a) Name and address of the business and local business operator;

(b) A brief description of business activity including SIC code;

(c) Inspection priority and inspection frequency; and

(d) If coverage under the Industrial General Permit is required.

iii. Reporting – The Permittees shall include the following in the Annual Report:

(1) The list of facilities identified in Provision 4.b.ii in the 2010 Annual Report and revisions or updates in subsequent annual reports; and

(2) The list of facilities scheduled for inspection during the current fiscal year.

C.4.c. Enforcement Response Plan (ERP)

i. Task Description – Permittees shall develop and implement an ERP that will serve as a reference document for inspection staff to take consistent actions to achieve timely and effective compliance from all commercial and industrial site operators.

ii. Implementation Level – The ERP shall contain the following:

(1) **Required enforcement actions** – including timeframes for corrections of problems – for various field violation scenarios. The ERP will provide guidance on appropriate use of the various enforcement tools, such as verbal and written notices of violation, citations, cleanup requirements, administrative and criminal penalties.

(2) **Timely Correction of Violations** – All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered. If more than 10 business days are required for compliance, a rationale shall be recorded in the electronic database or equivalent tabular system.

A description of the Permittee's procedures for follow-up inspections and enforcement actions or referral to another agency, including appropriate time periods for each level of corrective action.

(3) **Referral and Coordination with Water Board** – Each Permittee shall enforce its stormwater ordinances as necessary to achieve compliance at sites with observed violations. For cases in which Permittee enforcement tools are inadequate to remedy the noncompliance, the Permittee shall refer the case to the Water Board, district attorney or other relevant agencies for additional enforcement.

(4) **Recordkeeping** – Permittees shall maintain adequate records to demonstrate compliance and appropriate follow-up enforcement responses for facilities inspected.

Permittees shall maintain an electronic database or equivalent tabular system that contains the following information regarding industrial commercial site inspections:

(a) Name of Facility/Site Inspected
(b) Inspection Date
(c) Industrial General Permit coverage required (Yes or No)
(d) Compliance Status
(e) Type of Enforcement (if applicable)
(f) Type of Activity or Pollutant Source

Examples: Outdoor process/manufacturing areas, Outdoor material storage areas, Outdoor waste storage/disposal areas, outdoor vehicle and equipment storage/maintenance areas, Outdoor parking areas and access roads, Outdoor wash areas, Rooftop equipment, Outdoor drainage from indoor areas

(g) Specific Problems

(h) Problem Resolution

(i) Additional Comments

The electronic database or equivalent tabular system shall be made readily available to the Executive Officer and during inspections and audits by the Water Board staff or its representatives.

(5) The ERP shall be developed and implemented by April 1, 2010.

iii. Reporting – Permittees shall include the following information in each Annual Report:

(1) Number of inspections conducted, Number of violations issued (excluding verbal warnings), Percentage of sites inspected in violation, and number and percent of violations resolved within 10 working days or otherwise deemed resolved in a longer but still timely manner;

(2) Frequency and Types/categories of violations observed, Frequency and type of enforcement conducted;

(3) Summary of types of violations noted by business category; and

(4) Facilities that are required to have coverage under the Industrial General Permit, but have not filed for coverage.

C.4.d. Staff Training

i. Task Description

Permittees shall provide focused training for inspectors annually. Trainings may be Program-wide, Region-wide, or Permittee-specific.

ii. Implementation Level

At a minimum, train inspectors, within the 5-year term of this Permit, in the following topics:

(1) Urban runoff pollution prevention;

(2) Inspection procedures;

(3) Illicit Discharge Detection, Elimination and follow-up; and

(4) Implementation of typical BMPs at Industrial and Commercial Facilities.

Permittees, either countywide or regionally, if they have not already done so, are encouraged to create or adopt guidance for inspectors or reference existing inspector guidance including the California Association of Stormwater Quality Agencies (CASQA) Industrial BMP Handbook.

iii. Reporting

The Permittees shall include the following information in the Annual Report:

(1) Dates of trainings;

(2) Training topics that have been covered; and

(3) Percentage of Permittee inspectors attending training.

C.5. Illicit Discharge Detection and Elimination

The purpose of this provision is to implement the illicit discharge prohibition and to ensure illicit discharges are detected and controlled that are not otherwise controlled under provision C4, Industrial and Commercial Site Controls and C6, Construction Site Controls. Permittees shall develop and implement an illicit discharge program that includes an active surveillance component and a centralized complaint collection and follow-up component to target illicit discharge and non-stormwater sources. Permittees shall maintain a complaint tracking and follow-up data system as their primary accountability reporting for this provision.

C.5.a. Legal Authority

i. Task Description – Permittees shall have the legal authority to prohibit and control illicit discharges and escalate stricter enforcement to achieve expedient compliance.

ii. Implementation Level

(1) Permittees shall have adequate legal authority to address stormwater and non-stormwater pollution associated with, but not limited to the following:

(a) Sewage;

(b) Discharges of wash water resulting from the cleaning of exterior surfaces and pavement, or the equipment and other facilities of any commercial business, or any other public or private facility;

(c) Discharges of runoff from material storage areas, including containing chemicals, fuels, or other potentially polluting or hazardous materials;

(d) Discharges of pool or fountain water containing chlorine, biocides, or other chemicals; discharges of pool or fountain filter backwash water;

(e) Discharges of sediment, pet waste, vegetation clippings, or other landscape or construction-related wastes; and

(f) Discharges of food-related wastes (e.g., grease, fish processing, and restaurant kitchen mat and trash bin wash water, etc.).

(2) Permittees shall have adequate legal authority to prohibit, discover through inspection and surveillance, and eliminate illicit connections and discharges to storm drains.

(3) Permittees shall have adequate legal authority to control the discharge of spills, dumping, or disposal of materials other than storm water to storm drains.

C.5.b. Enforcement Response Plan (ERP)

i. Task Description – Permittees shall develop and implement an ERP that will serve as guidance for inspection staff to take consistent actions to achieve timely and effective abatement of illicit discharges.

ii. Implementation Level – The ERP shall contain the following:

(1) Recommended responses and enforcement actions – including timeframes for corrections of problems – for various types and degree of violations. The ERP shall provide guidelines on when to employ the range of regulatory responses from warnings, citations and cleanup and cost recovery, to administrative or criminal penalties.

(2) Timely Correction of Violations: All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered. If more than 10 business days are required for compliance, a rationale shall be recorded in the electronic database or equivalent tabular system. Immediate correction can be temporary and short-term if a long-term, permanent correction will involve significant resources and construction time. An example would be replumbing of a wash area to the sanitary sewer, which would involve an immediate short-term, temporary fix followed by permanent replumbing.

(3) If corrective actions are not implemented promptly or if there are repeat violations, Permittees shall escalate responses as needed to achieve compliance, including referral to other agencies were necessary.

(4) The ERP shall be developed and implemented by April 1, 2010.

C.5.c. Spill and Dumping Response, Complaint Response, and Frequency of Inspections

i. Task Description – Permittees shall have a central contact point, including a phone number for complaints and spill reporting, and publicize this number to both internal Permittee staff and the public. If 911 is selected, also maintain and publicize a staffed, non-emergency phone number with voicemail, which is checked during normal business hours.

Permittees shall develop a spill/dumping response flow chart and phone tree or contact list for internal use that shows the various responsible agencies and their contacts, who would be involved in illicit discharge incident response that goes beyond the Permittees immediate capabilities. The list shall be maintained and updated as changes occur.

Permittees shall conduct reactive inspections in response to complaints and follow-up inspections as needed to ensure that corrective measures have been implemented to achieve and maintain compliance.

ii. Implementation Level – Permittees will have the phone number and contact information available and integrated into training and outreach both to Permittee staff and the public by July 1, 2010.

iii. Reporting – Submit the complaint and spill response phone number and spill contact list with the 2010 Annual Report and update annually if changes occur.

C.5.d. Control of Mobile Sources

i. Task Description – The purpose of this section is to establish oversight and control of pollutants associated with mobile business sources.

ii. Implementation Level – Each Permittee shall develop and implement a program to reduce the discharge of pollutants from mobile businesses.

(1) The program shall include the following:

(a) Development and implementation of minimum standards and BMPs to be required for each of the various types of mobile businesses such as automobile washing, power washing, steam cleaning, and carpet cleaning. This guidance can be developed via county-wide or regional collaboration.

(b) Development and implementation of an enforcement strategy which specifically addresses the unique characteristics of mobile businesses.

(c) Outreach to mobile businesses operating within the Permittee's jurisdiction with minimum standards and BMP requirements and local ordinances through an outreach and education strategy.

(d) Inspection of mobile businesses as needed.

(2) Permittees should cooperate regionally in developing and implementing their programs for mobile businesses, including sharing of mobile business inventories, BMP requirements, enforcement action information, and education.

iii. Reporting – Permittees shall report on implementation of minimum standards and BMPs for mobile business and their enforcement strategy in each Annual Report.

C.5.e. Collection System Screening - Municipal Separate Storm Sewer System (MS4) Map Availability

i. Task Description – Permittees shall perform routine surveys for illicit discharges and illegal dumping in above ground check points in the collection system including elements that are typically inspected for other maintenance purposes, such as end of pipes, creeks, flood conveyances, storm drain inlets and catch basins, in coordination with public works/flood control maintenance surveys, video inspections of storm drains, and during other routine Permittee maintenance and inspection activities when Permittee staff are working in or near the MS4 system.

ii. Implementation Level – Permittees shall develop and implement a screening program utilizing the USEPA/Center for Watershed Protection publication, "Illicit Discharge Detection and Elimination: A Guidance Manual for Program Development and Technical Assessment." Permittees shall implement the screening program by conducting a survey of strategic collection system check points (one screening point per square mile of Permittee urban and suburban jurisdiction area, less open space) including some key major outfalls draining industrial areas as defined in 40 CFR 122.26 (b)(5) once each year in dry weather conditions meaning no significant rainfall within the past 3 weeks. Routine surveys that occur on an ongoing basis during regular conveyance system inspections may be credited toward this requirement. Make maps of the MS4 publicly available, either electronically or in hard copy by July 1, 2010. The public availability shall be through a publicized single point of contact that

is convenient for the public, such as a staffed counter or web accessible maps. The MS4 map availability shall be publicized through Permittee directories and web pages.

iii. Reporting – Permittees shall provide a summary of their collection screening program, a summary of problems found during collection system screening, and any changes to the screening program in each Annual Report.

C.5.f. Tracking and Case Follow-up

i. Task Description – All incidents or discharges reported to the complaint/spill system that might pose a threat to water quality shall be logged to track follow-up and response through problem resolution. The data collected shall be sufficient to demonstrate escalating responses for repeated problems, and inter/intra-agency coordination, where appropriate.

ii. Implementation Level – Create and maintain a water quality spill and discharge complaint tracking and follow-up in an electronic database or equivalent tabular system by April 1, 2010.

The spill and discharge complaint tracking system shall contain the following information:

(1) Complaint information:
   (a) Date and time of complaint
   (b) Type of pollutant
   (c) Problem Status (potential or actual discharge.)

(2) Investigation information:
   (a) Date and time started
   (b) Type of pollutant
   (c) Entered storm drain and/or receiving water
   (d) Date abated
   (e) Type of enforcement (if applicable)

(3) Response time (days)
   (a) Call to investigation
   (b) Investigation to abatement
   (c) Call to abatement

The electronic database or equivalent tabular system shall be made available to Water Board staff as needed for review of enforcement response through problem resolution.

iii. Reporting – Permittees shall provide the following information in the Annual Report:

(1) Number of discharges reported;

(2) Number of discharges reaching storm drains and/or receiving waters;

(3) Number and percentage of discharges resolved in a timely manner; and

(4) Summary of major types of discharges and complaints.

C.6. Construction Site Control

Each Permittee shall implement a construction site inspection and control program at all construction sites, with follow-up and enforcement consistent with each Permittee's respective Enforcement Response Plan (ERP), to prevent construction site discharges of pollutants and impacts on beneficial uses of receiving waters. Inspections shall confirm implementation of appropriate and effective erosion and other construction pollutant controls by construction site operators/developers; and reporting shall demonstrate the effectiveness of this inspection and problem solution activity by the Permittees.

C.6.a. Legal Authority for Effective Site Management

i. Task Description – Permittees shall have the ability to require effective stormwater pollutant controls, and escalate progressively stricter enforcement to achieve expedient compliance and clean up at all public and private construction sites.

ii. Implementation Level

(1) Permittees shall have the legal authority to require at all construction sites year round effective erosion control, run-on and runoff control, sediment control, active treatment systems (as appropriate), good site management, and non storm water management through all phases of construction (including but not limited to site grading, building, and finishing of lots) until the site is fully stabilized by landscaping or the installation of permanent erosion control measures.

(2) Permittees shall have the legal authority to oversee, inspect, and require expedient compliance and clean up at all construction sites year round.

iii. Reporting – Permittees shall certify adequacy of their respective legal authority in the 2010 Annual Report.

C.6.b. Enforcement Response Plan (ERP)

i. Task Description – Permittees shall develop and implement an ERP that will serve as a reference document for inspection staff to take consistent actions to achieve timely and effective compliance from all public and private construction site owners/operators.

ii. Implementation Level

(1) The ERP shall include required enforcement actions – including timeframes for corrections of problems – for various field violation scenarios. All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered. If more than 10 business days are required for compliance, a rationale shall be recorded in the electronic database or equivalent tabular system.

(2) If site owners/operators do not implement appropriate corrective actions in a timely manner, or if violations repeat, Permittees shall take progressively stricter responses to achieve compliance. The ERP shall include the structure for progressively stricter responses and various violation scenarios that evoke progressively stricter responses.

(3) The ERP shall be developed and implemented by April 1, 2010.

C.6.c. Best Management Practices Categories

i. Task Description – Permittees shall require all construction sites to have site specific, and seasonally- and phase-appropriate, effective Best Management Practices (BMPs) in the following six categories:

- Erosion Control
- Run-on and Run-off Control
- Sediment Control
- Active Treatment Systems (as necessary)
- Good Site Management
- Non Stormwater Management.

Theses BMP categories are listed in State General NPDES Permit for Stormwater Discharges Associated with Construction Activities (hereinafter the Construction General Permit).

ii. Implementation Level

The BMPs targeting specific pollutants within the six categories listed in C.6.c.i. shall be site specific. Site specific BMPs targeting specific pollutants from the six categories listed in C.6.c.i. can be a combination of BMPs from:

- California BMP Handbook, Construction, January 2003.
- Caltrans Stormwater Quality Handbooks, Construction Site Best Management Practices Manual, March 2003, and addenda.
- California Regional Water Quality Control Board, San Francisco Bay Region, Erosion and Sediment Control Field Manual, 2002.
- New BMPs available since the release of these Handbooks.

C.6.d. Plan Approval Process

i. Task Description – Permittees shall review erosion control plans for consistency with local requirements, appropriateness and adequacy of proposed BMPs for each site before issuance of grading permits for projects. Permittees shall also verify that sites disturbing one acre or more of land have filed a Notice of Intent for coverage under the Construction General Permit.

ii. Implementation Level – Before approval and issuance of local grading permits, each Permittee shall perform the following:

(1) Review the site operator's/developer's erosion/pollution control plan or Stormwater Pollution Prevention Plan (SWPPP) to verify compliance with the Permittee's grading ordinance and other local requirements. Also review the site operator's/developer's erosion/pollution control plan or SWPPP to verify that seasonally appropriate and effective BMPs for the six categories listed in C.6.c.i. are planned;

(2) For sites disturbing one acre or more of soil, verify that the site operators/developers have filed a Notice of Intent for permit coverage under the Construction General Permit; and

(3) Provide construction stormwater management educational materials to site operators/developers, as appropriate.

C.6.e. Inspections

i. Task Description – Permittees shall conduct inspections to determine compliance with local ordinances (grading and stormwater) and determine the effectiveness of the BMPs in the six categories listed in C.6.c.i.; and Permittees shall require timely corrections of all actual and threatened violations of local ordinances observed.

ii. Implementation Level

(1) **Wet Season Notification**

By September 1st of each year, each Permittee shall remind all site developers and/or owners disturbing one acre or more of soil to prepare for the upcoming wet season.

(2) **Frequency of Inspections**

Inspections shall be conducted monthly during the wet season[11] at the following sites:

(a) All construction sites disturbing one or more acre of land; and

(b) **High Priority Sites** – Other sites determined by the Permittee or the Water Board as significant threats to water quality. In evaluating threat to water quality, the following factors shall be considered:

(i) Soil erosion potential or soil type;

(ii) Site slope;

(iii) Project size and type;

(iv) Sensitivity or receiving waterbodies;

(v) Proximity to receiving waterbodies;

(vi) Non-stormwater discharges; and

(vii) Any other relevant factors as determined by the local agency or the Water Board.

[11] For the purpose of inspections, the wet season is defined as October through April, but sites need to implement seasonally appropriate BMPs in the six categories listed in C.6.c.i throughout the year.

(3) **Contents of Inspections**

Inspections shall focus on the adequacy and effectiveness of the site specific BMPs implemented for the six categories listed in C.6.c.i. Permittees shall require timely corrections of all actual and potential problems observed. Inspections of construction sites shall include, but are not limited to, the following:

(a) Assessment of compliance with Permittee's ordinances and permits related to urban runoff, including the implementation and maintenance of the verified erosion/pollution control plan or SWPPP (from C.6.d.ii.(1));

(b) Assessment of the adequacy and effectiveness of the site specific BMPs implemented for the six categories listed in C.6.c.i.;

(c) Visual observations for:

- actual discharges of sediment and/or construction related materials into stormdrains and/or waterbodies.
- evidence of sediment and/or construction related materials discharges into stormdrains and/or waterbodies.
- illicit connections.
- potential illicit connections.

(d) Education on stormwater pollution prevention, as needed.

(4) **Tracking**

All inspections must be recorded on a written or electronic inspection form. Inspectors shall follow the ERP if a violation is noted and shall require timely corrections of all actual and threatened violations of local ordinances observed. All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered. If more than 10 business days are required for compliance, a rationale shall be recorded on the inspection form.

Permittees shall track in an electronic database or tabular format all inspections. This electronic database or tabular format shall be made readily available to the Executive Officer and during inspections and audits by the Water Board staff or its representatives. This electronic database or tabular format shall record the following information for each site inspection:

(a) Site name;

(b) Inspection date;

(c) Weather during inspection;

(d) Has there been rainfall with runoff since the last inspection?;

(e) Enforcement Response Level (Use ERP);

(f) Problem(s) observed using Illicit Discharge and the six BMP categories listed in C.6.c.i.;

(g) Specific Problem(s) (List the specific problem(s) within the BMP categories);

(h) Resolution of Problems noted using the following three standardized categories: Problems Fixed, Need More Time, and Escalate Enforcement; and

(i) Comments, which shall include all Rationales for Longer Compliance Time, all escalation in enforcement discussions, and any other information that may be relevant to that site inspection.

iii. Reporting

(1) In each Annual Report, each Permittee shall summarize the following information:

(a) Total number of active sites disturbing less than one acre of soil requiring inspection;

(b) Total number of active sites disturbing 1 acre or more of soil;

(c) Total number of inspections conducted;

(d) Number and percentage[12] of violations in each of the six categories listed in C.6.c.i.;

(e) Number and percentage[13] of each type of enforcement action taken as listed in each Permittee's ERP;

(f) Number of discharges, actual and those inferred through evidence, of sediment or other construction related materials;

(g) Number of sites with discharges, actual and those inferred through evidence, of sediment or other construction related materials;

(h) Number and percentage[14] of violations fully corrected prior to the next rain event but no longer than 10 business days after the violations are discovered or otherwise considered corrected in a timely, though longer period; and

(i) Number and percentage[15] of violations not fully corrected 30 days after the violations are discovered.

(2) In each Annual Report, each Permittee shall evaluate its respective electronic database or tabular format and the summaries produced in C.6.e.ii.(4) above. This evaluation shall include findings on the program's strength, comparison to previous years' results, as well as areas that need

[12] Percentage shall be calculated as number of violations in each category divided by total number of violations in all six categories.

[13] Percentage shall be calculated as number of each type of enforcement action divided by the total number of enforcement actions.

[14] Percentage shall be calculated as follows: number of violations fully corrected prior to the goal of the next rain event but no later than10 business days after the violations are discovered divided by the total number of violations for the reporting year.

[15] Percentage shall be calculated as follows: number of violations not fully corrected 30 days after the violations are discovered divided by the total number of violations for the reporting year.

more focused education for site owners, operators, and developers the following year.

(3) The Executive Officer may require that the information recorded and tracked by C.6.e.ii.(4) be submitted electronically or in a tabular format. Permittees shall submit the information within 10-working days of the Executive Officer's requirement. Submittal of the information in tabular form for the reporting year is not required in each Annual Report but encouraged.

C.6.f. Staff Training

i. Task Description – Permittees shall provide training or access to training for staff conducting construction stormwater inspections.

ii. Implementation Level – Permittees shall provide training at least every other year to municipal staff responsible for conducting construction site stormwater inspections. Training topics will include information on correct uses of specific BMPs, proper installation and maintenance of BMPs, Permit requirements, local requirements, and ERP.

iii. Reporting – Permittees shall include in each Annual Report the following information: training topics covered, dates of training, and the percentage of Permittees' inspectors attending each training. If no training in that year, so state.

C.7. Public Information and Outreach

Each Permittee shall increase the knowledge of the target audiences regarding the impacts of stormwater pollution on receiving water and potential solutions to mitigate the problems caused; change the waste disposal and runoff pollution generation behavior of target audiences by encouraging implementation of appropriate solutions; and involve various citizens in mitigating the impacts of stormwater pollution.

C.7.a. Storm Drain Inlet Marking

i. Task Description – Permittees shall mark and maintain at least 80 percent of municipally-maintained storm drain inlets with an appropriate stormwater pollution prevention message, such as "No dumping, drains to Bay" or equivalent. At least 80% of municipally-maintained storm drain inlet markings shall be inspected and maintained at least once per 5-year permit term. For newly approved, privately maintained streets, Permittees shall require inlet marking by the project developer upon construction and maintenance of markings through the development maintenance entity. Markings shall be verified prior to acceptance of the project.

ii. Implementation Level

(1) Inspect and maintain markings of at least 80 percent of municipality maintained inlets to ensure they are legibly labeled with a no dumping message or equivalent once per permit term.

(2) Verify that newly developed streets are marked prior to acceptance of the project.

iii. Reporting

(1) In the 2013 Annual Report, each Permittee shall report prior years' annual percentages of municipality maintained inlet markings inspected and maintained as legible with a no dumping message or equivalent.

(2) In the 2013 Annual Report, each Permittee shall report prior years' annual number of projects accepted after inlet markings were verified.

C.7.b. Advertising Campaigns

i. Task Description – Permittees shall participate in or contribute to advertising campaigns on trash/litter in waterways and pesticides with the goal of significantly increasing overall awareness of stormwater runoff pollution prevention messages and behavior changes in target audience.

ii. Implementation Level

(1) Target a broad audience with two separate advertising campaigns, one focused on reducing trash/litter in waterways and one focused on reducing the impact of urban pesticides. The advertising campaigns may be coordinated regionally or county-wide.

(2) Permittees shall conduct a pre-campaign survey and a post-campaign survey to identify and quantify the audiences' knowledge, trends, and

attitudes and/or practices; and to measure the overall population's awareness of the messages and behavior changes achieved by the two advertising campaigns. These surveys may be done regionally or county-wide.

iii. Reporting

(1) In the Annual Report following the pre-campaign survey, each Permittee (or the Countywide Program, if the survey was done county-wide or regionally) shall provide a report of the survey completed, which at a minimum, shall include the following:

- A summary of how the survey was implemented.
- A copy of the survey.
- A copy of the survey results.
- An analysis of the survey results.
- A discussion of the outreach strategies based on the survey results.
- A discussion of the planned or future advertising campaigns to influence awareness and behavior changes regarding trash/litter and pesticides.

(2) In the Annual Report following the post campaign survey, each Permittee (or the Countywide Program, if survey was done county-wide or regionally) shall provide a report of the survey completed, which at minimum shall include the information required in the pre-campaign report (C.7.b.iii.(1)) and the following:

- A discussion of the campaigns.
- A discussion of the measurable changes in awareness and behavior achieved.
- An update of outreach strategies based on the survey results.

C.7.c. Media Relations – Use of Free Media

i. Task Description – Permittees shall participate in or contribute to a media relations campaign. Maximize use of free media/media coverage with the objective of significantly increasing the overall awareness of stormwater pollution prevention messages and associated behavior change in target audiences, and to achieve public goals.

ii. Implementation Level – Conduct a minimum of six pitches (e.g., press releases, public service announcements, and/or other means) per year at the county-wide program, regional, and/or local levels.

iii. Reporting – In each Annual Report, each Permittee (or the Countywide Program, if the media relations campaign was done county-wide or regionally) shall include the details of each media pitch, such as the medium, date, and content of the pitch.

C.7.d. Stormwater Point of Contact

i. Task Description – Permittees shall individually or collectively create and maintain a point of contact, e.g., phone number or website, to provide the public with information on watershed characteristics and stormwater pollution prevention alternatives.

ii. Implementation Level – Maintain and publicize one point of contact for information on stormwater issues. Permittees may combine this function with the complaint/spill contact required in C.5.

iii. Reporting – In the 2010 Annual Report, each Permittee shall discuss how this point of contact is publicized and maintained. If any change occurs in this contact, report in subsequent annual report.

C.7.e. Public Outreach Events

i. Task Description – Participate in and/or host events such as fairs, shows, workshops, (e.g., community events, street fairs, and farmers' markets), to reach a broad spectrum of the community with both general and specific stormwater runoff pollution prevention messages. Pollution prevention messages shall include encouraging residents to (1) wash cars at commercial car washing facilities, (2) use minimal detergent when washing cars, and (3) divert the car washing runoff to landscaped area.

ii. Implementation Level – Each Permittee shall annually participate and/or host the number of events according to its population, as shown in the table below:

Table 7.1 Public Outreach Events[16]

Permittee Population	Number of Outreach Events
< 10,000	2
10,001– 40,000	3
40,001 – 100,000	4
100,001 – 175,000	5
175,001 – 250,000	6
> 250,000	8
Non-population-based Permittees[17]	6

Should a public outreach event contain significant citizen involvement elements, the Permittee may claim credit for both Public Outreach Events (C.7.e.) and Citizen Involvement Events (C.7.g.).

iii. Reporting – In each Annual Report, each Permittee shall list the events (name of event, event location, and event date) participated in and assess the effectiveness

[16] Permittees may claim individual credits for all events in which their Countywide Program or BASMAA participates, supports, and/or hosts, which are publicized to reach the Permittees jurisdiction.

[17] Alameda County Flood Control and Water Conservation District, Contra Costa Flood Control and Water Conservation District, Santa Clara Valley Water District, Vallejo Sanitation and Flood Control District, and Zone 7 of the Alameda County Flood Control and Water Conservation District

of efforts with appropriate measures (e.g., success at reaching a broad spectrum of the community, number of participants compared to previous years, post-event survey results, quantity/volume materials cleaned up and comparisons to previous efforts).

C.7.f. Watershed Stewardship Collaborative Efforts

i. Task Description – Permittees shall individually or collectively encourage and support watershed stewardship collaborative efforts of community groups such as the Contra Costa Watershed Forum, the Santa Clara Basin Watershed Management Initiative, "friends of creek" groups, and other organizations that benefit the health of the watershed such as the Bay-Friendly Landscaping and Gardening Coalition. If no such organizations exist, encourage and support development of grassroots watershed groups or engagement of an existing group, such as a neighborhood association, in watershed stewardship activities. Coordinate with existing groups to further stewardship efforts.

ii. Implementation Level – Annually demonstrate effort.

iii. Reporting – In each Annual Report, each Permittee shall state the level of effort, describe the support given, state what efforts were undertaken and the results of these efforts, and provide an evaluation of the effectiveness of these efforts.

C.7.g. Citizen Involvement Events

i. Task Description – Permittees shall individually or collectively, support citizen involvement events, which provide the opportunity for citizens to directly participate in water quality and aquatic habitat improvement, such as creek/shore clean-ups, adopt-an-inlet/creek/beach programs, volunteer monitoring, service learning activities such as storm drain inlet marking, community riparian restoration activities, community grants, other participation and/or host volunteer activities.

ii. Implementation Level – Each Permittee shall annually sponsor and/or host the number of citizen involvement events according to its population, as shown in the table below:

Table 7.2 Community Involvement Events[18]

Permittee Population	Number of Involvement Events
< 10,000	1
10,001 – 40,000	1
40,001 – 100,000	2
100,001 – 175,000	3
175,001 – 250,000	4
> 250,000	5
Non-population-based Permittees	2

[18] Permittees can claim individual credit for all events sponsored or hosted by their Countywide Program or BASMAA, which are publicized to reach the Permittee's jurisdiction.

Should a citizen involvement event contain significant public outreach elements, the Permittee may claim credit for both Citizen Involvement Events (C.7.g.) and Public Outreach Events (C.7.e.).

iii. Reporting – In each Annual Report, each Permittee shall list the events (name of event, event location, and event date) participated in and assess the effectiveness of efforts with appropriate measures (e.g., success at reaching a broad spectrum of the community, number of participants compared to previous years, post-event survey results, number of inlets/creeks/shores/parks/and such adopted, quantity/volume materials cleaned up, data trends, and comparisons to previous efforts).

C.7.h. School-Age Children Outreach

i. Task Description – Permittees shall individually or collectively implement outreach activities designed to increase awareness of stormwater and/or watershed message(s) in school-age children (K through 12).

ii. Implementation Level – Implement annually and demonstrate effectiveness of efforts through assessment.

iii. Reporting – In each Annual Report, each Permittee shall state the level of effort, spectrum of children reached, and methods used, and provide an evaluation of the effectiveness of these efforts.

C.7.i. Outreach to Municipal Officials

i. Task Description – Permittees shall conduct outreach to municipal officials. One alternative means of accomplishing this is through the use of the Nonpoint Education for Municipal Officials program (NEMO) to significantly increase overall awareness of stormwater and/or watershed message(s) among regional municipal officials.

ii. Implementation Level – At least once per permit cycle, or more often.

iii. Reporting – Permittees shall summarize efforts in the 2013 Annual Report.

C.8. Water Quality Monitoring

C.8.a. Compliance Options

i. Regional Collaboration – All Permittees shall comply with the monitoring requirements in C.8, however, Permittees may choose to comply with any requirement of this Provision through a collaborative effort to conduct or cause to be conducted the required monitoring in their jurisdictions. Where all or a majority of the Permittees collaborate to conduct water quality monitoring, this shall be considered a regional monitoring collaborative.

Where an existing collaborative body has initiated plans, before the adoption of this Permit, to conduct monitoring that would fulfill a requirement(s) of this Provision, but the monitoring would not meet this Provision's due date(s) by a year or less, the Permittees may request the Executive Officer adjust the due date(s) to synchronize with such efforts.

The types, quantities, and quality of data required within Provision C.8 establish the minimum level-of-effort that a regional monitoring collaborative must achieve. Provided these data types, quantities, and quality are obtained, a regional monitoring collaborative may develop its own sampling design. For Pollutants of Concern and Long-Term monitoring required under C.8.e, an alternative approach may be pursued by Permittees provided that: either similar data types, data quality, data quantity are collected with an equivalent level of effort described under C.8.e; or an equivalent level of monitoring effort is employed to answer the management information needs stated under C.8.e.

ii. Implementation Schedule – Monitoring conducted through a regional monitoring collaborative shall commence data collection by October 2011. All other Permittee monitoring efforts shall commence data collection by October 2010. By July 1, 2010, each Permittee shall provide documentation to the Water Board, such as a written agreement, letter, or similar document that confirms whether the Permittee will conduct monitoring individually or through a regional monitoring collaborative.[19]

iii. Permittee Responsibilities – A Permittee may comply with the requirements in Provision C.8 by performing the following:

(1) Contributing to its stormwater countywide program, as determined appropriate by the Permittee members, so that the stormwater countywide Program conducts monitoring on behalf of its members;

(2) Contributing to a regional collaborative effort;

[19] This documentation will allow the Water Board to know when monitoring will commence for each Permittee. Permittees who commit to monitoring individually may join the regional monitoring collaborative at any time. Any Permittee who discontinues monitoring through the regional collaborative must commence complying with all requirements of Provision C.8 immediately.

(3) Fulfilling monitoring requirements within its own jurisdictional boundaries; or

(4) A combination of the previous options, so that all requirements are fulfilled.

iv. Third-party Monitoring – Permittees may choose to fulfill requirements of Provision C.8 using data collected by citizen monitors or other third-party organizations, provided the data are demonstrated to meet the data quality objectives described in Provision C.8.h. Where an existing third-party organization has initiated plans to conduct monitoring that would fulfill a requirement(s) of this Provision, but the monitoring would not meet this Provision's due date(s) by a year or less, the Permittees may request that the Executive Officer adjust the due date(s) to synchronize with such efforts.

C.8.b. San Francisco Estuary Receiving Water Monitoring

With limited exceptions, urban runoff from the Permittees' jurisdictions ultimately discharges to the San Francisco Estuary. Monitoring of the Estuary is intended to answer questions[20] such as:

- Are chemical concentrations in the Estuary potentially at levels of concern and are associated impacts likely?
- What are the concentrations and masses of contaminants in the Estuary and its segments?
- What are the sources, pathways, loadings, and processes leading to contaminant related impacts in the Estuary?
- Have the concentrations, masses, and associated impacts of contaminants in the Estuary increased or decreased?
- What are the projected concentrations, masses, and associated impacts of contaminants in the Estuary?

Permittees shall participate in implementing an Estuary receiving water monitoring program, at a minimum equivalent to the San Francisco Estuary Regional Monitoring Program for Trace Substances (RMP), by contributing their fair-share financially on an annual basis.

C.8.c. Status Monitoring/Rotating Watersheds

i. Status Monitoring is intended to answer these questions: Are water quality objectives, both numeric and narrative, being met in local receiving waters,

[20] These are the management questions approved by the Regional Monitoring Program's Steering Committee on May 9, 2008, and stated at http://www.sfei/rmp/rmp_steering_meetings/rmp_steering_meeting_5_09_08/Item%2010a%20Attachment%201%20%20Draft%20RMP%20Management%20Questions%2005-02-08%20Annotated.pdf. While the stated objectives may change over time, the intent of this provision is for Permittees to continue contributing financially and as stakeholders in such a program as the RMP, which monitors the quality of San Francisco Bay.

including creeks, rivers and tributaries? Are conditions in local receiving waters supportive of or likely to be supportive of beneficial uses?

ii. Parameters and Methods – Permittees shall conduct Status Monitoring using the parameters, methods, occurrences, durations, and minimum number of sampling sites as described in Table 8.1. Spring sampling shall be conducted during the April - June timeframe; dry weather sampling shall be conducted during the July - September timeframe. Minor variations of the parameters and methods may be allowed with Executive Officer concurrence.

iii. Frequency – Permittees shall complete the Status Monitoring in Table 8.1 at the following frequencies:

- Alameda Permittees – annually
- Contra Costa Permittees – annually
- Fairfield-Suisun Permittees – twice during the Permit term
- San Mateo Permittees – annually
- Santa Clara Permittees – annually
- Vallejo Permittees – once during the Permit term

Table 8.1 Status Monitoring Elements

Status Monitoring Parameter	**Sampling and/or Analytical Method**[21]	**Minimum Sampling Occurrence**[22]	**Duration of Sampling**	**Minimum # Sample Sites to Monitor/Yr**[23] Santa Clara & Alameda Permittees/ Contra Costa & San Mateo Permittees/ Fairfield-Suisun & Vallejo Permittees	**Result(s) that Trigger a Monitoring Project in Provision C.8.d.i.**
Biological Assessment[24] (Includes Physical Habitat Assessment and General Water Quality Parameters[25]) Nutrients (total phosphorus, dissolved orthophosphate, total nitrogen, nitrate, ammonia, silica, chloride,	SWAMP Std Operating Procedure[26,27,28] for Biological Assessments & PHab; SWAMP	1/yr (Spring Sampling)	Grab sample	Spring 20 / 10 / 4	BMI metrics that indicate substantially degraded community as per Attachment H, Table H-1 For Nutrients: 20% of results in one waterbody exceed one or more water quality standard

21 Refers to field protocol, instrumentation and/or laboratory protocol.

22 Refers to the number of sampling events at a specific site in a given year.

23 The number of sampling sites shown is based on the relative population in each Regional Stormwater Countywide Program and is listed in this order: Santa Clara & Alameda Countywide / Contra Costa & San Mateo Countywide / Vallejo & Fairfield-Suisun Programs.

24 The same general location must be used to collect benthic community, sediment chemistry, and sediment toxicity samples. General Water Quality Parameters need not be collected twice, where it is collected by a multi-parameter probe at a subset of these sample sites (see next row of Table 8.1).

25 Includes dissolved oxygen, temperature, conductivity, and pH.

26 Ode, P.R. 2007. Standard Operating Procedures for Collecting Benthic Macroinvertebrate Samples and Associated Physical and Chemical Data for Ambient Bioassessments in California, California State Water Resources Control Board Surface Water Ambient Monitoring Program (SWAMP), as subsequently revised (http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/phab_sopr6.pdf). Permittees may coordinate with Water Board staff to modify their sampling procedures if these referenced procedures change during the Permit term.

27 Biological assessments shall include benthic macroinvertebrates and algae. Bioassessment sampling method shall be multihabitat reach-wide. Macroinvertebrates shall be identified according to the Standard Taxonomic Effort Level I of the Southwestern Association of Freshwater Invertebrate Taxonomists, using the most current SWAMP approved method. Current methods are documented in (1) SWAMP Standard Operating Procedure (SOP) and Interim Guidance on Quality Assurance for SWAMP Bioassessments, Memorandum to SWAMP Roundtable from Beverly H. van Buuren and Peter R. Ode, 5-21-07, and (2) Amendment to SWAMP Interim Guidance on Quality Assurance for SWAMP Bioassessments, Memorandum to SWAMP Roundtable from Beverly H. van Buuren and Peter R. Ode, 9-17-08. For algae, include mass (ash-free dry weight), chlorophyll a, diatom and soft algae taxonomy, and reachwide algal percent cover. Physical Habitat (PHab) Assessment shall include the SWAMP basic method plus 1) depth and pebble count + CPOM, 2) cobble embeddedness, 3) discharge measurements, and 4) in-stream habitat. Permittees may coordinate with Water Board staff to modify these sampling procedures if SWAMP procedures change during the Permit term.

28 Algae shall be collected in a consistent timeframe as Regional SWAMP. For guidance on algae sampling and evaluation: Fetscher, A. and K. McLaughlin, May 16, 2008. Incorporating Bioassessment Using Freshwater Algae into California's Surface Water Ambient Monitoring Program (SWAMP). Technical Report 563 and current SWAMP-approved updates to Standard Operating Procedures therein. Available at http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/563_periphyton_bioassessment.pdf.

Status Monitoring Parameter	**Sampling and/or Analytical Method**[21]	**Minimum Sampling Occurrence**[22]	**Duration of Sampling**	**Minimum # Sample Sites to Monitor/Yr**[23] Santa Clara & Alameda Permittees/ Contra Costa & San Mateo Permittees/ Fairfield-Suisun & Vallejo Permittees	**Result(s) that Trigger a Monitoring Project in Provision C.8.d.i.**
dissolved organic carbon, suspended sediment concentration)	comparable methods for Nutrients				or established threshold
General Water Quality[29]	Multi-Parameter Probe	2/yr (Concurrent with bioassessment & during the Aug. - Sept. timeframe)	15-minute intervals for 1-2 weeks	3 / 2 / 1	20% of results in one waterbody exceed one or more water quality standard or established threshold
Chlorine (Free and Total)	USEPA Std. Method 4500 Cl F[30]	2/yr Spring & Dry Seasons	Grab sample	Spring 20 / 10 / 2 Dry 3 / 2 / 1	After immediate resampling, concentrations remain > 0.08 mg/L
Temperature	Digital Temperature Logger	60-minute intervals	60-minute intervals April through Sept.	8 / 4 / 1	20% of results in one waterbody exceed applicable temperature threshold[31]
Toxicity – Water Column[32]	Applicable SWAMP Comparable Method	2/yr (1/Dry Season & 1 Storm Event)	Grab or composite sample	3 / 2 / 1	If toxicity results < 50% of control results, repeat sample. If 2nd sample yields < 50% of control results, proceed to C.8.d.i.

[29] Includes dissolved oxygen, temperature, conductivity, and pH.

[30] The method of analysis shall achieve a method detection limit at least as low as that achieved by the Amperometric Titration Method (4500-Cl from *Standard Methods for Examination of Water and Wastewater*, Edition 20).

[31] If temperatures exceed applicable threshold (e.g., Maximum Weekly Average Temperature, Sullivan K., Martin, D.J., Cardwell, R.D., Toll, J.E., Duke, S. 2000. *An Analysis of the Effects of Temperature on Salmonids of the Pacific Northwest with Implications for Selecting Temperature Criteria, Sustainable Ecosystem Institute*) or spike with no obvious natural explanation observed.

[32] *US EPA three species toxicity tests: Selenastrum* growth and *Ceriodaphnia* and *Pimephales* with lethal and sublethal endpoints. Also H*yalella azteca with lethal endpoint.*

Status Monitoring Parameter	**Sampling and/or Analytical Method**[21]	**Minimum Sampling Occurrence**[22]	**Duration of Sampling**	**Minimum # Sample Sites to Monitor/Yr**[23] Santa Clara & Alameda Permittees/ Contra Costa & San Mateo Permittees/ Fairfield-Suisun & Vallejo Permittees	**Result(s) that Trigger a Monitoring Project in Provision C.8.d.i.**
Toxicity– Bedded Sediment, Fine-grained[33]	Applicable SWAMP Comparable Method	1/yr	Grab sample	3 / 2 / 1 At fine-grained depositional area at bottom of watershed	See Attachment H, Table H-1
Pollutants – Bedded Sediment,[34] fine-grained	Applicable SWAMP Comparable Method inc. grain size	1/yr	Grab sample	3 / 2 / 1 At fine-grained depositional area at bottom of watershed	See Attachment H, Table H-1
Pathogen Indicators[35]	U.S. EPA protocol[36]	1/yr (During Summer)	Follow U.S. EPA protocol	5 / 5 / * *Fairfield-Suisun & Vallejo Permittees: 3 sites twice in permit term	Exceedance of USEPA criteria
Stream Survey (stream walk & mapping)[37]	USA[38] or equivalent	1 waterbody/yr	N/A	9 / 6 / 3 stream miles/year	N/A

[33] Bedded sediments should be fine-grain from depositional areas. Grain size and TOC must be reported. Coordinate with TMDL Provision requirements as applicable.

[34] Bedded sediments should be fine-grain from depositional areas. Grain size and TOC must be reported. Analytes shall include all of those reported in MacDonald et al. 2000 (including copper, nickel, mercury, PCBs, DDT, chlordane, dieldrin) as well as pyrethroids (see Table 8.4 for list of pyrethroids). Coordinate with TMDL Provision requirements as applicable. MacDonald, D.D., G.G. Ingersoll, and T.A. Berger. 2000. Development and Evaluation of Consensus-based Sediment Quality Guidelines for Freshwater Ecosystems. *Archives of Environ. Contamination and Toxicology* 39(1):20–31.

[35] Includes fecal coliform and *E. Coli.*

[36] Rather than collecting samples over five separate days, Permittees may use Example #2, pg. 54, of USEPA's *Implementation Guidance for Ambient Water Quality Criteria for Bacteria*, March 2004 Final.

[37] The Stream Surveys need not be repeated on a watershed if a Stream Survey was completed on that waterbody within the previous five years. The number of stream miles to be surveyed in any given year may be less than that shown in Table 8-1 in order to avoid repeating surveys at areas surveyed during the previous five years.

[38] Center for Watershed Protection, Manual 10: *Unified Stream Assessment: A User's Manual*, February 2005.

iv. Locations – For each sampling year (per C.8.c.iii.), Permittees shall select at least one waterbody to sample from the applicable list below. Locations shall be selected so that sampling is sufficient to characterize segments of the waterbody(s). For example, Permittees required to collect a larger number of samples should sample two or more waterbodies, so that each sampling effort represents a reasonable segment length and/or type. Samples shall be collected in reaches that receive urban stormwater discharges, except in possible infrequent instances where non-urban-impacted stream samples are needed for comparison[39]. Waterbody selection shall be based on factors such as watershed area, land use, likelihood of urban runoff impacts, and existing monitoring data.

Table 8.2 Status Monitoring Locations – Waterbodies

SCVURPPP	ACCWP	CCCWP	SMCWPPP	FSUMRP	VALLEJO
Coyote Creek and tributaries	Arroyo Valle (below Livermore or lower)	Kirker Creek	San Pedro Creek and tributaries	Laurel Creek	Chabot Creek
Guadalupe River and tributaries	Arroyo Mocho	Mt. Diablo Creek	Pilarcitos Creek	Ledgewood Creek	Austin Creek & tributaries
San Tomas Creek and tributaries	Tassajara Creek	Walnut Creek and tributaries	Colma Creek		
Calabazas Creek	Alamo Creek	Rodeo Creek	San Bruno Creek and tributaries		
Permanente Creek and tributaries	Arroyo de la Laguna	Pinole Creek	Millbrae Creek and tributaries		
Stevens Creek and tributaries	Alameda Creek (at Fremont or below)	San Pablo Creek	Mills Creek and tributaries		
Matadero Creek and tributaries	San Lorenzo Creek & tribs	Alhambra Creek	Easton Creek and tributaries		
Adobe Creek	San Leandro Creek & tribs	Wildcat Creek	Sanchez Creek and tributaries		
Lower Penitencia Creek and tributaries	Oakland, Berkeley, or Albany Creeks		Burlingame Creek and tributaries		
Barron Creek			San Mateo Creek (below dam only)		
San Francisquito Creek & tributaries			Borel Creek & tributaries		
			Laurel Creek & tribs		
			Belmont Creek & tribs		
			Pulgas Creek & tribs		
			Cordilleras & tributaries		
			Redwood Creek & tribs		
			Atherton Creek & tribs		
			San Francisquito Creek and tributaries		

[39] Sampling efforts shall focus on stream reaches with urban stormwater system discharges. Sampling upstream of urban outfalls is not precluded where needed to meet sampling plan objectives.

v. Status Monitoring Results – When Status Monitoring produces results such as those described in the final column of Table 8.1, Permittees shall conduct Monitoring Project(s) as described in C.8.d.i.

C.8.d. Monitoring Projects – Permittees shall conduct the Monitoring Projects listed below.

i. Stressor/Source Identification – When Status results trigger a follow-up action as indicated in Table 8.1, Permittees shall take the following actions, as also required by Provision C.1. If the trigger stressor or source is already known, proceed directly to step 2. The first follow-up action shall be initiated as soon as possible, and no later than the second fiscal year after the sampling event that triggered the Monitoring Project.

(1) Conduct a site specific study (or non-site specific if the problem is wide-spread) in a stepwise process to identify and isolate the cause(s) of the trigger stressor/source. This study should follow guidance for Toxicity Reduction Evaluations (TRE)[40] or Toxicity Identification Evaluations (TIE).[41] A TRE, as adapted for urban stormwater data, allows Permittees to use other sources of information (such as industrial facility stormwater monitoring reports) in attempting to determine the trigger cause, potentially eliminating the need for a TIE. If a TRE does not result in identification of the stressor/source, Permittees shall conduct a TIE.

(2) Identify and evaluate the effectiveness of options for controlling the cause(s) of the trigger stressor/source.

(3) Implement one or more controls.

(4) Confirm the reduction of the cause(s) of trigger stressor/source.

(5) Stressor/Source Identification Project Cap: Permittees who conduct this monitoring through a regional collaborative shall be required to initiate no more than ten Stressor/Source Identification projects during the Permit term in total, and at least two must be toxicity follow-ups, unless monitoring results do not indicate the presence of toxicity. If conducted through a stormwater countywide program, the Santa Clara and Alameda

Office of Research and Development, Washington, DC., or (3) USEPA. 1996. *Marine Toxicity Identification Evaluation (TIE), Phase I Guidance Document.* EPA/600/R-95/054. Office of Research and Development, Washington, DC.

Permittees each shall be required to initiate no more than five (two for toxicity); the Contra Costa and San Mateo Permittees each shall be required to initiate no more than three (one for toxicity); and the Fairfield-Suisun and Vallejo Permittees each shall be required to initiate no more than one Stressor/Source Identification project(s) during the Permit term.

(6) As long as Permittees have complied with the procedures set forth above, they do not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed to do so by the Water Board.

ii. BMP Effectiveness Investigation – Investigate the effectiveness of one BMP for stormwater treatment or hydrograph modification control. Permittees who do this project through a regional collaborative are required to initiate no more than one BMP Effectiveness Investigation during the Permit term. If conducted through a stormwater countywide program, the Santa Clara, Alameda, Contra Costa, and San Mateo Permittees shall be required to initiate one BMP Effectiveness Investigation each, and the Fairfield-Suisun and Vallejo Permittees shall be exempt from this requirement. The BMP(s) used to fulfill requirements of C.3.b.iii., C.11.e. and C.12.e. may be used to fulfill this requirement, provided the BMP Effectiveness Investigation includes the range of pollutants generally found in urban runoff. The BMP Effectiveness Investigation will not trigger a Stressor/Source Identification Project. Data from this Monitoring Project need not be SWAMP-comparable.

iii. Geomorphic Project – This monitoring is intended to answer the questions: How and where can our creeks be restored or protected to cost-effectively reduce the impacts of pollutants, increased flow rates, and increased flow durations of urban runoff?

Permittees shall select a waterbody/reach, preferably one that contains significant fish and wildlife resources, and conduct one of the following projects within each county, except that only one such project must be completed within the collective Fairfield-Suisun and Vallejo Permittees' jurisdictions:

(1) Gather geomorphic data to support the efforts of a local watershed partnership[42] to improve creek conditions; or

(2) Inventory locations for potential retrofit projects in which decentralized, landscape-based stormwater retention units can be installed; or

(3) Conduct a geomorphic study which will help in development of regional curves which help estimate equilibrium channel conditions for different-sized drainages. Select a waterbody/reach that is not undergoing changing land use. Collect and report the following data:

- Formally surveyed channel dimensions (profile), planform, and cross-sections. Cross-sections shall include the topmost floodplain terrace and

[42] A list of local watershed partnerships may be obtained from Water Board staff.

be marked by a permanent, protruding (not flush with ground) monument.

- Contributing drainage area.
- Best available information on bankfull discharges and width and depth of channel formed by bankfull discharges.
- Best available information on average annual rainfall in the study area.

Permittees shall complete the selected geomorphic project so that project results are reported in the Integrated Monitoring Report (see Provision C.8.g.v).

C.8.e. Pollutants of Concern and Long-Term Trends Monitoring

Pollutants of Concern (POC) monitoring is intended to assess inputs of Pollutants of Concern to the Bay from local tributaries and urban runoff, assess progress toward achieving wasteload allocations (WLAs) for TMDLs and help resolve uncertainties associated with loading estimates for these pollutants. In particular, there are four priority management information needs toward which POC monitoring must be directed: 1) identifying which Bay tributaries (including stormwater conveyances) contribute most to Bay impairment from pollutants of concern; 2) quantifying annual loads or concentrations of pollutants of concern from tributaries to the Bay; 3) quantifying the decadal-scale loading or concentration trends of pollutants of concern from small tributaries to the Bay; and 4) quantifying the projected impacts of management actions (including control measures) on tributaries and identifying where these management actions should be implemented to have the greatest beneficial impact.

Permittees shall implement the following POC monitoring components or pursue an alternative approach that addresses each of the aforementioned management information needs. An alternative approach may be pursued by Permittees provided that: either similar data types, data quality, data quantity are collected with an equivalent level of effort described; or an equivalent level of monitoring effort is employed to answer the management information needs.

Long-Term monitoring is intended to assess long-term trends in pollutant concentrations and toxicity in receiving waters and sediment, in order to evaluate if stormwater discharges are causing or contributing to toxic impacts on aquatic life. Permittees shall implement the following Long-Term monitoring components or, following approval by the Executive Officer, an equivalent monitoring program.

i. Pollutants of Concern Loads Monitoring Locations – Permittees shall conduct Pollutants of Concern monitoring at stations listed below. Permittees may install these stations in two phases providing at least half of the stations are monitored in the water year beginning October 2010, and all the stations are monitored in the water year beginning October 2012. Upon approval by the Executive Officer, Permittees may use alternate POC monitoring locations.

(1) Castro Valley Creek S3 at USGS gauging station in Castro Valley

(2) Guadalupe River

(3) Zone 4 Line A at Chabot Road in Hayward

(4) Rheem Creek at Giant Road in Richmond

(5) Walnut Creek at a downstream location

(6) Calabazas Creek at Lakeside Drive in Sunnyvale, at border with Santa Clara

(7) San Mateo Creek at downstream location

(8) Laurel Creek at Laurie Meadows park, off Casanova Drive in City of San Mateo.

ii. Long-Term Monitoring Locations – Permittees shall conduct Long-Term monitoring at stations listed below. After conferring with the Regional SWAMP program, and upon approval by the Executive Officer, Permittees may use alternate Long-Term monitoring locations.

Table 8.3. Long-Term Monitoring Locations

Stormwater Countywide Program	Waterbody	Suggested Location
Alameda Permittees	Alameda Creek OR	East of Alvarado Blvd*
	Lower San Leandro Creek	Empire Road*
Contra Costa Permittees	Kirker Creek OR	Floodway*
	Walnut Creek	Concord Avenue*
Santa Clara Permittees	Guadalupe River OR	USGS Gaging Station 11169025*
	Coyote Creek	Montague*
San Mateo Permittees	San Mateo Creek	Gateway Park*

* SWAMP is scheduled to collect sediment toxicity and sediment chemistry samples annually at these stations during the month of June.

iii. Parameters and Frequencies – Permittees shall conduct Pollutants of Concern sampling pursuant to Table 8.4, Categories 1 and 2. In Table 8.4, Category 1 pollutants are those for which the Water Board has active water quality attainment strategies (WQAS), such as TMDL or site-specific objective projects. Category 2 pollutants are those for which WQAS are in development. The lower monitoring frequency for Category 2 pollutants is sufficient to develop preliminary loading estimates for these pollutants.

Permittees shall conduct Long-Term monitoring pursuant to Table 8.4, Category 3. SWAMP has scheduled collection of Category 3 data at the Long-Term monitoring locations stated in C.8.e.ii. As stated in Provision C.8.a.iv., Permittees may use SWAMP data to fulfill Category 3 sampling requirements.

iv. Protocols – At a minimum, sampling and analysis protocols shall be consistent with 40 CFR 122.21(g)(7)(ii).

v. Methods – Methyl mercury samples shall be grab samples collected during storm events that produce rainfall of at least 0.10 inch, shall be frozen immediately upon collection, and shall be kept frozen during transport to the laboratory. All other Category 1 and 2 samples shall be wet weather flow-weighted composite samples, collected during storm events that produce rainfall of at least 0.10 inch. Sampled storms should be separated by 21 days of dry weather, but, at a minimum, sampled storms must have 72 hours of antecedent dry weather. Samples must include the first rise in the hydrograph. Category 3 monitoring data shall be SWAMP-comparable.

Table 8.4 Pollutants of Concern Loads & Long-Term Monitoring Elements

Category/Parameter	Sampling Years	Minimum Sampling Occurrence	Sampling Interval
Category 1 • Total and Dissolved Copper • Total Mercury[43] • Methyl Mercury • Total PCBs[44] • Suspended Sediments (SSC) • Total Organic Carbon • Toxicity – Water Column • Nitrate as N • Hardness	Annually	Average of 4 wet weather events per year For methyl mercury only: average of 2 wet & 2 dry weather events per year	Flow-weighted composite For methyl mercury only: grab samples collected during the first rise in the hydrograph of a storm event.
Category 2 • Total and Dissolved Selenium • Total PBDEs (Polybrominated Diphenyl Ethers) • Total PAHs (Poly-Aromatic Hydrocarbons) • Chlordane • DDTs (Dichloro-Diphenyl-Trichloroethane) • Dieldrin • Nitrate as N • Pyrethroids - bifenthrin, cyfluthrin, beta-cyfluthrin, cypermethrin, deltamethrin, esfenvalerate, lambda-cyhalothrin, permethrin, and tralomethrin • Carboryl and fipronil • Total and Dissolved Phosphorus	Oct. 2010 - 2011 water year and Oct. 2012 - 2013 water year	2 times per year	Flow-weighted composite
Category 3 Toxicity – Bedded Sediment, fine-grained[45]	Biennially, Coordinate	Once per year, during April-June,	Grab sample

[43] The monitoring type and frequency shown for mercury is not sufficient to determine progress toward achieving TMDL load allocations. Progress toward achieving load allocations will be accomplished by assessing loads avoided resulting from treatment, source control, and pollution prevention actions.

[44] The monitoring type and frequency shown for PCBs is not sufficient to determine progress toward achieving TMDL load allocations. Progress toward achieving load allocations will be accomplished by assessing loads avoided resulting from treatment, source control, and pollution prevention actions.

Category/Parameter	Sampling Years	Minimum Sampling Occurrence	Sampling Interval
Pollutants – Bedded Sediment, fine-grained	with SWAMP	coordinate with SWAMP	

vi. Sediment Delivery Estimate/Budget – The objective of this monitoring is to develop a strong estimate of the amount of sediment entering the Bay from local tributaries and urban drainages. By July 1, 2011, Permittees shall develop a design for a robust sediment delivery estimate/sediment budget in local tributaries and urban drainages. Permittees shall implement the study by July 1, 2012.

vii. Emerging Pollutants – Permittees shall develop a work plan and schedule for initial loading estimates and source analyses for emerging pollutants: endocrine-disrupting compounds, PFOS/PFAS (Perfluorooctane Sulfonates (PFOS), Perfluoroalkyl sulfonates (PFAS); these perfluorocompounds are related to Teflon products), and NP/NPEs (nonylphenols/nonylphenol esters —estrogen-like compounds). This work plan, which is to be implemented in the next Permit term, shall be submitted with the Integrated Monitoring Report (see Provision C.8.g.).

C.8.f. Citizen Monitoring and Participation

i. Permittees shall encourage Citizen Monitoring.

ii. In developing Monitoring Projects and evaluating Status & Trends data, Permittees shall make reasonable efforts to seek out citizen and stakeholder information and comment regarding waterbody function and quality.

iii. Permittees shall demonstrate annually that they have encouraged citizen and stakeholder observations and reporting of waterbody conditions. Permittees shall report on these outreach efforts in the annual Urban Creeks Monitoring Report.

C.8.g. Reporting

i. Water Quality Standard Exceedence – When data collected pursuant to C.8.a.-C.8.f. indicate that stormwater runoff or dry weather discharges are or may be causing or contributing to exceedance(s) of applicable water quality standards, including narrative standards, a discussion of possible pollutant sources shall be included in the Urban Creeks Monitoring Report. When data collected pursuant to C.8.a.-C.8.f. indicate that discharges are causing or contributing to an exceedance of an applicable water quality standard, Permittees shall notify the Water Board within no more than 30 days of such a determination and submit a follow-up report in accordance with Provision C.1 requirements. The preceding reporting requirements shall not apply to

[45] If Ceriodaphnia, H*yalella azteca,* or Pimephales survival or Selenastrum growth is < 50% of control results, repeat wet weather sample. If 2nd sample yields < 50% of control results, proceed to C.8.d.i.

continuing or recurring exceedances of water quality standards previously reported to the Water Board or to exceedances of pollutants that are to be addressed pursuant to Provisions C.8 through C.14 of this Order in accordance with Provision C.1.

ii. Status Monitoring Electronic Reporting – Permittees shall submit an Electronic Status Monitoring Data Report no later than January 15 of each year, reporting on all data collected during the foregoing October 1–September 30 period. Electronic Status Monitoring Data Reports shall be in a format compatible with the SWAMP database.[46] Water Quality Objective exceedances shall be highlighted in the Report.

iii. Urban Creeks Monitoring Report – Permittees shall submit a comprehensive Urban Creeks Monitoring Report no later than March 15 of each year, reporting on all data collected during the foregoing October 1–September 30 period, with the initial report due March 15, 2012, unless the Permittees choose to monitor through a regional collaborative, in which case the due date is March 15, 2013. Each Urban Creeks Monitoring Report shall contain summaries of Status, Long-Term, Monitoring Projects, and Pollutants of Concern Monitoring including, as appropriate, the following:

(1) Maps and descriptions of all monitoring locations;

(2) Data tables and graphical data summaries; Constituents that exceed applicable water quality standards shall be highlighted;

(3) For all data, a statement of the data quality;

(4) An analysis of the data, which shall include the following:

- Calculations of biological metrics and physical habitat endpoints.
- Comparison of biological metrics to:
  - Each other
  - Any applicable, available reference site(s)
  - Any applicable, available index of biotic integrity
  - Physical habitat endpoints.
- Identification and analysis of any long-term trends in stormwater or receiving water quality.

(5) A discussion of the data for each monitoring program component, which shall:

- Discuss monitoring data relative to prior conditions, beneficial uses and applicable water quality standards as described in the Basin Plan, the Ocean Plan, or the California Toxics Rule or other applicable water quality control plans.

[46] See http://mpsl.mlml.calstate.edu/swdataformats.htm. Permittees shall maintain an information management system that will support electronic transfer of data to the Regional Data Center of the ***California Environmental Data Exchange Network*** **(*CEDEN*)**, located within the San Francisco Estuary Institute.

- Where appropriate, develop hypotheses to investigate regarding pollutant sources, trends, and BMP effectiveness.
- Identify and prioritize water quality problems.
- Identify potential sources of water quality problems.
- Describe follow-up actions.
- Evaluate the effectiveness of existing control measures.
- Identify management actions needed to address water quality problems.

iv. Monitoring Project Reports – Permittees shall report on the status of each ongoing Monitoring Project in each annual Urban Creeks Monitoring Report. In addition, Permittees shall submit stand-alone summary reports within six months of completing BMP Effectiveness and Geomorphic Projects; these reports shall include: a description of the project; map(s) of project locations; data tables and summaries; and discussion of results.

v. Integrated Monitoring Report – No later than March 15, 2014, Permittees shall prepare and submit an Integrated Monitoring Report through the regional collaborative monitoring effort on behalf of all participating Permittees, or on a countywide basis on behalf of participating Permittees, so that all monitoring conducted during the Permit term is reported.[47] This report shall be in lieu of the Annual Urban Creeks Monitoring Report due on March 15, 2014.

The report shall include, but not be limited to, a comprehensive analysis of all data collected pursuant to Provision C.8., and may include other pertinent studies. For Pollutants of Concern, the report shall include methods, data, calculations, load estimates, and source estimates for each Pollutant of Concern Monitoring parameter. The report shall include a budget summary for each monitoring requirement and recommendations for future monitoring. This report will be part of the next Report of Waste Discharge for the reissuance of this Permit.

vi. Standard Report Content –All monitoring reports shall include the following:

- The purpose of the monitoring and briefly describe the study design rationale.
- Quality Assurance/Quality Control summaries for sample collection and analytical methods, including a discussion of any limitations of the data.
- Brief descriptions of sampling protocols and analytical methods.
- Sample location description, including waterbody name and segment and latitude and longitude coordinates.
- Sample ID, collection date (and time if relevant), media (e.g., water, filtered water, bed sediment, tissue).
- Concentrations detected, measurement units, and detection limits.

[47] Permittees who do not participate in the Regional Monitoring Group or in a stormwater countywide program must submit an individual Integrated Receiving Water Impacts Report.

- Assessment, analysis, and interpretation of the data for each monitoring program component.
- Pollutant load and concentration at each mass emissions station.
- A listing of volunteer and other non-Permittee entities whose data are included in the report.
- Assessment of compliance with applicable water quality standards.
- A signed certification statement.

vii. Data Accessibility – Permittees shall make electronic reports available through a regional data center, and optionally through their web sites. Permittees shall notify stakeholders and members of the general public about the availability of electronic and paper monitoring reports through notices distributed through appropriate means, such as an electronic mailing list.

C.8.h. Monitoring Protocols and Data Quality

Where applicable, monitoring data must be SWAMP comparable. Minimum data quality shall be consistent with the latest version of the SWAMP Quality Assurance Project Plan (QAPP)[48] for applicable parameters, including data quality objectives, field and laboratory blanks, field duplicates, laboratory spikes, and clean techniques, using the most recent Standard Operating Procedures. A Regional Monitoring Collaborative may adapt the SWAMP QAPP for use in conducting monitoring in the San Francisco Bay Region, and may use such QAPP if acceptable to the Executive Officer.

[48] The current SWAMP QAPP at the time of Permit issuance is dated September 1, 2008, and is available at http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/swamp_qapp_master090108a.pdf.

C.9. Pesticides Toxicity Control

To prevent the impairment of urban streams by pesticide-related toxicity, the Permittees shall implement a pesticide toxicity control program that addresses their own and others' use of pesticides within their jurisdictions that pose a threat to water quality and that have the potential to enter the municipal conveyance system. This provision implements requirements of the TMDL for Diazinon and Pesticide related Toxicity for Urban Creeks in the region. The TMDL includes urban runoff allocations for Diazinon of 100 ng/l and for pesticide related toxicity of 1.0 Acute Toxicity Units (TUa) and 1.0 Chronic Toxicity Units (TUc) to be met in urban creek waters. However, urban runoff management agencies (i.e., the Permittees) are not solely responsible for attaining the allocations because their authority to regulate pesticide use is constrained by federal and State law. Accordingly, the Permittees' requirements for addressing the allocations are set forth in the TMDL implementation plan and are included in this provision.

Pesticides of concern include: organophosphorous pesticides (chlorpyrifos, diazinon, and malathion); pyrethroids (bifenthrin, cyfluthrin, beta-cyfluthrin, cypermethrin, deltamethrin, esfenvalerate, lambda-cyhalothrin, permethrin, and tralomethrin); carbamates (e.g., carbaryl); and fipronil. The Permittees may coordinate with BASMAA, the Urban Pesticide Pollution Prevention Project, the Urban Pesticide Committee, the Bay-Friendly Landscaping and Gardening Coalition, and other agencies and organizations in carrying out these activities.

C.9.a. Adopt an Integrated Pest Management (IPM) Policy or Ordinance

i. Task Description – In their IPM policies or ordinances, the Permittees shall include provisions to minimize reliance on pesticides that threaten water quality and to require the use of IPM in municipal operations and on municipal property.

ii. Implementation Level – If not already in place, the Permittees shall adopt IPM policies or ordinances no later than July 1, 2010.

iii. Reporting – The Permittees shall submit a copy of their IPM ordinance(s) or policy(s) in their 2010 Annual Report.

C.9.b. Implement IPM Policy or Ordinance

i. Task Description – The Permittees shall establish written standard operating procedures for pesticide use that ensure implementation of the IPM policy or ordinance and require municipal employees and contractors to adhere to the IPM standard operating procedures.

ii. Reporting

(1) In their Annual Reports, the Permittees shall report on IPM implementation by showing trends in quantities and types of pesticide used, and suggest reasons for increases in use of pesticides that threaten water quality, specifically organophosphorous pesticides, pyrethroids, carbaryl, and fipronil.

(2) The Permittees shall maintain pesticide application standard operating procedures and submit them upon request.

C.9.c. Train Municipal Employees

i. Task Description – The Permittees shall ensure that all municipal employees who, within the scope of their duties, apply or use pesticides that threaten water quality are trained in IPM practices and the Permittee's IPM policy. This training may also include other training opportunities such as Bay-Friendly Landscape Maintenance Training & Qualification Program and EcoWise Certified.

ii. Reporting

(1) In their Annual Reports, the Permittees shall report the percentage of municipal employees who apply pesticides who have received training in IPM policy and IPM standard operating procedures within the last three years.

(2) The Permittees shall submit training materials (e.g., course outline, date, attendees) upon request.

C.9.d. Require Contractors to Implement IPM

i. Task Description – The Permittees shall hire IPM-certified contractors or include contract specifications requiring contractors to implement IPM no later than July 1, 2010.

ii. Reporting – In their Annual Reports, the Permittees shall submit documentation to confirm compliance, such as the Permittee's standard contract specification or copy of contractors' certification(s).

C.9.e. Track and Participate in Relevant Regulatory Processes (may be done jointly with other Permittees, such as through CASQA or BASMAA and/or the Urban Pesticide Pollution Prevention Project)

i. Task Description

(1) The Permittees shall track USEPA pesticide evaluation and registration activities as they relate to surface water quality, and when necessary, encourage USEPA to coordinate implementation of the Federal Insecticide, Fungicide, and Rodenticide Act and the CWA and to accommodate water quality concerns within its pesticide registration process;

(2) The Permittees shall track California Department of Pesticide Regulation (DPR) pesticide evaluation activities as they relate to surface water quality, and when necessary, encourage DPR to coordinate implementation of the California Food and Agriculture Code with the California Water Code and to accommodate water quality concerns within its pesticide evaluation process;

(3) The Permittees shall assemble and submit information (such as monitoring data) as needed to assist DPR and County Agricultural Commissioners in

ensuring that pesticide applications comply with water quality standards; and

(4) As appropriate, the Permittees shall submit comment letters on USEPA and DPR re-registration, re-evaluation, and other actions relating to pesticides of concern for water quality.

ii. Reporting – In their Annual Reports, the Permittees who participate in a regional effort to comply with C.9.e. may reference a regional report that summarizes regional participation efforts, information submitted, and how regulatory actions were affected. All other Permittees shall list their specific participation efforts, information submitted, and how regulatory actions were affected.

C.9.f. Interface with County Agricultural Commissioners

i. Task Description – The Permittees shall maintain regular communications with county agricultural commissioners (or other appropriate State and/or local agencies) to (1) get input and assistance on urban pest management practices and use of pesticides, (2) inform them of water quality issues related to pesticides, and (3) report violations of pesticide regulations (e.g., illegal handling) associated with stormwater management.

ii. Reporting – In their Annual Reports, the Permittees shall summarize improper pesticide usage reported to county agricultural commissioners and report follow-up actions to correct violations.

C.9.g. Evaluate Implementation of Source Control Actions Relating to Pesticides

i. Task Description – The Permittees shall evaluate the effectiveness of the control measures implemented, evaluate attainment of pesticide concentration and toxicity targets for water and sediment from monitoring data (Provision C.8.), and identify improvements to existing control measures and/or additional control measures, if needed, to attain targets with an implementation time schedule.

ii. Reporting – In their 2013 Annual Reports, the Permittees shall report the evaluation results, and if needed, submit a plan to implement improved and/or new control measures.

C.9.h. Public Outreach (may be done jointly with other Permittees, such as through CASQA or BASMAA and/or the Urban Pesticide Pollution Prevention Project or the Bay-Friendly Landscaping and Gardening Coalition).

i. Point of Purchase Outreach: The Permittees shall:

(1) Conduct outreach to consumers at the point of purchase;

(2) Provide targeted information on proper pesticide use and disposal, potential adverse impacts on water quality, and less toxic methods of pest prevention and control; and

(3) Participate in and provide resources for the "Our Water, Our World" program or a functionally equivalent pesticide use reduction outreach program.

ii. Reporting – In their Annual Reports, the Permittees who participate in a regional effort to comply with C.9.h.i. may reference a report that summarizes these actions. All other Permittees shall summarize activities completed and document any measurable awareness and behavior changes resulting from outreach.

iii. Pest Control Contracting Outreach: The Permittees shall conduct outreach to residents who use or contract for structural or landscape pest control and shall:

(1) Provide targeted information on proper pesticide use and disposal, potential adverse impacts on water quality, and less toxic methods of pest prevention and control, including IPM;

(2) Incorporate IPM messages into general outreach;

(3) Provide information to residents about "Our Water, Our World" or functionally equivalent program;

(4) Provide information to residents about EcoWise Certified IPM certification in Structural Pest Management, or functionally equivalent certification program; and

(5) Coordinate with household hazardous-waste programs to facilitate appropriate pesticide waste disposal, conduct education and outreach, and promote appropriate disposal.

iv. Reporting – In their 2013 Annual Reports, the Permittees who participate in a regional effort to comply with C.9.h.iii. may reference a report that summarizes these actions. All other Permittees shall document the effectiveness of their actions in their 2013 Annual Reports. This documentation may include percentages of residents hiring certified IPM providers and the change in this percentage.

v. Outreach to Pest Control Operators: The Permittees shall conduct outreach to pest control operators (PCOs) and landscapers; Permittees are encouraged to work with DPR, county agricultural commissioners, UC-IPM, BASMAA, the Urban Pesticide Committee, the EcoWise Certified Program (or functionally equivalent certification program), the Bio-integral Resource Center and others to promote IPM to PCOs and landscapers.

vi. Reporting – In each Annual Report, the Permittees who participate in a regional effort to comply with C.9.h.v. may reference a report that summarizes these actions. All other Permittees shall summarize how they reached PCOs and landscapers and reduced pesticide use.

C.10. Trash Load Reduction

The Permittees shall demonstrate compliance with Discharge Prohibition A.2 and trash-related Receiving Water Limitations through the timely implementation of control measures and other actions to reduce trash loads from municipal separate storm sewer systems (MS4s) by 40% by 2014, 70% by 2017, and 100% by 2022 as further specified below.

During this permit term, the Permittees shall develop and implement a Short-Term Trash Load Reduction Plan. This includes implementation of a mandatory minimum level of trash capture; cleanup and abatement progress on a mandatory minimum number of Trash Hot Spots; and implementation of other control measures and best management practices, such as trash reduction ordinances, to prevent or remove trash loads from MS4s to attain a 40% reduction in trash loads by July 1, 2014. The Permittees shall also develop and begin implementation of a Long-Term Trash Load Reduction Plan to attain a 70% reduction in trash loads from their MS4s by 2017 and 100% by 2022. Flood management agencies, which are non-population-based Permittees that do not have jurisdiction over urban watershed land, are not subject to these trash reduction requirements except for minimum full trash capture and Trash Hot Spot requirements, as specified in subsections C.10.a.iii and C.10.b below.

C.10.a. Short-Term Trash Load Reduction

i. Short-Term Trash Loading Reduction Plan – Each Permittee shall submit a Short-Term Trash Load Reduction Plan, including an implementation schedule, to the Water Board by February 1, 2012. The Plan shall describe control measures and best management practices, including any trash reduction ordinances, that are currently being implemented and the current level of implementation and additional control measures and best management practices that will be implemented, and/or an increased level of implementation designed to attain a 40% trash load reduction from its MS4 by July 1, 2014.

The Short-Term Trash Load Reduction Plan shall account for required mandatory minimum Full Trash Capture devices called for in Provision C.10.a.iii and Trash Hot Spot Cleanup called for in Provision C.10.b.

ii. Baseline Trash Load and Trash Load Reduction Tracking Method – Each Permittee, working collaboratively or individually, shall determine the baseline trash load from its MS4 to establish the basis for trash load reductions and submit the determined load level to the Water Board by February 1, 2012, along with documentation of methodology used to determine the load level. The submittal shall also include a description of the trash load reduction tracking method that will be used to account for trash load reduction actions and to demonstrate progress and attainment of trash load reduction levels. The submittal shall account for the drainage areas of a Permittee's jurisdiction that are associated with the baseline trash load from its MS4, and the baseline trash load level per unit area by land use type and drainage area characteristics used to derive the total baseline trash load level for each Permittee.

In the determination of applicable areas that generate trash loads for inclusion in the Baseline Trash Load, the Permittees may propose areas for exclusion, with supporting documentation, which meet Discharge Prohibition A.2 and trash-

related Receiving Water Limitations. Documentation demonstrating no material trash presence or adverse impact may include data from the maintenance of existing trash capture devices, data from trash flux measurements in the MS4 and the water column of streams during wet weather, Trash Hot Spot assessments, and litter audits of street curb and gutter areas in high pedestrian traffic and high commercial activity areas.

If proposed areas for exclusion are commercial, industrial, or high density residential areas, or adjacent to schools or event venues, the Permittee shall collect and submit by February 1, 2013, an additional year of documentation to further support the basis for the exclusion. If the data continue to support the exclusion determination, further trash reduction actions are not required in these areas, unless the Water Board notifies the Permittee otherwise.

Each Permittee shall submit a progress report by February 1, 2011, that indicates whether it is determining its baseline trash load and trash load reduction method individually or collaboratively with other Permittees and a summary of the approach being used. The report shall also include the types and examples of documentation that will be used to propose exclusion areas, and the land use characteristics and estimated area of potentially excluded areas.

iii. Minimum Full Trash Capture – Except as excluded below, population-based Permittees shall install and maintain a mandatory minimum number of full trash capture devices by July 1, 2014, to treat runoff from an area equivalent to 30% of Retail/Wholesale Land[49] that drains to MS4s within their jurisdictions (see Table 10.1 in Attachment J). If the sum of the areas that generate trash loads determined pursuant to C.10.a.ii above is a smaller acreage than the required trash capture acreage, a population-based Permittee may reduce its minimum full trash capture requirement to the smaller acreage. A population-based Permittee with a population less than 12,000 and retail/wholesale land less than 40 acres, or a population less than 2000, is exempt from this trash capture requirement. The minimum number of trash capture devices required to be installed and maintained by non-population-based Permittees is included in Attachment J.

All installed devices that meet the following full trash capture definition may be counted toward this requirement regardless of date of installation. A full capture system or device is any single device or series of devices that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one-year, one-hour, storm in the sub-drainage area.

C.10.b. Trash Hot Spot Selection and Cleanup

Trash Hot Spots in receiving waters shall be cleaned annually to achieve the multiple benefits of beginning abatement of these impacts as mitigation and to learn more about the sources and patterns of trash loading.

[49] [http://quake.abag.ca.gov/mitigation/pickdbh2.html] and Association of Bay Area Governments, 2005 ABAG Land Use Existing Land Use in 2005: Report and Data for Bay Area Counties

i. **Hot Spot Cleanup and Definition** – The Permittees shall cleanup selected Trash Hot Spots to a level of "no visual impact" at least one time per year for the term of the permit. Trash Hot Spots shall be at least 100 yards of creek length or 200 yards of shoreline length.

ii. **Hot Spot Selection** – Population-based Permittees shall identify high trash-impacted locations on State waters totaling at least one Trash Hot Spot per 30,000 population, or one per 100 acres of Retail/Wholesale Commercial Land Area, within their jurisdictions based on Association of Bay Area Governments (ABAG) 2005 data1, whichever is greater. If the hot spot number by one of the two determination methods is more than twice that determined by the other method, double the smaller hot spot number shall be used. Otherwise, the larger hot spot number determined by the two methods shall be the Trash Hot Spot assignment for a population-based Permittee. Each population-based Permittee shall select at least one Trash Hot Spot. The Permittees shall each submit selected Trash Hot Spots to the Water Board by July 1, 2010. The list should include photo documentation (one photo per 50 feet) and initial assessment results for the proposed hot spots. The minimum number of Trash Hot Spots per Permittee is included in Attachment J for population and non-population-based Permittees. The Permittees shall proceed with cleanup of selected Trash Hot Spots unless informed otherwise by the Water Board.

iii. **Hot Spot Assessments** – The Permittees shall quantify the volume of material removed from each Trash Hot Spot cleanup, and identify the dominant types of trash (e.g., glass, plastics, paper) removed and their sources to the extent possible. Documentation shall include the trash condition before and after clean up of the entire hot spot using photo documentation with a minimum of one photo per 50 feet of hot spot length. Trash Hot Spots may also be assessed using either the Rapid Trash Assessment (RTA v.8) or the SCVURPPP Urban RTA variation of that method.

C.10.c. Long-Term Trash Load Reduction

Each Permittee shall submit a Long-Term Trash Load Reduction Plan, including an implementation schedule, to the Water Board by February 1, 2014. The Plan shall describe control measures and best management practices, including any trash reduction ordinances, that are being implemented and the level of implementation and additional control measures and best management practices that will be implemented, and/or an increased level of implementation designed to attain a 70% trash load reduction from its MS4 by July 1, 2017, and 100% by July 1, 2022.

C.10.d. Reporting

i. In each Annual Report, each Permittee shall provide a summary of its trash load reduction actions (control measures and best management practices) including the types of actions and levels of implementation, the total trash loads and dominant types of trash removed by its actions, and the total trash loads and dominant types of trash for each type of action. The latter shall include each Trash Hot Spot selected pursuant to C.10.b. Beginning with the 2012 Annual

Report, each Permittee shall also report its percent annual trash load reduction relative to its Baseline Trash Load.

ii. The Permittees shall retain records for review providing supporting documentation of trash load reduction actions and the volume and dominant type of trash removed from full trash capture devices, from each Trash Hot Spot cleanup, and from additional control measures or best management practices implemented. Data may be combined for specific types of full trash capture devices deployed in the same drainage area. These records shall have the specificity required for the trash load reduction tracking method established pursuant to subsection C.10.a.iii.

C.11. Mercury Controls

The Permittees shall implement the following control programs for mercury. The Permittees shall perform the control measures and provide reporting on those control measures according to the provisions below. The purpose of this provision is to implement the urban runoff requirements of the San Francisco Bay mercury TMDL and reduce mercury loads to make substantial progress toward achieving the urban runoff mercury load allocation established for the TMDL. The aggregate, regionwide, urban runoff wasteload load allocation is 82 kg/yr. This allocation should be achieved by February 2028 and, as a way to measure progress, an interim loading milestone of 120 kg/yr, halfway between the current load and the allocation, should be achieved by February 2018. If the interim loading milestone is not achieved, the Permittees shall demonstrate reasonable and measurable progress toward achieving the milestone. The Permittees may comply with any requirement of this provision through a collaborative effort.

C.11.a. Mercury Collection and Recycling Implemented throughout the Region

i. Task Description – The Permittees shall promote, facilitate, and/or participate in collection and recycling of mercury containing devices and equipment at the consumer level (e.g., thermometers, thermostats, switches, bulbs).

ii. Reporting – The Permittees shall report on these efforts in their Annual Report, including an estimate of the mass of mercury collected.

C.11.b. Monitor Methylmercury

i. Task Description – The Permittees shall monitor methymercury in runoff discharges. The objective of the monitoring is to investigate a representative set of drainages and obtain seasonal information and to assess the magnitude and spatial/temporal patterns of methylmercury concentrations.

ii. Implementation Level – The Permittees shall analyze aqueous grab samples already being collected for total mercury analysis for methylmercury as specified in Provision C.8.f.

iii. Reporting – The Permittees shall report monitoring results annually beginning with their 2010 Annual Report.

C.11.c. Pilot Projects To Investigate and Abate Mercury Sources in Drainages, Including Public Rights-Of-Way, and Stormwater Conveyances with Accumulated Sediment that Contains Elevated Mercury Concentrations.

i. Task Description – The Permittees shall investigate and abate mercury sources in or to their storm drain systems in conjunction with the Water Board and other appropriate regulatory agencies with investigation and cleanup authorities. The purpose of this task is to implement and evaluate the benefit of a suite of abatement measures at five pilot project locations. The Permittees shall document the knowledge and experience gained through pilot implementation,

and this documentation will provide a basis for determining the scope of abatement implementation in subsequent permit terms. The Permittees shall also quantify and report the amount of mercury loads abated resulting from implementation of these measures.

ii. Implementation Level – Reducing loads of PCBs is the main pilot location selection factor for this Provision, and reducing loads of mercury is a secondary criterion. Accordingly, for PCB pilot project locations selected as part of Provision C.12.c, the Permittees shall conduct reconnaissance in the pilot project drainage areas. The Permittees shall test sediments in storm drains and conveyances to characterize the extent and magnitude of mercury concentrations. They shall evaluate monitoring data and determine if a mercury sediment abatement program would reduce mercury loading significantly. If so determined, the Permittees shall cause abatement activities to be conducted at those sites under Permittee jurisdiction with identified remedial activities. When contamination is located on private property, a Permittee must either exercise direct authority to require cleanup or notify and request other appropriate authorities to exercise their cleanup authority.

iii. Reporting – Report on mercury-related aspects of work and loads abated as part of reporting requirements for Provision C.12.c.

C.11.d. Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices

i. Task Description – The Permittees shall jointly evaluate ways to enhance mercury load reduction benefits of operation and maintenance actives that remove or manage sediment. The purpose of this task is to implement these management practices at the pilot scale in five drainages during this permit term. The knowledge and experience gained through pilot implementation will be used to determine the implementation scope of enhanced sediment removal and management practices in subsequent permit terms. The Permittees shall document the knowledge and experience gained through pilot implementation, and this documentation will provide a basis for determining the implementation scope of enhanced sediment removal management practices in subsequent permit terms. The Permittees shall also quantify and report the amount of mercury loads removed or avoided resulting from implementation of these measures.

ii. Implementation Level – In all pilot program drainages selected as part of Provision C.12.c, the Permittees shall jointly evaluate ways to enhance existing sediment removal and management practices such as municipal street sweeping, curb clearing parking restrictions, inlet cleaning, catch basin cleaning, stream and stormwater conveyance system maintenance, and pump station cleaning via increased effort and/or retrofits for the control of mercury. This evaluation shall also include consideration of street flushing and capture, collection, or routing to the sanitary sewer (in coordination and consultation with local sanitary sewer agencies) as a potential enhanced management practice in coordination and consultation with local sanitary sewer agencies.

Beginning July 1, 2011, the Permittees shall implement pilot studies for the most potentially effective measures(s) based on the evaluation of Provision C.11.d.ii in all drainages for which PCB pilot projects are being conducted.

iii. Reporting

(1) The Permittees shall present a progress report on the results of the evaluation in their 2010 Annual Report and the final evaluation results in their 2011 Annual Report.

(2) In their March 15, 2014 Integrated Monitoring Report, the Permittees shall report the effectiveness of enhanced practices pilot implementation, report estimates of loads reduced, and present a plan and schedule for possible expanded implementation for subsequent permit terms.

C.11.e. Conduct Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit

i. Task Description – The Permittees shall evaluate and quantify the removal of mercury by on-site treatment systems via retrofit of such systems into existing storm drain systems. The purpose of this task is to implement on-site treatment projects at the pilot scale in ten locations during this permit term. The Permittees shall document the knowledge and experience gained through pilot implementation, and this documentation will provide a basis for determining the implementation scope of on-site treatment retrofits in subsequent permit terms. The Permittees shall also quantify and report the amount of mercury loads removed or avoided resulting from implementation of these measures.

ii. Implementation Level – The Permittees, working collaboratively, shall identify at least ten locations throughout the Permittees' jurisdictions that present opportunities to install and evaluate[50] on-site treatment systems (e.g., detention basins, bioretention units, sand filters, infiltration basins, treatment wetlands) and shall assess best treatment options for those locations. Every county (San Mateo, Contra Costa, Alameda, Santa Clara, and Solano) should have at least one location. This effort shall identify potential locations draining a variety of land uses; evaluate technical feasibility; and discuss economical feasibility. The pilot locations may be the same as those chosen for Provision C.12.e, but consideration should be given to areas of elevated mercury concentrations.

On the basis of the Provision C.11.e.ii report, the Permittees shall select sites to perform pilot studies and shall conduct pilot studies in ten selected locations. Pilot studies shall span treatment types and drainage characteristics.

iii. Reporting –

(1) In their 2011 Annual Report, the Permittees shall report on candidate locations and types of treatment retrofit for each location. The report shall include assessment of at least ten locations.

[50] Permittees may evaluate a maximum of two pre-existing treatment systems of the ten total required systems to be evaluated provided that these existing treatment systems are applicable to the intent of this provision..

(2) In their March 15, 2014 Integrated Monitoring Report, the Permittees shall report status, results, mercury removal effectiveness, and lessons learned from the ten pilot studies and their plan for implementing this type of treatment on an expanded basis throughout their jurisdictions during the next permit term.

C.11.f. Diversion of Dry Weather and First Flush Flows to Publicly Owned Treatment Works (POTWs)

i. Task Description – The Permittees shall evaluate the reduced loads of mercury from diversion of dry weather and first flush stormwater flows to sanitary sewers. The Permittees shall document the knowledge and experience gained through pilot implementation, and this documentation will provide a basis for determining the implementation scope of urban runoff diversion projects in subsequent permit terms. The Permittees shall also quantify and report the amount of mercury loads removed or avoided resulting from implementation of these measures.

ii. Implementation Level – The Permittees shall implement pilot projects to divert dry weather and first flush flows to POTWs to address these flows as a source of PCBs and mercury to receiving waters. The Permittees are strongly encouraged to make use of stormwater pump stations in this effort because pump station characterization work performed pursuant to Provisions C.2 and C.10, addressing dissolved oxygen depletion and trash impacts, may be efficiently leveraged for the initial phase of these diversion pilot projects. The objectives of this Provision are to: implement five pilot projects for urban runoff diversion from stormwater pump stations to POTWs; evaluate the reduced loads of mercury and PCBs resulting from each diversion; and gather information to guide the selection of additional diversion projects in future permits. Collectively, the Permittees shall select five stormwater pump stations and five alternates by evaluating drainage characteristics and the feasibility of diverting flows to the sanitary sewer.

(1) The Permittees should work with local POTWs on a watershed, county, or regional level to evaluate feasibility and to establish cost sharing agreements. The feasibility evaluation shall include, but not be limited to, costs, benefits, and impacts on the stormwater and wastewater agencies and the receiving waters relevant to the diversion and treatment of the dry weather and first flush flows.

(2) From this feasibility evaluation, the Permittees shall select five pump stations and five alternates for pilot diversion studies. At least one urban runoff diversion pilot project shall be implemented in each of the five counties (San Mateo, Contra Costa, Alameda, Santa Clara, and Solano). The pilot and alternate locations should be located in industrially-dominated catchments where elevated PCB concentrations are documented.

(3) The Permittees shall implement flow diversion to the sanitary sewer at five pilot pump stations. As part of the pilot studies, the Permittees shall monitor, measure, and report mercury load reduction.

iii. Reporting

(1) The Permittees shall summarize the results of the feasibility evaluation in their 2010 Annual Report, including:

- Selection criteria leading to the identification of the five candidate and five alternate pump stations for pilot studies.
- Time schedules for conducting the pilot studies.
- A proposed method for distributing mercury load reductions to participating wastewater and stormwater agencies.

(2) The Permittees shall report annually on the status of the pilot studies in each subsequent Annual Report.

(3) The Permittees shall include in their March 15, 2014 Integrated Monitoring Report:

- Evaluation of pilot program effectiveness.
- Mercury loads reduced.
- Updated feasibility evaluation procedures to guide future diversion project selection.

C.11.g. Monitor Stormwater Mercury Pollutant Loads and Loads Reduced

i. Task Description – The Permittees shall develop and implement a monitoring program to quantify mercury loads and loads reduced through source control, treatment and other management measures as required in Provision C.8.f.

ii. Implementation Level – The Permittees shall demonstrate progress toward (a) the interim loading milestones, or (b) attainment of the program area allocations, by using the following methods:

(1) Quantify through estimates the annual average mercury load reduced by implementing pollution prevention, source control and treatment control efforts required by the provisions of this permit or other relevant efforts; or

(2) Quantify the mercury load as a rolling five-year annual average using data on flow and water column mercury concentrations; or

(3) Quantitatively demonstrate that the mercury concentration of suspended sediment that best represents sediment discharged with urban runoff is below the target of 0.2 mg mercury/kg dry weight.

iii. Reporting

(1) The Permittees shall report in their 2010 Annual Report methods used to assess progress toward meeting WLA goals and a full description of the

measurement and estimation methodology and rationale for the approaches.

(2) The Permittees shall report in their March 15, 2014 Integrated Monitoring Report results of chosen monitoring/measurement approach concerning loads assessment and estimation of loads reduced.

C.11.h. Fate and Transport Study of Mercury in Urban Runoff

i. Task Description – The Permittees shall conduct or cause to be conducted studies aimed at better understanding the fate, transport, and biological uptake of mercury discharged in urban runoff to San Francisco Bay and tidal areas.

ii. Implementation Level – The specific information needs include understanding the in-Bay transport of mercury discharged in urban runoff, the influence of urban runoff on the patterns of food web mercury accumulation, and the identification of drainages where urban runoff mercury is particularly important in food web accumulation.

iii. Reporting – The Permittees shall submit in their 2010 Annual Report a work plan describing the specific manner in which these information needs will be accomplished and describing the studies to be performed with a schedule. The Permittees shall report on status of these studies in their 2010, 2011, and 2012 Annual Reports. In the March 15, 2014 Integrated Monitoring Report, the Permittees shall report the findings and results of the studies completed, planned, or in progress as well as implications of studies on potential control measures to be investigated, piloted or implemented in future permit cycles.

C.11.i. Development of a Risk Reduction Program Implemented Throughout the Region.

i. Task Description – The Permittees shall develop and implement or participate in effective programs to reduce mercury-related risks to humans and quantify the resulting risk reductions from these activities.

ii. Implementation Level – The risk reduction activities shall include investigating ways to address public health impacts of mercury in San Francisco Bay/Delta fish, including activities that reduce actual and potential exposure of health impacts to those people and communities most likely to be affected by mercury in San Francisco Bay-caught fish, such as subsistence fishers and their families. Such strategies should include public participation in developing effective programs in order to ensure their effectiveness. The Permittees may include studies needed to establish effective exposure reduction activities and risk communication messages as part of their planning. The risk reduction activities may be performed by a third party if the Permittees wish to provide funding for this purpose. This requirement may be satisfied by a combination of related efforts through the Regional Monitoring Program or other similar collaborative efforts.

iii. Reporting – The Permittees shall submit in their 2010 Annual Report the specific manner in which these risk reduction activities will be accomplished and describe the studies to be performed with a schedule. The Permittees shall report on the status of the risk reduction efforts in their 2011 and 2012 Annual Reports. The Permittees shall report the findings and results of the studies completed, planned, or in progress as well as the status of other risk reduction actions in their March 15, 2014 Integrated Monitoring Report.

C.11.j. Develop Allocation Sharing Scheme with Caltrans.

i. Task Description – The wasteload allocations for urban stormwater developed through the San Francisco Bay mercury TMDL implicitly include California Department of Transportation (Caltrans) roadway and non-roadway facilities within the geographic boundaries of urban runoff management agencies. Consistent with the TMDL, the Permittees are required to develop an equitable mercury allocation-sharing scheme in consultation with Caltrans to address the Caltrans facilities in the program area, and report the details to the Water Board. Alternatively, Caltrans may choose to implement mercury load reduction actions on a watershed or regionwide basis in lieu of sharing a portion of an urban runoff management agencies' mercury allocation. In such a case, the Water Board will consider a separate allocation for Caltrans for which it may demonstrate progress toward attaining an allocation or load reduction in the same manner as municipal programs.

ii. Reporting – The Permittees shall report on the status of the efforts to develop this allocation sharing scheme in their 2010, 2011, and 2012 Annual Reports. The Permittees shall submit in their March 15, 2014 Integrated Monitoring Report the manner in which the urban runoff mercury TMDL allocation will be shared between the Permittees and Caltrans.

C.12. Polychlorinated Biphenyls (PCBs) Controls

The Permittees shall implement the following control programs for PCBs. The Permittees shall perform the control measures and provide reporting on those control measures according to the provisions below. The purpose of these provisions is to implement the urban runoff requirements of the PCBs TMDL and reduce PCBs loads to make substantial progress toward achieving the urban runoff PCBs load allocation. The Permittees may comply with any requirement of this Provision through a collaborative effort.

C.12.a. Implement Project throughout Region to Incorporate PCBs and PCB-Containing Equipment Identification into Existing Industrial Inspections

i. Task Description – The Permittees shall develop training materials and train municipal industrial building inspectors to identify, in the course of their existing inspections, PCBs or PCB-containing equipment. The Permittees shall incorporate such PCB identification into industrial inspection programs.

ii. Implementation Level – Where inspectors identify during inspections PCBs or PCB-containing equipment, the Permittees shall document incidents in inspection reports and refer to appropriate regulatory agencies (e.g. county health departments, Department of Toxic Substances Control, California Department of Public Health, and the Water Board) as necessary.

iii. Reporting – The Permittees shall report the results of training in their 2010 Annual Report and report on both ongoing training development and inspections for PCB identification in their 2011, and following, Annual Reports.

C.12.b. Conduct Pilot Projects to Evaluate Managing PCB-Containing Materials and Wastes during Building Demolition and Renovation (e.g., Window Replacement) Activities

i. Task Description – The Permittees shall evaluate potential presence of PCBs at construction sites, current material handling and disposal regulations/programs (e.g., municipal ordinances, RCRA, TSCA) and current level of implementation.

ii. Implementation Level –

(1) The Permittees shall develop a sampling and analysis plan to evaluate PCBs at construction sites that involve demolition activities (including research on when, where, and which materials potentially contained PCBs).

(2) The Permittees shall implement a sampling and analysis plan at a minimum of 10 sites distributed throughout the combined Permittees' jurisdiction areas.

(3) The Permittees shall develop/select BMPs to reduce or prevent discharges of PCBs during demolition/remodeling. The BMPs will focus on methods

to identify, handle, contain, transport and dispose of PCB-containing building materials.

(4) The Permittees shall develop model ordinances or policies, train and deploy inspectors, and pilot test BMPs at 5 sites.

iii. Reporting –

(1) In their 2010 Annual Report, the Permittees shall submit the sampling and analysis plan (of Provision C.12.b.ii.).

(2) In their 2010 Annual Report, the Permittees shall submit a status report on sampling and analysis along with whatever sampling results are available.

(3) In their 2011 Annual Report, the Permittees shall submit the results of the evaluation (Provision C.12.b.i.) of current regulations, level of implementation, and regulatory gaps as well as the final sampling and analysis report, a list of appropriate BMPs, BMP training program, and model ordinances and policies to prevent PCB discharges from building demolition and improvement activities.

(4) In the March 15, 2014 Integrated Monitoring Report, the Permittees shall submit the results of pilot program effectiveness evaluation.

C.12.c. Pilot Projects to Investigate and Abate On-land Locations with Elevated PCB Concentrations, Including Public Rights-of-way, and Stormwater Conveyances with Accumulated Sediments with Elevated PCBs Concentrations.

i. Task Description – The Permittees shall investigate and abate PCBs sources in or to their storm drain systems in conjunction with the Water Board and other appropriate regulatory agencies with investigation and cleanup authorities. The purpose of this task is to implement and evaluate the benefit of a suite of abatement measures at five pilot project locations. The Permittees shall document the knowledge and experience gained through pilot implementation, and this documentation will provide a basis for determining the implementation scope of abatement projects in subsequent permit terms. The Permittees shall also quantify and report the amount of PCBs loads abated resulting from implementation of these measures.

ii. Implementation Level –

(1) The Permittees, working collaboratively, shall identify 5 drainage areas that contain high levels of PCBs and conduct pilot projects to investigate and abate these high PCB concentrations. To accomplish this, the Permittees shall interview municipal staff and review municipal databases, data collected or compiled through grant-funded efforts, other agency files, and other available information to identify potential PCB source areas and areas where PCB-contaminated sediment accumulates, including within stormwater conveyances. The Permittees shall qualitatively rank and map potential PCB source areas within each drainage. Investigation of mercury (Provision C.11.c.) shall be included in these efforts unless not

appropriate. When contamination is located on private property, the Permittees must either exercise direct authority to require cleanup or notify and request other appropriate authorities to exercise their cleanup authority.

(2) The Permittees shall conduct reconnaissance surveys of the identified drainages and gather information concerning past or current use of PCBs to further identify potential source areas and determine whether runoff from such locations is likely to convey soils/sediments with PCBs to municipal stormwater conveyances.

(3) The Permittees shall validate existence of elevated PCB concentrations through surface soil/sediment sampling and analysis where visual inspections and/or other information suggest potential source areas within each drainage.

Where data confirm significantly elevated PCB concentrations in surface soils/sediments within the subject pilot drainage, the Permittees shall provide available information on current site conditions and owner/operators and other potentially responsible parties to Water Board and other appropriate regulatory agencies to facilitate their issuance of orders for further investigation and remediation of subject sites. The Permittees shall assist the Water Board and other appropriate agencies to identify/evaluate funding to perform abatement and/or responsible parties and abatement options.

(4) The Permittees shall identify areas for expedited abatement on the basis of loading potential including factors such as PCB concentration, mass of sediment, and mobilization potential and/or human health protection thresholds, such as California Human Health Screening Levels.

(5) The Permittees shall conduct an abatement program in portions of drainages under their jurisdiction in conjunction with the Water Board and other appropriate agencies.

iii. Reporting

(1) The Permittees shall report on the identified suspect drainage areas [Provision C.12.c.ii (1)] in their 2010 Annual Report and results of the surveys [Provision C.12.c.ii.(2)] in their 2011 Annual Report.

(2) The Permittees shall report sampling and chemical analysis results at pilot locations [Provision C.12.c.ii.(3)] in their 2011 Annual Reports.

(3) The Permittees shall report on proposed abatement opportunities and activities [Provision C.12.c.ii.(4) and (5)], responsible parties, funding, agency oversight, and schedules in their 2012 Annual Report.

(4) The Permittees shall report results of abatement program effectiveness and estimates of loads reduced (see C.11.g) in the March 15, 2014 Integrated Monitoring Report.

C.12.d. Conduct Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices

i. **Task Description** – The Permittees shall jointly evaluate ways to enhance PCBs load reduction benefits of operation and maintenance activities that remove or manage sediment. The purpose of this task is to implement these management practices at the pilot scale in five drainages during this permit term. The Permittees shall document the knowledge and experience gained through pilot implementation, and this documentation will provide a basis for determining the implementation scope of enhanced sediment removal and management practices in subsequent permit terms. The Permittees shall also quantify and report the amount of PCBs loads removed or avoided resulting from implementation of these measures.

ii. **Implementation Level** – In all pilot program drainages selected as part of Provision C.12.c, the Permittees shall jointly evaluate ways to enhance existing sediment removal and management practices such as municipal street sweeping, curb clearing parking restrictions, inlet cleaning, catch basin cleaning, stream and stormwater conveyance system maintenance, and pump station cleaning via increased effort and/or retrofits. This evaluation shall also include consideration of street flushing and capture, collection, or routing to the sanitary sewer (in coordination and consultation with local sanitary sewer agency) as a potential enhanced management practice. The Permittees shall also jointly evaluate existing information on high-efficiency street sweepers. The goal is to evaluate the cost-effectiveness of high-efficiency street sweeping relative to reducing pollutant loads. The Permittees shall develop recommendations for follow-up studies to be conducted.

iii. **Reporting** – The Permittees shall submit a progress report on the results of these two evaluations in their 2010 Annual Report and the final evaluation results in their 2011 Annual Report.

iv. Beginning July 1, 2011, the Permittees shall implement pilot studies for the most potentially effective measure(s) based on the evaluation of Provision C.12.d. ii. throughout the region.

v. **Reporting** – The Permittees shall report effectiveness of enhanced practices pilot implementation in the March 15, 2014 Integrated Monitoring Report, and their plan for implementing enhanced practices in the next permit term.

C.12.e. Conduct Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit

i. **Task Description** – The Permittees shall evaluate and quantify the removal of PCBs by on-site treatment systems via retrofit of such systems into existing storm drain systems. The purpose of this task is to implement on-site treatment projects at the pilot scale in ten locations during this permit term. The Permittees shall document the knowledge and experience gained through pilot implementation, and this documentation will provide a basis for determining the implementation scope of on-site treatment retrofits in subsequent permit terms.

ii. Implementation Level – The Permittees, working collaboratively, shall identify at least 10 locations throughout the Permittees' jurisdictions that present opportunities to install and evaluate[51] on-site treatment systems (e.g., detention basins, bioretention units, sand filters, infiltration basins, treatment wetlands) and shall assess the best treatment options for those locations. Every county (San Mateo, Contra Costa, Alameda, Santa Clara, and Solano) should have at least one location. This assessment shall identify potential locations draining a variety of land uses, discuss technical feasibility, and discuss economical feasibility. The Permittees shall choose pilot study locations primarily on the basis of elevated PCBs concentrations with additional consideration to mercury concentrations.

iii. On the basis of the Provision C.12.e.ii. report, the Permittees shall select sites to perform pilot studies and shall conduct pilot studies in selected locations. Taken as a group, these 10 pilot study locations should span treatment types and drainage characteristics.

iv. Reporting –

(1) In their 2011 Annual Report, the Permittees shall report on candidate locations with types of treatment retrofit for each location. The report shall include assessment of at least 10 locations.

(2) In the March 15, 2014 Integrated Monitoring Report, the Permittees shall report status, results, PCBs-removal effectiveness, and lessons learned from the pilot studies and their plan for implementing this type of treatment on an expanded basis throughout the region during the next permit term.

C.12.f. Diversion of Dry Weather and First Flush Flows to POTWs

i. Task Description – The Permittees shall evaluate the reduced loads of PCBs from diversion of dry weather and first flush stormwater flows to sanitary sewers. The knowledge and experience gained through pilot implementation will be used to determine the implementation scope of urban runoff diversion in subsequent permit terms. The Permittees shall document the knowledge and experience gained through pilot implementation, and this documentation will provide a basis for determining the implementation scope of urban runoff diversion projects in subsequent permit terms.

ii. Implementation Level – The Permittees shall implement pilot projects to address the role of pump stations as a source of pollutants of concern (primarily PCBs and secondarily mercury). This work is in addition to Provisions C.2 and C.10 that address dissolved oxygen depletion and trash impacts in receiving waters. The objectives of this provision are: to implement five pilot projects for urban runoff diversion from stormwater pump stations to POTWs; evaluate the reduced loads of mercury and PCBs resulting from the diversion; and gather

[51] The Permittees may evaluate a maximum of two pre-existing treatment systems of the ten total required systems to be evaluated provided that these existing treatment systems are applicable to the intent of this provision.

information to guide the selection of additional diversion projects required in future permits. Collectively, the Permittees shall select 5 stormwater pump stations and 5 alternates by evaluating drainage characteristics and the feasibility of diverting flows to the sanitary sewer.

(1) The Permittees should work with the local POTW on a watershed, program, or regional level to evaluate feasibility and to establish cost sharing agreements. The feasibility evaluation shall include, but not be limited to, costs, benefits, and impacts on the stormwater and wastewater agencies and the receiving waters relevant to the diversion and treatment of the dry weather and first flush flows.

(2) From this feasibility evaluation, the Permittees shall select 5 pump stations and 5 alternates for pilot diversion studies. At least one urban runoff diversion pilot project shall be implemented in each of the five counties (San Mateo, Contra Costa, Alameda, Santa Clara, and Solano). The pilot and alternate locations should be located in industrially dominated catchments where elevated PCB concentrations are documented.

(3) The Permittees shall implement flow diversion to the sanitary sewer at the 5 pilot pump stations. As part of the pilot studies, they shall monitor and measure PCBs load reduction.

iii. Reporting –

(1) The Permittees shall summarize the results of the feasibility evaluation in their 2010 Annual Report, including:

- Selection criteria leading to the identification of the 5 candidate and 5 alternate pump station for pilot studies.
- Time schedules for conducting the pilot studies.
- A proposed method for distributing PCBs load reductions to participating wastewater and stormwater agencies.

(2) The Permittees shall report annually on the status of the pilot studies in each subsequent annual report.

(3) The March 15, 2014 Integrated Monitoring Report shall include:

- Evaluation of pilot program effectiveness.
- PCBs loads reduced.
- Updated feasibility evaluation procedures to guide future diversion project selection.

C.12.g. Monitor Stormwater PCB Pollutant Loads and Loads Reduced

The Permittees shall develop and implement a monitoring program as required in Provision C.8.f to quantify PCBs loads and loads reduced (see C.11.g for details) through the source control, treatment and other management measures implemented as part of the pilot studies of C.12.a through C.12.f.

C.12.h. Fate and Transport Study of PCBs in Urban Runoff

i. Task Description – The Permittees shall conduct or cause to be conducted studies aimed at better understanding the fate, transport, and biological uptake of PCBs discharged in urban runoff.

ii. Implementation Level – The specific information needs include understanding the in-Bay transport of PCBs discharged in urban runoff, the influence of urban runoff on the patterns of food web PCBs accumulation, and the identification of drainages where urban runoff PCBs are particularly important in food web accumulation.

iii. Reporting – The Permittees shall submit in their 2010 Annual Report a workplan describing the specific manner in which these information needs will be accomplished and describing the studies to be performed with a schedule. The Permittees shall report on status of the studies in their 2011 and 2012 Annual Reports. The Permittees shall report in the March 15, 2014 Integrated Monitoring Report the findings and results of the studies completed, planned, or in progress as well as implications of studies on potential control measures to be investigated, piloted or implemented in future permit cycles.

C.12.i. Development of a Risk Reduction Program Implemented throughout the Region

i. Task Description – The Permittees shall develop and implement or participate in effective programs to reduce PCBs-related risks to humans and quantify the resulting risk reductions from these activities.

ii. Implementation Level – The risk reduction activities shall include investigating ways to address public health impacts of PCBs in San Francisco Bay/Delta fish, including activities that reduce actual and potential exposure of health impacts to those people and communities most likely to be affected by PCBs in San Francisco Bay-caught fish, such as subsistence fishers and their families. Such strategies should include public participation in developing effective programs in order to ensure their effectiveness. The Permittees may include studies needed to establish effective exposure reduction activities and risk communication messages as part of their planning. The risk reduction activities may be performed by a third party if the Permittees wish to provide funding for this purpose. This requirement may be satisfied by a combination of related efforts through the Regional Monitoring Program or other similar collaborative efforts.

iii. Reporting – The Permittees shall submit in their 2010 Annual Report the specific manner in which these risk reduction activities will be accomplished and describe the studies to be performed with a schedule. The Permittees shall report on status of the studies in their 2011 and 2012 Annual Reports. The Permittees shall report the findings and results of the studies completed, planned, or in progress as well as the status of other risk reduction actions in the March 15, 2014 Integrated Monitoring Report.

C.13. Copper Controls

The control program for copper is detailed below. The Permittees shall implement the control measures and accomplish the reporting on those control measures according to the provisions below. The purpose of these provisions is to implement the control measures identified in the Basin Plan amendment necessary to support the copper site-specific objectives in San Francisco Bay. The Permittees may comply with any requirement of C.13 Provisions through a collaborative effort.

C.13.a. Manage Waste Generated from Cleaning and Treating of Copper Architectural Features, Including Copper Roofs, during Construction and Post-Construction.

i. Task Description – The Permittees shall ensure that local ordinance authority is established to prohibit the discharge of wastewater to storm drains generated from the installation, cleaning, treating, and washing of the surface of copper architectural features, including copper roofs to storm drains.

ii. Implementation Level

(1) The Permittees shall develop BMPs on how to manage the waste during and post-construction.

(2) The Permittees shall require use of appropriate BMPs when issuing building permits.

(3) The Permittees shall educate installers and operators on appropriate BMPs.

(4) The Permittees shall enforce against noncompliance.

iii. Reporting

(1) The Permittees shall certify adequate legal authority in their 2011 Annual Report or otherwise provide justification for schedule not to exceed one year to comply.

(2) The Permittees shall report annually, starting with their 2012 Annual Report, on training, permitting and enforcement activities.

(3) In their 2013 Annual Report, the Permittees shall evaluate the effectiveness of these measures, including BMP implementation and propose any additional measures to address this source.

C.13.b. Manage Discharges from Pools, Spas, and Fountains that Contain Copper-Based Chemicals

i. Task Description – By adopting local ordinances, the Permittees shall prohibit discharges to storm drains from pools, spas, and fountains that contain copper-based chemicals.

ii. Implementation Level – The Permittees shall either: 1) require installation of a sanitary sewer discharge connection for pools, spas, and fountains, including

connection for filter backwash, with a proper permit from the POTWs; or 2) require diversion of discharge for use in landscaping or irrigation.

iii. Reporting – The Permittees shall certify adequate legal authority in their 2011 Annual Report or otherwise provide justification for schedule not to exceed one year to comply.

C.13.c. Vehicle Brake Pads

i. Task Description – The Permittees shall engage in efforts to reduce the copper discharged from automobile brake pads to surface waters via urban runoff.

ii. Implementation Level – The Permittees shall participate in the Brake Pad Partnership (BPP) process to develop California legislation phasing out copper from certain automobile brake pads sold in California.

iii. Reporting – The Permittees shall report on legislation development and implementation status in Annual Reports during the permit term. In their 2013 Annual Report, the Permittees shall assess status of copper water quality issues associated with automobile brake pads and recommend brake pad-related actions for inclusion in subsequent permits if needed.

C.13.d. Industrial Sources

i. Task Description – The Permittees shall ensure industrial facilities do not discharge elevated levels of copper to storm drains by ensuring, through industrial facility inspections, that proper BMPs are in place.

ii. Implementation Level –

(1) As part of industrial site controls required by Provision C.4, the Permittees shall identify facilities likely to use copper or have sources of copper (e.g., plating facilities, metal finishers, auto dismantlers) and include them in their inspection program plans.

(2) The Permittees shall educate industrial inspectors on industrial facilities likely to use copper or have sources of copper and proper BMPs for them.

(3) As part of the industrial inspection, inspectors shall ensure that proper BMPs are in place at such facilities to minimize discharge of copper to storm drains, including consideration of roof runoff that might accumulate copper deposits from ventilation systems on-site.

iii. Reporting

The Permittees shall highlight copper reduction results in the industrial inspection component in the C.13 portion of each Annual Report beginning September 2010.

C.13.e. Studies to Reduce Copper Pollutant Impact Uncertainties

i. Task Description – The Permittees shall conduct or cause to be conducted technical studies to investigate possible copper sediment toxicity and technical studies to investigate sub-lethal effects on salmonids.

ii. Implementation Level – Technical uncertainties regarding copper effects in the Bay are described in the Basin Plan's implementation program for copper site-specific objectives. These uncertainties include toxicity to Bay benthic organisms possibly caused by high copper concentrations as well as possible impacts to the olfactory system of salmonids. The Permittees shall ensure that these studies are supported and conducted. Similar requirements are included in NPDES permits for wastewater discharges. The Permittees shall submit in their 2010 Annual Report the specific manner in which these information needs will be accomplished and describe the studies to be performed with a schedule. The Permittees shall report the findings and results of the studies completed, planned, or in progress in their 2012 Annual Report.

C.14. Polybrominated Diphenyl Ethers (PBDE), Legacy Pesticides and Selenium

The control program for PBDEs, legacy pesticides, and selenium is detailed below. The Permittees shall perform the control measures and accomplish the reporting on those control measures according to the provisions below. The purpose of these provisions is to gather concentration and loading information on a number of pollutants of concern (e.g., PBDEs, DDT, dieldrin, chlordane, selenium) for which TMDLs are planned or are in the early stages of development. The Permittees may comply with any requirement of C.14 Provisions through a collaborative effort.

C.14.a. Control Program for PBDEs, Legacy Pesticides, and Selenium.

i. Task Description – To determine if urban runoff is a conveyance mechanism associated with the possible impairment of San Francisco Bay for PBDEs, legacy pesticides (such as DDT, dieldrin, and chlordane), and selenium, the Permittees shall work with the other municipal stormwater management agencies in the Bay Region to implement a plan (PBDEs/Legacy Pesticides/Selenium Plans) to identify, assess, and manage controllable sources of PBDEs, legacy pesticides, and selenium found in urban runoff, if any. The Water Board recognizes that these three pollutants are distinct in terms of origin and transport, but they have been grouped into a single permit provision because the requirements are identical. The Water Board anticipates that some of the control measures that are developed for PCBs consistent with aforementioned efforts warrant consideration for the control of PBDEs and possibly legacy pesticides.

ii. Implementation Level – The PBDEs/Legacy Pesticides/Selenium Plan shall include actions to do the following:

Characterize the representative distribution of PBDEs, legacy pesticides, and selenium in the urban areas of the Bay Region covered by this permit to determine:

(1) If PBDEs, legacy pesticides, and selenium are present in urban runoff;

(2) If PBDEs, legacy pesticides, or selenium are distributed relatively uniformly in urban areas; and

(3) Whether storm drains or other surface drainage pathways are sources of PBDEs, legacy pesticides, or selenium in themselves, or whether there are specific locations within urban watersheds where prior or current uses result in land sources contributing to discharges of PBDEs, legacy pesticides, or selenium to San Francisco Bay via urban runoff conveyance systems.

iii. Report on progress in 2010 and 2011 Annual Reports. Submit in the 2012 Annual Report a report with the results of the characterization of PBDEs, legacy pesticides, and selenium in urban areas throughout the Bay Region.

iv. Provide information to allow calculation of PBDEs, legacy pesticides, and selenium loads to San Francisco Bay from urban runoff conveyance systems.

v. Submit in the 2013 Annual Report a report with the information required to compute such loads to San Francisco Bay of PBDEs, legacy pesticides, and selenium from urban runoff conveyance systems throughout the Bay.

vi. Identify control measures and/or management practices to eliminate or reduce discharges of PBDEs, legacy pesticides, or selenium conveyed by urban runoff conveyance systems.

vii. Submit in the 2013 Annual Report a report identifying such control measures/management practices.

C.15. Exempted and Conditionally Exempted Discharges

The objective of this provision is to exempt unpolluted non-stormwater discharges from Discharge Prohibition A.1 and to conditionally exempt non-stormwater discharges that are potential sources of pollutants. In order for non-stormwater discharges to be conditionally exempted from Discharge Prohibition A.1, the Permittees must identify appropriate BMPs, monitor the non-stormwater discharges where necessary, and ensure implementation of effective control measures – as listed below – to eliminate adverse impacts to waters of the State consistent with the discharge prohibitions of the Order.

C.15.a. Exempted Non-Stormwater Discharges (Exempted Discharges):

i. Discharge Type – In carrying out Discharge Prohibition A.1, the following unpolluted discharges are exempted from prohibition of non-stormwater discharges:

(1) Flows from riparian habitats or wetlands;

(2) Diverted stream flows;

(3) Flows from natural springs;

(4) Rising ground waters;

(5) Uncontaminated and unpolluted groundwater infiltration;

(6) Single family homes' pumped groundwater, foundation drains, and water from crawl space pumps and footing drains;

(7) Pumped groundwater from drinking water aquifers; and

(8) NPDES permitted discharges (individual or general permits).

ii. Implementation Level – The non-stormwater discharges listed in Provision C.15.a.i above are exempted unless they are identified by the Permittees or the Executive Officer as sources of pollutants to receiving waters. If any of the above categories of discharges, or sources of such discharges, are identified as sources of pollutants to receiving waters, such categories or sources shall be addressed as conditionally exempted discharges in accordance with Provision C.15.b below.

C.15.b. Conditionally Exempted Non-Stormwater Discharges:

The following non-stormwater discharges are also exempt from Discharge Prohibition A.1 if they are either identified by the Permittees or the Executive Officer as not being sources of pollutants to receiving waters, or if appropriate control measures to eliminate adverse impacts of such sources are developed and implemented in accordance with the tasks and implementation levels of each category of Provision C.15.b.i-viii below.

i. Discharge Type – Pumped Groundwater, Foundation Drains, and Water from Crawl Space Pumps and Footing Drains

(1) **Pumped Groundwater from Non Drinking Water Aquifers** –

Groundwater pumped from monitoring wells, used for groundwater basin management, which are owned and/or operated by the Permittees who pump groundwater as drinking water. These aquifers tend to be shallower, when compared to drinking water aquifers.

(a) **Implementation Level** – Twice a year (once during the wet season and once during the dry season), representative samples shall be taken from each aquifer that potentially will discharge or has discharged into a storm drain. Samples collected and analyzed for compliance in accordance with self-monitoring requirements of other NPDES permits or sample data collected for drinking water regulatory compliance may be submitted to comply with this requirement as long as they meet the following criteria:

(i) The water samples shall meet water quality standards consistent with the existing effluent limitations in the Water Board's NPDES General Permits, such as NPDES Nos. CAG912002 and CAG912003 for Discharge or Reuse of Extracted and Treated Groundwater Resulting from the Cleanup of Groundwater Polluted by fuel and VOCs, respectively, and NPDES No. CAG912004 for discharges of low-level, incidental, and potentially contaminated groundwater.

(ii) The water samples shall be analyzed using approved USEPA Methods (e.g., (a) USEPA Method 160.2 for total suspended solids; (b) USEPA Method 8015 Modified for total petroleum hydrocarbons; (c) USEPA Method 8260B and 8270C or equivalent for volatile and semi-volatile organic compounds; and (d) USEPA Method 3005 for metals.

(iii) The water samples shall be analyzed for pH and turbidity.

(iv) If a Permittee is unable to comply with the above criteria, the Permittee shall notify the Water Board upon becoming aware of the compliance issue.

(b) **Required BMPs** – When uncontaminated (meeting the criteria in C.15.b.i.(1)(a)(i)) groundwater is discharged from these monitoring wells, the following shall be implemented:

(i) Discharges shall be properly controlled and maintained to prevent erosion at the discharge point and at a rate that avoids scouring of banks and excess sedimentation in the receiving waterbody.

(ii) Appropriate BMPs shall be implemented to remove total suspended solids and silt to allowable discharge levels. Appropriate BMPs may include filtration, settling, coagulant application with no residual coagulant discharge, minor odor or color removal with activated carbon, small scale peroxide addition, or other minor treatment.

(iii) Turbidity of the discharged groundwater shall be maintained below 50 NTUs for discharges to dry creeks, 110 percent of the

ambient stream turbidity for a flowing stream with turbidities greater than 50 NTU, or 5 NTU above ambient turbidity for flowing streams with turbidities less than or equal to 50 NTU.

(iv) pH of the discharged groundwater shall be maintained within the range of 6.5 to 8.5.

(c) **Reporting** – The Permittees shall maintain records of these discharges, BMPs implemented, and any monitoring data collected.

(2) **Pumped[52] Groundwater, Foundation Drains, and Water from Crawl Space Pumps and Footing Drains**

(a) Proposed new discharges of uncontaminated groundwater at flows of 10,000 gallons/day or more and all new discharges of potentially contaminated groundwater shall be reported to the Water Board so that they can be subject to NPDES permitting requirements.

(b) Proposed new discharges of uncontaminated groundwater at flows of less than 10,000 gallons/day shall be encouraged to discharge to a landscaped area or bioretention unit that is large enough to accommodate the volume.

(c) If the discharge options in C.15.b.i.(2)(b) above are not feasible and these discharges must enter a storm drain, sampling shall be done to verify that the discharge is uncontaminated.

(i) The discharge shall meet water quality standards consistent with the existing effluent limitations in the Water Board's NPDES General Permits, such as NPDES Nos. CAG912002 and CAG912003 for Discharge or Reuse of Extracted and Treated Groundwater Resulting from the Cleanup of Groundwater Polluted by fuel and VOCs, respectively, and NPDES No. CAG912004 for discharges of low-level, incidental, and potentially contaminated groundwater.

(ii) The Permittees shall require that water samples from these discharge types be analyzed using approved USEPA Methods (e.g., (a) USEPA Method 160.2 for total suspended solids; (b) USEPA Method 8015 Modified for total petroleum hydrocarbons; (c) USEPA Method 8260B and 8270C or equivalent for volatile and semi-volatile organic compounds; and (d) USEPA Method 3005 for metals.

(d) **Required BMPs** – When the discharge has been verified as uncontaminated per sampling completed in C.15.b.i.(2)(c) above, the Permittees shall require the following during discharge:

(i) Proper control and maintain to prevent erosion at the discharge point and at a rate that avoids scouring of banks and excess sedimentation in the receiving waterbody.

(ii) Appropriate BMPs to render pumped groundwater free of pollutants and therefore exempted from prohibition may include

[52] Pumped groundwater not exempted in C.15.a or conditionally exempted in C.15.b.i.(1).

the following: filtration, settling, coagulant application with no residual coagulant discharge, minor odor or color removal with activated carbon, small scale peroxide addition, or other minor treatment.

(iii) Testing of water samples for turbidity and pH on the first two consecutive days of dewatering.

(iv) Turbidity of discharged groundwater shall be maintained below 50 NTU for discharges to dry creeks, 110 percent of the ambient stream turbidity for a flowing stream with turbidities greater than 50 NTU, or 5 NTU above ambient turbidity for a flowing stream with turbidities less than or equal to 50 NTU.

(v) pH of discharged water shall be maintained within the range of 6.5 to 8.5.

(e) If a Permittee determines that a discharger or a project proponent is unable to comply with the above criteria, the discharger shall be directed to obtain approval or permits directly from the Water Board.

(f) **Reporting** – The Permittees shall maintain records of these discharges, BMPs implemented, and any monitoring data collected.

ii. Discharge Type – Air Conditioning Condensate

Required BMPs – Condensate from air conditioning units shall be directed to landscaped areas or the ground. Discharge to a storm drain system may be allowed if discharge to landscaped areas or the ground is not feasible.

iii. Discharge Types – Planned,[53] Unplanned,[54] and Emergency Discharges of the Potable Water System

(1) **Planned Discharges** – Planned discharges are routine operation and maintenance activities in the potable water distribution system that can be scheduled in advance, such as disinfecting water mains, testing fire hydrants, storage tank maintenance, cleaning and lining pipe sections, routine distribution system flushing, reservoir dewatering, and water main dewatering activities. The following requirements only apply to those Permittees that are water purveyors and pertain to their planned discharges of potable water to their storm drain systems.

(a) **Required BMPs[55]** – The Permittees shall implement appropriate BMPs for dechlorination, and erosion and sediment controls for all planned potable water discharges.

[53] Planned discharges typically result from required routine operation and maintenance activities that can be scheduled in advance. Planned discharges are easier to control than unplanned discharges, and the BMPs are significantly easier to plan and implement.

[54] Unplanned discharges are non-routine, the result of accidents or incidents that cannot be scheduled or planned for in advance.

[55] Reference for BMPs, monitoring methods: *Guidelines for the Development of Your BMP Manual for Drinking Water System Releases.* Developed by the California-Nevada Sections of the American Water Works Association (CA-NV AWWA), Environmental Compliance Committee (ECC) 2005.

(b) **Notification Requirements**

(i) The Permittees shall notify the Water Board staff at least one week in advance for planned discharges with a flow rate of 250,000 gallons per day or more, or a total volume of 500,000 gallons or more. The Permittees shall also notify other interested parties who may be impacted by planned discharges, such as flood control agencies, downstream jurisdictions, and non-governmental organizations such as creek groups, before discharge. The notification shall include the following information, but is not limited to: (1) project name; (2) type of discharges; (3) receiving waterbody(ies); (4) date of discharge; (5) time of discharge (in military time); (6) estimated volume (gallons); and (7) estimated flow rate (gallons per day); and (8) monitoring plan of the discharges and receiving water. If receiving water monitoring is infeasible or is not practicable, justification shall be provided.

(c) **Monitoring and Reporting Requirements**

(i) The Permittees shall monitor planned discharges for pH, chlorine residual, and turbidity.

(ii) The following discharge benchmarks shall be used to evaluate the effectiveness of BMPs for all planned discharges:

- Chlorine residual 0.05 mg/L using the field test (Standard Methods 4500-Cl F and F) or equivalent
- pH ranges between 6.5 and 8.5
- Turbidity of 50 NTU post-BMPs or limit increase in turbidity above background level as follows:

Receiving Water Background	Incremental Increase
Dry Creek	50 NTU
< 50 NTU	5 NTU
50–100 NTU	10 NTU
> 100 NTU	10% of background

(iii) The Permittees shall submit the following information with the Annual Report in tabular form for all planned discharges. Reporting content shall include, but is not limited to the following parameters: (1) project name; (2) type of discharge; (3) receiving waterbody(ies); (4) date of discharge; (5) duration of discharge (in military time); (6) estimated volume (gallons); (7) estimated flow rate (gallons per day); (8) chlorine residual (mg/L); (9) pH; (10) turbidity (NTU) for receiving water where feasible and point of discharge, and (11) description of implemented BMPs or corrective actions.

(2) **Unplanned Discharges** – Unplanned discharges are non-routine activities such as water line breaks, leaks, overflows, fire hydrant shearing, and emergency flushing. The following requirements only apply to those Permittees that are water purveyors and pertain to their unplanned discharges of potable water to their storm drain systems.

(a) **Required BMPs** – The Permittees shall implement appropriate BMPs for dechlorination and erosion and sediment control for all unplanned discharges upon containing the discharge and attaining safety of the discharge site.

(b) **Administrative BMPs** – In some instances, the Permittees shall implement Administrative BMPs, such as source control measures, managerial practices, operations and maintenance procedures, or other measures to reduce or prevent potential pollutants from being discharged during unplanned discharges upon containing the discharge and attaining safety of the discharge site.

(c) **Notification Requirements**

(i) The Permittees shall report to the State Office of Emergency Services as soon as possible, but no later than two hours after becoming aware of (1) any aquatic impacts (e.g., fish kill) as a result of the unplanned discharges, or (2) when the discharge might endanger or compromise public health and safety.

(ii) The Permittees shall report to Water Board staff, by telephone or email as soon as possible, but no later than 24 hours after becoming aware of any unplanned discharges, where the total chlorine residual is greater than 0.05 mg/L and the total volume is approximately 50,000 gallons or more.

- Within five working days after the 24-hour telephone or email report, the Permittees shall submit a report documenting the discharge and corrective actions taken to Water Board staff and other interested parties.

(d) Monitoring and Reporting Requirements

(i) The Permittees shall monitor at least 10% of their unplanned discharges for pH and chlorine residual, and visually assess each discharge for turbidity immediately downstream of implemented BMPs to demonstrate their effectiveness. After the implementation of appropriate BMPs, the discharge pH levels outside the discharge ranges (below 6.5 and above 8.5), chlorine residual above 0.05 mg/l, or moderate and high turbidity shall trigger BMP improvement. If the Permittees monitor more than 10% of the unplanned discharges, all monitoring results shall be included in the Annual Report.

(ii) The Permittees shall submit the following information with the Annual Report in tabular form for all unplanned discharges. The reporting format and content shall be as described in Provision C.15.b.ii.(1)(c)(iii) of the Planned Discharges above. In addition, these reports shall also state the time of discharge discovery, notification time, inspector arrival time, and responding crew arrival time.

(iii) After 18 months of consecutive data gathering, a Permittee may propose, to the Executive Officer, a reduced monitoring plan targeting specific "high-risk" or "environmentally sensitive"

areas (i.e., areas that are prone to erosion and excess sedimentation at high flows, support rare or endangered species, or provide aquatic habitat with proven effective BMPs). Until the Executive Officer approves the reduced monitoring plan, the Permittee shall continue the monitoring plan prescribed in C.15.b.iii.(2)(d)(i).

(3) **Emergency Discharges** – Emergency discharges are the result of firefighting, unauthorized hydrant openings, natural or man-made disasters (e.g., earthquakes, floods, wildfires, accidents, terrorist actions).

Required BMPs

(a) The Permittees shall implement or require fire fighting personnel to implement BMPs for emergency discharges. However, the BMPs should not interfere with immediate emergency response operations or impact public health and safety. BMPs may include, but are not limited to, the plugging of the storm drain collection system for temporary storage, the proper disposal of water according to jurisdictional requirements, and the use of foam where there may be toxic substances on the property the fire is located.

(b) During emergency situations, priority of efforts shall be directed toward life, property, and the environment (in descending order). The Permittees or fire fighting personnel shall control the pollution threat from their activities to the extent that time and resources allow.

(c) **Reporting Requirements** – Reporting requirements will be determined by Water Board staff on a case-by-case basis, such as for fire incidents at chemical plants.

iv. Discharge Type – Individual Residential Car Washing

Required BMPs

(1) The Permittees shall discourage through outreach efforts individual residential car washing within their jurisdictional areas that discharge directly into their MS4s.

(2) The Permittees shall encourage individuals to direct car wash waters to landscaped areas, use as little detergent as necessary, wash cars at commercial car wash facilities, etc.

v. Discharge Type – Swimming Pool, Hot Tub, Spa, and Fountain Water Discharges

(1) **Required BMPs**

(a) The Permittees shall prohibit discharge of water that contains chlorine residual, copper algaecide, filter backwash or other pollutants to storm drains or to waterbodies. Such polluted discharges from pools, hot tubs, spas, and fountains shall be directed to the sanitary sewer (with the local sanitary sewer agency's approval) or to landscaped areas that can accommodate the volume.

(b) Discharges from swimming pools, hot tubs, spas and fountains shall be allowed into storm drain collection systems only if there are no

other feasible disposal alternatives (e.g., disposal to sanitary sewer or landscaped areas) and if the discharge is properly dechlorinated to non-detectable levels of chlorine consistent with water quality standards.

(c) The Permittees shall require that new or rebuilt swimming pools, hot tubs, spas and fountains within their jurisdictions have a connection[56] to the sanitary sewer to facilitate draining events. The Permittees shall coordinate with local sanitary sewer agencies to determine the standards and requirements necessary for the installation of a sanitary sewer discharge location to allow draining events for pools, hot tubs, spas, and fountains to occur with the proper permits from the local sanitary sewer agency.

(d) The Permittees shall improve their public outreach and educational efforts and ensure implementation of the required BMPs and compliance in commercial, municipal, and residential facilities.

(e) The Permittees shall implement the Illicit Discharge Enforcement Response Plan from C.5.b for polluted (contains chlorine, copper algaecide, filter backwash, or other pollutants) swimming pool, hot tub, spa, or fountain waters that get discharged into the storm drain.

(2) **Reporting** – The Permittees shall keep records of the authorized major discharges of dechlorinated pool, hot tubs, spa and fountain water to the storm drain, including BMPs employed; such records shall be available for inspection by the Water Board.

vi. Discharge Type – Irrigation Water, Landscape Irrigation, and Lawn or Garden Watering

(1) **Required BMPs** – The Permittees shall promote measures that minimize runoff and pollutant loading from excess irrigation via the following:

(a) Promoting and/or working with potable water purveyors to promote conservation programs that minimize discharges from lawn watering and landscape irrigation practices;

(b) Promoting outreach messages regarding the use of less toxic options for pest control and landscape management;

(c) Promoting and/or working with potable water purveyors to promote the use of drought tolerant, native vegetation to minimize landscape irrigation demands;

(d) Promoting and/or working with potable water purveyors to promote outreach messages that encourage appropriate applications of water needed for irrigation and other watering practices; and,

(e) Implementing the Illicit Discharge Enforcement Response Plan from C.5.b, as necessary, for ongoing, large-volume landscape irrigation runoff to their MS4s.

[56] This connection could be a drain in the pool to the sanitary sewer or a sanitary sewer clean out located close enough to the pool so that a hose can readily direct the pool discharge into the sanitary sewer clean out.

(2) **Reporting** – The Permittees shall provide implementation summaries in their Annual Report.

vii. Additional Discharge Types –The Permittees shall identify and describe additional types and categories of discharges not yet listed in Provision C.15.b that they propose to conditionally exempt from Prohibition A.1 in periodic submissions to the Executive Officer. For each such category, the Permittees shall identify and describe, as necessary and appropriate to the category, either documentation that the discharges are not sources of pollutants to receiving waters or circumstances in which they are not found to be sources of pollutants to receiving waters. Otherwise, the Permittees shall describe control measures to eliminate adverse impacts of such sources, procedures and performance standards for their implementation, procedures for notifying the Water Board of these discharges, and procedures for monitoring and record management.

viii. Permit Authorization for Exempted Non-Stormwater Discharges

(1) Discharges of non-stormwater from sources owned or operated by the Permittees are authorized and permitted by this Permit, if they are in accordance with the conditions of this provision.

(2) The Water Board may require dischargers of non-stormwater, other than the Permittees, to apply for and obtain coverage under an NPDES permit and to comply with the control measures pursuant to Provision C.15.b. Non-stormwater discharges that are in compliance with such control measures may be accepted by a Permittee and are not subject to Prohibition A.1.

(3) The Permittees may propose, as part of their annual updates consistent with the requirements of Provision C.15.b of this Permit, additional categories of non-stormwater discharges with BMPs, to be included in the exemption to Prohibition A.1. Such proposals may be subject to approval by the Executive Officer as a minor modification of the Permit.

C.16. Annual Reports

C.16.a. The Permittees shall submit Annual Reports electronically and in paper copy upon request by September 15 of each year. Each Annual Report shall report on the previous fiscal year beginning July 1 and ending June 30. The annual reporting requirements are set forth in Provisions C.1 – C.15. The Permittees shall retain documentation as necessary to support their Annual Report. The Permittees shall make this supporting information available upon request within a timely manner, generally no more that ten business days unless otherwise agreed to by the Executive Officer.

C.16.b. The Permittees shall collaboratively develop a common annual reporting format for acceptance by the Executive Officer by April 1, 2010. The resulting Annual Report Form, once approved, shall be used by all Permittees. The Annual Report Form may be changed by April 1 of each year for the following annual report, to more accurately reflect the reporting requirements of Provisions C.1 – C.15, with the agreement of the Permittees and by the approval of the Executive Officer.

C.16.c. The Permittees shall certify in each Annual Report that they are in compliance with all requirements of the Order. If a Permittee is unable to certify compliance with a requirement, it must submit in the Annual Report the reason for failure to comply, a description and schedule of tasks necessary to achieve compliance, and an estimated date for achieving full compliance.

C.17. Modifications to this Order

This Order may be modified, or alternatively, revoked or reissued, before the expiration date as follows:

C.17.a. To address significant changed conditions identified in the technical or Annual Reports required by the Water Board, or through other means or communication, that were unknown at the time of the issuance of this Order;

C.17.b. To incorporate applicable requirements of statewide water quality control plans adopted by the State Board or amendments to the Basin Plan approved by the State Board; or

C.17.c. To comply with any applicable requirements, guidelines, or regulations issued or approved under section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable.

C.18. Standard Provisions

Each Permittee shall comply with all parts of the Standard Provisions contained in Attachment K of this Order.

C.19. Expiration Date

This Order expires on November 30, 2014, five years from the effective date of this Order. The Permittees must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

C.20. Rescission of Old Orders

Order Nos. 99-058, 99-059, 01-024, R2-2003-0021, and R2-2003-0034 are hereby rescinded on the effective date of this Order, which shall be December 1, 2009, provided that the Regional Administrator of USEPA, Region IX, does not object.

C.21. Effective Date

The Effective Date of this Order and Permit shall be December 1, 2009, provided that the Regional Administrator of USEPA, Region IX, does not object.

I, Bruce H. Wolfe, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Francisco Bay Region, on October 14, 2009.

RCRA	Resource Conservation and Recovery Act
RMP	Regional Monitoring Program
ROWD	Report of Waste Discharge
RTA	Rapid Trash Assessment
SARA	Superfund Amendments and Reauthorization Act
SCURTA	Santa Clara Urban Rapid Trash Assessment
SCVURPPP	Santa Clara Valley Urban Runoff Pollution Prevention Program
SFRWQCB	San Francisco Bay Regional Water Quality Control Board
SIC	Standard Industrial Classification
SMWPPP	San Mateo Countywide Water Pollution Prevention Program
SOP	Standard Operating Procedure
SWAMP	Surface Water Ambient Monitoring Program
SWPPP	Stormwater Pollution Prevention Plan
SWRCB	State Water Resources Control Board
TIE	Toxicity Identification Evaluation
TMDLs	Total Maximum Daily Loads
TSCA	Toxic Substances Control Act
USEPA	Unites States Environmental Protection Agency
Water Board	San Francisco Bay Regional Water Quality Control Board
WLAs	Wasteload Allocations

GLOSSARY

Arterial Roads	Freeways, multilane highways, and other important roadways that supplement the Interstate System. Arterial roads connect, as directly as practicable, principal urbanized areas, cities, and industrial centers.
Beneficial Uses	The uses of water of the state protected against degradation, such as domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation and preservation of fish and wildlife, and other aquatic resources or preserves.
Collector Roads	Major and minor roads that connect local roads with arterial roads. Collector roads provide less mobility than arterial roads at lower speeds and for shorter distances.
Commercial Development	Development or redevelopment to be used for commercial purposes, such as office buildings, retail or wholesale facilities, restaurants, shopping centers, hotels, and warehouses.
Construction Site	Any project, including projects requiring coverage under the General Construction Permit, that involves soil disturbing activities including, but not limited to, clearing, grading, paving, disturbances to ground such as stockpiling, and excavation. Construction sites are all sites with disturbed or graded land area not protected by vegetation, or pavement, that are subject to a building or grading permit.
Conditionally Exempted Non-Stormwater Discharge	Non-stormwater discharges that are prohibited by A.1. of this permit, unless such discharges are authorized by a separate NPDES permit or are not in violation of water quality standards because appropriate BMPs have been implemented to reduce pollutants to the maximum extent practicable, consistent with Provision C.15.
Discharger	Any responsible party or site owner or operator within the Permittees' jurisdiction whose site discharges stormwater runoff, or a non-stormwater discharge
Detached Single-family Home Project	The building of one single new house or the addition and/or replacement of impervious surface associated with one single existing house, which is not part of a larger plan of development.
Development	Construction, rehabilitation, redevelopment, or reconstruction of any public or private residential project (whether single-family, multi-unit, or planned unit development); or industrial, commercial, retail or other nonresidential project, including public agency projects.
Estate Residential Development	Development zoned for a minimum 1 acre lot size
Emerging Pollutants	Pollutants in water that either: (1) May not have been thoroughly studied to date but are suspected by the scientific community to be a source of impairment of beneficial uses and/or present a health risk; or (2) Are not yet part of a monitoring program.
Erosion	The diminishing or wearing away of land due to wind, or water. Often the eroded debris (silt or sediment) becomes a pollutant via stormwater runoff. Erosion occurs

	naturally, but can be intensified by land disturbing and grading activities such as farming, development, road building, and timber harvesting.
Full Trash Capture Device	Full trash capture systems are defined as "any device or series of devices that traps all particles retained by a 5mm mesh screen and has a design treatment capacity of not less than the peak flow rate resulting from a one-year, one-hour, storm in the tributary drainage catchment area." Trash collection booms and sea curtains do not meet this definition, but are effective for removal of floating trash if properly maintained. Because these devices do not meet the Full Trash Capture Device definition, only ¼ of the catchment area treated by these measures is credited toward meeting the trash management area requirement of C.10.a.
General Permits	Waste Discharge Requirements or NPDES Permits containing requirements that are applicable to a class or category of dischargers. The State of California has general stormwater permits for construction sites that disturb soil of 1 acre or more; industrial facilities; `Phase II smaller municipalities (including nontraditional Small MS4s, which are governmental facilities, such as military bases, public campuses, and prison and hospital complexes); and small linear underground/overhead projects disturbing at least 1 acre, but less than 5 acres (including trenching and staging areas).
Grading	The cutting and/or filling of the land surface to a slope or elevation.
Hydrologic source control measures	Site design techniques that minimize and/or slow the rate of stormwater runoff from the site.
Hydromodification	The modification of a stream's hydrograph, caused in general by increases in flows and durations that result when land is developed (e.g., made more impervious). The effects of hydromodification include, but are not limited to, increased bed and bank erosion, loss of habitat, increased sediment transport and deposition, and increased flooding.
Illicit Discharge	Any discharge to a municipal separate storm sewer (storm drain) system (MS4) that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term *illicit discharge* includes all non-stormwater discharges not composed entirely of stormwater and discharges that are identified under Section A. (Discharge Prohibitions) of this Permit. The term illicit discharge does not include discharges that are regulated by an NPDES permit (other than the NPDES permit for discharges from the MS4) or authorized by the Regional Water Board Executive Officer.
Impervious Surface	A surface covering or pavement of a developed parcel of land that prevents the land's natural ability to absorb and infiltrate rainfall/stormwater. Impervious surfaces include, but are not limited to, roof tops; walkways; patios; driveways; parking lots; storage areas; impervious concrete and asphalt; and any other continuous watertight pavement or covering. Landscaped soil and pervious pavement, including pavers with pervious openings and seams, underlain with pervious soil or pervious storage material, such as a gravel layer sufficient to hold at least the C.3.d volume of rainfall runoff are not impervious surfaces. Open, uncovered retention/detention facilities shall not be considered as impervious surfaces for purposes of determining whether a project is a Regulated Project under

	Provisions C.3.b. and C.3.g. Open, uncovered retention/detention facilities shall be considered impervious surfaces for purposes of runoff modeling and meeting the Hydromodification Standard.
Industrial Development	Development or redevelopment of property to be used for industrial purposes, such as factories; manufacturing buildings; and research and development parks.
Infill Site	A site in an urbanized area where the immediately adjacent parcels are developed with one or more qualified urban uses or at least 75% of the perimeter of the site adjoins parcels that are developed with qualified urban uses and the remaining 25% of the site adjoins parcels that have previously been developed for qualified urban uses and no parcel within the site has been created within the past 10 years.
Infiltration Device	Any structure that is deeper than wide and designed to infiltrate stormwater into the subsurface, and, as designed, bypass the natural groundwater protection afforded by surface soil. These devices include dry wells, injection wells, and infiltration trenches (includes French drains).
Joint Stormwater Treatment Facility	A stormwater treatment facility built to treat the combined runoff from two or more Regulated Projects located adjacent to each other,
Local Roads	Roads that provide limited mobility and are the primary access to residential areas, businesses, farms, and other local areas. Local roads offer the lowest level of mobility and usually contain no bus routes. Service to through traffic movement usually is deliberately discouraged in local roads.
Maximum Extent Practicable (MEP)	A standard for implementation of stormwater management actions to reduce pollutants in stormwater. Clean Water Act (CWA) 402(p)(3)(B)(iii) requires that municipal stormwater permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." Also see State Board Order WQ 2000-11.
Mixed-use Development or Redevelopment	Development or redevelopment of property to be used for two or more different uses, all intended to be harmonious and complementary. An example is a high-rise building with retail shops on the first 2 floors, office space on floors 3 through 10, apartments on the next 10 floors, and a restaurant on the top floor.
Municipal Separate Storm Sewer System (MS4)	A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains), as defined in 40 CFR 122.26(b)(8): (1) Owned or operated by a state, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law...including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization or a designated and approved management agency under section 208 of the CWA) that discharges into waters of the United States; (2) Designed or used for collecting or conveying stormwater; (3) Which is not a combined sewer; and (4) Which is not part of a Publicly Owned Treatment Works (POTW), as defined in

	40 CFR 122.2.
Municipal Corporation Yards, Vehicle Maintenance/Material Storage Facilities/	Any Permittee-owned or -operated facility, or portion thereof, that: (1) Conducts industrial activity, operates or stores equipment, and materials; (2) Performs fleet vehicle service/maintenance including repair, maintenance, washing, or fueling; (3) Performs maintenance and/or repair of machinery/equipment;
National Pollutant Discharge Elimination System (NPDES)	A national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under sections 307, 402, 318, and 405 of the CWA.
Notice of Intent (NOI)	The application form by which dischargers seek coverage under General Permits, unless the General Permit requires otherwise.
Parking Lot	Land area or facility for the parking or storage of motor vehicles used for business, commerce, industry, or personal use.
Permittee/Permittees	Municipal agency/agencies that are named in and subject to the requirements of this Permit.
Permit Effective Date	The date at least 45 days after Permit adoption, provided the Regional Administrator of U.S. EPA Region 9 has no objection, whichever is later.
Pervious Pavement	Pavement that stores and infiltrates rainfall at a rate equal to immediately surrounding unpaved, landscaped areas, or that stores and infiltrates the rainfall runoff volume described in C.3.d.
Point Source	Any discernible, confined, and discrete conveyance including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operations, landfill leachate collection systems, vessel, or other floating craft, from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural stormwater runoff.
Pollutants of Concern	Pollutants that impair waterbodies listed under CWA section 303(d), pollutants associated with the land use type of a development, including pollutants commonly associated with urban runoff. Pollutants commonly associated with stormwater runoff include, but are not limited to, total suspended solids; sediment; pathogens (e.g., bacteria, viruses, protozoa); heavy metals (e.g., copper, lead, zinc, and cadmium); petroleum products and polynuclear aromatic hydrocarbons; synthetic organics (e.g., pesticides, herbicides, and PCBs); nutrients (e.g., nitrogen and phosphorus fertilizers); oxygen-demanding substances (e.g., decaying vegetation and animal waste) litter and trash.
Potable Water	Water that is safe for domestic use, drinking, and cooking.
Pre-Project Runoff Conditions	Stormwater runoff conditions that exist onsite immediately before development activities occur. This definition is not intended to be interpreted as that period before any human-induced land activities occurred. This definition pertains to redevelopment as well as initial development.
Public Development	Any construction, rehabilitation, redevelopment or reconstruction of any public agency project, including but not limited to, libraries, office buildings, roads, and

	highways.
Redevelopment	Land-disturbing activity that results in the creation, addition, or replacement of exterior impervious surface area on a site on which some past development has occurred.
Regional Monitoring Program (RMP)	A monitoring program aimed at determining San Francisco Bay Region receiving water conditions. The program was established in 1993 through an agreement among the Water Board, wastewater discharger agencies, dredgers, Municipal Stormwater Permittees and the San Francisco Estuary Institute to provide regular sampling of Bay sediments, water, and organisms for pollutants. The program is funded by the dischargers and managed by San Francisco Estuary Institute.
Regional Project	A regional or municipal stormwater treatment facility that discharges into the same watershed that the Regulated Project does.
Regulated Projects	Development projects as defined in Provision C.3.b.ii.
Residential Housing Subdivision	Any property development of multiple single-family homes or of dwelling units intended for multiple families/households (e.g., apartments, condominiums, and town homes).
Retrofitting	Installing improved pollution control devices at existing facilities to attain water quality objectives.
Sediments	Soil, sand, and minerals washed from land into water, usually after rain.
Solid Waste	All putrescible and nonputrescible solid, semisolid, and liquid wastes as defined by California Government Code Section 68055.1 (h).
Source Control BMP	Land use or site planning practices, or structural or nonstructural measures, that aim to prevent runoff pollution by reducing the potential for contact with rainfall runoff at the source of pollution. Source control BMPs minimize the contact between pollutants and urban runoff.
Standard Industrial Classification (SIC)	A federal system for classifying establishments by the type of activity in which they are engaged using a four-digit code.
Stormwater Pumping Station	Mechanical device (or pump) that is installed in MS4s or pipelines to discharge stormwater runoff and prevent flooding.
Stormwater Treatment System	Any engineered system designed to remove pollutants from stormwater runoff by settling, filtration, biological degradation, plant uptake, media absorption/adsorption or other physical, biological, or chemical process. This includes landscape-based systems such as grassy swales and bioretention units as well as proprietary systems.
Surface Water Ambient Monitoring Program (SWAMP)	The State Water Board's program to monitor surface water quality; coordinate consistent scientific methods; and design strategies for improving water quality monitoring, assessment, and reporting.
Total Maximum Daily Loads (TMDLs)	The maximum amount of a pollutant that can be discharged into a waterbody from all sources (point and nonpoint) and still maintain water quality standards. Under CWA section 303(d), TMDLs must be developed for all waterbodies that do not meet water quality standards even after application of technology-based controls,

	more stringent effluent limitations required by a state or local authority, and other pollution control requirements such as BMPs.
Toxicity Identification Evaluation (TIE)	TIE is a series of laboratory procedures used to identify the chemical(s) responsible for toxicity to aquatic life. These procedures are designed to decrease, increase, or transform the bioavailable fractions of contaminants to assess their contributions to sample toxicity. TIEs are conducted separately on water column and sediment samples.
Trash and Litter	Trash consists of litter and particles of litter. California Government Code Section 68055.1 (g) defines litter as all improperly discarded waste material, including, but not limited to, convenience food, beverage, and other product packages or containers constructed of steel, aluminum, glass, paper, plastic, and other natural and synthetic materials, thrown or deposited on the lands and waters of the state, but not including the properly discarded waste of the primary processing of agriculture, mining, logging, sawmilling, or manufacturing.
Treatment	Any method, technique, or process designed to remove pollutants and/or solids from polluted stormwater runoff, wastewater, or effluent.
Waste Load Allocations (WLAs)	A portion of a receiving water's TMDL that is allocated to one of its existing or future point sources of pollution.
Water Quality Control Plan (Basin Plan)	The Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) is the Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State within the Region, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives and discharge prohibitions. The Basin Plan was duly adopted and approved by the State Water Resources Control Board, U.S. EPA, and the Office of Administrative Law where required. The latest version is effective as of December 22, 2006.
Water Quality Objectives	The limits or levels of water quality elements or biological characteristics established to reasonably protect the beneficial uses of water or to prevent pollution problems within a specific area. Water quality objectives may be numeric or narrative.
Water Quality Standards	State-adopted and USEPA-approved water quality standards for waterbodies. The standards prescribe the use of the waterbody and establish the water quality criteria that must be met to protect designated uses. Water quality standards also include the federal and state anti-degradation policy.
Wet Season	October 1 through April 30 of each year

I. CONTACT INFORMATION

Water Board Staff Contact: Dale Bowyer, 1515 Clay Street, Suite 1400, Oakland, CA 94612, 510-622-2323, 510-622-2501 (fax), email: dbowyer@waterboards.ca.gov

The Permit and other related documents can be downloaded from the Water Board website at: http://www.waterboards.ca.gov/sanfranciscobay/mrp.htm

Comments can be electronically submitted to mrp@waterboards.ca.gov.

All documents referenced in this Fact Sheet and in the Order are available for public review at the Water Board office, located at the address listed above. Public records are available for inspection during regular business hours, from 9:00 am to 4:00 pm, Monday through Friday, 12 - 1 pm excluded. Per the Governor's order calling for furloughs, the Water Board office will be closed the first three Fridays of each month through June 2010. To schedule an appointment to inspect public records, contact Melinda Wong at 510-622-2430.

II. PERMIT GOALS AND PUBLIC PROCESS

Goals

The Goals for the Municipal Regional Stormwater Permit (hereinafter, the Permit) Development Process include:

1. Consolidate six Phase I municipal stormwater NPDES permits into one consistent permit which is regional in scope.
2. Include more specificity in NPDES permit order language and requirements. Create (A) required stormwater management actions, (B) a specific level of implementation for each action or set of actions, and (C) reporting and effectiveness evaluation requirements for each action sufficient to determine compliance.
3. Incorporate the Stormwater Management Plan level of detail and specificity into the Permit. Stormwater Management Plans have always been considered integral to the municipal stormwater NPDES permits, but have not received the level of public review in the adoption process necessary relative to their importance in adequate stormwater pollutant management implementation.
4. Implement and enhance actions to control 303(d) listed pollutants, pollutants of concern, and achieve Waste Load Allocations adopted under Total Maximum Daily Loads.
5. Implement more specific and comprehensive stormwater monitoring, including monitoring for 303(d) listed pollutants.

Public Process

Water Board staff conducted a series of stakeholder meetings and workshops with the Permittees and other interested parties to develop this Permit over the past 3 years. These meetings included Water Board staff, representatives of the Permittees, representatives of

environmental groups, homebuilders, private citizens, and other interested parties. The following is a summary of the lengthy stakeholder process.

(2004–2005) Water Board staff and the Bay Area Stormwater Management Agencies Association (BASMAA) agreed to develop a municipal regional stormwater permit. Board staff and BASMAA held monthly meetings to agree on the regional permit approach and developed concepts and ground rules for a Steering Committee. The Steering Committee for the Permit began regular monthly meetings, and there was agreement to form work groups to develop options for permit program components in table format.

(2006) Water Board staff, BASMAA, and nongovernmental groups met and discussed the Performance Standard (i.e., actions, implementation levels, and reporting requirements) tables from six workgroups. In addition to the Steering Committee, Work Group Stakeholder meetings focused on the six program elements to complete the Performance Standard Tables and discuss other issues in preparation for creating the first Draft Permit Provisions. Two large public workshops were held in November with all interested stakeholders to discuss Work Group products.

(2007) The Water Board held a public workshop in March to receive public input. Board staff distributed an Administrative Draft Permit dated May 1, 2007, held multiple meetings and received comment.

(2007- 2008) On December 14, 2007, Board staff distributed the Tentative Order for a 77-day written public comment period ending February 29, 2008. A public hearing for oral testimony was held on March 11, 2008. During the remainder of 2008 there were additional meetings with stakeholders, and Board staff worked on revisions to the Tentative Order and produced responses to both written comments received by February 29, 2008, and oral comments received at the March 11, 2008, hearing. The Revised Tentative Order for the MRP was released on February 11, 2009, and a May 13, 2009, hearing before the Water Board was scheduled. Written comments on the revisions to the Tentative Order were received until April 3, 2009.

(2009) After the May 2009 MRP Public Hearing, Water Board staff held numerous meetings with the Permittees (via the Bay Area Stormwater Management Agencies Association) and other key stakeholders including Save the Bay, NRDC, the Northern California Homebuilders, S.F. BayKeeper and the U.S. EPA. These meetings have been focused on discussion of revisions to the MRP Tentative Order in response to comments received, in an effort to resolve issues primarily related to Provisions C.3 New Development, C.8 Monitoring, C.10 Trash Load Reduction, C.11 Mercury Controls, C.12 PCBs Controls, and C.15 Exempt Non-Stormwater Discharges.

Implementation

It is the Water Board's intent that this Permit shall ensure attainment of applicable water quality objectives and protection of the beneficial uses of receiving waters and associated habitat. This Permit requires that discharges shall not cause exceedances of water quality objectives nor shall they cause certain conditions to occur that create a condition of nuisance or water quality impairment in receiving waters. Accordingly, the Water Board is

requiring that these standard requirements be addressed through the implementation of technically and economically feasible control measures to reduce pollutants in stormwater discharges to the maximum extent practicable as provided in Provisions C.1 through C.15 of this Permit and section 402(p) of the CWA. Compliance with the Discharge Prohibitions, Receiving Water Limitations, and Provisions of this Permit is deemed compliance with the requirements of this Permit. If these measures, in combination with controls on other point and nonpoint sources of pollutants, do not result in attainment of applicable water quality objectives, the Water Board may invoke Provision C.1. and may reopen this Permit pursuant to Provisions C.1 and C.15 of this Permit to impose additional conditions that require implementation of additional control measures.

Each of the Permittees is individually responsible for adoption and enforcement of ordinances and policies, for implementation of assigned control measures or best management practices (BMPs) needed to prevent or reduce pollutants in stormwater, and for providing funds for the capital, operation, and maintenance expenditures necessary to implement such control measures/BMPs within its jurisdiction. Each Permittee is also responsible for its share of the costs of the area-wide component of the countywide program to which the Permittee belongs. Enforcement actions concerning non-compliance with the Permit will be pursued against individual Permittee(s) responsible for specific violations of the Permit.

III. BACKGROUND

Early Permitting Approach

The federal Clean Water Act (CWA) was amended in 1987 to address urban stormwater runoff pollution of the nation's waters. One requirement of the amendment was that many municipalities throughout the United States were obligated for the first time to obtain National Pollutant Discharge Elimination System (NPDES) permits for discharges of urban runoff from their Municipal Separate Storm Sewer Systems (MS4s). In response to the CWA amendment (and the pending federal NPDES regulations which would implement the amendment), the Water Board issued a municipal storm water Phase I permits in the early 1990s. These permits were issued to the entire county-wide urban areas of Santa Clara, Alameda, San Mateo and Contra Costa Counties, rather than to individual cities over 100,000 population threshold. The cities chose to collaborate in countywide groups, to pool resources and expertise, and share information, public outreach and monitoring costs, among other tasks.

During the early permitting cycles, the county-wide programs developed many of the implementation specifics which were set forth in their Stormwater Pollution Prevention Management Plans (Plans). The permit orders were relatively simple documents that referred to the stormwater Plans for implementation details. Often specific aspects of permit and Plan implementation evolved during the five year permit cycle, with relatively significant changes approved at the Water Board staff level without significant public review and comment.

Merging Permit Requirements and Specific Requirements Previously Contained in Stormwater Management Plans

US EPA stormwater rules for Phase I stormwater permits envisioned a process in which municipal stormwater management programs contained the detailed BMP and specific level of implementation information, and are reviewed and approved by the permitting agency before the municipal NPDES stormwater permits are adopted. The current and previous permits established a definition of a stormwater management program and required each Permittee to submit an urban runoff management plan and annual work plans for implementing its stormwater management program. An advantage to this approach was that it provided flexibility for Permittees to tailor their stormwater management programs to reflect local priorities and needs. However, Water Board staff found it difficult to determine Permittees' compliance with the current permits, due to the lack of specific requirements and measurable outcomes of some required actions. Furthermore, federal stormwater regulations require that modifications to stormwater management programs, such as annual revisions to urban runoff management plans, be approved through a public process.

Recent court decisions have reiterated that federal regulations and State law require that the implementation specifics of Municipal Stormwater NPDES permits be adopted after adequate public review and comment, and that no significant change in the permit requirements except minor modifications can occur during the permit term without a similar level of public review and comment.

This Permit introduces a modification to these previous approaches by establishing the stormwater management program requirements and defining up front, as part of the Permit Development Process, the minimum acceptable elements of the municipal stormwater management program. The advantages of this approach are that it satisfies the public involvement requirements of both the federal Clean Water Act and the State Water Code. An advantage for Permittees and the public of this approach is that the permit requirements are known at the time of permit issuance and not left to be determined later through iterative review and approval of work plans. While it may still be necessary to amend the Permit prior to expiration, any need to this should be minimized.

This Permit does not include approval of all Permittees' stormwater management programs or annual reports as part of the administration of the Permit. To do so would require significantly increased staff resources. Instead, minimum measures have been established to simplify assessment of compliance and allow the public to more easily assess each Permittee's compliance. Each Permit provision and its reporting requirements are written with this in mind. That is, each provision establishes the required actions, minimum implementation levels (i.e., minimum percentage of facilities inspected annually, escalating enforcement, reporting requirements for tracking projects, number of monitoring sites, etc.), and specific reporting elements to substantiate that these implementation levels have been met. Water Board staff will evaluate each individual Permittee's compliance through annual report review and the audit process.

The challenge in drafting the Permit is to provide the flexibility described above considering the different sizes and resources while ensuring that the Permit is still enforceable. To achieve this, the Permit frequently prescribes minimum measurable

outcomes, while providing Permittees with flexibility in the approaches they use to meet those outcomes. Enforceability has been found to be a critical aspect of the Permit. To avoid these types of situations, a balance between flexibility and enforceability has been crafted into the Permit.

Current Permit Approach

In the previous permit issuances, the detailed actions to be implemented by the Permittees were contained in Stormwater Management Plans, which were separate from the NPDES permits, and incorporated by reference. Because those plans were legally an integral part of the permits and were subject to complete public notice, review and comment, this permit reissuance incorporates those plan level details in the permit, thus merging the Permittees' stormwater management plans into the permit in one document. This Permit specifies the actions necessary to reduce the discharge of pollutants in stormwater to the maximum extent practicable, in a manner designed to achieve compliance with water quality standards and objectives, and effectively prohibit non-stormwater discharges into municipal storm drain systems and watercourses within the Permittees' jurisdictions. This set of specific actions is equivalent to the requirements that in past permit cycles were included in a separate stormwater management plan for each Permittee or countywide group of Permittees. With this permit reissuance, that level of specific compliance detail is integrated into permit language and is not a separate document.

The Permit includes requirements for the following components:

- Municipal Operations
- New Development and Redevelopment
- Industrial and Commercial Site Controls
- Illicit Discharge and Elimination
- Construction Site Controls
- Public Information and Outreach
- Water Quality Monitoring
- Pesticides Toxicity Controls
- Trash Reduction
- Mercury Controls
- PCBs Controls
- Copper Controls
- Polybrominated Diphenyl Ethers (PBDE), Legacy Pesticides, and Selenium
- Exempt and Conditionally Exempt Discharges

IV. ECONOMIC ISSUES

Economic discussions of urban runoff management programs tend to focus on costs incurred by municipalities in developing and implementing the programs. This is appropriate, and these costs are significant and a major issue for the Permittees. However, when considering the cost of implementing the urban runoff programs, it is also important

to consider the alternative costs incurred by not fully implementing the programs, as well as the benefits which result from program implementation.

It is very difficult to ascertain the true cost of implementation of the Permittees' urban runoff management programs because of inconsistencies in reporting by the Permittees. Reported costs of compliance for the same program element can vary widely from Permittee to Permittee, often by a very wide margin that is not easily explained.[57] Despite these problems, efforts have been made to identify urban runoff management program costs, which can be helpful in understanding the costs of program implementation.

In 1999, United States Environmental Protection Agency (USEPA) reported on multiple studies it conducted to determine the cost of urban runoff management programs. A study of Phase II municipalities determined that the annual cost of the Phase II program was expected to be $9.16 per household. USEPA also studied 35 Phase I municipalities, finding costs to be similar to those anticipated for Phase II municipalities, at $9.08 per household annually.[58]

A study on program cost was also conducted by the Los Angeles Regional Water Quality Control Board (LARWQCB), where program costs reported in the municipalities' annual reports were assessed. The LARWQCB estimated that average per household cost to implement the MS4 program in Los Angeles County was $12.50.

The State Water Resources Control Board (State Water Board) also commissioned a study by the California State University, Sacramento to assess costs of the Phase I MS4 program. This study is current and includes an assessment of costs incurred by the City of Encinitas in implementing its program. Annual cost per household in the study ranged from $18-46, with the City of Encinitas representing the upper end of the range.[59] The cost of the City of Encinitas' program is understandable, given the City's coastal location, reliance on tourism, and consent decree with environmental groups regarding its program. For these reasons, as well as the general recognition the City of Encinitas receives for implementing a superior program, the City's program cost can be considered as the high end of the spectrum for Permittee urban runoff management program costs.

It is important to note that reported program costs are not all attributable to compliance with MS4 permits. Many program components, and their associated costs, existed before any MS4 permits were issued. For example, street sweeping and trash collection costs cannot be solely or even principally attributable to MS4 permit compliance, since these practices have long been implemented by municipalities. Therefore, true program cost resulting from MS4 permit requirements is some fraction of reported costs. The California State University, Sacramento study found that only 38% of program costs are new costs fully attributable to MS4 permits. The remainder of program costs were either pre-existing or resulted from enhancement of pre-exiting programs.[60] The County of Orange found that even lesser amounts of program costs are solely attributable to MS4 permit compliance, reporting that the amount attributable to implement its Drainage Area Management Plan, its municipal

[57] LARWQCB, 2003. Review and Analysis of Budget Data Submitted by the Permittees for Fiscal Years 2000-2003.p.2
[58] Federal Register / Vol. 64, No. 235 / Wednesday, December 8, 1999 / Rules and Regulations. P. 68791-68792.
[59] State Water Board, 2005. NPDES Stormwater Cost Survey. P. ii
[60] Ibid. P. 58.

stormwater permit requirements, is less than 20% of the total budget. The remaining 80% is attributable to pre-existing programs.[61]

It is also important to acknowledge that the vast majority of costs that will be incurred as a result of implementing the Order are not new. Urban runoff management programs have been in place in this region for over 15 years. Any increase in cost to the Permittees will be incremental in nature.

Urban runoff management programs cannot be considered in terms of their costs only. The programs must also be viewed in terms of their value to the public. For example, household willingness to pay for improvements in fresh water quality for fishing and boating has been estimated by USEPA to be $158-210.[62] This estimate can be considered conservative, since it does not include important considerations such as marine waters benefits, wildlife benefits, or flood control benefits. The California State University, Sacramento study corroborates USEPA's estimates, reporting annual household willingness to pay for statewide clean water to be $180.[63] When viewed in comparison to household costs of existing urban runoff management programs, these household willingness to pay estimates exhibit that per household costs incurred by Permittees to implement their urban runoff management programs remain reasonable.

Another important way to consider urban runoff management program costs is to consider the implementation cost in terms of costs incurred by not improving the programs. Urban runoff in southern California has been found to cause illness in people bathing near storm drains.[64] A study of south Huntington Beach and north Newport Beach found that an illness rate of about 0.8% among bathers at those beaches resulted in about $3 million annually in health-related expenses.[65] Extrapolation of such numbers to the beaches and other water contact recreation in San Francisco Bay and the tributary creeks of the region could result in huge expenses to the public.

Urban runoff and its impact on receiving waters also places a cost on tourism. the California Division of Tourism has estimated that each out-of-state visitor spends $101.00 a day. The experience of Huntington Beach provides an example of the potential economic impact of poor water quality. Approximately 8 miles of Huntington Beach were closed for two months in the middle of summer of 1999, impacting beach visitation and the local economy.

Finally, it is important to consider the benefits of urban runoff management programs in conjunction with their costs. A recent study conducted by USC/UCLA assessed the costs and benefits of implementing various approaches for achieving compliance with the MS4 permits in the Los Angeles Region. The study found that non-structural systems would cost $2.8 billion but provide $5.6 billion in benefit. If structural systems were determined to be needed, the study found that total costs would be $5.7 to $7.4 billion, while benefits could

reach $18 billion.[66] Costs are anticipated to be borne over many years – probably ten years at least. As can be seen, the benefits of the programs are expected to considerably exceed their costs. Such findings are corroborated by USEPA, which found that the benefits of implementation of its Phase II storm water rule would also outweigh the costs.[67]

V. LEGAL AUTHORITY

The following statutes, regulations, and Water Quality Control Plans provide the basis for the requirements of Order No. R2-2009-0074: CWA, California Water Code (CWC), 40 CFR Parts 122, 123, 124 (National Pollutant Discharge Elimination System Permit Application Regulations for Storm Water Discharges, Final Rule), Part II of 40 CFR Parts 9, 122, 123, and 124 (National Pollutant Discharge Elimination System – Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges; Final Rule), Water Quality Control Plan – Ocean Waters of California (California Ocean Plan), Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan), 40 CFR 131Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California; Rule (California Toxics Rule), and the California Toxics Rule Implementation Plan.

The legal authority citations below generally apply to directives in Order No. R2-2009-0074, and provide the Water Board with ample underlying authority to require each of the directives of Order No. R2-2009-0074.. Legal authority citations are also provided with each permit provision in this Fact Sheet.

CWA 402(p)(3)(B)(ii) – The CWA requires in section 402(p)(3)(B)(ii) that permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."

CWA 402(p)(3)(B)(iii) – The CWA requires in section 402(p)(3)(B)(iii) that permits for discharges from municipal storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

40 CFR 122.26(d)(2)(i)(B,C,E, and F) – Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B,C,D,E, and F) require that each Permittee's permit application "shall consist of: (i) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to: […] (B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer; (C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water; (D) Control through interagency agreements among co-applicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system; (E) Require compliance with condition in ordinances, permits, contracts or orders; and (F) Carry out all

[66] LARWQCB, 2004. Alternative Approaches to Stormwater Control.
[67] Federal Register / Vol. 64, No. 235 / Wednesday, December 8, 1999 / Rules and Regulations. P. 68791.

inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer."

40 CFR 122.26(d)(2)(iv) – Federal NPDES regulation 40 CFR 122.26(d)(2)(iv) requires "a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. […] Proposed programs may impose controls on a system wide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. […] Proposed management programs shall describe priorities for implementing controls."

40 CFR 122.26(d)(2)(iv)(A -D) – Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A - D) require municipalities to implement controls to reduce pollutants in urban runoff from new development and significant redevelopment, construction, and commercial, residential, industrial, and municipal land uses or activities. Control of illicit discharges is also required.

CWC 13377 – CWC section 13377 requires that "Notwithstanding any other provision of this division, the state board or the regional boards shall, as required or authorized by the CWA, as amended, issue waste discharge requirements and dredged or fill material permits which apply and ensure compliance with all applicable provisions of the act and acts amendatory thereof or supplementary, thereto, together with anymore stringent effluent standards or limitation necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance."

Order No. R2-2009-0074 is an essential mechanism for achieving the water quality objectives that have been established for protecting the beneficial uses of the water resources in the San Francisco Bay Region. Federal NPDES regulation 40 CFR 122.44(d)(1) requires MS4 permits to include any requirements necessary to "achieve water quality standards established under CWA section 303, including State narrative criteria for water quality." The term "water quality standards" in this context refers to a water body's beneficial uses and the water quality objectives necessary to protect those beneficial uses, as established in the Basin Plan.

State Mandates

This Permit does not constitute an unfunded local government mandate subject to subvention under Article XIIIB, Section (6) of the California Constitution for several reasons, including, but not limited to, the following. First, this Permit implements federally mandated requirements under CWA section 402, subdivision (p)(3)(B). (33 U.S.C. § 1342(p)(3)(B).) This includes federal requirements to effectively prohibit non-stormwater discharges, to reduce the discharge of pollutants to the maximum extent practicable, and to include such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. Federal cases have held that these provisions require the development of permits and permit provisions on a case-by-case basis to satisfy federal requirements. (Natural Resources Defense Council, Inc. v. USEPA

(9th Cir. 1992) 966 F.2d 1292, 1308, fn. 17.) The authority exercised under this Permit is not reserved state authority under the CWA's savings clause (cf. Burbank v. State Water Resources Control Bd. (2005) 35 Cal.4th 613, 627-628 [relying on 33 U.S.C. § 1370, which allows a state to develop requirements that are not less stringent than federal requirements]), but instead, is part of a federal mandate to develop pollutant reduction requirements for MS4. To this extent, it is entirely federal authority that forms the legal basis to establish the permit provisions. (See, City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region (2006) 135 Cal.App.4th 1377, 1389; Building Industry Association of San Diego County v. State Water Resources Control Bd. (2004) 124 Cal.App.4th 866, 882-883.)

Likewise, the provisions of this Permit to implement total maximum daily loads (TMDLs) are federal mandates. The CWA requires TMDLs to be developed for waterbodies that do not meet federal water quality standards. (33 U.S.C. § 1313(d).) Once USEPA or a state develops a TMDL, federal law requires that permits must contain effluent limitations consistent with the assumptions of any applicable WLA. (40 CFR 122.44(d)(1)(vii)(B).)

Second, the local agencies' (Permittees') obligations under this Permit are similar to, and in many respects less stringent than, the obligations of nongovernmental dischargers who are issued NPDES permits for stormwater discharges. With a few inapplicable exceptions, the CWA regulates the discharge of pollutants from point sources (33 U.S.C. § 1342) and the Porter-Cologne regulates the discharge of waste (Water Code, section 13263), both without regard to the source of the pollutant or waste. As a result, the costs incurred by local agencies to protect water quality reflect an overarching regulatory scheme that places similar requirements on governmental and nongovernmental dischargers. (See County of Los Angeles v. State of California (1987) 43 Cal.3d 46, 57-58 [finding comprehensive workers compensation scheme did not create a cost for local agencies that was subject to state subvention].)

The CWA and the Porter-Cologne Water Quality Control Act largely regulate stormwater with an even hand, but to the extent that there is any relaxation of this evenhanded regulation, it is in favor of the local agencies. Except for MS4s, the CWA requires point source dischargers, including discharges of stormwater associated with industrial or construction activity, to comply strictly with water quality standards. (33 U.S.C. § 1311(b)(1)(C), Defenders of Wildlife v. Browner (1999) 191 F.3d 1159, 1164-1165 [noting that industrial stormwater discharges must strictly comply with water quality standards].) As discussed in prior State Water Board decisions, this Permit does not require strict compliance with water quality standards. (SWRCB Order No. WQ 2001-15, p. 7.) The Permit, therefore, regulates the discharge of waste in municipal stormwater more leniently than the discharge of waste from nongovernmental sources.

Third, the Permittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Permit. The fact sheet demonstrates that numerous activities contribute to the pollutant loading in the MS4. Permittees can levy service charges, fees, or assessments on these activities, independent of real property ownership. (See, e.g., Apartment Association of Los Angeles County, Inc. v. City of Los Angeles (2001) 24 Cal.4th 830, 842 [upholding inspection fees associated with renting property].) The ability of a local agency to defray the cost of a program without raising

taxes indicates that a program does not entail a cost subject to subvention. (County of Fresno v. State of California (1991) 53 Cal.3d 482, 487-488.)

Fourth, the Permittees have requested permit coverage in lieu of compliance with the complete prohibition against the discharge of pollutants contained in CWA section 301, subdivision (a) (33 U.S.C. § 1311(a)) and in lieu of numeric restrictions on their discharges. To the extent Permittees have voluntarily availed themselves of the Permit, the program is not a state mandate. (Accord County of San Diego v. State of California (1997) 15 Cal.4th 68, 107-108.) Likewise, the Permittees have voluntarily sought a program-based municipal stormwater permit in lieu of a numeric limits approach. (See City of Abilene v. USEPA (5th Cir. 2003) 325 F.3d 657, 662-663 [noting that municipalities can choose between a management permit or a permit with numeric limits].) The Permittees' voluntary decision to file a report of waste discharge proposing a program-based permit is a voluntary decision not subject to subvention. (See Environmental Defense Center v. USEPA (9th Cir. 2003) 344 F.3d 832, 845-848.)

Fifth, the Permittees' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIIIB, Section (6) of the California Constitution.

This Permit is based on the federal CWA, the Porter-Cologne Water Quality Control Act (Division 7 of the CWC, commencing with Section 13000), applicable State and federal regulations, all applicable provisions of statewide Water Quality Control Plans and Policies adopted by the State Water Board, the Basin Plan, the California Toxics Rule, and the California Toxics Rule Implementation Plan.

Discussion: In 1987, Congress established CWA Amendments to create requirements for storm water discharges under the NPDES program, which provides for permit systems to regulate the discharge of pollutants. Under the Porter-Cologne Water Quality Control Act, the State Water Board and Regional Water Quality Control Boards (Water Boards) have primary responsibility for the coordination and control of water quality, including the authority to implement the CWA. Porter-Cologne (section 13240) directs the Water Boards to set water quality objectives via adoption of Basin Plans that conform to all state policies for water quality control. As a means for achieving those water quality objectives, Porter-Cologne (section 13243) further authorizes the Water Boards to establish waste discharge requirements (WDRs) to prohibit waste discharges in certain conditions or areas. Since 1990, the Water Board has issued area-wide MS4 NPDES permits. The Permit will re-issue Order Nos. 99-058, 99-059, 01-024, R2-2003-0021, R2-2003-0034 to comply with the CWA and attain water quality objectives in the Basin Plan by limiting the contributions of pollutants conveyed by urban runoff. Further discussions of the legal authority associated with the prohibitions and directives of the Permit are provided in section V. of this document.

This Permit supersedes NPDES Permit Nos. CAS029718, CAS029831, CAS029912, CAS029921, CAS612005, and CAS612006.

Basin Plan

The Urban Runoff Management, Comprehensive Control Program section of the Basin Plan requires the Permittees to address existing water quality problems and prevent new problems associated with urban runoff through the development and implementation of a comprehensive control program focused on reducing current levels of pollutant loading to storm drains to the maximum extent practicable. The Basin Plan comprehensive program requirements are designed to be consistent with federal regulations (40 CFR Parts 122-124) and are implemented through issuance of NPDES permits to owners and operators of MS4s. A summary of the regulatory provisions is contained in Title 23 of the California Code of Regulations at section 3912. The Basin Plan identifies beneficial uses and establishes water quality objectives for surface waters in the Region, as well as effluent limitations and discharge prohibitions intended to protect those uses. This Permit implements the plans, policies, and provisions of the Water Board's Basin Plan.

Statewide General Permits

The State Water Board has issued NPDES general permits for the regulation of stormwater discharges associated with industrial activities and construction activities. To effectively implement the New Development (and significant redevelopment) and Construction Controls, Illicit Discharge Controls, and Industrial and Commercial Discharge Controls components in this Permit, the Permittees will conduct investigations and local regulatory activities at industrial and construction sites covered by these general permits. However, under the CWA, the Water Board cannot delegate its own authority to enforce these general permits to the Permittees. Therefore, Water Board staff intends to work cooperatively with the Permittees to ensure that industries and construction sites within the Permittees' jurisdictions are in compliance with applicable general permit requirements and are not subject to uncoordinated stormwater regulatory activities.

Regulated Parties

Each of the Permittees listed in this Permit owns or operates a MS4, through which it discharges urban runoff into waters of the United States within the San Francisco Bay Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the United States.

Permit Coverage

The Permittees each have jurisdiction over and maintenance responsibility for their respective MS4s in the Region. Federal, State or regional entities within the Permittees' boundaries, not currently named in this Permit, operate storm drain facilities and/or discharge stormwater to the storm drains and watercourses covered by this Permit. The Permittees may lack jurisdiction over these entities. Consequently, the Water Board recognizes that the Permittees should not be held responsible for such facilities and/or discharges. The Water Board will consider such facilities for coverage under NPDES permitting pursuant to USEPA Phase II stormwater regulations. Under Phase II, the Water

Board intends to permit these federal, State, and regional entities through use of a Statewide Phase II NPDES General Permit.

Discussion: Section 402 of the CWA prohibits the discharge of any pollutant to waters of the United States from a point source, unless that discharge is authorized by a NPDES permit. Though urban runoff comes from a diffuse source, it is discharged through MS4s, which are point sources under the CWA. Federal NPDES regulation 40 CFR 122.26(a) (iii) and (iv) provide that discharges from MS4s, which service medium or large populations greater than 100,000 or 250,000 respectively, shall be required to obtain a NPDES permit. Federal NPDES regulation 40 CFR 122.26(a)(v) also provides that a NPDES permit is required for "A [storm water] discharge which the Director, or in States with approved NPDES programs, either the Director or the USEPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States." Such sources are then designated into the program.

VI. PERMIT PROVISIONS

A. Discharge Prohibitions

Prohibition A.1. Legal Authority – CWA 402(p)(3)(B)(ii) – The CWA requires in section 402(p)(3)(B)(ii) that permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."

Prohibition A.2. Legal Authority – San Francisco Bay Basin Plan, 2006 Revision, Chapter 4 Implementation, Table 4-1, Prohibition 7.

B. Receiving Water Limitations

Receiving Water Limitation B.1. Legal Authority – Receiving Water Limitations are retained from previous Municipal Stormwater Runoff NPDES permits. They reflect applicable water quality standards from the Basin Plan.

Receiving Water Limitation B.2. Legal Authority – Receiving Water Limitations are retained from previous Municipal Stormwater Runoff NPDES permits. They reflect applicable water quality standards from the Basin Plan.

C. Provisions

C.1. Compliance with Discharge Prohibitions and Receiving Water Limitations

Legal Authority

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: The Water Board's Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) contains the following waste discharge prohibition: "The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination, or nuisance as defined in California Water Code Section 13050, is prohibited."

California Water Code section 13050(l) states "(1) 'Pollution' means an alteration of the quality of waters of the state by waste to a degree which unreasonably affects either of the following: (A) The water for beneficial uses. (B) Facilities which serve beneficial uses. (2) 'Pollution' may include "contamination."

California Water Code section 13050(k) states "'Contamination' means an impairment of the quality of waters of the state by waste to a degree which creates a hazard to public health through poisoning or through the spread of disease. 'Contamination' includes any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected."

California Water Code section 13050(m) states "'Nuisance' means anything which meets all of the following requirements: (1) Is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property. (2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. (3) Occurs during, or as a result of, the treatment or disposal of wastes."

California Water Code section 13241 requires each water board to "establish such water quality objectives in water quality control plans as in its judgment will ensure the reasonable protection of beneficial uses and the prevention of nuisance […]."

California Water Code Section 13243 provides that a water board, "in a water quality control plan or in waste discharge requirements, may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted."

California Water Code Section 13263(a) provides that waste discharge requirements prescribed by the water board implement the Basin Plan.

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A -D) require municipalities to implement controls to reduce pollutants in urban runoff from commercial, residential, industrial, and construction land uses or activities.

Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(A -D) require municipalities to have legal authority to control various discharges to their MS4.

Federal NPDES regulation 40 CFR 122.44(d)(1) requires municipal storm water permits to include any requirements necessary to "[a]chieve water quality standards established under section 303 of the CWA, including State narrative criteria for water quality."

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to "control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality."

State Water Resources Control Board ("State Water Board") Order WQ 1999-05, is a precedential order requiring that municipal stormwater permits achieve water quality standards and water quality standard based discharge prohibitions through the implementation of control measures, by which Permittees' compliance with the permit can be determined. The State Water Board Order specifically requires that Provision C.1 include language that Permittees shall comply with water quality standards based discharge prohibitions and receiving water limitations through timely implementation of control measures and other actions to reduce pollutants in the discharges. State Water Board Order WQ 2001-15 refines Order 1999-05 by requiring an iterative approach to compliance with water quality standards that involves ongoing assessments and revisions.

C.2. Municipal Operations

Legal Authority

The following legal authority applies to Provision C.2:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), California Water Code (CWC) section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(1) requires, "A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(3) requires, "A description for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(4) requires, "A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving waterbodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(5) requires, "A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) requires, "A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities."

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to "control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality."

Fact Sheet Findings in Support of Provision C.2

C.2-1 Municipal maintenance activities are potential sources of pollutants unless appropriate inspection, pollutant source control, and cleanup measures are implemented during routine maintenance works to minimize pollutant discharges to storm drainage facilities.

Sediment accumulated on paved surfaces, such as roads, parking lots, parks, sidewalks, landscaping, and corporation yards, is the major source of point source pollutants found in urban runoff. Thus, Provision C.2 requires the Permittees to designate minimum BMPs for all municipal facilities and activities as part of their ongoing pollution prevention efforts as set forth in this Permit. Such prevention measures include, but are not limited to, activities as described below. The work of municipal maintenance personnel is vital to minimize stormwater pollution, because personnel work directly on municipal storm drains and other municipal facilities. Through work such as inspecting and cleaning storm drain drop inlets and pipes and conducting municipal construction and maintenance activities upstream of the storm drain, municipal maintenance personnel are directly responsible for preventing and removing pollutants from the storm drain. Maintenance personnel also play an important role in educating the public and in reporting and cleaning up illicit discharges.

C.2-2 Road construction and other activities can disturb the soil and drainage patterns to streams in undeveloped areas, causing excess runoff and thereby erosion and the release of sediment. In particular, poorly designed roads can act as man-made drainages that carry runoff and sediment into natural streams, impacting water quality.

Provision C.2 also requires the Permittees to implement effective BMPs for the following rural works maintenance and support activities: (a) Road design, construction, maintenance, and repairs in rural areas that prevent and control road-related erosion and sediment transport; (b)Identification and prioritization of rural roads maintenance on the basis of soil erosion potential, slope steepness, and stream habitat resources; (c) Road and culvert construction designs that do not impact creek functions. New or replaced culverts shall not create a migratory fish passage barrier, where migratory fish are present, or lead to stream instability; (d) Development and implement an inspection program to maintain roads structural integrity and prevent impacts on water quality; (e) Provide adequate maintenance of rural roads adjacent to streams and riparian habitat to reduce erosion, replace damaging shotgun culverts, re-grade roads to slope outward where consistent with road engineering safety standards, and install water bars; and (f) When replacing existing culverts or redesigning new culverts or bridge crossings use measures to reduce erosion, provide fish passage and maintain natural stream geomorphology in a stable manner.

Road construction, culvert installation, and other rural maintenance activities can disturb the soil and drainage patterns to streams in undeveloped areas, causing excess runoff and thereby erosion and the release of sediment. Poorly

designed roads can act as preferential drainage pathways that carry runoff and sediment into natural streams, impacting water quality. In addition, other rural public works activities, including those the BMP approach would address, have the potential to significantly affect sediment discharge and transport within streams and other waterways, which can degrade the beneficial uses of those waterways. This Provision would help ensure that these impacts are appropriately controlled.

Specific Provision C.2 Requirements

Provision C.2.a-f. (Operation and Maintenance of Municipal Separate Storm Sewer Systems (MS4) facilities) requires that the Permittees implement appropriate pollution control measures during maintenance activities and to inspect and, if necessary, clean municipal facilities such as conveyance systems, pump stations, and corporation yards, before the rainy season. The requirements will assist the Permittees to prioritize tasks, implement appropriate BMPs, evaluate the effectiveness of the implemented BMPs, and compile and submit annual reports.

Provision C.2.d. (Stormwater Pump Stations) In late 2005, Board staff investigated the occurrence of low salinity and dissolved oxygen conditions in Old Alameda Creek (Alameda County) and Alviso Slough (Santa Clara County) in September and October of 2005. Board staff became aware of this problem in their review of receiving water and discharge sampling conducted by the U.S. Geological Survey as part of its routine monitoring on discharges associated with the former salt ponds managed by the U.S. Fish and Wildlife Service in Santa Clara County and the California Department of Fish and Game in Alameda County.

In the case of Old Alameda Creek, discharge of black-colored water from the Alvarado pump station to the slough was observed at the time of the data collection on September 7, 2005, confirming dry weather urban runoff as the source of the documented violations of the 5 mg/L dissolved oxygen water quality objective. Such conditions were measured again on September 21, 2005.

On October 17, 2005, waters in Alviso Slough were much less saline than the salt ponds and had the lowest documented dissolved oxygen of the summer, suggesting a dry weather urban runoff source. The dissolved oxygen sag was detected surface to bottom at 2.3 mg/L at a salinity of less than 1 part per thousand (ppt), mid-day, when oxygen levels should be high at the surface. The sloughs have a typical depth of 6 feet.

Board staff's investigations of these incidents, documented in a memorandum,[68] found that "storm water pump stations, universally operated by automatic float triggers, have been confirmed as the cause in at least one instance, and may represent an overlooked source of controllable pollution to the San Francisco Bay Estuary and its tidal sloughs. . . . the discharges of dry weather urban runoff from these pump stations are not being

[68] Internal Water Board Memo dated December 2, 2005: "Dry Weather Urban Weather Urban Runoff Causing or Contributing to Water Quality Violations: Low Dissolved Oxygen (DO) in Old Alameda Creek and Alviso Slough"

managed to protect water quality, and [that] surveillance monitoring has detected measurable negative water quality consequences of this current state of pump station management."

Pump station discharges of dry weather urban runoff can cause violations of water quality objectives. These discharges are controllable point sources of pollution that are virtually unregulated. The Water Board needs a complete inventory of dry weather urban runoff pump stations and to require BMP development and implementation for these discharges now. In the long term, Water Board staff should prioritize the sites from the regional inventory for dry weather diversion to sanitary sewers and encourage engineering feasibility studies to accomplish the diversions in a cost-effective manner. Structural treatment alternatives should be explored for specific pump stations.

To address the short term goals identified in the previous paragraph, Provision C.2.g. requires the Permittees to implement the following measures to reduce pollutant discharges to stormwater runoff from Permittee-owned or operated pump stations:

1. Establish an inventory of pump stations within each Permittee's jurisdiction, including pump station locations and key characteristics, and inspection frequencies.
2. Inspect these pump stations regularly, but at least two times a year, to address water quality problems, including trash control and sediment and debris removal.
3. Inspect trash racks and oil absorbent booms at pump stations in the first business day after ¼-inch within 24 hours and larger storm events. Remove debris in trash racks and replace oil absorbent booms, as needed.

C.3. New Development and Redevelopment

Legal Authority

Broad Legal Authority: CWA Sections 402(p)(3)(B)(ii-iii), CWA Section 402(a), CWC Section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F), 40 CFR 131.12, and 40 CFR 122.26(d)(2)(iv).

Fact Sheet Findings in Support of Provision C.3

C.3-1 Urban development begins at the land use planning phase; therefore, this phase provides the greatest cost-effective opportunities to protect water quality in new development and redevelopment. When a Permittee incorporates policies and principles designed to safeguard water resources into its General Plan and development project approval processes, it has taken a critical step toward the preservation and most of local water resources for current and future generations.

C.3-2 Provision C.3. is based on the assumption that Permittees are responsible for considering potential stormwater impacts when making planning and land use decisions. The goal of Provision C.3. is for Permittees to use their planning authority to include appropriate source control, site design, and stormwater treatment measures to address both soluble and insoluble stormwater runoff pollutant discharges and prevent increases in runoff flow from new development and redevelopment projects. This goal is to be accomplished primarily through the implementation of low impact development (LID) techniques. Neither Provision C.3. nor any of its requirements are intended to restrict or control local land use decision-making authority.

C.3-3 Certain control measures implemented or required by Permittees for urban runoff management might create a habitat for vectors (e.g., mosquitoes and rodents) if not properly designed or maintained. Close collaboration and cooperative efforts among Permittees, local vector control agencies, Water Board staff, and the State Department of Public Health are necessary to minimize potential nuisances and public health impacts resulting from vector breeding.

C.3-4 The Water Board recognized in its Policy on the Use of Constructed Wetlands for Urban Runoff Pollution Control (Resolution No. 94-102) that urban runoff treatment wetlands that are constructed and operated pursuant to that Resolution and are constructed outside a creek or other receiving water are stormwater treatment systems and, as such, are not waters of the United States subject to regulation pursuant to Sections 401 or 404 of the federal Clean Water Act. Water Board staff is working with the California Department of Fish and Game (CDFG) and U.S. Fish and Wildlife Service (USFWS) to identify how maintenance for stormwater treatment controls required under permits such as this Permit can be appropriately streamlined, given CDFG and USFWS requirements, and particularly those that address special status species. This Permit requires Permittees to ensure that constructed wetlands installed by

Regulated Projects are consistent with Resolution No. 94-102 and the operation and maintenance requirements contained therein.

C.3-5 The Permit requires Permittees to ensure that onsite, joint, and offsite stormwater treatment systems and HM controls installed by Regulated Projects are properly operated and maintained for the life of the projects. In cases where the responsible parties for the treatment systems or HM controls have worked diligently and in good faith with the appropriate state and federal agencies to obtain approvals necessary to complete maintenance activities for the treatment systems or HM controls, but these approvals are not granted, the Permittees shall be considered by the Water Board to be in compliance with Provision C.3.h.iii. of the Permit.

Specific Provision C.3 Requirements

Provision C.3.a. (New Development and Redevelopment Performance Standard Implementation) sets forth essentially the same legal authority, development review and permitting, environmental review, training, and outreach requirements that are contained in the existing permits. This Provision also requires the Permittees to encourage all projects not regulated by Provision C.3., but that are subject to the Permittees' planning, building, development , or other comparable review, to include adequate source control and site design measures, which include discharge of appropriate wastestreams to the sanitary sewer, subject to the local sanitary agency's authority and standards. Lastly, this Provision requires Permittees to revise, as necessary, their respective General Plans to integrate water quality and watershed protection with water supply, flood control, habitat protection, groundwater recharge, and other sustainable development principles and policies. Adequate implementation time has been allocated to Provisions C.3.a.i.(6)-(8), which may be considered new requirements.

Provision C.3.b. (Regulated Projects) establishes the different categories of new development and redevelopment projects that Permittees must regulate under Provision C.3. These categories are defined on the basis of the land use and the amount of impervious surface created and/or replaced by the project because all impervious surfaces contribute pollutants to stormwater runoff and certain land uses contribute more pollutants. Impervious surfaces can neither absorb water nor remove pollutants as the natural, vegetated soil they replaced can. Also, urban development creates new pollution by bringing higher levels of car emissions that are aerially deposited, car maintenance wastes, pesticides, household hazardous wastes, pet wastes, and trash, which can all be washed into the storm sewer.

Provision C.3.b.ii.(1) lists Special Land Use Categories that are already regulated under the current stormwater permits. Therefore, extra time is not necessary for the Permittees to comply with this Provision, so the Permit Effective Date is set as the required implementation date. For these categories, the impervious surface threshold (for classification as a Regulated Project subject to Provision C.3.) will be decreased from the current 10,000 ft^2 to 5,000 ft^2 beginning two years from the Permit Effective Date. These special land use categories represent land use types

that may contribute more polluted stormwater runoff. Regulation of these special land use categories at the lower impervious threshold of 5,000 square feet is considered the maximum extent practicable and is consistent with State Board guidance, court decisions, and other Water Boards' requirements. In the precedential decision contained in its WQ Order No. 2000-11, the State Board upheld the SUSMP (Standard Urban Stormwater Mitigation Plan) requirements issued by the Los Angeles Water Board's Executive Officer on March 8, 2000, and found that they constitute MEP for addressing pollutant discharges resulting from Priority Development Projects. The State Board re-affirmed that SUSMP requirements constitute MEP in their Order WQ 2001-15. Provision C.3.b.ii.(1)'s requirement that development projects in the identified Special Land Use Categories adding and/or replacing > 5000 ft^2 of impervious surface shall install hydraulically sized stormwater treatment systems is consistent with the SUSMP provisions upheld by the State Board. Provision C.3.b.ii.(1) is also consistent with Order No. R9-2007-0001 issued by the San Diego Water Board, Order Nos. R4-2009-0057 and R4-2001-182 issued by the Los Angeles Water Board, Order No. 2009-0030 issued by the Santa Ana Water Board, and State Board's Order WQ 2003-0005 issued to Phase II MS4s. Under Order WQ 2003-0005, Phase II MS4s with populations of 50,000 and greater must apply the lower 5000 ft^2 threshold for requiring stormwater treatment systems by April 2008. The MRP allows two years from the MRP effective date for the Permittees to implement the lower 5000 ft^2 threshold for the special land use categories, three and half years later than the Phase II MS4s. However, the additional time is necessary for the Permittees to revise ordinances and permitting procedures and conduct training and outreach.

This Provision contains a "grandfathering" clause, which allows any private development project in a special land use category for which a planning application has been deemed complete by a Permittee on or before the Permit effective date to be exempted from the lower 5,000 square feet impervious surface threshold (for classification as a Regulated Project) as long as the project applicant is diligently pursuing the project. Diligent pursuance may be demonstrated by the project applicant's submittal of supplemental information to the original application, plans, or other documents required for any necessary approvals of the project by the Permittee. If during the time period between the Permit effective date and the required implementation date of December 1, 2011, for the 5000 square feet threshold, the project applicant has not taken any action to obtain the necessary approvals from the Permittee, the project will then be subject to the lower 5000 square feet impervious surface threshold specified in Provision C.3.b.ii.(1).

For any private development project in a special land use category with an application deemed complete after the Permit effective date, the lower 5000 square feet impervious surface threshold (for classification as a Regulated Project) shall not apply if the project applicant has received final discretionary approval for the project before the required implementation date of December 1, 2011 for the 5000 square feet threshold.

Previous stormwater permits also used the "application deemed complete" date as the date for determining Provision C.3. applicability, but it was tied to the implementation date for new requirements and not the Permit effective date. The Permit Streamlining Act requires that a public agency must determine whether a permit application is complete within 30 days after receipt; if the public agency does not make this determination, the application is automatically deemed complete after 30 days. Data we have collected from audits and file reviews as well as reported to us by Permittees confirm that in many cases, the development permit applications have indeed not been reviewed for compliance with Provision C.3. requirements and yet have automatically been deemed complete 30 days after the application submittal date. As soon as the Permit is adopted, there is certainty about any new requirements that must be implemented during the Permit term. Therefore, the "application deemed complete" date should only be used to exempt projects that have reached this milestone by the Permit effective date and not years later at a new requirement's implementation date. However, this change requires consideration of those applications that are deemed complete after the Permit effective date. Because there is certainty with regard to new requirements as soon as the Permit becomes effective, we have tied the "final discretionary approval" date to a new requirement's implementation date for determining whether to exempt the projects with applications deemed complete after the Permit effective date. After a project receives "final discretionary approval" it would be too late in the permitting process to implement new requirements, particularly since this type of approval requires actions by city councils or boards of supervisors. Therefore, the "grandfathering" language is a hybrid that makes use of both the "application deemed complete" date and the "final discretionary approval" date, two known and recognized milestones in development planning.

As for private projects, public projects should be far enough along in the design and approval process to warrant being grandfathered and essentially exempted from complying with the lower 5000 ft^2 threshold when it becomes effective. Previous stormwater permits grandfathered projects that only had funds committed by the new threshold's effective date, which was too early because projects can be held for years before design can begin, well after funding commitments have been made. Conversely, application of the grandfathering exemption to projects that have construction scheduled to begin by the threshold effective date (or 2 years after the MRP effective date) may be too late in the permitting process to implement new threshold requirements, particularly since this type of approval requires actions by city councils or boards of supervisors. Therefore, the Permit provides the grandfathering exemption for projects that have construction set to begin within 1 year of the threshold effective date (or 3 years after the MRP effective date).

Provisions C.3.b.ii.(2)-(3) describe land use categories that are already regulated under the current stormwater permits; therefore, extra time is not necessary for the Permittees to comply with these Provisions and the implementation date is the Permit effective date. Because the Vallejo Permittees do not have post-

construction requirements in their current stormwater permit, the Permit allows an extra year for them to comply with these Provisions.

Provision C.3.b.ii.(4) applies to road projects adding and/or replacing 10,000 ft^2 of impervious surface, which include the construction of new roads and sidewalks and bicycle lanes built as part of the new roads; widening of existing roads with additional traffic lanes; and construction of impervious trails that are greater than 10 feet wide or are creekside (within 50 feet of the top of bank). Although widening existing roads with bike lanes and sidewalks increases impervious surface and therefore increases stormwater pollutants because of aerial deposition, they have been excluded from this Provision because we recognize the greater benefit that bike lanes and sidewalks provide by encouraging less use of automobiles. Likewise, this Provision also contains specific exclusions for: sidewalks built as part of a new road and built to direct stormwater runoff to adjacent vegetated areas; bike lanes built as part of a new road but not hydraulically connected to the new road and built to direct stormwater runoff to adjacent vegetated areas; impervious trails built to direct stormwater runoff to adjacent vegetated areas, or other non-erodible permeable areas, preferably away from creeks or towards the outboard side of levees; and sidewalks, bike lanes, or trails constructed with permeable surfaces.

In the case of road widening projects where additional lanes of traffic are added, the 50% rule also applies. That is, the addition of traffic lanes resulting in an alteration of more than 50 percent of the impervious surface of an existing street or road that was not subject to Provision C.3, the entire project, consisting of all existing, new, and/or replaced impervious surfaces, must be included in the treatment system design (i.e., stormwater treatment systems must be designed and sized to treat stormwater runoff from the entire street or road that had additional traffic lanes added).

Where the addition of traffic lanes results in an alteration of less than 50 percent of the impervious surface of an existing street or road that was not subject to Provision C.3, only the new and/or replaced impervious surface of the project must be included in the treatment system design (i.e., stormwater treatment systems must be designed and sized to treat stormwater runoff from only the new traffic lanes). However, if the stormwater runoff from the existing traffic lanes and the added traffic lanes cannot be separated, any onsite treatment system must be designed and sized to treat stormwater runoff from the entire street or road. If an offsite treatment system is installed or in-lieu fees paid in accordance with Provision C.3.e., the offsite treatment system or in-lieu fees must address only the stormwater runoff from the added traffic lanes.

Because road widening and trail projects belong to a newly added category of Regulated Projects, adequate implementation time has been included as well as "grandfathering" language. (See discussion under Provision C.3.b.ii.(1).)

Provision C.3.b.iii. requires that the Permittees cumulatively complete 10 pilot "green street" projects within the Permit term. This Provision was originally intended to require stormwater treatment for road rehabilitation projects on

arterial roads that added and/or replaced > 10,000 ft^2 of impervious surface. We acknowledge the logistical difficulties in retrofitting roads with stormwater treatment systems as well as the funding challenges facing municipalities in the Bay Area. However, we are aware that some cities have or will have funding for "green street" retrofit projects that will provide water quality benefits as well as meet broader community goals such as fostering unique and attractive streetscapes that protect and enhance neighborhood livability, serving to enhance pedestrian and bike access, and encouraging the planting of landscapes and vegetation that contribute to reductions in global warming. Therefore, instead of requiring post-construction treatment for all road rehabilitation of arterial streets, this Provision requires the completion of 10 pilot "green street" projects by the Permittees within the Permit term. These projects must incorporate LID techniques for site design and treatment in accordance with Provision C.3.c. and provide stormwater treatment pursuant to Provision C.3.d. and must be representative of the three different types of streets: arterial, collector, and local. To ensure equity and an even distribution of projects, at least two pilot projects must be located in each of the following counties: Alameda, Contra Costa, San Mateo, and Santa Clara. Parking lot projects are acceptable as pilot projects as long as both parking lot and street runoff is addressed. Because these are pilot projects, we have not specified a minimum or maximum size requirement and the details of which cities will have these projects are to be determined by the Permittees.

Provision C.3.c (Low Impact Development (LID)) recognizes LID as a cost-effective, beneficial, holistic, integrated stormwater management strategy[69]. The goal of LID is to reduce runoff and mimic a site's predevelopment hydrology by minimizing disturbed areas and impervious cover and then infiltrating, storing, detaining, evapotranspiring, and/or biotreating stormwater runoff close to its source. LID employs principles such as preserving and recreating natural landscape features and minimizing imperviousness to create functional and appealing site drainage that treat stormwater as a resource, rather than a waste product. Practices used to adhere to these LID principles include measures such as preserving undeveloped open space, rain barrels and cisterns, green roofs, permeable pavement, and biotreatment through rain gardens, bioretention units, bioswales, and planter/tree boxes.

This Provision sets forth a three-pronged approach to LID with source control, site design, and stormwater treatment requirements. The concepts and techniques for incorporating LID into development projects, particularly for site design, have been extensively discussed in BASMAA's Start at the Source manual (1999) and its companion document, Using Site Design Techniques to Meet Development Standards for Stormwater Quality (May 2003), as well as in various other LID reference documents.

Provision C.3.c.i.(1) lists source control measures that must be included in all Regulated Projects as well as some that are applicable only to certain types of

[69] USEPA, *Reducing Stormwater Costs through Low Impact Development (LID) Strategies and Practices* **(**Publication Number EPA 841-F-07-006, December 2007) http://www.epa.gov/o**wow/nps/lid/costs07)**

businesses and facilities. These measures are recognized nationwide as basic, effective techniques to minimize the introduction of pollutants into stormwater runoff. The current stormwater permits also list these methods; however, they are encouraged rather than required. By requiring these source control measures, this Provision sets a consistent, achievable standard for all Regulated Projects and allows the Board to more systematically and fairly measure permit compliance. This Provision retains enough flexibility such that Regulated Projects are not forced to include measures inappropriate, or impracticable, to their projects. This Provision does not preclude Permittees from requiring additional measures that may be applicable and appropriate.

Provision C.3.c.i.(2)(a) lists site design elements that must be implemented at all Regulated Projects. These design elements are basic, effective techniques to minimize pollutant concentrations in stormwater runoff as well as the volume and frequency of discharge of the runoff. On the basis of the Board staff's review of the Permittees' Annual Reports and CWA section 401 certification projects, these measures are already being done at many projects. One design element requires all Regulated Projects to include at least one site design measure from a list of six which includes recycling of roof runoff, directing runoff into vegetated areas, and installation of permeable surfaces instead of traditional paving. All these measures serve to reduce the amount of runoff and its associated pollutants being discharged from the Regulated Project.

Provision C.3.c.i.(2)(b) requires each Regulated Project to treat 100% of the Provision C.3.d. runoff with LID treatment measures onsite or with LID treatment measures at a joint stormwater treatment facility. LID treatment measures are harvesting and re-use, infiltration, evapotranspiration, or biotreatment. A properly engineered and maintained biotreatment system may be considered only if it is infeasible to implement harvesting and re-use, infiltration, or evapotranspiration at a project site. Infeasibility may result from conditions including the following:

- Locations where seasonal high groundwater would be within 10 feet of the base of the LID treatment measure.
- Locations within 100 feet of a groundwater well used for drinking water.
- Development sites where pollutant mobilization in the soil or groundwater is a documented concern.
- Locations with potential geotechnical hazards.
- Smart growth and infill or redevelopment sites where the density and/or nature of the project would create significant difficulty for compliance with the onsite volume retention requirement.
- Locations with tight clay soils that significantly limit the infiltration of stormwater.

This Provision recognizes the benefits of harvesting and reuse, infiltration and evapotranspiration and establishes these methods at the top of the LID treatment hierarchy. This Provision also acknowledges the challenges, both institutional and technical, to providing these LID methods at all Regulated Projects. There

are certainly situations where biotreatment is a valid LID treatment measure and this Provision allows Permittees the flexibility to make this determination so that Regulated Projects are not forced to include measures inappropriate or impracticable to the project sites. However, Permittees are required to submit a report within 18 months of the Permit effective date and prior to the required implementation date on the criteria and procedures that Permittees will employ to determine when harvesting and re-use, infiltration, or evapotranspiration is feasible and infeasible at a Regulated Project site. The Permittees are also required to submit a second report two years after implementing the new LID requirements that documents their experience with determining the feasibility and infeasibility of harvesting and reuse, infiltration, and evapotranspiration at Regulated Project sites. This report shall also discuss barriers, including institutional and technical site specific constraints, to implementation of infiltration, harvesting and reuse, or evapotranspiration and proposed strategies for removing these identified barriers.

This Provision specifies minimum specifications for biotreatment systems to be considered as LID treatment and requires Permittees to develop soil media specifications. Because this Provision recognizes green roofs as biotreatment systems for roof runoff, it also requires Permittees to develop minimum specifications for green roofs.

Provision C.3.c.ii. establishes the implementation date for the new LID requirements of Provision C.3.c.i. to be two years after the Permit effective date. Grandfathering language consistent with Provision C.3.b.ii.(1) has been included in this Provision to exempt private development projects (that are far along in their permitting and approval process) and public projects (that are far along in their funding and design) from the requirements of Provision C.3.c.i.

Provision C.3.d (Numeric Sizing Criteria for Stormwater Treatment Systems) lists the hydraulic sizing design criteria that the stormwater treatment systems installed for Regulated Projects must meet. The volume and flow hydraulic design criteria are the same as those required in the current stormwater permits. These criteria ensure that stormwater treatment systems will be designed to treat the optimum amount of relatively smaller-sized runoff-generating storms each year. That is, the treatment systems will be sized to treat the majority of rainfall events generating polluted runoff but will not have to be sized to treat the few very large annual storms as well. For many projects, such large treatment systems become infeasible to incorporate into the projects. Provision C.3.d. also adds a new combined flow and volume hydraulic design criteria to accommodate those situations where a combination approach is deemed most efficient.

Provision C.3.d.iv. defines infiltration devices and establishes limits on the use of stormwater treatment systems that function primarily as infiltration devices The intent of the Provision is to ensure that the use of infiltration devices, where feasible and safe from the standpoint of structural integrity, must also not cause or contribute to the degradation of groundwater quality at the project sites. This Provision requires infiltration devices to be located a minimum of 10 feet

(measured from the base) above the seasonal high groundwater mark and a minimum of 100 feet horizontally away from any known water supply wells, septic systems, and underground storage tanks with hazardous materials, and other measures to ensure that any potential threat to the beneficial uses of ground water is appropriately evaluated and avoided.

Provision C.3.e (Alternative or In-Lieu Compliance with Provision C.3.c.) recognizes that not all Regulated Projects may be able to install LID treatment systems onsite because of site conditions, such as existing underground utilities, right-of-way constraints, and limited space.

Provision C.3.e.i. In keeping with LID concepts and strategies, we expect new development projects to provide LID treatment onsite and to allocate the appropriate space for these systems because they do not have the site limitations of redevelopment and infill site development in the urban core. However, this Provision does not restrict alternative compliance to redevelopment and infill projects because the Permittees have requested flexibility to make the determination of when alternative compliance is appropriate. Based on the lack of offsite alternative compliance projects installed during the current stormwater permit terms, it seems that having to find offsite projects is already a great disincentive. Therefore, this Provision allows any Regulated Project to provide LID treatment for up to 100% of the required Provision C.3.d. stormwater runoff at an offsite location or pay equivalent in-lieu fees to provide LID treatment at a Regional Project, as long as the offsite and Regional Projects are in the same watershed as the Regulated Project.

For the LID Treatment at an Offsite Location alternative compliance option, offsite projects must be constructed by the end of construction of the Regulated Project. We acknowledge that a longer timeframe may be required to complete construction of offsite projects because of administrative, legal, and/or construction delays. Therefore, up to 3 years additional time is allowed for construction of the offsite project; however, to offset the untreated stormwater runoff from the Regulated Project that occurs while construction of the offsite project is taking place, the offsite project must be sized to treat an additional 10% of the calculated equivalent quantity of both stormwater runoff and pollutant loading for each year that it is delayed. Permittees have commented that for projects that are delayed, requiring treatment of an additional (10-30)% of stormwater runoff may result in costly re-design of treatment systems. In those cases, payment of in-lieu fees to provide the additional treatment at a Regional Project is a viable alternative.

For the Payment of In-Lieu Fees to a Regional Project alternative compliance option, the Regional Project must be completed within 3 years after the end of construction of the Regulated Project. We acknowledge that a longer timeframe may be required to complete construction of Regional Projects because they may involve a variety of public agencies and stakeholder groups and a longer planning and construction phase. Therefore, the timeline for completion of a Regional Project may be extended, up to 5 years after the completion of the Regulated

Project, with prior Water Board Executive Officer approval. Executive Officer approval will be granted contingent upon a demonstration of good faith efforts to implement the Regional Project, such as having funds encumbered and applying for the appropriate regulatory permits.

Provision C.3.e.ii. (Special Projects) When considered at the watershed scale, certain types of smart growth, high density, and transit-oriented development can either reduce existing impervious surfaces, or create less "accessory" impervious areas and auto-related pollutant impacts. Incentive LID treatment reduction credits approved by the Water Board may be applied to these types of Special Projects.

This Provision requires that by December 1, 2010, Permittees shall submit a proposal to the Water Board containing the following information:

- Identification of the types of projects proposed for consideration of LID treatment reduction credits and an estimate of the number and cumulative area of potential projects during the remaining term of this permit for each type of project..
- Identification of institutional barriers and/or technical site specific constraints to providing 100% LID treatment onsite that justify the allowance for non-LID treatment measures onsite.
- Specific criteria for each type of Special Project proposed, including size, location, minimum densities, minimum floor area ratios, or other appropriate limitations.
- Identification of specific water quality and environmental benefits provided by these types of projects that justify the allowance for non-LID treatment measures onsite.
- Proposed LID treatment reduction credit for each type of Special Project and justification for the proposed credits. The justification shall include identification and an estimate of the specific water quality benefit provided by each type of Special Project proposed for LID treatment reduction credit.
- Proposed total treatment reduction credit for Special Projects that may be characterized by more than one category and justification for the proposed total credit.

Provision C.3.f (Alternative Certification of Adherence to Numeric Sizing Criteria for Stormwater Treatment Systems) allows Permittees to have a third-party review and certify a Regulated Project's compliance with the hydraulic design criteria in Provision C.3.d. Some municipalities do not have the staffing resources to perform these technical reviews. The third-party review option addresses this staffing issue. This Provision requires Permittees to make a reasonable effort to ensure that the third-party reviewer has no conflict of interest with regard to the Regulated Project being reviewed. That is, any consultant, contractor or their employees hired to design and/or construct a stormwater treatment system for a Regulated Project can not also be the certifying third party.

Provision C.3.g. (Hydromodification Management, HM) requires that certain new development projects manage increases in stormwater runoff flow and volume so that post-project runoff shall not exceed estimated pre-project runoff rates and durations, where such increased flow and/or volume is likely to cause increased potential for erosion of creek beds and banks, silt pollutant generation, or other adverse impacts on beneficial uses due to increased erosive force.

Background for Provision C.3.g. Based on Hydrograph Modification Management Plans prepared by the Permittees, the Water Board adopted hydromodification management (HM) requirements for Alameda Permittees (March 2007), Contra Costa Permittees (July 2006), Fairfield-Suisun Permittees (March 2007), Santa Clara Permittees (July 2005), and San Mateo Permittees (March 2007). Within Provision C.3.g, the major common elements of these HM requirements are restated. Attachments B–F contain the HM requirements as adopted by the Water Board, with some changes to correct minor errors and to provide consistency across the Region. Attachment F contains updated HM requirements for the Santa Clara Permittees. Permittees will continue to implement their adopted HM requirements; where Provision C.3.g. contradicts the Attachments, Provision C.3.g. shall be implemented. Additional requirements and/or options contained in the Attachments, above and beyond what is specified in Provision C.3.g., remain unaltered by Provision C.3.g. In all cases, the HM Standard must be achieved.

The Alameda, Santa Clara and San Mateo Permittees have adapted the Western Washington Hydrology Model[70] for modeling runoff from development project sites, sizing flow duration control structures, and determining overall compliance of such structures and other HM control structures (HM controls) in controlling runoff from the project sites to manage hydromodification impacts as described in the Permit. The adapted model is called the Bay Area Hydrology Model (BAHM).[71] All Permittees may use the BAHM if its inputs reflect actual conditions at the project site and surrounding area, including receiving water conditions. As Permittees gain experience in designing and operating HM controls, the Programs may make adjustments in the BAHM to improve its function in controlling excess runoff and managing hydromodification impacts. Notification of all such changes shall be given to the Water Board and the public through such mechanism as an electronic email list.

The Contra Costa Permittees have developed sizing charts for the design of flow duration control devices. Attachment C requires the Contra Costa Permittees to conduct a monitoring program to verify the performance of these devices. Following the satisfactory conclusion of this monitoring program, or conclusion of other study(s) that demonstrate devices built according to Attachment C specifications satisfactorily protect streams from excess erosive flows, the Water Board intends to allow the use of the Contra Costa sizing charts, when tailored to local conditions, by other stormwater programs and Permittees. Similarly, any other control strategies or criteria approved by the Board would be made available across the Region. This would be accomplished

[70] http://www.ecy.wa.gov/programs/wq/stormwater/wwhm_training/wwhm/wwhm_v2/instructions_v2.html
[71] See www.bayareahydrologymodel.org , Resources.

through Permit amendment or in another appropriate manner following appropriate public notification and process.

The Fairfield-Suisun Permittees have developed design procedures, criteria, and sizing factors for infiltration basins and bioretention units. These procedures, criteria, and sizing factors have been through the public review process already, and are not subject to public review at this time. Water Board staff's technical review found that the procedures, criteria, and sizing factors are acceptable in all ways except one: they are based on an allowable low flow rate that exceeds the criteria established in this Permit. Fairfield-Suisun Permittees may choose to change the design criteria and sizing factors to the allowable criterion of 20 percent of the 2-year peak flow, and seek Executive Officer approval of the modified sizing factors. This criterion, which is greater than the criterion allowed for other Bay Area Stormwater Countywide Programs, is based on data collected from Laurel and Ledgewood Creeks and technical analyses of these site-specific data. Following approval by the Executive Officer and notification of the public through such mechanism as an email list-serve, project proponents in the Fairfield-Suisun area may meet the HM Standard by using the Fairfield-Suisun Permittees' design procedures, criteria, and sizing factors for infiltration basins and/or bioretention units.

Attachments B and F allow the Alameda and Santa Clara Permittees to prepare a user guide to be used for evaluating individual receiving waterbodies using detailed methods to assess channel stability and watercourse critical flow. This user guide would reiterate and collate established stream stability assessment methods that have been presented in these Programs' HMPs, which have undergone Water Board staff review and been made available for public review. After the Programs have collated their methods into user guide format, received approval of the user guide from the Executive Officer, and informed the public through such process as an email list-serve, the user guide may be used to guide preparation of technical reports for: implementing the HM standard using in-stream or regional measures; determining whether certain projects are discharging to a watercourse that is less susceptible (from point of discharge to the Bay) to hydromodification (e.g., would have a lower potential for erosion than set forth in this Permit); and/or determining if a watercourse has a higher critical flow and project(s) discharging to it are eligible for an alternative Qcp[72] for the purpose of designing on-site or regional measures to control flows draining to these channels (i.e., the actual threshold of erosion-causing critical flow is higher than 10 percent of the 2-year pre-project flow).

The Water Board recognizes that the collective knowledge of management of erosive flows and durations from new and redevelopment is evolving, and that the topics listed below are appropriate topics for further study. Such a study may be initiated by Water Board staff, or the Executive Officer may request that all Bay Region municipal stormwater Permittees jointly conduct investigations as appropriate. Any future

[72] Qcp is the allowable low flow discharge from a flow control structure on a project site. It is a means of apportioning the critical flow in a stream to individual projects that discharge to that stream, such that cumulative discharges do not exceed the critical flow in the stream.

proposed changes to the Permittees' HM provisions may reflect improved understanding of these issues:

- Potential incremental costs, and benefits to waterways, from controlling a range of flows up to the 35- or 50-year peak flow, versus controlling up to the 10-year peak flow, as required by this Permit;
- The allowable low-flow (also called Qcp and currently specified as 10–20 percent of the pre-project 2-year runoff from the site) from HM controls;
- The effectiveness of self-retaining areas for management of post-project flows and durations; and/or
- The appropriate basis for determining cost-based impracticability of treating stormwater runoff and controlling excess runoff flows and durations.

Within Attachments B-F, this Permit allows for alternative HM compliance when on-site and regional HM controls and in-stream measures are not practicable. Alternative HM compliance includes contributing to or providing mitigation at other new or existing development projects that are not otherwise required by this Permit or other regulatory requirements to have HM controls. The Permit provides flexibility in the type, location, and timing of the mitigation measure. The Board recognizes that handling mitigation funds may be difficult for some municipalities because of administrative and legal constraints. The Board intends to allow flexibility for project proponents and/or Permittees to develop new or retrofit stormwater treatment or HM control projects within a broad area and reasonable time frame. Toward the end of the Permit term, the Board will review alternative projects and determine whether the impracticability criteria and options should be broadened or made narrower.

Provision C.3.g.i. defines the subset of Regulated Projects that must install hydromodification controls (HM controls). This subset, called HM Projects, are Regulated Projects that create and/or replace one acre or more of impervious surface and are not specifically excluded within Attachments B–F of the Permit. Within these Attachments, the Permittees have identified areas where the potential for single-project and/or cumulative development impacts to creeks is minimal, and thus HM controls are not required. Such areas include creeks that are concrete-lined or significantly hardened (e.g., with concrete) from point of discharge and continuously downstream to their outfall into San Francisco Bay; underground storm drains discharging to the Bay; and construction of infill projects in highly developed watersheds.[73]

Provision C.3.g.ii. establishes the standard hydromodification controls must meet. The HM Standard is based largely on the standards proposed by Permittees in their Hydrograph Modification Management Plans. The method for calculating post-project runoff in regards to HM controls is standard practice in Washington State and is equally applicable in California.

[73] Within the context of Provision C.3.g., "highly developed watersheds; refer to catchments or sub-catchments that are 65 percent impervious or more.

Provision C.3.g.iii. identifies and defines three methods of hydromodification management.

Provision C.3.g.iv. sets forth the information on hydromodification management to be submitted in the Permittees' Annual Reports.

Provision C.3.g.v. requires the Vallejo Permittees to develop a Hydromodification Management Plan (HMP), because the Vallejo Permittees have not been required to address HM impacts to date. Vallejo's current permit was issued by USEPA and does not require the Vallejo Permittees' to develop an HMP. The Vallejo Permittees may choose to adopt and implement one or a combination of the approaches in Attachments B–F.

Provision C.3.h (Operation and Maintenance of Stormwater Treatment Systems) establishes permitting requirements to ensure that proper maintenance for the life of the project is provided for all onsite, joint, and offsite stormwater treatment systems installed. The Provision requires Permittees to inspect at least 20% of these systems annually, at least 20% of all vault-based systems annually, and every treatment system at least once every 5 years. Requiring inspection of at least 20% of the total number of treatment and HM controls serves to prevent failed or improperly maintained systems from going undetected until the 5th year. We have the additional requirement to inspect at least 20% of all installed vault-based systems because they require more frequent maintenance and problems arise when the appropriate maintenance schedules are not followed. Also, problems with vault systems may not be as readily identified by the projects' regular maintenance crews. Neither of these inspection frequency requirements interferes with the Permittees' current ability to prioritize their inspections based on factors such as types of maintenance agreements, owner or contractor maintained systems, maintenance history, etc. This Provision also requires the development of a database or equivalent tabular format to track the operation and maintenance inspections and any necessary enforcement actions against Regulated Projects and submittal of Reporting Table C.3.h., which requires standard information that should be collected on each operation and maintenance inspection. We require this type of information to evaluate a Permittee's inspection and enforcement program and to determine compliance with the Permit. Summary data alone without facility-specific inspection findings does not allow us to determine whether Permittees are doing timely follow-up inspections at problematic facilities and taking appropriate enforcement actions.

Stormwater treatment system maintenance has been identified as a critical aspect of addressing urban runoff from Regulated Projects by many prominent urban runoff authorities, including CASQA, which states that "long-term performance of BMPs [stormwater treatment systems] hinges on ongoing and proper maintenance."[74] USEPA also stresses the importance of BMP [stormwater treatment system] maintenance,

[74] California Stormwater Quality Association, 2003. Stormwater Best Management Practice Handbook – New Development and Redevelopment, p. 6-1.

stating that "Lack of maintenance often limits the effectiveness of stormwater structure controls such as detention/retention basins and infiltration devices."[75]

Provision C.3.i. (Required Site Design Measures for Small Project and Detached Single-Family Homes Projects) introduces new requirements on single-family home projects that create and/or replace 2500 square feet or more of impervious surface and small development projects that create and/or replace > 2500 ft^2 to <10,000 ft^2 impervious surface (collectively over the entire project). A detached single-family home project is defined as the building of one single new house or the addition and/or replacement of impervious surface to one single existing house, which is not part of a larger plan of development.

This Provision requires these projects to select and implement one or more stormwater site design measures from a list of six. These site design measures are basic methods to reduce the amount and flowrate of stormwater runoff from projects and provide some pollutant removal treatment of the runoff that does leave the projects. Under this Provision, only projects that already require approvals and/or permits under the Permittees' current planning, building, or other comparable authority are regulated. Hence this Provision does not require Permittees to regulate small development and single-family home projects that would not otherwise be regulated under the Permittees' current ordinances or authorities. Water Board staff recognizes that the stormwater runoff pollutant and volume contribution from each one of these projects may be small; however, the cumulative impacts could be significant. This Provision serves to address some of these cumulative impacts in a simple way that will not be too administratively burdensome on the Permittees. To assist these small development and single-family home projects, this Provision also requires the Permittees to develop standard specifications for lot-scale site design and treatment measures.

[75] USEPA. 1992. *Guidance Manual for the Preparation of Part II of the NPDES Permit Application for Discharges from Municipal Separate Storm Sewer Systems*. EPA 833-B-92-002.

C.4. Industrial and Commercial Site Controls

Legal Authority

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, D, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(C) requires, "A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system."

Specific Provision C.4. Requirements

Provision C.4.a (Legal Authority for Effective Site Management)

Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(A) provides that each Permittee must demonstrate that it can control "through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from site of industrial activity." This section also describes requirements for effective follow-up and resolution of actual or threatened discharges of either polluted non-stormwater or polluted stormwater runoff from industrial/commercial sites.

Provision C.4.b (Inspection Plan)

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(C)(1) provides that Permittees must "identify priorities and procedures for inspections and establishing and implementing control measures for such discharges." The Permit requires Permittees to implement an industrial and commercial site controls program to reduce pollutants in runoff from all industrial and commercial sites/sources.

Provision C.4.b.ii.(1) (Commercial and Industrial Source Identification)

Federal NPDES regulation 40 CFR 122.26(d)(2)(ii) provides that Permittees "Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity."

USEPA requires "measures to reduce pollutants in storm water discharges to municipal separate storm sewers from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of

1986 (SARA)."[76] USEPA "also requires the municipal storm sewer Permittees to describe a program to address industrial dischargers that are covered under the municipal storm sewer permit."[77] To more closely follow USEPA's guidance, this Permit also includes operating and closed landfills, and hazardous waste treatment, disposal, storage and recovery facilities.

The Permit requires Permittees to identify various industrial sites and sources subject to the General Industrial Permit or other individual NPDES permit. USEPA supports the municipalities regulating industrial sites and sources that are already covered by an NPDES permit:

> Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system's discharges. These permits are expected to require that controls be placed on storm water discharges associated with industrial activity which discharge through the municipal system. It is anticipated that general or individual permits covering industrial storm water discharges to these municipal separate storm sewer systems will require industries to comply with the terms of the permit issued to the municipality, as well as other terms specific to the Permittee.[78]

And:

> Although today's rule will require industrial discharges through municipal storm sewers to be covered by separate permit, USEPA still believes that municipal operators of large and medium municipal systems have an important role in source identification and the development of pollutant controls for industries that discharge storm water through municipal separate storm sewer systems is appropriate. Under the CWA, large and medium municipalities are responsible for reducing pollutants in discharges from municipal separate storm sewers to the maximum extent practicable. Because storm water from industrial facilities may be a major contributor of pollutants to municipal separate storm sewer systems, municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program.[79]

Provision C.4.b.ii.(5) (Inspection Frequency)
USEPA guidance[80] says, "management programs should address minimum frequency for routine inspections." The USEPA Fact Sheet—Visual Inspection[81] says, "To be effective, inspections must be carried out routinely."

[81] USEPA. 1999. 832-F-99-046, "Storm Water Management Fact Sheet – Visual Inspection".

Provision C.4.c (Enforcement Response Plan) requires the Permittees to establish an Enforcement Response Plan (ERP) that ensures timely response to actual or potential stormwater pollution problems discovered in the course of industrial/commercial stormwater inspections. The ERP also provides for progressive enforcement of violations of ordinances and/or other legal authorities. The ERP will provide guidance on the appropriate use of the various enforcement tools, such as verbal and written notices of violation, when to issue a citations, and require cleanup requirements, cost recovery, and pursue administrative or and criminal penalties. All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer than 10 business days after the violations are discovered.

Provision C.4.d (Staff Training) section of the Permit requires the Permittees to conduct annual staff trainings for inspectors. Trainings are necessary to keep inspectors current on enforcement policies and current MEP BMPs for industrial and commercial stormwater runoff discharges.

C.5. Illicit Discharge Detection and Elimination

Legal Authority

The following legal authority applies to section C.5:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, D, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulations 40 CFR 122.26(d)(1)(iii)(B)(1) provides that the Permittee shall include in their application, "the location of known municipal storm sewer system outfalls discharging to waters of the United States."

Federal NPDES regulations 40 CFR 122.26(d)(1)(iii)(B)(5) provides that the Permittee shall include in their application, "The location of major structural controls for storm water discharge (retention basins, detention basins, major infiltration devices, etc."

Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B) provides that the Permittee shall have, "adequate legal authority to prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer."

Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B) provides that the Permittee shall, "Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer."

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B) requires, "shall be based on a description of a program, including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(1) requires, "a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(2) requires, "a description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(3) requires, "procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water."

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(4) requires, "a description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer."

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(5) requires, "a description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers."

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(7) requires, "a description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary."

Fact Sheet Findings in Support of Provision C.5

C.5-1 Illicit and inadvertent connections to MS4 systems result in the discharge of waste and chemical pollutants to receiving waters. Every Permittee must have the ability to discover, track, and clean up stormwater pollution discharges by illicit connections and other illegal discharges to the MS4 system.

C.5-2 Illicit discharges to the storm drain system can be detected in several ways. Permittee staff can detect discharges during their course of other tasks, and business owners and other aware citizens can observe and report suspect discharges. The Permittee must have a direct means for these reports of suspected polluted discharges to receive adequate documentation, tracking, and response through problem resolution.

Specific Provision C.5 Requirements

Provision C.5.a (Legal Authority) requires each Permittee have adequate legal authority to effectuate cessation, abatement, and/or clean up of non-exempt non-stormwater discharges per Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B). Illicit and inadvertent connections to MS4 systems result in the discharge of waste and chemical pollutants to receiving waters. Every Permittee must have the ability to discover, track, and clean up stormwater pollution discharges by illicit connections and other illegal discharges to the MS4 system.

Provision C.5.b (ERP) requires Permittees to establish an ERP that ensures timely response to illicit discharges and connections to the MS4 and provides progressive enforcement of violations of ordinances and/or other legal authorities. This section also requires Permittees to establish criteria for triggering follow-up investigations. Additional language has been added to this section to clarify the minimum level of effort and time frames for follow-up investigations when violations are discovered. Timely investigation and follow up when action levels are exceeded is necessary to identify sources of illicit discharges, especially since many of the discharges are transitory. The requirements for all violations to be corrected before the next rain event but no longer than 10 business days when there is evidence of illegal non-stormwater discharge, dumping, or illicit connections having reached municipal storm drains is necessary to ensure timely response by Permittees.

Provision C.5.c (Spill and Dumping Response, Complaint Response, and Frequency of Inspections) Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(4) requires, "a description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer." This Provision of the Permit requires the Permittees to establish and maintain a central point of contact including phone numbers for spill and complaint reporting. Reports from the public are an essential tool in discovering and investigating illicit discharge activities. Maintaining contact points will help ensure that there is effective reporting to assist with the discovery of prohibited discharges. Each Permittee must have a direct means for these reports of suspected polluted discharges to receive adequate documentation, tracking, and response through problem resolution.

Provision C.5.d (Control of Mobile Sources) requires each Permittee to develop and implement a program to reduce the discharge of pollutants from mobile businesses. The purpose of this section is to establish oversight and control of pollutants associated with mobile business sources to the MEP.

Provision C.5.e (Collection System Screening and MS4 Map Availability) Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(3) requires, "procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water." This Provision of the Permit requires the Permittees to conduct follow up investigations and inspect portions of the MS4 for illicit discharges and connections. Permittees shall implement a program to actively seek and eliminate illicit connections and discharges during their routine collection system screening and during screening surveys at strategic check points. Additional wording has been added to this section to clarify and ensure that all appropriate municipal personnel are used in the program to observe and report these illicit discharges and connections when they are working the system.

This section also requires the Permittees to develop or obtain a map of their entire MS4 system and drainages within their jurisdictions and provide the map to the public for review. As part of the permit application process federal NPDES regulations 40 CFR 122.26(d)(1)(iii)(B)(1) and 40 CFR 122.26(d)(1)(iii)(B)(5) specify that dischargers must identify the location of any major outfall that discharges to waters of the United States, as well as the location of major structural controls for stormwater discharges. A major outfall is any outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than a circular pipe which is associated with a drainage area of more than 50 acres) or; for areas zoned for industrial activities, any pipe with a diameter of 12 inches or more or its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more). The permitting agency may not process a permit until the applicant has fully complied with the application requirements.[82] If, at the time of application, the information is unavailable, the Permit must require implementation of a program to meet the application requirements.[83] The requirement in this Provision of the Permit for

[82] 40 CFR 124.3 (applicable to state programs, see section 123.25).
[83] 40 CFR. 122.26(d)(1)(iv)(E).

Permittees to prepare maps of the MS4 system will help ensure that Permittees comply with federal NPDES permit application requirements that are more than 10 years old.

Provision C.5.f (Tracking and Case Follow-up) section of the Permit requires Permittees to track and monitor follow-up for all incidents and discharges reported to the complaint/spill response system that could pose a threat to water quality. This requirement is included so Permittees can demonstrate compliance with the ERP requirements of Section C.5.b and to ensure that illicit discharge reports receive adequate follow up through to resolution.

C.6. Construction Site Control

Legal Authority

The following legal authority applies to section C.6:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, D, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D) requires, "A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(1) requires, "A description of procedures for site planning which incorporate consideration of potential water quality impacts."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(2) requires, "A description of requirements for nonstructural and structural best management practices."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(3) requires, "A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(4) requires, "A description of appropriate educational and training measures for construction site operators."

Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(A) provides that each Permittee must demonstrate that it can control, "through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from site of industrial activity."

Federal NPDES regulation 40 CFR 122.26(b)(14) provides that, "The following categories of facilities are considered to be engaging in 'industrial activity' for the purposes of this subsection: […] (x) Construction activity including cleaning, grading and excavation activities […]."

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to, "control all pollutants or pollutant parameters (either conventional, non-conventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute

to an excursion above any State water quality standard, including State narrative criteria for water quality."

Fact Sheet Findings in Support of Provision C.6.

C.6-1 Vegetation clearing, mass grading, lot leveling, and excavation expose soil to erosion processes and increase the potential for sediment mobilization, runoff and deposition in receiving waters. Construction sites without adequate BMP implementation result in sediment runoff rates that greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters.

C.6-2 Excess sediment can cloud the water, reducing the amount of sunlight reaching aquatic plants, clog fish gills, smother aquatic habitat and spawning areas, and impede navigation in our waterways. Sediment also transports other pollutants such as nutrients, metals, and oils and grease. Permittees are on-site at local construction sites for grading and building permit inspections, and also have in many cases dedicated construction stormwater inspectors with training in verifying that effective BMPs are in place and maintained. Permittees also have effective tools available to achieve compliance with adequate erosion control, such as *stop work* orders and citations.

C.6-3 Mobilized sediment from construction sites can flow into receiving waters. According to the 2004 National Water Quality Inventory[84], States and Tribes report that sediment is one of the top 10 causes of impairment of assessed rivers and streams, next to pathogens, habitat alteration, organic enrichment or oxygen depletion, nutrients, metals, etc.. Sediment impairs 35,177 river and stream miles (14% of the impaired river and stream miles). Sources of sedimentation include agriculture, urban runoff, construction, and forestry. Sediment runoff rates from construction sites, however, are typically 10 to 20 times greater than those of agricultural lands, and 1,000 to 2,000 times greater than those of forest lands. During a short period of time, construction sites can contribute more sediment to streams than can be deposited naturally during several decades.[85]

Specific Provision C.6 Requirements

Provision C.6.a. Legal Authority for Effective Site Management. Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(A) requires that each Permittee demonstrate that it can control "through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from site of industrial activity." This section of the Permit requires each Permittee to have the

[84] http://www.epa.gov/owow/305b/2004report/2004_305Breport.pdf

[85] USEPA. December 2005. *Stormwater Phase II Final Rule Fact Sheet Series – Construction Site Runoff Control Minimum Control Measure*. EPA 833-F-00-008. Fact Sheet 2.6.

authority to require year-round, seasonally and phase appropriate effective erosion control, run-on and runoff control, sediment control, active treatment systems, good site management, and non stormwater management through all phases of site grading, building, and finishing of lots. All Permittees should already have this authority. Permittees shall certify adequacy of their respective legal authority in the 2010 Annual Report.

Inspectors should have the authority to take immediate enforcement actions when appropriate. Immediate enforcement will get the construction site's owner/operator to quickly implement corrections to violations, thereby minimizing and preventing threats to water quality. When inspectors are unable to take immediate enforcement actions, the threat to water quality continues until an enforcement incentive is issued to correct the violation. In its Phase II Compliance Assistance Guidance, USEPA says that, "Inspections give the MS4 operator an opportunity to provide additional guidance and education, issue warnings, or assess penalties."[86] To issue warnings and assess penalties during inspections, inspectors must have the legal authority to conduct enforcement.

Provision C.6.b. Enforcement Response Plan (ERP). This section requires each Permittee to develop and implement an escalating enforcement process that serves as reference for inspection staff to take consistent actions to achieve timely and effective corrective compliance from all public and private construction site owners/operators. Under this section, each Permittee develops its own unique ERP tailored for the specific jurisdiction; but all ERPs must make it a goal to correct all violations before the next rain event but no longer than 10 business days after the violations are discovered. In a few cases, such as slope inaccessibility, it may require longer than 10 days before crews can safely access the eroded area. The Permittees' tracking data need to provide a rationale for the longer compliance timeframe.

Water Board staff has noted deficiencies in the Permittees' enforcement procedures and implementation during inspections. The most common issues found were that enforcement was not firm and appropriate to correct the violation, and that repeat violations did not result in escalated enforcement procedures. USEPA supports enforcement of ordinances and permits at construction sites stating, "Effective inspection and enforcement requires […] penalties to deter infractions and intervention by the municipal authority to correct violations."[87] In addition, USEPA expects permits issued to municipalities to address "weak inspection and enforcement."[88] For these reasons, the enforcement requirements in this section have been established, while providing sufficient flexibility for each Permittee's unique stormwater program.

Provision C.6.c. Best Management Practices Categories. This section requires all Permittees to require all construction sites to have year-round seasonally appropriate effective Best Management Practices (BMPs) in the following six categories: (1)

---

[86] USEPA. 2000. 833-R-00-002, Storm Water Phase II Compliance Assistance Guide, P.4-31
[87] USEPA. 1992. Guidance 833-8-92-002. Section 6.3.2.3.
[88] *Federal Register*. Vol. 55, No. 222, Friday, November 16, 1990. Rules and Regulations. p. 48058.

erosion control, (2) run-on and runoff control, (3) sediment control, (4) active treatment systems, (5) good site management, and (6) non stormwater management. These BMP categories are listed in the State General NPDES Permit for Stormwater Discharges Associated with Construction Activities (General Construction Permit). The Water Board staff decided it was too prescriptive and inappropriate to require a specific set of BMPs that are to be applicable to all sites. Every site is different with regards to terrain, soil type, soil disturbance, and proximity to a waterbody. The General Construction Permit recognizes these different factors and requires site specific BMPs through the Storm Water Pollution Prevention Plan that addresses the six specified BMP categories. This Permit allows Permittees the flexibility to determine if the BMPs for each construction site are effective and appropriate. This Permit also allows the Permittees and the project proponents the necessary flexibility to make immediate decisions on appropriate, cutting-edge technology to prevent the discharge of construction pollutants into stormdrains, waterways, and right-of-ways. Appropriate BMPs for the different site conditions can be found in different handbooks and manuals. Therefore, this Permit is consistent with the General Construction Permit in its requirements for BMPs in the six specified categories.

Vegetation clearing, mass grading, lot leveling, and excavation expose soil to erosion processes and increase the potential for sediment mobilization, runoff and deposition in receiving waters. Construction sites without adequate BMP implementation result in sediment runoff rates that greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. This can even occur in conjunction with unexpected rain events during the so-called *dry-season*. Although rare, significant rains can occur in the San Francisco Bay Region during the dry season. Therefore, Permittees should ensure that construction sites have materials on hand for rapid rain response during the dry season.

Normally, stormwater restrictions on grading should be implemented during the wet season from October 1st through April 30th. Section C.6.c.ii.(1).d of the Permit requires, "project proponents to minimize grading during the wet season and scheduling of grading with seasonal dry weather periods to the extent feasible." If grading does occur during the wet season, Permittees shall require project proponents to (1) implement additional BMPs as necessary, (2) keep supplies available for rapid response to storm events, and (3) minimize wet-season, exposed, and graded areas to the absolute minimum necessary.

Slope stabilization is necessary on all active and inactive slopes during rain events regardless of the season, except in areas implementing advanced treatment. Slope stabilization is also required on inactive slopes throughout the rainy season. These requirements are needed because unstabilized slopes at construction sites are significant sources of erosion and sediment discharges during rainstorms. "Steep slopes are the most highly erodible surface of a construction site, and require special attention."[89] USEPA emphasizes the importance of slope stabilization when it states, "slope length

[89] Schueler, T., and H. Holland. 2000. *Muddy Water In—Muddy Water Out*? The Practice of Watershed Protection. p. 6.

and steepness are key influences on both the volume and velocity of surface runoff. Long slopes deliver more runoff to the base of slopes and steep slopes increase runoff velocity; both conditions enhance the potential for erosion to occur."[90] In lieu of vegetation preservation or replanting, soil stabilization is the most effective measure in preventing erosion on slopes. Research has shown that effective soil stabilization can reduce sediment discharge concentrations up to six times, as compared to soils without stabilization.[91] Slope stabilization at construction sites for erosion control is already the consensus among the regulatory community and is found throughout construction BMP manuals and permits. For these reasons, Permittees must ensure that slope stabilization is implemented on sites, as appropriate.

It is also necessary that Permittees ensure that construction sites are revegetated as early as feasible. Implementation of revegetation reduces the threat of polluted stormwater discharges from construction sites. Construction sites should permanently stabilize disturbed soils with vegetation at the conclusion of each phase of construction.[92] A survey of grading and clearing programs found one-third of the programs without a time limit for permanent revegetation, "thereby increasing the chances for soil erosion to occur."[93] USEPA states "the establishment and maintenance of vegetation are the most important factors to minimizing erosion during development."[94]

To ensure the MEP standard and water quality standards are met, advanced treatment systems may be necessary at some construction sites. In requiring the implementation of advanced treatment for sediment at construction sites, Permittees should consider the site's threat to water quality. In evaluating the threat to water quality, the following factors shall be considered: (1) soil erosion potential; (2) the site's slopes; (3) project size and type; (4) sensitivity of receiving waterbodies; (5) proximity to receiving waterbodies; (6) non-stormwater discharges; and (7) any other relevant factors. Advanced treatment is a treatment system that employs chemical coagulation, chemical flocculation, or electro coagulation in order to reduce turbidity caused by fine suspended sediment.[95] Advanced treatment consists of a three part treatment train of coagulation, sedimentation, and polishing filtration. Advanced treatment has been effectively implemented extensively in the other states and in the Central Valley Region of California.[96] In addition, Water Board's inspectors have observed advanced treatment being effectively implemented at both large sites greater than 100 acres, and at small, 5-acre sites. Advanced treatment is often necessary for Permittees to ensure that discharges from construction sites are not causing or contributing to a violation of water quality standards.

Provision C.6.d. Plan Approval Process. This section of the Permit requires the Permittees to review project proponents' stormwater management plans for compliance with local regulations, policies, and procedures. USEPA states that it is often easier and more effective to incorporate stormwater quality controls during the site plan review process or earlier.[97] In the Phase I stormwater regulations, USEPA states that a primary control technique is good site planning.[98] USEPA goes on to say that the most efficient controls result when a comprehensive stormwater management system is in place.[99] To determine if a construction site is in compliance with construction and grading ordinances and permits, USEPA states that the "MS4 operator should review the site plans submitted by the construction site operator before ground is broken."[100] Site plan review aids in compliance and enforcement efforts since it alerts the "MS4 operator early in the process to the planned use or non-use of proper BMPs and provides a way to track new construction activities."[101]

Provision C.6.e. (Inspections) The Water Board allows flexibility on the exact legal authority language, ERP, and BMPs required on a site. This section of the Permit pulls together the accountability of the whole Provision through regular inspections, consistent enforcement, and meaningful tracking. These three elements will help ensure that effective construction pollutant controls are in place in order to minimize construction polluted runoff to the stormdrain and waterbodies.

Currently, Annual Reports show that some Permittees provide no information on its construction inspection and enforcement programs; some Permittees only provide information on pre rainy season inspections; another group of Permittees conduct inspections through December and provide just the date each site was inspected; yet another group of Permittees provides a very brief summary of their respective overall inspection program; and there is a small group of Permittees who report meaningful inspection and enforcement information. Inspections of construction sites by Water Board staff have noted deficiencies in stormwater inspections and enforcement. Therefore, this section clearly identifies the level of effort necessary by all Permittees to minimize construction pollutant runoff into stormdrains and ultimately, waterbodies.

This section requires monthly inspections during the wet season of all construction sites disturbing one or more acre of land and at all high priority sites as determined by the Permittee or the Water Board as significant threats to water quality. Inspections shall focus on the adequacy and effectiveness of the site specific BMPs implemented for the six BMP categories. Permittees shall implement its ERP and require timely corrections of all actual and potential problems observed. All violations must be corrected in a timely manner with the goal of correcting them before the next rain event but no longer

[97] USEPA. 2000. *Storm Water Phase II Compliance Assistance Guide*. EPA 833-R-00-002. Section 6.3.2.1.

[101] Ibid. pp. 4–31.

than 10 business days after the violations are discovered. All inspections shall be recorded on a written or electronic inspection form, and also tracked in an electronic database or tabular format. The tracked information provides meaningful data for evaluating compliance. An example tabular format is included as Table 6 – Construction Inspection Data. Submittal of this Table is not required in each Annual Report but encouraged. Each Permittee will need to use the information in the electronic database or tabular format to compile its Annual Reports. The Executive Officer may require that the tracked information be submitted electronically or in a tabular format. When required, Permittees shall submit that data within 10-working days of the requirement. The recommended submittal format is in Table 6 – Construction Inspection Data.

Provision C.6.f. Staff Training. This section of the Permit requires Permittees to conduct annual staff trainings for municipal staff. These trainings have been found to be extremely effective means to educate inspectors and to inform them of any changes to local ordinances and state laws. Trainings provide valuable opportunity for Permittees to network and share strategies used for effective enforcement and management of erosion control practices.

Table 6 – Construction Inspection Data

Facility/Site Inspected	Inspection Date	Weather During Inspection	Inches of Rain Since Last Inspection	Enforcement Response Level	Problem(s) Observed							Specific Problem(s)	Resolution			Comments/ Rationale for Longer Compliance Time
					Erosion Control	Run-on and Runoff Control	Sediment Control	Active Treatment System	Good Site Management	Non Stormwater Management	Illicit Discharge		Problems Fixed	Need More Time	Escalate Enforcement	
Panoramic Views	9/30/08	Dry	0	Written Notice			x					Driveway not stabilized				
Panoramic Views	10/15/08	Dry	0.5										x			50' of driveway rocked.
Panoramic Views	11/15/08	Rain	3	Stop Work	x		x				x	Uncovered graded lots eroding; Sediment entering a stormdrain that didn't have adequate protection.				
Panoramic Views	11/15/08	Drizzling	0.25										x			Lots blanketed. Storm drains pumped. Street cleaned.
Panoramic Views	12/1/08	Dry	4	Verbal Warning					x			Porta potty next to stormdrain.	x			Porta potty moved away from stormdrain.
Panoramic Views	1/15/08	Rain	3.25	Written Warning	x					x		Fiber rolls need maintenance; Tire wash water flowing into street				
Panoramic Views	1/25/09	Dry	0										x			Fiber rolls replaced.

Facility/Site Inspected	Inspection Date	Weather During Inspection	Inches of Rain Since Last Inspection	Enforcement Response Level	Problem(s) Observed							Specific Problem(s)	Resolution			Comments/ Rationale for Longer Compliance Time
					Erosion Control	Run-on and Runoff Control	Sediment Control	Active Treatment System	Good Site Management	Non Stormwater Management	Illicit Discharge		Problems Fixed	Need More Time	Escalate Enforcement	
Panoramic Views	2/28/09	Rain	2.4	Stop Work	x		x				x	Slope erosion control failed. Fiber rolls at the bottom of the hill flattened. Sediment laden discharge skipping protected stormdrains and entering unprotected stormdrains.				
Panoramic Views	2/28/09	Rain	0.1											x		Fiber rolls replaced. Silt fences added. More stormdrains protected. Streets cleaned. Slope too soggy to access.
Panoramic Views	3/15/09	Dry	1	Citation with Fine					x		x	Paint brush washing not designated	x			Street and storm drains cleaned. Slopes blanketed.
Panoramic Views	4/1/09	Dry	0.5	Citation with Fine							x	Concrete washout overflowed; Evidence of illicit discharge				
Panoramic Views	4/15/09	Dry	0										x			Concrete washout replaced; Storm drain and line cleaned.

C.7. Public Information and Outreach

Legal Authority

The following legal authority applies to section C.7:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) requires, "A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(5) requires , "a description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(6) requires, "A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials."

Fact Sheet Finding in Support of Provision C.7.

C.7-1 An informed and knowledgeable community is critical to the success of a stormwater program since it helps ensure greater support for the program as the public gains a greater understanding of stormwater pollution issues.

C.7-2 An informed community also ensures greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.

C.7-3 The public education programs should use a mix of appropriate local strategies to address the viewpoints and concerns of a variety of audiences and communities, including minority and disadvantaged communities, as well as children.[102]

[102] USEPA. 2000. Storm Water Phase II Compliance Assistance Guide. EPA 833-R-00-002.

C.7-4 Target audiences should include (1) government agencies and official to achieve better communication, consistency, collaboration, and coordination at the federal, state, and local levels and (2) K-12/Youth Groups.103

C.7-5 Citizen involvement events should make every effort to reach out and engage all economic and ethnic groups.[104]

Specific Provision C.7 Requirements

Provision C.7.a. Storm Drain Inlet Marking. Storm drain inlet marking is a long-established program of outreach to the public on the nature of the storm drain system, providing the information that the storm drain system connects directly to creeks and the Bay and does not receive treatment. Past public awareness surveys have demonstrated that this BMP has achieved significant impact in raising awareness in the general public and meets the MEP standard as a required action. Therefore, it is important to set a goal of ensuring that all municipally-maintained inlets are legible labeled with a no dumping message. If storm drain marking can be conducted as a volunteer activity, it has additional public involvement value.

Provision C.7.b. Advertising Campaigns. Use of various electronic and/or print media on trash/litter in waterways and pesticides. Advertising campaigns are long-established outreach management practices. Specifically, the Bay Area Management Agencies Association (BASMAA) already implements an advertising campaign on behalf of the Permittees. While the Permittees have been successful at reaching certain goals for its Public Information/Participation programs, it must continue to increase public awareness of specific stormwater issues. This Permit also requires a pre-campaign survey and a post-campaign survey. These two surveys will help identify and quantify the audiences' knowledge, trends, and attitudes and/or practices; and to measure the overall population awareness of the messages and behavioral changes.

Provision C.7.c. Media Relations. Public service media time is available and allows the Permittees to leverage expensive media purchases to achieve broader outreach goals.

Provision C.7.d. Stormwater Point of Contact. As the public has become more aware, citizens are more frequently calling their local jurisdictions to report spills and other polluting behavior impacting stormwater runoff and causing non-stormwater prohibited discharges. Permittees are required to have a centralized, easily accessible point of contact both for citizen reports and to coordinate reports of problems identified by Permittee staff, permitting follow-up and pollution cleanup or prevention. Often the follow-up, cleanup, and/or prevention provide the opportunity to educate the immediate neighborhood through established public outreach mechanisms such as distributing door hangers in the neighborhood describing the remedy for the problem discovered. Permittees already have existing published stormwater point of contacts.

---

103 State Water Board. 1994. Urban Runoff Technical Advisory Committee Report and Recommendations. Nonpoint Source Management Program.

104 USEPA. 2000. Storm Water Phase II Compliance Assistance Guide. EPA 833-R-00-002.

Provision C.7.e. Public Outreach Events. Staffing tables or booths at fairs, street fairs or other community events are a long-established outreach mechanism employed by Permittees to reach large numbers of citizens with stormwater pollution prevention information in an efficient and convenient manner. These have been ongoing in the Region for several municipal stormwater permit cycles and are MEP outreach actions. Permittees shall continue with such outreach events utilizing appropriate outreach materials, such as printed materials, newsletter/journal articles, and videos. Permittees shall also utilize existing community outreach events such as the Bringing Back the Natives Garden Tour.

Provision C.7.f. Watershed Stewardship Collaborative Efforts. Watershed and Creek groups are comprised of active citizens, but they often need support from the local jurisdiction and certainly need to coordinate actions with Permittees such as flood districts and cities.

Provision C.7.g. Citizen Involvement Events. Citizen involvement and volunteer efforts both accomplish needed creek cleanups and restorations, and serve to raise awareness and provide outreach opportunities. These have been ongoing in the Region for several municipal stormwater permit cycles and are MEP outreach actions.

In previous municipal stormwater permits, Public Information/Participation encompassed both Citizen Involvement Events and Public Outreach Events. Citizen Involvement Events are important because they provide the community opportunities to actively practice being good stewards of our environment. Therefore, this Permit separates out the Public Outreach Events from the Citizen Involvement Events to ensure that citizens in all Bay Area communities are given the opportunity to be involved. In addition, the Permit allows Permittees to claim both Public Outreach and Citizen Involvement credits if the event contains significant elements of both. The combined specified number of events for Public Outreach and Citizen Involvement are very close to current performance standards and/or level of effort for respective Public Information/Participation Programs.

Provision C.7.h. School-Age Children Outreach. Outreach to school children has proven to be a particularly successful program with an enthusiastic audience who are efficient to reach. School children also take the message home to their parents, neighbors, and friends. In addition, they are the next generation of decision makers and consumers.

Provision C.7.i. Outreach to Municipal Officials. It is important for Permittee staff to periodically inform Municipal Officials of the permit requirements and also future planning and resource needs driven by the permit and stormwater regulations.

C.8. Water Quality Monitoring

Legal Authority

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii); CWC section 13377; Federal
NPDES regulations 40 CFR 122.26(d)(2)(iv)

Specific Legal Authority: Permittees must conduct a comprehensive monitoring program as required under Federal NPDES regulations 40 CFR 122.48, 40 CFR 122.44(i), 40 CFR 122.26.(d)(1)(iv)(D), and 40 CFR 122.26(d)(2)(ii)-(iv).

Fact Sheet Findings in Support of Provision C.8

C.8-1 In response to questions regarding the type of water quality-based effluent limitations that are most appropriate for NPDES stormwater permits, and because of the nature of stormwater discharges, USEPA established the following approach to stormwater monitoring:

> Each storm water permit should include a coordinated and cost-effective monitoring program to gather necessary information to determine the extent to which the permit provides for attainment of applicable water quality standards and to determine the appropriate conditions or limitations for subsequent permits. Such a monitoring program may include ambient monitoring, receiving water assessment, discharge monitoring (as needed), or a combination of monitoring procedures designed to gather necessary information.[105]

According to USEPA, the benefits of stormwater runoff monitoring include, but are not limited to, the following:

- Providing a means for evaluating the environmental risk of stormwater discharges by identifying types and amounts of pollutants present;
- Determining the relative potential for stormwater discharges to contribute to water quality impacts or water quality standard violations;
- Identifying potential sources of pollutants; and
- Eliminating or controlling identified sources more specifically through permit conditions.[106]

C.8-2 Provision C.8 requires Permittees to conduct water quality monitoring, including monitoring of receiving waters, in accordance with 40 CFR 122.44(i) and 122.48. One purpose of water quality monitoring is to demonstrate the effectiveness of the Permittees' stormwater management

[105] USEPA. 1996. Interim Permitting Approach for Water Quality-Based Effluent Limitations in Stormwater Permits. Sept. 1, 1996. http://www.epa.gov/npdes/pubs/swpol.pdf
[106] USEPA. 1992. NPDES Storm Water Sampling Guidance Document. EPA/833-B-92-001.

actions pursuant to this Permit and, accordingly, demonstrate compliance with the conditions of the Permit. Other water quality monitoring objectives under this Permit include:

- Assess the chemical, physical, and biological impacts of urban runoff on receiving waters;
- Characterize stormwater discharges;
- Assess compliance with Total Maximum Daily Loads (TMDLs) and Wasteload Allocations (WLAs) in impaired waterbodies;
- Assess progress toward reducing receiving water concentrations of impairing pollutants;
- Assess compliance with numeric and narrative water quality objectives and standards;
- Identify sources of pollutants;
- Assess stream channel function and condition, as related to urban stormwater discharges;
- Assess the overall health and evaluate long-term trends in receiving water quality; and
- Measure and improve the effectiveness of the Permittees' urban runoff control programs and the Permittees' implemented BMPs.

C.8-3 Monitoring programs are an essential element in the improvement of urban runoff management efforts. Data collected from monitoring programs can be assessed to determine the effectiveness of management programs and practices, which is vital for the success of the iterative approach, also called the "continuous improvement" approach, used to meet the MEP standard. When water quality data indicate that water quality standards or objectives are not being met, particular pollutants, sources, and drainage areas can be identified and targeted for urban runoff management efforts. The iterative process in Provision C.1, Water Quality Standards Exceedances, could potentially be triggered by monitoring results. Ultimately, the results of the monitoring program must be used to focus actions to reduce pollutant loadings to comply with applicable WLAs, and protect and enhance the beneficial uses of the receiving waters in the Permittees' jurisdictions and the San Francisco Bay.

C.8-4 Water quality monitoring requirements in previous permits were less detailed than the requirements in this Permit. Under previous permits, each program could design its own monitoring program, with few permit guidelines. A decision by the California Superior Court[107] regarding two of the programs' permits stated:

Federal law requires that all NPDES permits specify "[r]equired monitoring including type, intervals, and frequency sufficient to yield

[107] San Francisco Baykeeper vs. Regional Water Quality Control Board, San Francisco Bay Region, Consolidated Case No. 500527, filed Nov. 14, 2003.

data which are representative of the monitored activity." 40 C.F.R. § 122.48(b). Here, there is no monitoring program set forth in the Permit. Instead, an annual Monitoring Program Plan is to be prepared by the dischargers to set forth the monitoring program that will be used to demonstrate the effectiveness of the Stormwater Management Plan. This does not meet the regulatory requirements that a monitoring program be set forth including the types, intervals, and frequencies of the monitoring.

The water quality monitoring requirements in Provision C.8 comply with 40 CFR 122.44(i) and 122.48(b), and the Superior Court decision.

C.8-5 The Water Quality Monitoring Provision is intended to provide answers to five fundamental management questions, outlined below. Monitoring is intended to progress as iterative steps toward ensuring that the Permittees' can fully answer, through progressive monitoring actions, each of the five management questions:

- Are conditions in receiving waters protective, or likely to be protective, of beneficial uses?
- What is the extent and magnitude of the current or potential receiving water problems?
- What is the relative urban runoff contribution to the receiving water problem(s)?
- What are the sources of urban runoff that contribute to receiving water problem(s)?
- Are conditions in receiving waters getting better or worse?

C.8-6 On April 15, 1992, the Water Board adopted Resolution No. 92-043 directing the Executive Officer to implement the Regional Monitoring Program for San Francisco Bay. Subsequent to a public hearing and various meetings, Board staff requested major permit holders in the Region, under authority of CWC section 13267, to report on the water quality of the Estuary. These permit holders, including the Permittees, responded to this request by participating in a collaborative effort through the San Francisco Estuary Institute. This effort has come to be known as the San Francisco Estuary Regional Monitoring Program for Trace Substances (RMP). The RMP involves collection and analysis of data on pollutants and toxicity in water, sediment and biota of the Estuary. The Permittees are required to continue to report on the water quality of the Estuary, as presently required. Compliance with the requirement through participation in the RMP is considered to be adequate compliance.

C.8-7 The Surface Water Ambient Monitoring Program (SWAMP) is a statewide monitoring effort, administered by the State Water Board, designed to assess the conditions of surface waters throughout California. One purpose of SWAMP is to integrate existing water quality monitoring activities of the State Water Board and the Regional Water Quality Control Boards, and to coordinate with other monitoring programs. Provision C.8 contains a

framework, referred to as a regional monitoring collaborative, within which Permittees can elect to work cooperatively with SWAMP to maximize the value and utility of both the Permittees' and SWAMP's monitoring resources.

C.8-8 In 1998 BASMAA published *Support Document for Development of the Regional Stormwater Monitoring Strategy*,[108] a document describing a possible strategy for coordinating the monitoring activities of BASMAA member agencies. The document states:

> BASMAA's member agencies are connected not only by geography but also by an overlapping set of environmental issues and processes and a common regulatory structure. It is only natural that the evolution of their individual stormwater management programs has led toward increasing amounts of information sharing, cooperation, and coordination.
>
> This same concept is found in the optional provision for Permittees to form a regional monitoring collaborative. Such a group is meant to provide efficiencies and economies of scale by performing certain tasks (e.g., planning, contracting, data quality assurance, data management and analysis, and reporting) at the regional level. Further benefits are expected from closer cooperation between this group, the Regional Monitoring Program, and SWAMP.

C.8-9 This Permit includes monitoring requirements to verify compliance with adopted TMDL WLAs and to provide data needed for TMDL development and/or implementation. This Permit incorporates the TMDLs' WLAs adopted by the Water Board as required under CWA section 303(d).

C.8-10 SB1070 (California Legislative year 2005/2006) found that there is no single place where the public can go to get a look at the health of local waterbodies. SB1070 also states that all information available to agencies shall be made readily available to the public via the Internet. This Permit requires water quality data to be submitted in a specified format and uploaded to a centralized Internet site so that the public has ready access to the data.

Specific Provision C.8 Requirements

Each of the components of the monitoring provision is necessary to meet the objectives and answer the questions listed in the findings above. Justifications for each monitoring component are discussed below.

Provision C.8.a. Compliance Options. Provision C.8.a. provides Permittees options for obtaining monitoring data through various organizational structures, including use of data obtained by other parties. This is intended to

[108] EcoAnalysis, Inc. & Michael Drennan Assoc., Inc., *Support Document for Development of the Regional Stormwater Monitoring Strategy*, prepared for Bay Area Stormwater Management Agencies Association, March 2, 1998.

- Promote cost savings through economies of scale and elimination of redundant monitoring by various entities;
- Promote consistency in monitoring methods and data quality;
- Simplify reporting; and
- Make data and reports readily publicly available.

In the past, each Stormwater Countywide Program has conducted water quality monitoring on behalf of its member Permittees, and some data were collected by wider collaboratives, such as the Regional Monitoring Program. In this Permit, all the Stormwater Countywide Programs are encouraged to work collaboratively to conduct all or most of the required monitoring and reporting on a region-wide basis. For each monitoring component that is conducted collaboratively, one report would be prepared on behalf of all contributing Permittees; separate reports would not be required from each Program. Cost savings could result also from reduced contract and oversight hours, fewer quality assurance/quality control samples, shared sampling labor costs, and laboratory efficiencies.

Provision C.8.b. San Francisco Estuary Receiving Water Monitoring. The San Francisco Estuary is the ultimate receiving water for most of the urban runoff in this region. For this reason and because of the high value of its beneficial uses, Provision C.8.b requires focused monitoring on the Estuary to continue. Since the mid-1990s, Permittees have caused this monitoring to be conducted by contributing financially and with technical expertise, to the San Francisco Estuary Regional Monitoring Program for Trace Substances. Provision C.8.b requires such monitoring to continue.

Provisions C.8.c. & C.8.e.ii. Status Monitoring and Long-Term Monitoring. Status Monitoring and Long-Term Monitoring serve as surrogates to monitoring the discharge from all major outfalls, of which the Permittees have many. By sampling the sediment and water column in urban creeks, the Permittees can determine where water quality problems are occurring in the creeks, then work to identify which outfalls and land uses are causing or contributing to the problem. In short, Status and Long-Term Monitoring are needed to identify water quality problems and assess the health of streams; they are the first step in identifying sources of pollutants and an important component in evaluating the effectiveness of an urban runoff management program.

Provisions C.8.c.i. and C.8.e.iii. Parameters and Methods
Status & Long-Term parameters and methods reflect current accepted practices, based on the knowledge and experience of personnel responsible for water quality monitoring, including state and Regional SWAMP managers, Permittee representatives, and citizen monitors. Many Status and Long-Term Monitoring parameters are consistent with parameters the Permittees have been monitoring to date. The following parameters are new for some of the Permittees:

- Biological Assessment—to provide site-specific information about the health and diversity of freshwater benthic communities within a specific reach of a creek, using standard procedures developed and/or used by the State Water

Resources Control Board Surface Water Ambient Monitoring Program.[109] It consists of collecting samples of benthic communities and conducting a taxonomic identification to measure community abundance and diversity, which is then compared to a reference creek to assess benthic community health. This monitoring can also provide information on cumulative pollutant exposure/impacts because pollutant impacts to the benthic community accumulate and occur over time.

- Chlorine—to detect a release of potable water or other chlorinated water sources, which are toxic to aquatic life.
- Nutrients—recent monitoring data indicate nutrients, which can increase algal growth and decrease dissolved oxygen concentrations, are present in significant concentrations in Bay area creeks.
- Toxicity and Pollutants in Bedded Sediment—to determine the presence of, and identify, chemicals and compounds that bind to sediment in a creek bed and are toxic to aquatic life.
- Pathogen Indicators—to detect pathogens in waterbodies that could be sources of impairment to recreational uses at or downstream of the sampling location.
- Stream Survey (stream walk and mapping)—to assess the overall physical health of the stream and to gain information potentially useful in interpreting monitoring results.

In consideration of economic impacts to Permittees, the minimum number of Status & Long-Term samples ("Minimum # Sample Sites" columns in Tables 8.1 and 8.3) reflects the Programs' populations, not waterbody size. Permittees must select exact sample locations that will yield adequate information on the status of their waterbodies; in some cases, additional sampling above the minimum might be necessary.

Provisions C.8.c.ii. and C.8.e.iii. Frequency

Status Monitoring continues to be an annual requirement for the Permittees, except for two much smaller Permittees, Fairfield-Suisun and Vallejo. In considering costs, the frequency of Status Monitoring is established at twice per Permit term for Fairfield-Suisun, and once per Permit term for Vallejo. It is common for Permit terms to be extended through a lengthy Permit reissuance process. Thus, these frequencies are considered the minimum; costs are minimized while data necessary for successful stormwater management are obtained.

Long-Term Monitoring is required every second year (biennially), rather than annually, in order to balance data needs and Permittee costs. To further reduce costs, the Fairfield-Suisun and Vallejo Permittees have no Long-Term Monitoring requirements.

Provisions C.8.c.iii. and C.8.e.ii. Locations

Status Monitoring is to be conducted on a rotating-watershed basis, in similar fashion to the Statewide SWAMP. Provision C.8.c.iii. identifies the major waterbodies, and Permittees are to select which of these waterbodies will be sampled during the Permit

[109] Ode, P.R. 2007. Standard Operating Procedures for Collecting Macroinvertebrate Samples and Associated Physical and Chemical Data for Ambient Bioassessments in California, California State Water Resources Control Board Surface Water Ambient Monitoring Program (SWAMP), as subsequently revised.

term. The exact sample locations within each waterbody are critical in terms of determining the monitoring program's effectiveness. If correctly sited, the stations are expected to be very useful in answering the monitoring program's management questions and meeting its goals. For this reason, Provision C.8.c.iii. requires sample locations to be based on surrounding land use, likelihood of urban runoff impacts, existing data gaps, and similar considerations. This will help maximize the utility of the sample locations, while also providing the Permittees with adequate flexibility to ultimately choose practical Status Monitoring locations.

Long-Term Monitoring is to be conducted at fixed stations, which are intended to be lower reaches of urban creeks. This monitoring is intended to help assess progress toward reducing receiving water concentrations of impairing pollutants, among other purposes. Provision C.8.e.ii. establishes the waterbodies on which to locate fixed stations, and suggests that fixed stations be co-located with SWAMP fixed stations so that Permittees can use SWAMP data to fulfill some of their monitoring requirements. However, Permittees may select alternate locations based on their knowledge of such factors as site access and stream characteristics and provided that similar data types, data quality, and data quantity are collected.

Provision C.8.d. Monitoring Projects. Monitoring Projects are necessary to meet several water quality monitoring objectives under this Permit, including characterize stormwater discharges; identify sources of pollutants; identify new or emerging pollutants; assess stream channel function and condition; and measure and improve the effectiveness of Stormwater Countywide Programs and implemented BMPs. In consideration of economic impacts to Permittees, the number of Monitoring Projects required reflects the Permittees' populations.

Provision C.8.d.i. Stressor/Source Identification
Minimizing sources of pollutants that could impair water quality is a central purpose of urban runoff management programs. Monitoring which enables the Permittees to identify sources of water quality problems aids the Permittees in focusing their management efforts and improving their programs. In turn, the Permittees' programs can abate identified sources, which will improve the quality of urban runoff discharges and receiving waters. This monitoring is needed to address the management question, "What are the sources to urban runoff that contribute to receiving water problems?"

When Status or Long-Term Monitoring results indicate an exceedance of a water quality objective, toxicity threshold, or other "trigger", Permittees must identify the source of the problem and take steps to reduce any pollutants discharged from or through their municipal storm sewer systems. This requirement conforms to the process, outlined in Provision C.1., of complying with the Discharge Prohibition and Receiving Water Limitations. If multiple "triggers" are identified through monitoring, Permittees must focus on the highest priority problems; a cap on the total number of source identification projects conducted within the Permit term is provided to cap Permittees' potential costs.

Provision C.8.d.ii. BMP Effectiveness Investigation
U.S. EPA's stated approach to NPDES stormwater permitting uses BMPs in first-round permits, and expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards.[110] The purpose of this monitoring project is to investigate the effectiveness of one currently in-use BMP to determine how it might be improved. Permittees may choose the particular stormwater treatment or hydromodification control BMP to investigate. As with other monitoring requirements, Permittees may work collaboratively to conduct one investigation on a region-wide basis, or each stormwater countywide program may conduct an investigation.

Provision C.8.d.iii. Geomorphic Project
The physical integrity of a stream's bed, bank and riparian area is integral to the stream's capacity to withstand the impacts of discharged pollutants, including chemical pollutants, sediment, excess discharge volumes, increased discharge velocities, and increased temperatures. At present, various efforts are underway to improve geomorphic conditions in creeks, primarily through local watershed partnerships. In addition, local groups are undertaking *green stormwater projects* with the goal of minimizing the physical and chemical impacts of stormwater runoff on the receiving stream. Such efforts ultimately seek to improve the integrity of the waterbodies that receive urban stormwater runoff.

The purpose of the Geomorphic Project is to contribute to these ongoing efforts in each Stormwater Countywide Program area. Permittees may select the geomorphic project from three categories specified in the Permit.

C.8.e. Pollutants of Concern[111] Monitoring. Federal CWA section 303(d) TMDL requirements, as implemented under the CWC, require a monitoring plan designed to measure the effectiveness of the TMDL point and nonpoint source control measures and the progress the waterbody is making toward attaining water quality objectives. Such a plan necessarily includes collection of water quality data. Provision C.8.e. establishes a monitoring program to measure of the effectiveness of TMDL control measures in progressing toward WLAs. Locations, parameters, methods, protocols, and sampling frequencies for this monitoring are specified. A sediment delivery estimate/budget is also required to improve the Permittees' estimates of their loading estimates. In addition, a workplan is required for estimating loads and analyzing sources of emerging pollutants, which are likely to be present in urban runoff, in the next Permit term.

C.8.f. Citizen Monitoring and Participation. CWA section 101(e) and 40 CFR Part 25 broadly require public participation in all programs established pursuant to the CWA, to foster public awareness of environmental issues and decision-making processes. Provision C.8.f. is intended to do the following:

[110] USEPA. 1996. *Interim Permitting Approach for Water Quality-Based Effluent Limitations in Stormwater Permits*. Sept. 1, 1996. http://www.epa.gov/npdes/pubs/swpol.pdf
[111] See section C.9, C.11, C.12, and C.13 of this Fact Sheet for more information on Pollutants of Concern.

- Support current and future creek stewardship efforts by providing a framework for citizens and Permittees to share their collective knowledge of creek conditions; and
- Encourage Permittees to use and report data collected by creek groups and other third-parties when the data are of acceptable quality.

C.8.g. Reporting. CWC section 13267 provides authority for the Water Board to require technical water quality reports. Provision C.8.g. requires Permittees to submit electronic and comprehensive reports on their water quality monitoring activities to (1) determine compliance with monitoring requirements; (2) provide information useful in evaluating compliance with all Permit requirements; (3) enhance public awareness of the water quality in local streams and the Bay; and (4) standardize reporting to better facilitate analyses of the data, including for the CWA section 303(d) listing process.

C.9. – C.14. Pollutants of Concern including Total Maximum Daily Loads

Provisions C.9 through C.14 pertain to pollutants of concern, including those for which TMDLs are being developed or implemented.

Legal Authority

The following legal authority applies to provisions C.9 through C.14:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.44(d)(1) requires municipal stormwater permits to include any requirements necessary to, "[a]chieve water quality standards established under section 303 of the CWA, including State narrative criteria for water quality."

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to, "control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality."

Basin Plan Requirements: Section 4.8 of the Region's Water Quality Control Plan (Basin Plan) requires that stormwater permits include requirements to prevent or reduce discharges of pollutants that cause or contribute to violations of water quality objectives. In the first phase, the Water Board requires implementation of technically and economically feasible control measures to reduce pollutants in stormwater to the MEP. If this first phase does not result in attainment of water quality objectives, the Water Board will consider permit conditions that might require implementation of additional control measures. For example, the control measures required as a result of TMDLs may go beyond the measures required in the first phase of the program.

General Strategy for Sediment-Bound Pollutants (Mercury, PCBs, legacy pesticides, PBDEs)

The control measures for mercury are intended to implement the urban runoff requirements stemming from TMDLs for this pollutant. The control measures required for PCBs are intended to implement those that are consistent with control measures in the PCBs TMDL implementation plan that has been approved by the Water Board and is pending approval by the State Board, the Office of Administrative Law, and U.S. EPA. The urban runoff management requirements in the PCBs TMDL implementation plan call for permit-term requirements based on an assessment of controls to reduce

PCBs to the MEP, and that is the intended approach of the required provisions for all pollutants of concern. Many of the control actions addressing PCBs and mercury will result in reductions of a host of sediment-bound pollutants, including legacy pesticides, mercury, PBDEs, and PCBs. The strategy for these pollutants is to use PCBs control guide decisions concerning where to focus effort, but implementation of the control efforts would taken into account the benefits for controlling other pollutants of concern. Further, because many of the control strategies addressing these pollutants of concern are relatively untested, the Water Board will implement control measures in the following modes:

1. Full-scale implementation throughout the region.
2. Focused implementation in areas where benefits are most likely to accrue.
3. Pilot-testing in a few specific locations.
4. Other: This may refer to experimental control measures, Research and Development, desktop analysis, laboratory studies, and/or literature review.

The logic of such categorization is that, as actions are tested and confidence is gained regarding level of experience and confidence in the control measure's effectiveness, the control measure may be implemented with a greater scope. For example, an untested control measure for which the effectiveness is uncertain may be implemented as a pilot project in a few locations during this permit term. If benefits result, and the action is deemed effective, it will be implemented in subsequent permit terms in a focused fashion in more locations or perhaps fully implemented throughout the Region, depending upon the nature of the measure. On the other hand there may be some control measures in which there is sufficient confidence, on the basis of prior experience, that the control action should be implemented in all applicable locations and/or situations. By conducting actions in this way and gathering information about effectiveness and cost, we will advance our understanding and be able to perform an updated assessment of the suite of actions that will constitute MEP for the following permit term. In fact, in additional to implementing control measures, gathering the necessary information about control measure effectiveness is a vital part of what needs to be accomplished by Permittees during this permit term. In the next permit term, control measures will be implemented on the basis of what we learn in this term, and we will, thus, achieve iterative refinement and improvement through time.

Background on Specific Provisions: Provisions C.9 through C.14 contain both technology-based requirements to control pollutants to the MEP and water quality based requirements to prevent or reduce discharges of pollutants that may cause or contribute to violations of water quality standards. Provisions C.9 and C.11 of the Permit incorporate requirements for the two TMDLs that have been fully approved and are effective for the Permittees. These TMDLs are for pesticide-related toxicity in urban creeks and mercury in San Francisco Bay. Additionally, Provision C.12 contains measures that address PCBs. The Regional Water Board has adopted a PCB TMDL, but it is still pending approval by State Board, the Office of Administrative Law, and U.S. EPA. This PCBs TMDL includes requirements that would be consistent with this

provision. Finally, Provision C.13 contains measures to implement the copper site-specific objective in San Francisco Bay.

Where a TMDL has been approved, NPDES permits must contain effluent limitations and conditions consistent with the requirements and assumptions in the TMDL.[112] Effluent limitations are generally expressed in numerical form. However, USEPA recommends that for NPDES-regulated municipal and small construction stormwater discharges, effluent limitations should be expressed as BMPs or other similar requirements rather than as numeric effluent limitations.[113] Consistent with USEPA's recommendation, this section implements WQBELs expressed as an iterative BMP approach capable of meeting the WLAs in accordance with the associated compliance schedule. The Permit's WQBELs include the numeric WLA as a performance standard and not as an effluent limitation. The WLA can be used to assess if additional BMPs are needed to achieve the TMDL Numeric Target in the waterbody.

[113] USEPA, 2002. Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs. P. 4.

C.9. Pesticides Toxicity Control

Fact Sheet Findings in Support of Provision C.9.

C.9-1 This Permit fulfills the Basin Plan amendments the Water Board adopted that establish a Water Quality Containment Strategy and TMDL for diazinon and pesticide-related toxicity for Bay Area urban creeks on November 16, 2005, and approved by the State Water Board on November 15, 2006. The Water Quality Containment Strategy requires urban runoff management agencies to minimize their own pesticide use, conduct outreach to others, and lead monitoring efforts. Control measures implemented by urban runoff management agencies and other entities (except construction and industrial sites) shall reduce pesticides in urban runoff to the MEP.

C.9-2 **(Allocations):** The TMDL is allocated to all urban runoff, including urban runoff associated with MS4s, Caltrans facilities, and industrial, construction, and institutional sites. The allocations are expressed in terms of toxic units and diazinon concentrations.

Specific Provision C.9 Requirements

C.9 provisions fully implement the TMDL for Urban Creeks Pesticide Toxicity. All C.9 provisions are stated explicitly in the implementation plan for this TMDL. Permittees are encouraged to coordinate activities with the Urban Pesticide Pollution Prevention Project, the Urban Pesticide Committee, and other agencies and organizations. The Urban Pesticide Pollution Prevention (UP3) Project has been funded by a grant from the State Water Board and its goal is to prevent water pollution from urban pesticide use. The Urban Pesticides Committee serves as an information clearinghouse and as a forum for coordinating pesticide TMDL implementation.

The UP3 Project provides resources and information on integrated pest management (IPM) and tools to municipalities to support their efforts to reduce municipal pesticide use and to conduct outreach to their communities on less-toxic methods of pest control. In addition, it provides technical assistance to municipalities to encourage the U.S. Environmental Protection Agency and the California Department of Pesticide Regulation to prevent water quality problems from pesticides. It also maintains and manages the Urban Pesticides Committee, a statewide network of agencies, nonprofits, industry, and other stakeholders that are working to solve water quality problems from pesticides.

Specific tools provided by the UP3 Project that relate to permit requirements include:

- Guidance and resources to help agencies create contracts and bid documents for structural pest management services that help them meet their integrated pest management goals
- IPM policies and ordinances
- IPM training workshops and materials

- Outreach program design resources
- Resources for evaluating effectiveness

Provisions C.9.a through C.9.d are designed to insure that integrated pest management (IPM) is adopted and implemented as policy by all municipalities. IPM is a pest control strategy that uses an array of complementary methods: natural predators and parasites, pest-resistant varieties, cultural practices, biological controls, various physical techniques, and pesticides as a last resort. If implemented properly, it is an approach that can significantly reduce or eliminate the use of pesticides. The implementation of IPM will be assured through training of municipal employees and the requirement that municipalities only hire IPM-certified contractors.

Provision C.9.e requires that municipalities (through cooperation or participation with BASMAA) track and participate in pesticide regulatory processes like the USEPA pesticide evaluation and registration activities related to surface water quality, and the California Department of Pesticide Regulation (DPR) pesticide evaluation activities. The goal of these efforts is to encourage both the state and federal pesticide regulatory agencies to accommodate water quality concerns within the pesticide regulation or registration process. Through these efforts, it could be possible to prevent pesticide-related water quality problems from happening by affecting which products are brought to market.

Provision C.9.g is critical to the success of municipal efforts to control pesticide-related toxicity. Future permits must be based on an updated assessment of what is working and what is not. With every provision comes the responsibility to assess its effectiveness and report on these findings through the permit. The particulars of assessment will depend on the nature of the control measure.

Provision C.9.h directs the municipalities to conduct outreach to consumers at point of purchase and provide targeted information on proper pesticide use and disposal, potential adverse impacts on water quality, and less toxic methods of pest prevention and control. One way in which this can be accomplished is for the Permittees to participate in and provide resources for the "Our Water, Our World" program (www.ourwaterourworld.org) or a functionally equivalent pesticide use reduction outreach program. The "Our Water, Our World" program has developed a Web site with many resources, "to assist consumers in managing home and garden pests in a way that helps protect" the environment.

C.10. Trash Load Reduction

Legal Authority

The following legal authority applies to section C.10:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, D, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B) requires, "shall be based on a description of a program, including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(2) requires, "a description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(3) requires, "a description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water."

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(4) requires, "a description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer."

San Francisco Bay Basin Plan, Chapter 4 – Implementation, Table 4-1 Prohibitions, Prohibition 7, which is consistent with the State Water Board's Enclosed Bays and Estuaries Policy, Resolution 95-84, prohibits the discharge of rubbish, refuse, bark, sawdust, or other solid wastes into surface waters or at any place where they would contact or where they would be eventually transported to surface waters, including flood plain areas. This prohibition was adopted by the Water Board in the 1975 Basin Plan, primarily to protect recreational uses such as boating.

Fact Sheet Findings in Support of Provision C.10

C.10-1 Trash and litter are a pervasive problem near and in creeks and in San Francisco Bay. Controlling trash is one of the priorities for this Permit reissuance not only because of the trash discharge prohibition, but also because trash and litter cause particularly major impacts on our enjoyment of creeks and the Bay. There are also significant impacts on aquatic life and habitat in those waters and eventually to the global ocean ecosystem, where plastic often floats, persists in the environment for hundreds of years, if not

forever, concentrates organic toxins, and is ingested by aquatic life. There are also physical impacts, as aquatic species can become entangled and ensnared and can ingest plastic that looks like prey, losing the ability to feed properly.

For the purposes of this provision, trash is defined to consist of litter and particles of litter. Man made litter is defined in California Government Code section 68055.1 (g): *Litter* means all improperly discarded waste material, including, but not limited to, convenience food, beverage, and other product packages or containers constructed of steel, aluminum, glass, paper, plastic, and other natural and synthetic materials, thrown or deposited on the lands and waters of the state, but not including the properly discarded waste of the primary processing of agriculture, mining, logging, sawmilling, or manufacturing.

C.10-2 Data collected by Water Board staff using the SWAMP Rapid Trash Assessment (RTA) Protocol,[114] over the 2003–2005 period,[115] suggest that the current approach to managing trash in waterbodies is not reducing the adverse impact on beneficial uses. The levels of trash in the waters of the San Francisco Bay Region are alarmingly high, considering the Basin Plan prohibits discharge of trash and that littering is illegal with potentially large fines. Even during dry weather conditions, a significant quantity of trash, particularly plastic, is making its way into waters and being transported downstream to San Francisco Bay and the Pacific Ocean. On the basis of 85 surveys conducted at 26 sites throughout the Bay Area, staff have found an average of 2.93 pieces of trash for every foot of stream, and all the trash was removed when it was surveyed, indicating high return rates of trash over the 2003–2005 study period. There did not appear to be one county within the Region with higher trash in waters—the highest wet weather deposition rates were found in western Contra Costa County, and the highest dry weather deposition was found in Sonoma County. Results of the trash in waterbodies assessment work by staff show that rather than adjacent neighborhoods polluting the sites at the bottom of the watershed, these areas, which tend to have lower property values, are subject to trash washing off with urban stormwater runoff cumulatively from the entire watershed.

C.10-3 A number of key conclusions can be made on the basis of the trash measurement in streams:

- Lower watershed sites have higher densities of trash.
- All watersheds studied in the San Francisco Bay Region have high levels of trash.
- There are trash source hotspots, usually associated with parks, schools, or poorly kept commercial facilities, near creek channels, that appear to contribute a significant portion of the trash deposition at lower watershed sites.

[114] SWAMP Rapid Trash Assessment Protocol, Version 8
[115] SWAMP S.F. Bay Region Trash Report, January 23, 2007

- Dry season deposition of trash, associated with wind and dry season runoff, contributes measurable levels of trash to downstream locations.
- The majority of trash is plastic at lower watershed sites where trash accumulates in the wet season. This suggests that urban runoff is a major source of floatable plastic found in the ocean and on beaches as marine debris.
- Parks that have more evident management of trash by city staff and local volunteers, including cleanup within the creek channel, have measurably less trash pieces and higher RTA scores.

C.10-4 The ubiquitous, unacceptable levels of trash in waters of the San Francisco Bay Region warrant a comprehensive and progressive program of education, warning, and enforcement, and certain areas warrant consideration of structural controls and treatment.

C.10-5 Trash in urban waterways of coastal areas can become *marine debris*, known to harm fish and wildlife and cause adverse economic impacts.[116] Trash is a regulated water pollutant that has many characteristics of concern to water quality. It accumulates in streams, rivers, bays, and ocean beaches throughout the San Francisco Bay Region, particularly in urban areas.

C.10-6 Trash adversely affects numerous beneficial uses of waters, particularly recreation and aquatic habitat. Not all litter and debris delivered to streams are of equal concern with regards to water quality. Besides the obvious negative aesthetic effects, most of the harm of trash in surface waters is imparted to wildlife in the form of entanglement or ingestion.[117,118] Some elements of trash exhibit significant threats to human health, such as discarded medical waste, human or pet waste, and broken glass.[119] Also, some household and industrial wastes can contain toxic batteries, pesticide containers, and fluorescent light bulbs that contain mercury. Large trash items such as discarded appliances can present physical barriers to natural stream flow, causing physical impacts such as bank erosion. From a management perspective, the persistent accumulation of trash in a waterbody is of particular concern, and signifies a priority for prevention of trash discharges. Also of concern are trash *hotspots* where illegal dumping, littering, and/or accumulation of trash occur.

C.10-7 The narrative water quality objectives applicable to trash are Floating Material (Waters shall not contain floating material, including solids, liquids, foams, and scum, in concentrations that cause nuisance or adversely

[116] Moore, S.L., and M.J. Allen. 2000. Distribution of anthropogenic and natural debris on the mainland shelf of the Southern California Bight. *Mar. Poll. Bull*. 40:83-88.

[118] McCauley, S.J. and K.A. Bjorndahl. 1998. Conservation implications of dietary dilution from debris ingestion: sublethal effects in post-hatchling loggerhead sea turtles. *Conserv. Biol.* 13(4):925-929.

[119] Sheavly, S.B. 2004. *Marine Debris: an Overview of a Critical Issue for our Oceans.* 2004 International Coastal Cleanup Conference, San Juan, Puerto Rico. The Ocean Conservancy.

affect beneficial uses), Settleable Material (Waters shall not contain substances in concentrations that result in the deposition of material that cause nuisance or adversely affect beneficial uses), and Suspended Material (Waters shall not contain suspended material in concentrations that cause nuisance or adversely affect beneficial uses).

C.10-8 The Water Board, at its February 11, 2009 hearing, adopted a resolution proposing that 26 waterbodies in the region be added to the 303(d) list for the pollutant trash. The adopted Resolution and supporting documents are contained in Attachment 10.1 – 303(d) Trash Resolution and Staff Report Feb 2009.

Specific Provision C.10 Requirements

Provision C.10. Permittees shall demonstrate compliance with Discharge Prohibition A.2 and trash-related Receiving Water Limitations through the timely implementation of control measures and other actions to reduce trash loads from municipal separate storm sewer systems (MS4s) by 40% by 2014, 70% by 2017, and 100% by 2022 as further specified below.

C.10.a.i. Short-Term Trash Load Reduction Plan
The Short-Term Trash Load Reduction Plan is intended to describe actions to incrementally reduce trash loads toward the 2014 requirement of a 40% reduction and eventual abatement of trash loads to receiving waters.

C.10.a.ii. Baseline Trash Load and **Trash Load Reduction Tracking Method**
In order to achieve the incremental trash load reductions in an accountable manner, the Permittees will propose Baseline Trash Loads and a Trash Load Reduction Tracking Method. The Tracking will account for additional trash load reducing actions and BMPs the Permittees implement. Permittees are also able to propose, with documentation, areas for exclusion from the Tracking Method accounting, by demonstrating that these areas already meet the Discharge Prohibition A.2 and have no trash loads.

C.10.a.iii. Minimum Full Trash Capture
Installation of full trash capture systems to prevent trash loads through the MS4 is MEP as demonstrated by the significant implementation of these systems occurring in the Los Angeles region. The minimum full trash capture installation requirements in this permit represent a moderate initial step toward employing this tool for trash load reduction.

C.10.b.i, ii. Trash Hot Spot Selection and Clean Up
Trash Hot Spots must be cleaned up as an interim measure until complete abatement of trash loads occurs. Eventually, with adequate source controls and trash loading abatement, trash hot spots will not occur in the receiving waters. In addition, Permittees will be credited for trash volume removed from hot spots in the trash load reduction tracking.

C.10.b.iii. Hot Spot Assessments
Trash Hot Spot assessments have been simplified and streamlined. Rather than counting individual trash items, which can vary in size from small plastic of glass particles to shopping carts, volume of material removed is measured, along with dominant types of trash removed. Photographs are recorded both before and after cleanup, to add to the record and verify cleanup.

C.10.c. Long Term Trash Load Reduction
Each Permittee will submit a Plan to achieve the incremental progress of 70% trash load reduction by 2017 during the following permit term, and the 100% reduction of trash loading by 2022.

C.10.d. Reporting
This sub-provision sets forth the reporting required in this provision, including the specific submittals and reports, and the annual reporting requirements.

Costs of Trash Control

Costs for either enhanced trash management measure implementation or installation and maintenance of trash capture devices are significant, but when spread over several years, and when viewed on a per-capita basis, are reasonable. Also, Trash capture devices have been installed by cities in California and in the Bay Region.

Trash and litter are costly to remove from our aquatic resource environments. Staff from the California Coastal Commission report that the Coastal Cleanup Day budget statewide: $200,000-250,000 for staff Coastal Commission staff, and much more from participating local agencies. The main component of this event is the 18,000 volunteer-hours which translates to $3,247,200 in labor, and so is equivalent to $3,250,000-3,500,000 per year to clean up 903,566 pounds of trash and recyclables at $3.60 to $3.90 per pound. This is one of the most cost-effective events because of volunteer labor and donations. The County of Los Angeles spends $20 million per year to sweep beaches for trash, according to Coastal Commission staff.

In Oakland, the Lake Merritt Institute is currently budgeted at $160,000 per year, with trash and litter removal from the Lake as a major task. The budget has increased from about $45,000 in 1996 to current levels. In the period of 1996-2005 the Lake Merritt Institute staff, utilizing significant volunteer resources, and accomplishing other education tasks, removed 410,859 pounds of trash from the Lake at cost of $951,725 at $2.3 per pound.

The City of Oakland reports that installation of two vortex and screen separators, titled by their brand name of CDS units, which cost, according to the table below, $821,000 for installations that treat tributary catchments of 192 acres before discharge to Lake Merritt at $4,276 per acre.

City of Oakland—CDS Unit Overview 9-07

Existing CDS unit location	Outfall number	Treatment area (acres)	Cost of implementation	Sizing	Maintenance requirements	Comments
Intersection of 27th and Valdez Streets	56*	71	$203,000 to contactor; plus ~$100,000 City costs	73 cfs peak flow; 36" stormdrain; Unit sizing: 18'6'6' box with 10'11"diam x 9'6" long cylinder	Visually inspect CDS Unit; remove trash and debris with Hydro Flusher bi-monthly	Installed in 2006. Required relocation of electrical conduit. Water main and gas line were also in the way; the box was adjusted to accommodate these conflicts.
Intersection of 22nd and Valley Streets	56*	121	$368,000 to contactor; plus ~$150,000 City costs	115 cfs peak flow; 54" stormdrain; Unit sizing: 18'8.5'6' box with 12'diam x 9'6" long cylinder	Visually inspect CDS Unit; remove trash and debris with Hydro Flusher bi-monthly	Installed in 2006. Installation costs were higher than anticipated. Sewer lines and PGE facilities were exposed that were not known before. Unit had to be modified and poured-in-place.

* The city is treating 192 acres or 72 percent of the 252 acres draining to outfall 56.

Mr. Morad Sedrak, the TMDL Implementation Program Manager, Bureau of Sanitation, Department of Public Works, City of Los Angeles, reports that the City plans to invest $72 million dollars for storm drain catch basin based capture device installation primarily, for a City of 4 million population, for a per-capita cost of $18 dollars. This effort is occurring over a span of over five years, for an annual per-capita cost of under $4.

Mr. Sedrak reports that O&M costs are not anticipated to increase, as the City of L.A. is already budgeted for 3 catch basin cleanings per year. He also states that catch basin inserts installed inside the catch basin in front of the lateral pipe, which have been certified by the Los Angeles Regional Water Board as total capture trash control devices, cost approximately $800 to $3,000 depending on the depth of the catch basin. The price quoted includes installation and the insert is made of Stainless Steel 316.

Furthermore, the price for catch basin opening screen covers, which are designed to retain trash at the street level for removal by sweepers, and also to open if there is a potential flooding blockage, ranges roughly from $800 to $4,500, depending on the opening size of the catch basin.

The City of Los Angeles has currently spent 27 million dollars on a retrofit program to install catch basin devices in approximately 30% of its area, with either inserts or screens

or both. Mr. Sedrak states that Los Angeles plans to spend $45 million over the next 3 years to retrofit the remaining catch basins within the City. The total number of catch basins within the City is approximately 52,000.

Here are some links to information about the Los Angeles trash control approach:

http://www.lastormwater.org/Siteorg/program/poll_abate/cbscreens.htm

Additional cost information on various trash capture devices are included in the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVURPPP) BMP Trash Toolbox (July 2007). The Toolbox contains cost information for both trash capture devices and enhanced trash management measure implementation, covers a broad range of options and also discusses operation and maintenance costs. Catch basin screens are included with an earlier estimate by the City of Los Angeles of $44 million over 10 years to install devices in 34,000 inlets.

Litter booms are also discussed with an example from the City of Oakland. The Damon Slough litter boom or sea curtain cost $36,000 for purchase and installation, including slough side access improvements for maintenance and trash removal. Annual maintenance costs have been $77,000 for weekly maintenance, which includes use of a crane for floating trash removal.

The costs of the full trash capture device installation required in the Order is significantly less than the previous tentative orders requirements for trash capture, as set forth in the table below.

Trash Capture Cost Estimates – Final TO versus previous TOs

Trash Capture Device Requirement	Acres of Capture	Cost for Trash Capture Installation	Percent of Retail/Wholesale Commercial (ABAG 2005)	Per capita $, Population = 4,533,634
Final TO: Implemented in Year 4 – 30% of Retail/Wholesale Commercial	5527	**$ 27,635,000**	30%	$6.06
Previous TOs: Implement in Year 4, 5% of Urban/suburban land	0.05 X 529,712 = 26,485 (BASMAA) or ABAG 0.05 X 655,015 = 32,750	$132,425,000 or $163,750,000	5% of Urban/suburban land	$29 or $36

30**%** X 18,426 acres = 5527 acres X $5000/acre = **$27,635,000** for four counties for installation; maintenance will add an additional cost. The Permittees may work cooperatively to achieve this capture installation requirement, and there is the potential for Regional revenue development. The previous requirement was 5% of (.05 X 655,015) (529,712 by BASMAA's count) acres of urban land (from ABAG 2005 table) = 32,750 acres, ((26,486 according to BASMAA) X $5000 = $132,000,000).

C.11. Mercury Controls

Fact Sheet Findings in Support of Provision C.11

C.11-1 On August 9, 2006, the Water Board adopted a Basin Plan amendment including a revised TMDL for mercury in San Francisco Bay, two new water quality objectives, and an implementation plan to achieve the TMDL. The State Water Board has approved this Basin Plan amendment, and USEPA approval is pending. C.11-2 through C.11-6 are components of the Mercury TMDL implementation plan relevant to implementation through the municipal stormwater permit.

C.11-2 The 2003 load of mercury from urban runoff is 160 kg/yr, and the aggregate WLAs for urban runoff is 80 kg/yr and shall be implemented through the NPDES stormwater permits issued to urban runoff management agencies and Caltrans. The urban stormwater runoff allocations implicitly include all current and future permitted discharges, not otherwise addressed by another allocation, and unpermitted discharges within the geographic boundaries of urban runoff management agencies (collectively, *source category*) including, but not limited to, Caltrans roadway and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites.

C.11-3 The allocations for this source category shall be achieved within 20 years, and, as a way to measure progress, an interim loading milestone of 120 kg/yr, halfway between the current load and the allocation, should be achieved within 10 years. If the interim loading milestone is not achieved, NPDES-permitted entities shall demonstrate reasonable and measurable progress toward achieving the 10-year loading milestone.

C.11-4 The NPDES permits for urban runoff management agencies shall require the implementation of BMPs and control measures designed to achieve the allocations or accomplish the load reductions derived from the allocations. In addition to controlling mercury loads, BMPs or control measures shall include actions to reduce mercury-related risks to humans and wildlife. Requirements in the permit issued or reissued and applicable for the term of the permit shall be based on an updated assessment of control measures intended to reduce pollutants in stormwater runoff to the MEP and remain consistent with the section of this chapter titled, *Surface Water Protection and Management—Point Source Control—Stormwater Discharges*.

C.11-5 The following additional requirements are or shall be incorporated into NPDES permits issued or reissued by the Water Board for urban runoff management agencies.

a. Evaluate and report on the spatial extent, magnitude, and cause of contamination for locations where elevated mercury concentrations exist;

b. Develop and implement a mercury source control program;

c. Develop and implement a monitoring system to quantify either mercury loads or loads reduced through treatment, source control, and other management efforts;

d. Monitor levels of methylmercury in discharges;

e. Conduct or cause to be conducted studies aimed at better understanding mercury fate, transport, and biological uptake in San Francisco Bay and tidal areas;

f. Develop an equitable allocation-sharing scheme in consultation with Caltrans (see below) to address Caltrans roadway and non-roadway facilities in the program area, and report the details to the Water Board;

g. Prepare an Annual Report that documents compliance with the above requirements and documents either mercury loads discharged, or loads reduced through ongoing pollution prevention and control activities; and

h. Demonstrate progress toward (a) the interim loading milestone, or (b) attainment of the allocations shown in Individual WLAs (see Table 4-w of the Basin Plan amendment), by using one of the following methods:

(1) Quantify the annual average mercury load reduced by implementing

i. Pollution prevention activities, and
ii. Source and treatment controls. The benefit of efforts to reduce mercury-related risk to wildlife and humans should also be quantified. The Water Board will recognize such efforts as progress toward achieving the interim milestone and the mercury-related water quality standards upon which the allocations and corresponding load reductions are based. Loads reduced as a result of actions implemented after 2001 (or earlier if actions taken are not reflected in the 2001 load estimate) may be used to estimate load reductions.

(2) Quantify the mercury load as a rolling 5-year annual average using data on flow and water column mercury concentrations.

(3) Quantitatively demonstrate that the mercury concentration of suspended sediment that best represents sediment discharged with urban runoff is below the suspended sediment target.

C.11-6 Urban runoff management agencies have a responsibility to oversee various discharges within the agencies' geographic boundaries. However, if it is determined that a source is substantially contributing to mercury loads to the Bay or is outside the jurisdiction or authority of an agency, the Water Board will consider a request from an urban runoff management agency that may include an allocation, load reduction, and/or other regulatory requirements for the source in question.

Specific Provision C.11 Requirements

The C.11 provisions implement the mercury TMDL and follow the general approach for sediment-bound pollutants discussed above where we seek to build our understanding and level of certainty concerning control actions by implementing actions in a phased approach. We then expand implementation of those actions that prove effective, and perhaps scale back or discontinue those that are not effective. Accordingly, there are some provisions that will be implemented throughout the Region, some that will be tested on a limited basis first before making the decision to expand region-wide in the next permit term. Some of the measures are companion measures for efforts targeting PCBs.

Provision C.11.a. Mercury is found in a wide variety of consumer products (e.g., fluorescent bulbs) that are subject to recycling requirements. These recycling efforts are already happening throughout the Region, and Provision C.11.a requires promotion, facilitation and/or participation in these region-wide recycling efforts to increase effectiveness and public participation.

Provision C.11.b. The remand resolution of the SF Bay Mercury TMDL made it clear that methyl mercury monitoring must be required of all NPDES Permittees. Methyl mercury is the most toxic form of mercury, and there is very little information, if any, regarding the concentrations of methyl mercury found in urban runoff. The purpose of the monitoring required through this provision is to obtain seasonal information and to assess the magnitude and spatial/temporal patterns of methylmercury concentrations in urban runoff.

Provisions C.11.c through Provision C.11.f relate to identical C.12 Provisions for PCBs. For each of these, sites for pilot studies will primarily be chosen on the basis of the potential for reducing PCB loads, but consideration will be given to mercury removal in the final design and implementation of the studies. For more information, see the fact sheet discussions for
Provisions C.12.c, d, e, and f and Provision C.2.g.

Provision C.11.g implements the TMDL requirement that Permittees measure mercury loads and loads reduced from program activities. There are three options for accomplishing this requirement: quantifying mercury loads reduced through implemented control measures, quantify mercury loading into the Bay from urban runoff, or demonstrating that the concentration of mercury on suspended sediment particles is below the sediment target of 0.2 ppm. It is likely that the first option will be chosen, and this will require development of an accounting system to establish what load reductions result from program activities. This will not be difficult for those measures that involve capture and measurement of mercury-containing sediment, but it will be more challenging for efforts that do not involve direct measurement.

Provision C.11.h is equivalent to Provision C.12.h for PCBs and is motivated by the same remaining technical uncertainties.

Provision C.11.i requires actions that manage human health risk due to mercury and PCBs. These may include efforts to communicate the health risks of eating Bay fish and other efforts aimed at high risk-communities.

Provision C.11.j requires an allocation sharing scheme to be developed in cooperation with Caltrans. The urban runoff TMDL allocation implicitly includes loads from Caltrans facilities.

C.12. PCBs Controls

The C.12 provisions are consistent with the regulatory approach and implementation plan of the San Francisco Bay PCBs TMDL adopted by the Water Board. They follow the general approach for sediment-bound pollutants discussed above where we seek to build our understanding and level of certainty concerning control actions by implementing actions in a phased approach. We then expand implementation of those actions that prove effective, and perhaps scale back or discontinue those that are not effective. Accordingly, there are some provisions that will be implemented throughout the region, some that will be tested on a limited basis first before making the decision to expand region-wide in the next permit term.

Fact Sheet Findings in Support of Provision C.12

C.12-2 On February 13, 2008, the Water Board adopted a Basin Plan amendment establishing a TMDL for PCBs in San Francisco Bay and an implementation plan to achieve the TMDL. Approval by the State Water Board and USEPA is pending. The following excerpts from the TMDL implementation plan are relevant to implementation of the municipal stormwater permit.

"Stormwater runoff wasteload allocations shall be achieved within 20 years and shall be implemented through the NPDES stormwater permits issued to stormwater runoff management agencies and the California Department of Transportation (Caltrans). The urban stormwater runoff wasteload allocations implicitly include all current and future permitted discharges, not otherwise addressed by another allocation, and unpermitted discharges within the geographic boundaries of stormwater runoff management agencies including, but not limited to, Caltrans roadway and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites.

Requirements in each NPDES permit issued or reissued shall be based on an updated assessment of best management practices and control measures intended to reduce PCBs in urban stormwater runoff. Control measures implemented by stormwater runoff management agencies and other entities (except construction and industrial sites) shall reduce PCBs in stormwater runoff to the maximum extent practicable. Control measures for construction and industrial sites shall reduce discharges based on best available technology economically achievable. All permits shall remain consistent with Section 4.8 - Stormwater Discharges.

In the first five-year permit term, stormwater Permittees will be required to implement control measures on a pilot scale to determine their effectiveness and technical feasibility. In the second permit term, stormwater Permittees will be required to implement effective control measures, that will not cause significant adverse environmental impacts, in strategic locations, and to develop a plan to fully implement control measures that will result in

attainment of allocations, including an analysis of costs, efficiency of control measures and an identification of any significant environmental impacts. Subsequent permits will include requirements and a schedule to implement technically feasible, effective and cost efficient control measures to attain allocations. If, as a consequence, allocations cannot be attained, the Water Board will take action to review and revise the allocations and these implementation requirements as part of adaptive implementation.

In addition, stormwater Permittees will be required to develop and implement a monitoring system to quantify PCBs urban stormwater runoff loads and the load reductions achieved through treatment, source control and other actions; support actions to reduce the health risks of people who consume PCBs-contaminated San Francisco Bay fish; and conduct or cause to be conducted monitoring, and studies to fill critical data needs identified in the adaptive implementation section.

Stormwater runoff management agencies have a responsibility to oversee various discharges within the agencies' geographic boundaries. However, if it is determined that a source is substantially contributing to PCBs loads to the Bay or is outside the jurisdiction or authority of an agency the Water Board will consider a request from an stormwater runoff management agency which may include an allocation, load reduction, and/or other regulatory requirements for the source in question."

C.12-3 Some PCB congeners have dioxin-like properties. Dioxins are persistent, bioaccumulative, toxic compounds that are produced from the combustion of organic materials in the presence of chlorine. Dioxins enter the air through fuel and waste emissions, including diesel and other motor vehicle exhaust fumes and trash incineration, and are carried in rain and contaminate soil. Dioxins bioaccumulate in fat, and most human exposure occurs through the consumption of animal fats, including those from fish. Therefore, the actions targeting PCBs will likely have the simultaneous benefit of addressing a portion of the dioxin impairment resulting from dioxin-like PCBs.

Specific Provision C.12 Requirements

Provision C.12.a. PCBs were used in a variety of electrical devices and equipment, some of which still can be found during industrial inspections. Provision C.12.a requires the stormwater management agencies to ensure that industrial inspectors can identify PCBs or PCB-containing equipment during their inspections and make sure appropriate agencies are notified if they are found. There is enough experience and/or background knowledge about the presence of such PCB-containing equipment that this measure should be implemented region-wide during this permit term.

Provision C.12.b. PCBs are used in a variety of building materials like caulks and adhesives. PCBs contained in such materials can be liberated and transported in runoff during and after demolition and renovation activities. At this point, it is not known how extensive this type of PCB contamination is in the region. Therefore, the expectation for

this permit term is that Permittees conduct pilot studies (Provision C.12.b) that includes evaluation of the presence of PCBs in such materials, sampling and analysis, and BMP development to prevent PCBs in these materials from being released into the environment during demolition and renovation. Conducting these pilot tests and reporting results will help determine if control measures for PCBs from these sources should be implemented in a more widespread fashion in the next permit term.

Provisions C.12.c and C.12.d form the core of PCB-related efforts for this permit term, and these efforts are crucial for the iterative development of effective control measures for PCBs and other sediment-bound pollutants in future permit terms. The overarching purpose of these two provisions is to conduct five comprehensive pilot studies in locations known to contain high levels of PCBs. The pilot studies will involve a combination of efforts including abatement of the on-land PCB contamination (Provision C.12.c) as well as exploration of sediment management practices (C.12.d) that can be implemented by municipalities to control migration of the PCBs away from the source of contamination. We expect that a suite of control measures will be applied in these five pilot regions to determine the optimum suite of measures for controlling PCB contamination and preventing its transport through the storm drain system. The lessons learned through these pilot efforts will inform the direction of future efforts targeting contaminated zones throughout the Region in subsequent permit terms.

Provision C.12.e. One promising management practice for addressing a wide range of sediment-bound contaminants, including PCBs is on-site treatment. Provision C.12.e requires selection of 10 locations for pilot studies spanning treatment types as described in the Provision. This effort can be conducted in conjunction with Provision C.12.d such that on-site treatment efforts conducted as part of C.12.d can be counted toward accomplishing C.12.e requirements.

Provision C.12.f. Another promising management practice is the diversion of certain flows to the sanitary sewers to be treated by the local POTWs. Provision C.12.f requires an evaluation of locations for diversion pilot studies and implementation of pilot studies at five pump stations. This effort can be conducted in conjunction with Provision C.12.d such that POTW diversion efforts conducted as part of C.12.d can be counted toward accomplishing C.12.f requirements. Also see discussion under Provision C.2.g.

Provision C.12.g requires, consistent with the approach taken in the PCBs TMDL, development of a monitoring system to quantify PCBs loads and loads reduced through source control, treatment and other management measures. This monitoring system will be used to determine progress toward meeting TMDL load allocations. This system should establish the baseline loading or loads reduced against which to compare future loading and load reductions.

Provision C.12.h. There are still uncertainties surrounding the magnitude and nature of PCBs reaching the Bay in urban runoff and the ultimate fate of such PCBs, including biological uptake. Provision C.12.h requires that Permittees ensure that fate and transport studies of PCBs in urban runoff are completed.

Provision C.12.i. requires actions that manage human health risk due to mercury and PCBs. These may include efforts to communicate the health risks of eating Bay fish and other efforts aimed at high risk-communities.

C.13. Copper Controls

Chronic and acute site-specific objectives (SSOs) for dissolved copper have been established in all segments of San Francisco Bay. The plan to implement the SSOs and ensure the achievement and ongoing maintenance of the SSOs in the entire Bay includes two types of actions for urban runoff management agencies. These actions from the SSO implementation are implemented through this permit as provisions to control urban runoff sources of copper as well as measures to resolve remaining technical uncertainties for copper fate and effects in the Bay.

The control measures for urban runoff target significant sources of copper identified in a report produced in 2004 for the Clean Estuary Partnership.[120] This report updated information on sources of copper in urban runoff, loading estimates and associated level of uncertainty, and summarized feasible control measures and priorities for further investigation. Accordingly, the permit provisions target major sources of copper including vehicle brake pads, architectural copper, copper pesticides, and industrial copper use.

Fact Sheet Findings in Support of Provision C.13.

C.13-1 Urban runoff is a conveyance mechanism by which copper reaches San Francisco Bay.

C.13-2 Copper has the reasonable potential to cause or contribute to exceedances of copper water quality standards in San Francisco Bay.

C.13-3 Site specific water quality objectives for dissolved copper have already been adopted for South San Francisco Bay will soon be adopted for the rest of the Bay.

C.13-4 The Permit requirements to control copper to the MEP are necessary to implement and support ongoing achievement of the site-specific water quality objectives.

Specific Provision C.13. Requirements

Provision C.13.a. Copper is used as an architectural feature in roofs, gutters and downspouts. When these roofs are cleaned with aggressive cleaning solutions, substantial amounts of copper can be liberated. The provision C.13.a for architectural copper involves a variety of strategies ranging from BMPs to prohibition against discharge of these cleaning wastes to the storm drain.

[120] TDC (TDC Environmental). 2004. *Copper Sources in Urban Runoff and Shoreline Activities*. Prepared for the Clean Estuary Partnership.

Provision C.13.b. Copper is commonly used as an algaecide in pools, spas, and fountains. The provision C.13.b prohibits discharge to the storm drain of copper-containing wastewater from such amenities.

Provision C.13.c. Vehicle brake pads are a large source of copper to the urban environment. There are cooperative efforts (e.g., the Brake Pad Partnership) evaluating the potential effects of brake wear debris on water quality. This cooperative effort could result in voluntary actions to reduce the amount of copper in automobile brake pads. However, this voluntary reduction is uncertain, and some aftermarket brake pads are possibly unaffected by the voluntary action. Moreover, the benefits of copper content reduction might be slowly realized because there is a great deal of wear debris already deposited on watersheds, and this wear debris will continue to be deposited as long as copper-containing brake pads are in use. Therefore, there might need to be additional measures addressing copper-containing wear debris on the part of urban stormwater management agencies. Provision C.13.c requires ongoing participation in the cooperative efforts of the Partnership.

Provision C.13.d Some industrial facilities likely use copper or have sources of copper (e.g., plating facilities, metal finishers, auto dismantlers). This control measure requires municipalities to include these facilities in their inspection program plans.

The most recent Staff Report[121] for the SSOs north of the Dumbarton Bridge also describes several areas of remaining technical uncertainty, and **Provision C.13.e** requires studies to address these uncertainties. Two of these areas are of particular concern, and urban runoff management agencies are required to conduct or cause to be conducted studies to help resolve these two uncertainties.

The first uncertainty concerns copper's tendency, even at low concentrations, to cause a variety of sublethal (not resulting in death, but in impaired function) effects. The studies documenting such effects have, so far, been conducted in the laboratory in experiments modeling freshwater systems, and many of them have not yet been published. A number of uncertainties need to be resolved before interpretation and extension to marine or estuarine systems can be attempted.[122]

The second uncertainty is that surface sediment samples have exhibited toxicity to test organisms at a number of sites throughout the Bay. Research has shown that sediment toxicity to bivalve embryos is caused by "elevated concentrations of divalent cations….with copper as the most probable cause of toxicity." Additional studies are needed to further examine whether water and sediment toxicity tests used in the RMP are accurate predictors of impacts on the Bay's aquatic and benthic communities.

[121] SFBRWQCB (San Francisco Bay Regional Water Quality Control Board). 2007. *Copper Site-Specific Objectives in San Francisco Bay: Proposed Basin Plan Amendment and Draft Staff Report.* June.
[122] Ibid.

C.14. Polybrominated Diphenyl Ethers (PBDE), Legacy Pesticides and Selenium

This section is predicated on the fact that legacy pesticides, PBDEs, and selenium are either known to impair or potentially impair Bay and tributary beneficial uses. Further, urban stormwater is a likely or potential cause or contributor to such impairment. The requirements for this permit term are primarily information gathering consistent with Provision C.1. Namely, this provision requires that Permittees gather information on a number of pollutants of concern (e.g., PBDEs, DDT, dieldrin, chlordane, selenium) for which TMDLs are planned or are in the early stages of development.

The goals of the provisions in this section are the following: One goal is to determine the concentrations and distribution of these pollutants and if urban runoff is a conveyance mechanism associated with their possible impairment of San Francisco Bay.

A second goal is to gather and provide information to allow calculation of PBDEs, legacy pesticides, and selenium loads to San Francisco Bay from urban runoff conveyance systems. A third goal is to identify control measures and/or management practices to eliminate or reduce discharges of PBDEs, legacy pesticides, or selenium conveyed by urban runoff conveyance systems. The Permittees are encouraged to work with the other municipal stormwater management agencies in the Bay Region to implement a plan to identify, assess, and manage controllable sources of these pollutants in urban runoff. The control actions initiated for PCBs will form the core of initial actions targeting sediment bound pollutants like these. It is very likely that some of these PCB control measures (see Provision C.12) warrant consideration for the control of sediment bound pollutants like PBDEs, legacy pesticides, and possibly others as well.

C.15. Exempted and Conditionally Exempted Discharges

Legal Authority

Broad Legal Authority: CWA section 402(p)(3)(B)(ii-iii), CWC section 1337, and Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(B, C, D, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B) requires MS4 operators, "to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(1) provides that the Permittees shall prevent all types of illicit discharges into the MS4 except for certain non-stormwater discharges.

Fact Sheet Findings in Support of Provision C.15.

Prohibition A.1. effectively prohibits the discharge of non-stormwater discharges into the storm sewer system. However, we recognize that certain types of non-stormwater discharges may be exempted from this prohibition if they are unpolluted and do not violate water quality standards. Other types of non-stormwater discharges may be conditionally exempted from Prohibition A.1. if the discharger employs appropriate control measures and BMPs prior to discharge, and monitors and reports on the discharge.

Specific Provision C.15. Requirements

Provision C.15.a. Exempted Non-Stormwater Discharges. This section of the Permit identifies the types of non-stormwater discharges that are exempted from Discharge Prohibition A.1. if such discharges are unpolluted and do not violate water quality standards. If any exempted non-stormwater discharge is identified as a source of pollutants to receiving waters, the discharge shall be addressed as a conditionally exempted discharge and must meet the requirements of Provision C.15.b.

Provision C.15.b. Conditionally Exempted Non-Stormwater Discharges. This section of the Permit identifies the types of non-stormwater discharges that are conditionally exempted from Discharge Prohibition A.1. if they are identified by Permittees or the Executive Officer as not being sources of pollutants to receiving waters. To eliminate adverse impacts from such discharges, project proponents shall develop and implement appropriate pollutant control measures and BMPs, and where applicable, shall monitor and report on the discharges in accordance with the requirements specified in Provision C.15.b. The intent of Provision C.15.b.'s requirements is to facilitate Permittees in regulating these non-stormwater discharges to the storm drains since the Permittees have ultimate responsibility for what flows in those storm drains to receiving waters. For all planned discharges, the nature and characteristic of the discharge must be verified prior to the discharge so that effective

pollution control measures are implemented, if deemed necessary. Such preventative measures are cheaper by far than post-discharge cleanup efforts.

Provision C.15.b.i.(1). Pumped Groundwater from Non Drinking Water Aquifers. These aquifers tend to be shallower than drinking water aquifers and more subject to contamination. The wells must be purged prior to sample collection. Since wells are purged regularly, this section of the Permit requires twice a year monitoring of these aquifers. Pumped groundwater from non drinking water aquifers, which are owned and/or operated by Permittees who pump groundwater as drinking water, are conditionally exempted as long as the discharges meet the requirements in this section of the Permit.

Provision C.15.b.i.(2). Pumped Groundwater, Foundation Drains, and Water from Crawl Space Pumps and Footing Drains. This section of the Permit encourages these types of discharges to be directed to landscaped areas or bioretention units, when feasible. If the discharges cannot be directed to vegetated areas, it requires testing to determine if the discharge is uncontaminated. Uncontaminated discharges shall be treated, if necessary, to meet specified discharge limits for turbidity and pH.

Provision C.15.b.ii. Air Conditioning Condensate. Small air conditioning units are usually operated during the warm weather months. The condensate from these units are uncontaminated and unlikely to reach a storm drain or waters of the State because they tend to be low in volume and tend to evaporate or percolate readily. Therefore, condensate from small air conditioning units should be discharged to landscaped areas or the ground. Commercial and industrial air conditioning units tend to produce year-round continuous flows of condensate. It may be difficult to direct a continuous flow to a landscaped area large enough to accommodate the volume. While the condensate tends to be uncontaminated, it picks up contaminates on its way to the storm drain and/or waters of the State and can contribute to unnecessary dry weather flows. Therefore, discharges from new commercial and industrial air conditioning units should be discharged to landscaped areas, if they can accommodate the continuous volume, or to the sanitary sewer, with the local sanitary sewer agency's approval. If none of these options are feasible, air conditioning condensate can be directly discharged into the storm drain. If descaling or anti-algal agents are used to treat the air conditioning units, residues from these agents must be properly disposed of.

Provision C.15.b.iii. Planned, Unplanned, and Emergency Discharges of the Potable Water System.. Potable water discharges contribute pollution to water quality in receiving waters because they contain chlorine or chloramines, two very toxic chemicals to aquatic life. Potable water discharges can cause erosion and scouring of stream and creek banks, and sedimentation can result if effective BMPs are not implemented. Therefore, appropriate dechlorination and monitoring of chlorine residual, pH and turbidity, particularly for planned discharges of potable water, are crucial to prevent adverse impacts in the receiving waters.

This section of the Permit requires Permittees to notify Water Board staff at least one week in advance for planned discharges of potable water with a flowrate of 250,000 gpd or more or a total 500,000 gallons or more. These planned discharges must meet specified discharge benchmarks for chlorine residual, pH, and turbidity.

To address unplanned discharges of potable water such as non-routine water line breaks, leaks, overflows, fire hydrant shearing, and emergency flushing, this section of the Permit requires Permittees to implement administrative BMPs such as source control measures, managerial practices, operations and maintenance procedures or other measures to reduce or prevent potential pollutants from being discharged during these events. This Provision also contains specific notification and monitoring requirements to assess immediate and continued impacts to water quality when these events happen.

This section of the Permit acknowledges that in cases of emergency discharge, such as from firefighting and disasters, priority of efforts shall be directed toward life, property, and the environment, in that order. Therefore, Permittees are required to implement BMPs that do not interfere with immediate emergency response operations or impact public health and safety. Reporting requirements for such events shall be determined by Water Board staff on a case-by-case basis.

Provision C.15.b.iv. Individual Residential Car Washing. Soaps and automotive pollutants such as oil and metals can be discharged into storm drains and waterbodies from individual residential car washing activities. However, it is not feasible to prohibit individual residential car washing because it would require too much resources for the Permittees to regulate the prohibition. This section of the Permit requires Permittees to encourage residents to implement BMPs such as directing car washwaters to landscaped areas, using as little detergent as possible, and washing cars at commercial car washing facilities.

Provision C.15.b.v. Swimming Pool, Hot tub, Spa, and Fountain Water Discharges. These types of discharges can potentially contain high levels of chlorine and copper. Permittees shall prohibit the discharge of such waters that contain chlorine residual, copper algaecide, filter backwash, or other pollutants to the storm drains or to waterbodies. High flow rates into the storm drain or waterbody could cause erosion and scouring of the stream or creek banks. These types of discharges should be directed to landscaped areas large enough to accommodate the volume or to the sanitary sewer, with the local sanitary sewer's approval. If these discharge options are not feasible and the swimming pool, hot tub, spa, or fountain water discharges must enter the storm drain, they must be dechlorinated to non-detectable levels of chlorine and they must not contain copper algaecide. Flow rate should be regulated to minimize downstream erosion and scouring. We strongly encourage local sanitary sewer agencies to accept these types of non-stormwater discharges, especially for new and rebuilt ones where a connection could be achieved with marginal effort. This Provision also requires Permittees to coordinate with local sanitary agencies in these efforts.

Provision C.15.b.v.i. Irrigation Water, Landscape Irrigation, and Lawn or Garden Watering. Fertilizers and pesticides can be washed off of landscaping and discharged into storm drains and waterbodies. However, it is not feasible to prohibit excessive irrigation because it would require too much resource for the Permittees to regulate such a prohibition. It is also not feasible for individual Permittees to ban the use fertilizers and pesticides. This section of the Permit requires Permittees to promote and/or work with potable water purveyors to promote measures that minimize runoff and pollutant loading from excess irrigation, such as conservation programs, outreach regarding overwatering and less toxic options for pest control and landscape management, the use of drought tolerant and native vegetation, and to implement appropriate illicit discharge response and enforcement for ongoing, large-volume landscape irrigation runoff to the storm drains.

Provision C.15.b.vii. requires Permittees to identify and describe additional types and categories of discharges not listed in Provision C.15.b., that they propose to conditionally exempt from Prohibition A.1., in periodic submittals to the Executive Officer.

Provision C.15.b.viii. establishes a mechanism to authorize under the Permit non-stormwater discharges owned or operated by the Permittees.

Attachment J: Standard NPDES Stormwater Permit Provisions

The following legal authority applies to Attachment J:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, D, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Standard provisions, reporting requirements, and notifications are consistent to all NPDES permits and are generally found in federal NPDES regulation 40 CFR 122.41.

Attachment J includes Standard Provisions. These Standard Provisions ensure that NPDES stormwater permits are consistent and compatible with USEPA's federal regulations. Some Standard Provision sections specific to publicly owned sewage treatment works are not included in Attachment J.

Fact Sheet Attachment 6.1

Construction Inspection Data

Construction Inspection Data

Facility/Site Inspected	Inspection Date	Weather During Inspection	Inches of Rain Since Last Inspection	Enforcement Response Level	Problem(s) Observed							Specific Problem(s)	Resolution			Comments/ Rationale for Longer Compliance Time
					Erosion Control	Runon and Runoff Control	Sediment Control	Active Treatment System	Good Site Management	Non Stormwater Management	Illicit Discharge		Problems Fixed	Need More Time	Escalate Enforcement	
Panoramic Views	9/30/08	Dry	0	Written Notice			x					Driveway not stabilized				
Panoramic Views	10/15/08	Dry	0.5										x			50' of driveway rocked.
Panoramic Views	11/15/08	Rain	3	Stop Work	x		x				x	Uncovered graded lots eroding; Sediment entering a stormdrain that didn't have adequate protection.				
Panoramic Views	11/15/08	Drizzling	0.25										x			Lots blanketed. Storm drains pumped. Street cleaned.
Panoramic Views	12/1/08	Dry	4	Verbal Warning					x			Porta potty next to stormdrain.	x			Porta potty moved away from stormdrain.
Panoramic Views	1/15/08	Rain	3.25	Written Warning	x					x		Fiber rolls need maintenance; Tire wash water flowing into street				
Panoramic Views	1/25/09	Dry	0										x			Fiber rolls replaced.

Regulated Projects Approved During the Reporting Period 07/08 to 06/09
City of Eden Annual Report FY 2008-09

Project Name, Project Number, Location, Street Address,	Name of Developer, Project Phase No.,[1] Project Type & Description	Project Watershed[2]	Total Site Area, Total Area of Land Disturbed	Total New and/or Replaced Impervious Surface Area[3]	Total Pre- and Post-Project Impervious Surface Area[4]	Status of Project[5]	Source Control Measures	Site Design Measures	Treatment Systems Installed[6]	Operation & Maintenance Responsibility Mechanism	Hydraulic Sizing Criteria	Alternative Compliance Measures[7,8]	HM Controls[9,10]
New Beginnings; Project No. #05-456; Hope Street & Chance Road; 567 Hope Boulevard, Eden, CA	Fresh Start Corporation; Demolition of abandoned warehouse and construction of a 5-story building with 250 low-income rental housing units.	Runoff from site drains to Poor Man Creek	5 acres site area, 100,000 ft^2 disturbed	1 acre replaced	2 acres pre-project, 1 acre post-project	Application submitted 2/9/09, Application deemed complete 4/10/09; Project approved 6/30/09	Trash enclosures, underground parking, street sweeping, car wash pad drains to sanitary sewer	roof drains to landscaping	parking runoff flows to six bioretention units/gardens	Conditions of Approval require property owner (landlord) to perform regular maintenance. Written record will be made available to City inspectors.	BMP Handbook Method	n/a	n/a
Public Projects													
Gridlock Relief, Project No. #05-99, ABC Blvd between Main and Huett Streets, Eden, CA	City of Eden. Widening of ABC Blvd from 4 to 6 lanes	Runoff from site drains to Congestion River	6 acres site area, 3 acres disturbed	2 acres new, 1 acre replaced	4 acres pre-project, 6 acres post-project	Application submitted 7/9/06, Application deemed complete 10/6/08, Project approved 12/9/08, Construction scheduled to begin 7/10/09	none	ABC Blvd sloped to drain runoff into landscaped areas in median	Runoff leaving underdrain system of landscaped median is pumped to bioretention gardens along either side of ABC Blvd	Signed statement from City of Eden assuming post-construction responsibility for treatment BMP maintenance.	WEF Method	n/a	BAHM used to design and size stormwater treatment units so that increased runoff is detained.

Sample Reporting Table C.3.b. Footnotes

1. If a project is being constructed in Phases, use a separate row entry for each Phase.
2. State the watershed(s) that the Regulated Project drains to. Optional but recommended: Also state the downstream watershed(s).
3. State both the total new impervious surface area and the total replaced impervious surface area, as applicable.
4. For redevelopment projects state both the pre-project impervious surface area and the post-project impervious surface area.
5. State project application date; application deemed complete date; and final, major, staff-level discretionary review and approval date.
6. List stormwater treatment system(s) installed onsite or at a joint stormwater treatment system facility.
7. For Alternative Compliance at an offsite location in accordance with Provision C.3.e.i.(1), on a separate page, give a discussion of the alternative compliance site including the information specified in Provision C.3.b.v.(1)(m)(i) for the offsite project.
8. For Alternative Compliance by paying in-lieu fees in accordance with Provision C.3.e.i.(2), on a separate page, provide the information specified in Provision C.3.b.v.(1)(m)(ii) for the Regional Project.
9. If HM control is not required, state why not.
10. If HM control is required, state control method used (e.g., method to design and size device(s) or method(s) used to meet the HM Standard, and description of device(s) or method(s) used, such as detention basin(s), biodetention unit(s), regional detention basin, or in-stream control).

Instructions for Provision C.3.b. Sample Reporting Table

1. **Project Name, Number, Location, and Street Address** – Include the following information:
   - Name of the project
   - Number of the project (if applicable)
   - Location of the project with cross streets
   - Street address of the project (if available)

2. **Name of Developer, Project Phase Number, Project Type, and Project Description** – Include the following information:
   - Name of the developer
   - Project phase name and/or number (only if the project is being developed in phases) – each phase should have a separate row entry
   - Type of development (i.e., new and/or redevelopment)
   - Description of development (e.g., 5-story office building, residential with 160 single-family homes with five 4-story buildings to contain 200 condominiums, 100 unit 2-story shopping mall, mixed use retail and residential development (apartments), industrial warehouse)

3. **Project Watershed**
   - State the watershed(s) that the Project drains into
   - Optional but recommended: Also state the downstream watershed(s)

4. **Total Site Area and Total Area of Land Disturbed** – State the total site area and the total area of land disturbed.

5. **Total New and/or Replaced Impervious Surface Area**
   - State the total new impervious surface area
   - State the total replaced impervious surface area, as applicable

6. **Total Pre- and Post-Project Impervious Surface Area –** For redevelopment projects, state both the pre-project impervious surface area and the post-project impervious surface area.

7. **Status of Project –** Include the following information:
   - Project application submittal date
   - Project application deemed complete date
   - Final, major, staff-level discretionary review and approval date

8. **Source Control Measures** – List all source control measures that have been or will be included in the project.

9. Site Design Measures – List all site design measures that have been or will be included in the project.

10. Treatment Systems Installed – List all post-construction stormwater treatment system(s) installed onsite and/or at a joint stormwater treatment system facility.

11. Operation and Maintenance Responsibility Mechanism – List the legal mechanism(s) that have been or will be used to assign responsibility for the maintenance of the post-construction stormwater treatment systems.

12. Hydraulic Sizing Criteria Used – List the hydraulic sizing criteria used for the Project.

13. Alternative Compliance Measures

- **Option 1: LID Treatment at an Offsite Location (Provision C.3.e.i.(1))** – On a separate page, give a discussion of the alternative compliance project including the information specified in Provision C.3.b.v.(1)(m)(i) for the offsite project.
- **Option 2: Payment of In-Lieu Fees (Provision C.3.e.i.(2))** – On a separate page, provide the information specified in Provision C.3.b.v.(1)(m)(ii).

14. HM Controls

- If HM control is not required, state why not
- If HM control is required, state control method used (e.g., method to design and size device(s), method(s) used to meet the HM Standard, and description of device(s) or method(s) used, such as detention basin(s), biodetention unit(s), regional detention basins, or in-stream control)

ATTACHMENT B

Provision C.3.g.
Alameda Permittees
Hydromodification Management Requirements

Alameda Permittees Hydromodification Management Requirements

1. On-site and Regional Hydromodification Management (HM) Control Design Criteria

a. *Range of flows to control*: Flow duration controls shall be designed such that post-project stormwater discharge rates and durations match pre-project discharge rates and durations from 10 percent of the pre-project 2-year peak flow[123] up to the pre-project 10-year peak flow, except where the lower endpoint of this range is modified as described in Section 6 of this Attachment.

b. *Goodness of fit criteria*: The post-project flow duration curve shall not deviate above the pre-project flow duration curve by more than 10 percent over more than 10 percent of the length of the curve corresponding to the range of flows to control.

c. *Allowable low flow rate*: Flow control structures may be designed to discharge stormwater at a very low rate that does not threaten to erode the receiving waterbody. This flow rate (also called *Qcp*[124]) shall be no greater than 10 percent of the pre-project 2-year peak flow unless a modified value is substantiated by analysis of actual channel resistance in accordance with an approved User Guide as described in Section 6 of this Attachment.

d. *Standard HM modeling*: On-site and regional HM controls designed using the Bay Area Hydrology Model (BAHM[125]) and site-specific input data shall be considered to meet the HM Standard. Such use must be consistent with directions and options set forth in the most current BAHM User's Manual.[126] Permittees shall demonstrate to the satisfaction of the Executive Officer that any modifications of the BAHM made are consistent with the requirements of this Attachment and Provision C.3.f.

e. *Alternate HM modeling and design*: The project proponent may use a continuous simulation hydrologic computer model[127] to simulate pre-project and post-project runoff and to design HM controls. To use this method, the project proponent shall compare the

---

[123] Where referred to in this Order, the 2-year peak flow is determined using a flood frequency analysis procedure based on USGS Bulletin 17 B to obtain the peak flow statistically expected to occur at a 2-year recurrence interval. In this analysis, the appropriate record of hourly rainfall data (e.g., 35–50 years of data) is run through a continuous simulation hydrologic model, the annual peak flows are identified, rank ordered, and the 2-year peak flow is estimated. Such models include USEPA's Hydrologic Simulation Program—Fortran (HSPF), U.S. Army Corps of Engineers' Hydrologic Engineering Center-Hydrologic Modeling System (HEC-HMS), and USEPA's Storm Water Management Model (SWMM).

[124] Qcp is the allowable low flow discharge from a flow control structure on a project site. It is a means of apportioning the critical flow in a stream to individual projects that discharge to that stream, such that cumulative discharges do not exceed the critical flow in the stream.

[125] *The Bay Area Hydrology Model – A Tool for Analyzing Hydromodification Effects of Development Projects and Sizing Solutions*, Bicknell, J., D. Beyerlein, and A. Feng, September 26, 2006. Available at http://www.scvurppp-w2k.com/permit_c3_docs/Bicknell-Beyerlein-Feng_CASQA_Paper_9-26-06.pdf

[126] *The Bay Area Hydrology Model – A Tool for Analyzing Hydromodification Effects of Development Projects and Sizing Solutions*, Bicknell, J., D. Beyerlein, and A. Feng, September 26, 2006. Available at http://www.scvurppp-w2k.com/permit_c3_docs/Bicknell-Beyerlein-Feng_CASQA_Paper_9-26-06.pdf

[127] Such models include US EPA's Hydrologic Simulation Program—Fortran (HSPF), U.S. Army Corps of Engineers Hydrologic Engineering Center-Hydrologic Modeling System (HEC-HMS), and USEPA's Surface Water Management Model (SWMM).

pre-project and post-project model output for a rainfall record of at least 30 years, and shall show that all applicable performance criteria in 1.a-e above are met.

2. Impracticability Provision

Where conditions (e.g., extreme space limitations) prevent a project from meeting the HM Standard for a reasonable cost, *and* where the project's runoff cannot be directed to a regional HM control within a reasonable time frame, *and* where an in-stream measure is not practicable, the project shall use (1) site design for hydrologic source control, *and* (2) stormwater treatment measures that collectively minimize, slow, and detain[128] runoff to the maximum extent practicable. In addition, the project proponent shall provide for or contribute financially to an alternative HM project as set forth below:

a. *Reasonable cost*: To show that the HM Standard cannot be met at a reasonable cost, the project proponent must demonstrate that the total cost to comply with both the HM Standard and the Provision C.3.d treatment requirement exceeds 2 percent of the project construction cost, excluding land costs. Costs of HM and treatment control measures shall not include land costs, soil disposal fees, hauling, contaminated soil testing, mitigation, disposal, or other normal site enhancement costs such as landscaping or grading that are required for other development purposes.

b. *Regional HM controls:* A regional HM control shall be considered available if there is a planned location for the regional HM control and if an appropriate funding mechanism for a regional HM control is in place by the time of project construction.

c. *In-stream measures practicability:* In-stream measures shall be considered practicable when an in-stream measure for the project's watershed is planned and an appropriate funding mechanism for an in-stream measure is in place by the time of project construction.

d. *Financial contribution to an alternative HM project:* The difference between 2 percent of the project construction costs and the cost of the treatment measures at the site (both costs as described in Section 2.a of this Attachment) shall be contributed to an alternative HM project, such as a stormwater treatment retrofit, HM retrofit, regional HM control, or in-stream measure that is not otherwise required by the Water Board or other regulatory agency. Preference shall be given to projects discharging, in this order, to the same tributary, mainstem, watershed, then in the same municipality or county.

3. Record Keeping

Permittees shall collect and retain the following information for all projects subject to HM requirements:

a. Site plans identifying impervious areas, surface flow directions for the entire site, and location(s) of HM measures;

b. For projects using standard sizing charts, a summary of sizing calculations used;

c. For projects using the BAHM, a listing of model inputs;

[128] Stormwater treatment measures that detain runoff are generally those that filter runoff through soil or other media and include bioretention units, bioswales, basins, planter boxes, tree wells, media filters, and green roofs.

d. For projects using custom modeling, a summary of the modeling calculations with corresponding graph showing curve matching (existing, post-project, and post-project with HM controls curves);

e. For projects using the Impracticability Provision, a listing of all applicable costs and a brief description of the alternative HM Project (name, location, date of start up, entity responsible for maintenance); and

f. A listing, summary, and date of modifications made to the BAHM, including technical rationale. Permittees shall submit this list and explanation annually with the Annual Report. This may be prepared at the Countywide Program level and submitted on behalf of participating Permittees.

4. HM Control Areas

Applicable projects shall be required to meet the HM Standard when such projects are in areas of HM applicability shown in the Alameda Permittees' HM Map.[129] (available at http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/stormwater/muni/mrp/Final%20TO%20HM%20Maps.pdf). Plans to restore a creek reach may reintroduce the applicability of HM requirements; in these instances, Permittees may add, but shall not delete, areas of applicability accordingly.

To assist in location and evaluation of project applicability, the Alameda Permittees' HM Map depicts a number of features including the following:

- Hardened channels and culverts at least 24 inches in diameter (green solid or dashed lines);
- Natural channels (red lines);
- Boundaries of major watersheds (light blue lines); and
- Surface streets and highways (gray or black lines).

These data are of varying age, precision and accuracy and are not intended for legal description or engineering design. Watersheds extending beyond the County boundaries are shown for illustration purposes only. Project proponents are responsible for verifying and describing actual conditions of site location and drainage.

5. Alameda Permittees' HM Map is color-coded as follows:

a. Solid pink areas – Solid pink designates hilly areas, where high slopes (greater than 25 percent) occur. The HM Standard and all associated requirements apply in areas shown in solid pink on the map. In this area, the HM Standard does *not* apply if a project proponent demonstrates that all project runoff will flow through enclosed storm drains, existing concrete culverts, or fully hardened (with bed and banks continuously concrete-lined) channels to the tidal area shown in light gray.

b. Purple/red hatched areas – These are upstream of areas where hydromodification impacts are of concern because of factors such as bank instability, sensitive habitat, or restoration projects. The HM Standard and all associated requirements apply in areas

[129] The watercourses potentially susceptible to hydromodification impacts are identified based on an assessment approach developed by Balance Hydrologics (2003).

shown in purple/red (printer-dependant) hatch marking on the map. Projects in these areas may be subject to additional agency reviews related to hydrologic, habitat or other watershed-specific concerns.

c. Solid white areas – Solid white designates the land area between the hills and the tidal zone. This area may be susceptible to hydromodification unless the site is connected to storm drains that discharge to the tidal area. The HM Standard and all associated requirements apply to projects in solid white areas *unless* a project proponent demonstrates that all project runoff will flow through fully hardened channels.[130] Short segments of engineered earthen channels (length less than 10 times the maximum width of trapezoidal cross-section) can be considered resistant to erosion if located downstream of a concrete channel of similar or greater length and comparable cross-sectional dimensions. Plans to restore a hardened channel may affect the HM Standard applicability in this area.

d. Solid gray areas – Solid gray designates areas where streams or channels are tidally influenced or primarily depositional near their outfall in San Francisco Bay. The HM Standard does not apply to projects in this area. Plans to restore a hardened channel may affect the HM Standard applicability in this area.

e. Dark gray, *Eastern County* area – Dark gray designates the portion of eastern Alameda County that lies outside the discharge area of this NPDES permit. This area is in the Central Valley Regional Water Quality Control Board's jurisdiction.

6. Potential Exceptions to Alameda Permittees' HM Map Designations

The Program may choose to prepare a User Guide[131] to be used for evaluating individual receiving waterbodies using detailed methods to assess channel stability and watercourse critical flow. This User Guide would reiterate and collate established stream stability assessment methods that have been presented in the Program's HMP.[132] After the Program has collated its methods into a User Guide format, received approval of the User Guide from the Executive Officer,[133] and informed the public through such process as an electronic mailing list, the Permittees may use the User Guide to guide preparation of technical reports for the following: implementing the HM Standard using in-stream or regional HM controls; determining whether certain projects are discharging to a watercourse that is less susceptible (from point of discharge to the Bay) to hydromodification (e.g., would have a lower potential for erosion than set forth in these requirements); and/or determining if a watercourse has a higher critical flow and project(s) discharging to it are eligible for an alternative Qcp for the purpose of designing on-site or regional measures to control flows draining to these channels (i.e., the actual threshold of erosion-causing critical flow is higher than 10 percent of the 2-year pre-project flow). In no case shall the design value of Qcp exceed 50 percent of the 2-year pre-project flow.

[130] In this paragraph, *fully hardened channels* include enclosed storm drains, existing concrete culverts, or channels whose bed and banks are continuously concrete-lined to the tidal area shown in light gray on the map.
[131] The User Guide may be offered under a different title.
[132] The Program's HMP has undergone Water Board staff review and been subject to public notice and comment.
[133] The User Guide shall not introduce a new concept, but rather reformat existing methods; therefore, Executive Officer approval is appropriate.

ATTACHMENT C

Provision C.3.g.
Contra Costa Permittees
Hydromodification Management Requirements

Contra Costa Permittees Hydromodification Management Requirements

1. Demonstrating Compliance with the Hydromodification Management (HM) Standard

Contra Costa Permittees shall ensure that project proponents shall demonstrate compliance with the HM Standard by demonstrating that any one of the following four options is met:

a. *No increase in impervious area.* The project proponent may compare the project design to the pre-project condition and show that the project will not increase impervious area and also will not facilitate the efficiency of drainage collection and conveyance.

b. *Implementation of hydrograph modification IMPs.* The project proponent may select and size IMPs to manage hydrograph modification impacts, using the design procedure, criteria, and sizing factors specified in the Contra Costa Clean Water Program's *Stormwater C.3 Guidebook*. The use of flow-through planters shall be limited to upper-story plazas, adjacent to building foundations, on slopes where infiltration could impair geotechnical stability, or in similar situations where geotechnical issues prevent use of IMPs that allow infiltration to native soils. Limited soil infiltration capacity in itself does not make use of other IMPs infeasible.

c. *Estimated post-project runoff durations and peak flows do not exceed pre-project durations and peak flows.* The project proponent may use a continuous simulation hydrologic computer model such as USEPA's Hydrograph Simulation Program—Fortran (HSPF) to simulate pre-project and post-project runoff, including the effect of proposed IMPs, detention basins, or other stormwater management facilities. To use this method, the project proponent shall compare the pre-project and post-project model output for a rainfall record of at least 30 years, using limitations and instructions provided in the Program's *Stormwater C.3 Guidebook*, and shall show that the following criteria are met:

i. For flow rates from 10 percent of the pre-project 2-year runoff event (0.1Q2) to the pre-project 10-year runoff event (Q10), the post-project discharge rates and durations shall not deviate above the pre-project rates and durations by more than 10 percent over more than 10 percent of the length of the flow duration curve.

ii. For flow rates from 0.5Q2 to Q2, the post-project *peak flows* shall not exceed pre-project peak flows. For flow rates from Q2 to Q10, post-project peak flows may exceed pre-project flows by up to 10 percent for a 1-year frequency interval. For example, post-project flows could exceed pre-project flows by up to 10 percent for the interval from Q9 to Q10 or from Q5.5 to Q6.5, but not from Q8 to Q10.

d. *Projected increases in runoff peaks and durations will not accelerate erosion of receiving stream reaches.* The project proponent may show that, because of the specific characteristics of the stream receiving runoff from the project site, or because of proposed stream restoration projects, or both, there is little likelihood that the cumulative impacts from new development could increase the net rate of stream erosion to the extent that beneficial uses would be significantly impacted. To use this option, the project proponent shall evaluate the receiving stream to determine the relative risk of erosion impacts and take the appropriate actions as described below and in Table A-1. Projects 20 acres or larger in total area shall not use the medium risk methodology in *(d)ii* below.

i. ***Low Risk.*** In a report or letter report, signed by an engineer or qualified environmental professional, the project proponent shall show that all downstream channels between the project site and the Bay/Delta fall into one of the following *low-risk* categories.

(1) Enclosed pipes.

(2) Channels with continuous hardened beds and banks engineered to withstand erosive forces and composed of concrete, engineered riprap, sackcrete, gabions, mats, and such. This category excludes channels where hardened beds and banks are not engineered continuous installations (i.e., have been installed in response to localized bank failure or erosion).

(3) Channels subject to tidal action.

(4) Channels shown to be aggrading (i.e., consistently subject to accumulation of sediments over decades) and to have no indications of erosion on the channel banks.

ii. ***Medium Risk.*** Medium risk channels are those where the boundary shear stress could exceed critical shear stress as a result of hydrograph modification but where either the sensitivity of the boundary shear stress to flow is low (e.g., an oversized channel with high width to depth ratios) or where the resistance of the channel materials is relatively high (e.g., cobble or boulder beds and vegetated banks). In *medium-risk* channels, accelerated erosion due to increased watershed imperviousness is not likely but is possible, and the uncertainties can be more easily and effectively addressed by mitigation than by additional study.

In a preliminary report, the project proponent's engineer or qualified environmental professional shall apply the Program's *Basic Geomorphic Assessment*[134] methods and criteria to show each downstream reach between the project site and the Bay/Delta is either at *low-risk* or *medium-risk* of accelerated erosion due to watershed development. In a following, detailed report, a qualified stream geomorphologist[135] shall use the Program's Basic Geomorphic Assessment methods and criteria, available information, and current field data to evaluate each *medium-risk* reach. For *each medium-risk* reach, the detailed report shall show one of the following:

[134] Contra Costa Clean Water Program *Hydrograph Modification Management Plan*, May 15, 2005, Attachment 4, pp. 6-13. This method must be made available in the Program's *Stormwater C.3 Guidebook.*

[135] Typically, detailed studies will be conducted by a stream geomorphologist retained by the lead agency (or, on the lead agency's request, another public agency such as the Contra Costa County Flood Control and Water Conservation District) and paid for by the project proponent.

(1) A detailed analysis, using the Program's criteria, showing the particular reach may be reclassified as *low-risk.*

(2) A detailed analysis, using the Program's criteria, confirming the *medium-risk* classification, and:

(a) A preliminary plan for a mitigation project for that reach to stabilize stream beds or banks, improve natural stream functions, and/or improve habitat values, and

(b) A commitment to implement the mitigation project timely in connection with the proposed development project (including milestones, schedule, cost estimates, and funding), and

(c) An opinion and supporting analysis by one or more qualified environmental professionals that the expected environmental benefits of the mitigation project substantially outweigh the potential impacts of an increase in runoff from the development project, and

(d) Communication, in the form of letters or meeting notes, indicating consensus among staff representatives of regulatory agencies having jurisdiction that the mitigation project is feasible and desirable. In the case of the Regional Water Board, this must be a letter, signed by the Executive Officer or designee, specifically referencing this requirement. (This is a preliminary indication of feasibility required as part of the development project's Stormwater Control Plan. All applicable permits must be obtained before the mitigation project can be implemented.)

iii. ***High Risk.*** High-risk channels are those where the sensitivity of boundary shear stress to flow is high (e.g., incised or entrenched channels, channels with low width-to-depth ratios, and narrow channels with levees) or where channel resistance is low (e.g., channels with fine-grained, erodible beds and banks, or with little bed or bank vegetation). In a *high-risk* channel, it is presumed that increases in runoff flows will accelerate bed and bank erosion.

To implement this option (i.e., to allow increased runoff peaks and durations to a high-risk channel), the project proponent must perform a comprehensive analysis to determine the design objectives for channel restoration and must propose a comprehensive program of in-stream measures to improve channel functions while accommodating increased flows. Specific requirements are developed case-by-case in consultation with regulatory agencies having jurisdiction. The analysis will typically involve watershed-scale continuous hydrologic modeling (including calibration with stream gauge data where possible) of pre-project and post-project runoff flows, sediment transport modeling, collection and/or analysis of field data to characterize channel morphology including analysis of bed and bank materials and bank vegetation, selection and design of in-stream structures, and project environmental permitting.

2. IMP Model Calibration and Validation

The Program shall monitor flow from Hydrograph Modification Integrated Management Practices (IMPs) to determine the accuracy of its model inputs and assumptions. Monitoring

shall be conducted with the aim of evaluating flow control effectiveness of the IMPs. The Program shall implement monitoring where feasible at future new development projects to gain insight into actual versus predicted rates and durations of flow from IMP overflows and underdrains.

At a minimum, Permittees shall monitor five locations for a minimum of two rainy seasons. If two rainy seasons are not sufficient to collect enough data to determine the accuracy of model inputs and assumptions, monitoring shall continue until such time as adequate data are collected.

Permittees shall conduct the IMP monitoring as described in the IMP Model Calibration and Validation Plan in Section 5 of this Attachment. Monitoring results shall be submitted to the Executive Officer by June 15 of each year following collection of monitoring data. If the first year's data indicate IMPs are not effectively controlling flows as modeled in the HMP, the Executive Officer may require the Program to make adjustments to the IMP sizing factors or design, or otherwise take appropriate corrective action. The Permittees shall submit an IMP Monitoring Report by August 30 of the second year[136] of monitoring. The IMP Monitoring Report shall contain, at a minimum, all the data, graphic output from model runs, and a listing of all model outputs to be adjusted, with full explanation for each. Board staff will review the IMP Monitoring Report and require the Program to make any appropriate changes to the model within a 3-month time frame.

3. Stormwater C.3 Guidebook and IMP Design Criteria

The Current Contra Costa Clean Water Program C.3 Guidebook, 4th Edition (September 2008) shall be implemented until the expiration of this permit (November 2014). Any significant changes in the designs of the IMPs, their sizing factors or manner of implementation shall be approved by the Water Board.

4. IMP Model Calibration and Validation Plan Objective

Monitoring shall be conducted with the aim of evaluating flow control effectiveness of the IMPs. The IMPs were redesigned in 2008 to meet a low flow criterion of 0.2Q2, not 0.1Q2, which is current HMP standard for Contra Costa County. The Program shall implement monitoring at future new development projects at a minimum of five locations and for a minimum of two rainy seasons to gain insight into actual versus predicted rates and durations of flow from IMP overflows and underdrains. If two rainy seasons are not sufficient to collect enough data to determine the accuracy of model inputs and assumptions, monitoring shall continue until such time as adequate data are collected.

a. The Dischargers Shall Identify and Establish Monitoring Sites – Program staff shall work with municipal Co-Permittees to identify potential monitoring sites on development projects that implement IMPs. Proposed sites shall be identified during review of planning and zoning applications so that monitoring stations can be designed and constructed as part of the development project. Monitoring shall begin after the development project is complete and the site is in use.

Criteria for appropriate sites include**,** but are not limited to**,** the following:

[136] If the monitoring extends beyond 2 years, an IMP Monitoring Report shall be submitted by August 30 annually until model calibration and validation is complete.

- To ensure applicability of results, the development project and IMPs should be typical of development sites and types of IMPs foreseen throughout the County. In particular, at least one each of the infiltration planter, flow-through planter, and *dry* swale shall be selected for monitoring.
- The area tributary to the IMP should be clearly defined, should contain and direct runoff at all rainfall intensities to the IMP. Two monitoring locations shall contain tributary areas that are a mix of pervious and impervious areas to test the pervious area simplifying assumptions used in the HMP, Table 14, Attachment 2, page 49. If no such locations are constructed by the monitoring period, modeling of mixed (pervious and impervious) tributary areas can substitute for direct monitoring of this type of location.
- The site shall be easily accessible at all times of day and night to allow inspection and maintenance of measurement equipment.
- Hourly rain gauge data representative of the site's location shall be available.

b. Documentation of Monitoring Sites – The Dischargers shall record and report (i.e., document) pertinent information for each monitoring site. Documentation of each monitoring site shall include the following:

- Amount of tributary area;
- Condition of roof or paving;
- Grading and drainage to the IMP, including calculated time of concentration.
- Locations and elevations of inlets and outlets;
- As-built measurements of the IMP including depth of soil and gravel layers, height of underdrain pipe above the IMP floor or native soil;
- Detailed specifications of soil and gravel layers and of filter fabric and other appurtenances; and
- Condition of IMP surface soils and vegetation.

c. Design, Construction, and Operation of Monitoring Sites – The Dischargers shall ensure that IMPs selected for monitoring are equipped with a manhole, vault, or other means to install and access equipment for monitoring flows from IMP overflows and underdrains.

Development of suitable methods for monitoring the entire range of flows may require experiment. The Program and Water Board are interested in the timing and duration of very low flows from underdrains, as well as higher flows from IMP overflows. The Dischargers shall ensure that equipment is configured to measure the entire range of flows and to avoid potential clogging of orifices used to measure low flows.

The Dischargers shall ensure that construction of IMPs is inspected carefully to ensure that IMPs are installed as designed and to avoid potential operational problems. For example, gravel used for underdrain layers should be washed free of fines, and filter fabric should be installed without breaks.

The Dischargers shall ensure that, following construction, artificial flows are applied to the IMP to verify the IMP and monitoring equipment are operating correctly and to resolve any operational problems prior to measuring flows from actual rain storms.

The Dischargers shall ensure that monitoring equipment is properly maintained. Maintenance of monitoring equipment will require, initially, inspections during and after storms that produce runoff. The inspection and maintenance schedule may be adjusted as additional experience is gained.

d. Data to be Obtained – The Dischargers shall collect the following data for each IMP, during the monitoring period:

- Hourly rainfall and more frequent rainfall data where available;
- Hourly IMP outflow and 15-minute outflow for all time periods in which sub-hourly rainfall data are available;
- Hourly IMP inflow (if possible) and more frequent inflow (if possible) when sub-hourly rainfall data are available; and
- Notes and observations.

e. Evaluation of Data – The principal use of the monitoring data shall be a comparison of predicted to actual flows. The Dischargers shall ensure that the HSPF model is set up as it was to prepare the curves in Attachment 2 of the HMP, with appropriate adjustments for the drainage area of the IMP to be monitored and for the actual sizing and configuration of the IMP. Hourly rainfall data from observed storms shall be input to the model, and the resulting hourly predicted output recorded. Where sub-hourly rainfall data are available, the model shall be run with, and output recorded for, 15-minute time steps.

The Dischargers shall compare predicted hourly outflows to the actual hourly outflows. As more data are gathered, the Dischargers may examine aggregated data to characterize deviations from predicted performance at various storm intensities and durations.

Because high-intensity storms are rare, it will take many years to obtain a suitable number of events to evaluate IMP performance under overflow conditions. Underdrain flows will occur more frequently, but possibly only a few times a year, depending on rainfall and IMP characteristics (e.g., extent to which the IMP is oversized, and actual, rather than predicted, permeability of native soils). However, evaluating a range of rainfall events that do *not* produce underflow will help demonstrate the effectiveness of the IMP.

5. Record Keeping and Reporting

Permittees shall collect and retain the following information for all projects subject to HM requirements:

a. Site plans identifying impervious areas, surface flow directions for the entire site, and location(s) of HM measures;

b. For projects using standard sizing charts, a summary of sizing calculations used;

c. For projects using the BAHM, a listing of model inputs;

d. For projects using custom modeling, a summary of the modeling calculations with corresponding graph showing curve matching (existing, post-project, and post-project with HM controls curves);

e. For projects using the Impracticability Provision, a listing of all applicable costs and a brief description of the alternative HM project (name, location, date of start up, entity responsible for maintenance); and

f. A list and thorough technical explanation of any changes in design criteria for HM Controls, including IMPs. Permittees shall submit this list and explanation annually with the Annual Report.

6. The current Contra Costa Clean Water Program C.3 Guidebook, 4th Edition (C.3 Guidebook) (September 2008) design approach and IMPs shall be used to comply with Provision C.3.g flow requirements until this permit expires and is reissued, pending model verification studies as described below. The IMPs shall be an implementation option as the flow control implementation for development projects up to a footprint of 30 acres

By April 1, 2014, the Contra Costa Clean Water Program shall submit a proposal containing one or a combination of the following three options (a.-c.) for implementation after the expiration and reissuance of this permit:

a. Present model verification monitoring results demonstrating that the IMPs are sufficiently overdesigned and perform to meet the 0.1Q2 low flow design criteria; or

b. Present study results of Contra Costa County streams geology and other factors that support the low flow design criteria of 0.2Q2 as the limiting HMP design low flow; or

c. Propose redesigns of the IMPs to meet the low flow design criteria of 0.1Q2 to be implemented during the next permit term.

ATTACHMENT D

Provision C.3.g.
Fairfield-Suisun Permittees
Hydromodification Management Requirements

Fairfield-Suisun Permittees Hydromodification Management Requirements

1. On-site and Regional Hydromodification Management (HM) Control Design Criteria

a. *Range of flows to control*: Flow duration controls shall be designed such that post-project stormwater discharge rates and durations match pre-project discharge rates and durations from 20 percent of the pre-project 2-year peak flow[137] up to the pre-project 10-year peak flow.

b. *Goodness of fit criteria*: The post-project flow duration curve shall not deviate above the pre-project flow duration curve by more than 10 percent over more than 10 percent of the length of the curve corresponding to the range of flows to control.

c. *Allowable low flow rate:* Flow control structures may be designed to discharge stormwater at a very low rate that does not threaten to erode the receiving waterbody. This flow rate (also called Qcp[138]) shall be no greater than 20 percent of the pre-project 2-year peak flow.

d. *Standard HM modeling:* On-site and regional HM controls designed using the Bay Area Hydrology Model (BAHM[139]) and site-specific input data shall be considered to meet the HM Standard. Such use must be consistent with directions and options set forth in the most current BAHM User Manual.[140] Permittees shall demonstrate to the satisfaction of the Executive Officer that any modifications of the BAHM made are consistent with this Attachment and Provision C.3.g.

---

[137] Where referred to in this Order, the 2-year peak flow is determined using a flood flow frequency analysis procedure based on USGS Bulletin 17 B to obtain the peak flow statistically expected to occur at a 2-year recurrence interval. In this analysis, the appropriate record of hourly rainfall data (e.g., 35–50 years of data) is run through a continuous simulation hydrologic model, the annual peak flows are identified, rank ordered, and the 2-year peak flow is estimated. Such models include USEPA's Hydrologic Simulation Program—Fortran (HSPF), U.S. Army Corps of Engineers' Hydrologic Engineering Center-Hydrologic Modeling System (HEC-HMS), and USEPA's Storm Water Management Model (SWMM).

[138] Qcp is the allowable low flow discharge from a flow control structure on a project site. It is a means of apportioning the critical flow in a stream to individual projects that discharge to that stream, such that cumulative discharges do not exceed the critical flow in the stream.

[139] See www.bayareahydrologymodel.org , Resources

[140] *The Bay Area Hydrology Model User Manual*is available at http://www.bayareahydrologymodel.org/downloads.html.

e. *Alternate HM modeling and design:* The project proponent may use a continuous simulation hydrologic computer model[141] to simulate pre-project and post-project runoff and to design HM controls. To use this method, the project proponent shall compare the pre-project and post-project model output for a rainfall record of at least 30 years, and shall show that all applicable performance criteria in 1.a–c above are met.

f. *Sizing Charts:* The Program developed design procedures, criteria, and sizing factors for infiltration basins and bioretention units, based on a low flow rate that exceeds the allowable low flow rate. After the Program has modified its sizing factors[142] to the allowable criteria, received approval of the modified sizing factors from the Executive Officer,[143] and informed the public through such mechanism as an electronic mailing list, project proponents may meet the HM Standard by using the Program's design procedures, criteria, and sizing factors for infiltration basins and/or bioretention units.

2. Impracticability Provision

Where conditions (e.g., extreme space limitations) prevent a project from meeting the HM Standard for a reasonable cost, *and* where the project's runoff cannot be directed to a regional HM control within a reasonable time frame, *and* where an in-stream measure is not practicable, the project shall use (1) site design for hydrologic source control, *and* (2) stormwater treatment measures that collectively minimize, slow, and detain[144] runoff to the maximum extent practicable. In addition, if the cost of providing site design for hydrologic source control and treatment measures to the maximum extent practicable does not exceed 2% of the project cost (as defined in "2.a." below), the project proponent shall provide for or contribute financially to an alternative HM project as set forth below:

a. *Reasonable cost*: To show that the HM Standard cannot be met at a reasonable cost, the project proponent must demonstrate that the total cost to comply with both the HM Standard and the Provision C.3.d. treatment requirement exceeds 2 percent of the project construction cost, excluding land costs. Costs of HM and treatment control measures shall not include land costs, soil disposal fees, hauling, contaminated soil testing, mitigation, disposal, or other normal site enhancement costs such as landscaping or grading that are required for other development purposes.

b. *Regional HM controls*: A regional HM control shall be considered available if there is a planned location for the regional HM control and if an appropriate funding mechanism for a regional HM control is in place by the time of project construction.

c. *In-stream measures practicability*: In-stream measures shall be considered practicable when an in-stream measure for the project's watershed is planned and an appropriate funding mechanism for an in-stream measure is in place by the time of project construction.

---

[141] Such models include USEPA's Hydrologic Simulation Program—Fortran (HSPF), U.S. Army Corps of Engineers Hydrologic Engineering Center-Hydrologic Modeling System (HEC-HMS), and USEPA's Storm Water Management Model (SWMM).

[142] Current sizing factors and design criteria are shown in Appendix D of the FSURMP HMP.

[143] The modified sizing factors will not introduce a new concept but rather make an existing compliance mechanism more stringent; therefore, Executive Officer approval is appropriate.

[144] Stormwater treatment measures that detain runoff are generally those that filter runoff through soil or other media, and include bioretention units, bioswales, basins, planter boxes, tree wells, media, filters, and green roofs.

d. *Financial contribution to an alternative HM project*: The difference between 2 percent of the project construction costs and the cost of the treatment measures at the site (both costs as described in Section 2.a of this Attachment) shall be contributed to an alternative HM project, such as a stormwater treatment retrofit, HM retrofit, regional HM control, or in-stream measure. Preference shall be given to projects discharging, in this order, to the same tributary, mainstem, watershed, then in the same municipality or county.

3. Record Keeping

Permittees shall collect and retain the following information for all projects subject to HM requirements:

a. Site plans identifying impervious areas, surface flow directions for the entire site, and location(s) of HM measures;

b. For projects using standard sizing charts, a summary of sizing calculations used;

c. For projects using the BAHM, a listing of model inputs;

d. For projects using custom modeling, a summary of the modeling calculations with corresponding graph showing curve matching (existing, post-project, and post-project with HM controls curves);

e. For projects using the Impracticability Provision, a listing of all applicable costs and a brief description of the alternative HM project (name, location, date of start up, entity responsible for maintenance); and

f. A listing, summary, and date of modifications made to the BAHM, including technical rationale. Permittees shall submit this list and explanation annually with the Annual Report.

4. HM Control Areas

Applicable projects shall be required to meet the HM Standard when such projects discharge into the upstream reaches of Laurel or Ledgewood Creeks, as delineated in the Fairfield-Suisun Permittees' HM Maps (available at http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/stormwater/muni/mrp/Final%20TO%20HM%20Maps.pdf.). Plans to restore a creek reach may reintroduce the applicability of HM requirements; in these instances, Permittees may add, but shall not delete, areas of applicability accordingly.

in-stream measure. Preference shall be given to projects discharging, in this order, to the same tributary, mainstem, watershed, then in the same municipality, or county.

3. Record Keeping

Permittees shall collect and retain the following information for all projects subject to HM requirements:

a. Site plans identifying impervious areas, surface flow directions for the entire site, and location(s) of HM measures;

b. For projects using standard sizing charts, a summary of sizing calculations used;

c. For projects using the BAHM, a listing of model inputs;

d. For projects using custom modeling, a summary of the modeling calculations with corresponding graph showing curve matching (existing, post-project, and post-project with HM controls curves);

e. For projects using the Impracticability Provision, a listing of all applicable costs and a brief description of the alternative HM project (name, location, date of startup, entity responsible for maintenance); and

f. A listing, summary, and date of modifications made to the BAHM, including technical rationale. Permittees shall submit this list and explanation annually with the Annual Report. This may be prepared at the Countywide Program level and submitted on behalf of participating Permittees.

4. HM Control Areas

Applicable projects shall be required to meet the HM Standard when such projects are in the HM control areas shown in the San Mateo Permittees' HM Map (available at http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/stormwater/muni/mrp/Final%20TO%20HM%20Maps.pdf). Plans to restore a creek reach may reintroduce the applicability of HM requirements; in these instances, Permittees may add, but shall not delete, areas of applicability accordingly.

The HM Standard and all associated requirements apply in areas that are shown in green on the map and noted in the map's key as *areas subject to HMP*. The other areas are exempt from the HM Standard because they drain to hardened channels or low gradient channels (a characteristic applicable to San Mateo County's particular shoreline properties), or are in highly developed areas. Plans to restore a hardened channel may affect areas of applicability.

Areas shown in the San Mateo Permittees' HM Map may be modified as follows:

b. **Street Boundary Interpretation** – Streets are used to mark the boundary between areas where the HM Standard must be met and exempt areas. Parcels on the boundary street are considered within the area exempted from the hydromodification requirements. Nonetheless, there might be cases where the drainage from a particular parcel(s) on the boundary street drains westward into the hydromodification required area and, as such, any applicable project on such a parcel(s) would be subject to the hydromodification requirements.

c. Hardened Channel/Drainage to Exempt Area – If drainage leaving a proposed project subject to the HM Standard is determined to flow only through a hardened channel and/or enclosed pipe along its entire length before directly discharging into a waterway in the exempt area or into tidal waters, the project would be exempted from the HM Standard and its associated requirements. The project proponent must demonstrate, in a statement signed by an engineer or qualified environmental professional, that this condition is met.

d. Boundary Re-Opener – If the municipal regional permit or future permit reissuances or amendments modify the types of projects subject to the hydromodification requirements, the appropriate location for an HMP boundary or boundaries will be reevaluated at the same time.

f. A listing, summary, and date of modifications made to the BAHM, including technical rationale. Permittees shall submit this list and explanation annually with the Annual Report. This may be prepared at the Countywide Program level and submitted on behalf of participating Permittees.

4. HM Control Areas

Applicable projects shall be required to meet the HM Standard when such projects are located in areas of HM applicability as described below and shown in the Santa Clara Permittees' HM Map (available at http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/stormwater/muni/mrp/Final%20TO%20HM%20Maps.pdf).

a. **Purple areas**: These areas represent catchments that drain to hardened channels that extend continuously to the Bay or to tidally influenced sections of creeks. The HM Standard and associated requirements do not apply to projects in the areas designated in purple on the map.

Plans to restore a creek reach may reintroduce the applicability of HM requirements, unless the creek restoration project is designed to accommodate the potential hydromodification impacts of future development; if this is not the case, in these instances, Permittees may add, but shall not delete, areas of applicability accordingly.

b. **Red areas**: These areas represent catchments and subwatersheds that are greater than or equal to 65% impervious, based on existing imperviousness data sources. The HM Standard and associated requirements do not apply to projects in the areas designated in red on the map.

c. **Pink areas**: These are areas that are under review by the Permittees for accuracy of the imperviousness data. The HM Standard and associated requirements apply to projects in areas designated as pink on the map until such time as a Permittee presents new data that indicate that the actual level of imperviousness of a particular area is greater than or equal

to 65% impervious. Any new data will be submitted to the Water Board in one coordinated submittal within one year of permit adoption.

d. Green area: These areas represent catchments and subwatersheds that are less than 65% impervious and are not under review by the Permittees. The HM Standard and associated requirements apply to projects in areas designated as green on the map.

5. Potential Exceptions to Map Designations

The Program may choose to prepare a User Guide[158] to be used for evaluating individual receiving waterbodies using detailed methods to assess channel stability and watercourse critical flow. This User Guide would reiterate and collate established stream stability assessment methods that have been presented in the Program's HMP.[159] After the Program has collated its methods into User Guide format, received approval of the User Guide from the Executive Officer,[160] and informed the public through such process as an electronic mailing list, the Permittees may use the User Guide to guide preparation of technical reports for the following: implementing the HM Standard using in-stream or regional controls; determining whether certain projects are discharging to a watercourse that is less susceptible (from point of discharge to the Bay) to hydromodification (e.g., would have a lower potential for erosion than set forth in these requirements); and/or determining if a watercourse has a higher critical flow and project(s) discharging to it are eligible for an alternative Qcp for the purpose of designing on-site or regional measures to control flows draining to these channels (i.e., the actual threshold of erosion-causing critical flow is higher than 10 percent of the 2-year pre-project flow). In no case shall the design value of Qcp exceed 50 percent of the 2-year pre-project flow.

[158] The User Guide may be offered under a different title.
[159] The Program's HMP has undergone Water Board staff review and been subject to public notice and comment.
[160] The User Guide will not introduce a new concept, but rather reformat existing methods; therefore, Executive Officer approval is appropriate.

Provision C.3.h.
Sample Reporting Table

Table C.3.h. – Operation and Maintenance of Stormwater Treatment Systems
City of Eden Annual Report FY 2008-09

Facility/Site Inspected and Responsible Party for Maintenance	Date of Inspection	Type of Inspection (annual, follow-up, etc.)	Type of Treatment System or HM Control Inspected	Inspection Findings or Results	Enforcement Action Taken (Warning, NOV, administrative citation, etc.)	Comments
ABC Company 123 Alphabet Road San Jose	12/06/08	annual	offsite bioretention unit	proper operation	none	Unit is operating properly and is well maintained.
DEF site 234 Blossom Drive Santa Clara	12/17/08	annual	onsite media filter	ineffective filter media	verbal warning	Media filter is clogged and needs to be replaced.
	12/19/08	follow-up	onsite media filter	proper operation	none	New media filter in place and unit is operating properly.
	1/19/09	follow-up	onsite media filter	proper operation	none	Unit is operating properly.
GHI Hotel 1001 Grand Blvd 227 Touring Parkway	12/21/08	annual	onsite swales	proper operation	notice of violation	Bioretention unit #2 is badly eroded because of flow channelization. Stormwater is flowing over the eroded areas, bypassing treatment and running off into parking area.
			onsite bioretention unit #1	proper operation		
			onsite bioretention unit #2	eroded areas due to flow channelization		
	12/27/08	follow-up	onsite bioretention unit #2	proper operation	none	Entire bioretention unit #2 has been replanted and re-graded. Raining heavily but no overflow observed.
Rolling Hills Estates Homeowners' Association 543 Rolling Hill Drive Pleasanton	01/17/09	annual	onsite pond	sediment and debris accumulation	notice of violation	Pond needs sediment removal and check dam needs debris removal.
	01/24/09	follow-up	onsite pond	sediment and debris accumulation	administrative citation $1000	Pond still a mess. Administrative citation requires maintenance within a week.
	01/31/09	follow-up	onsite pond	proper maintenance	none	Pond maintenance completed.
	02/18/09	spot inspection	onsite pond	proper operation and maintenance	none	Proper operation and maintenance.

Provision C.8.
Status and Long-Term Monitoring
Follow-up Analysis and Actions

Status and Long-Term Monitoring Follow-up Analysis and Actions for Biological Assessment, Bedded Sediment Toxicity, and Bedded Sediment Pollutants

When results from Biological Assessment, Bedded Sediment Toxicity, and/or Bedded Sediment Pollutants monitoring indicate impacts at a monitoring location, Permittees shall evaluate the extent and cause(s) of impacts to determine the potential role of urban runoff as indicated in Table H-1.

Table H-1. Sediment Triad Approach to Determining Follow-Up Actions

Chemistry Results[161]	Toxicity Results[162]	Bioassessment Results[163]	Action
No chemicals exceed Threshold Effect Concentrations (TEC), mean Probable Effects Concentrations (PEC) quotient < 0.5 and pyrethroids < 1.0 Toxicity Unit (TU)[164]	No Toxicity	No indications of alterations	No action necessary
No chemicals exceed TECs, mean PEC quotient < 0.5 and pyrethroids< 1.0 TU	Toxicity	No indications of alterations	(1) Take confirmatory sample for toxicity. (2) If toxicity repeated, attempt to identify cause and spatial extent. (3) Where impacts are under Permittee's control, take management actions to minimize upstream sources causing toxicity; initiate no later than the second fiscal year following the sampling event.

[161] TEC and PEC are found in MacDonald, D.D., G.G. Ingersoll, and T.A. Berger. 2000. Development and Evaluation of Consensus-based Sediment Quality Guidelines for Freshwater Ecosystems. *Archives of Environ. Contamination and Toxicology* 39(1):20–31.

[162] Toxicity is exhibited when *Hyallela* survival statistically different than and < 20 percent of control.

[163] Alterations are exhibited if metrics indicate substantially degraded community.

[164] Toxicity Units (TU) are calculated as follows: TU = Actual concentration (organic carbon normalized) ÷ Reported *H. azteca* LC_{50} concentration (organic concentration normalized). Weston, D.P., R.W. Holmes, J. You, and M.J. Lydy, 2005. Aquatic Toxicity Due to Residential Use of Pyrethroid Insecticides. *Environ. Science and Technology* 39(24):9778–9784.

Chemistry Results[161]	Toxicity Results[162]	Bioassessment Results[163]	Action
No chemicals exceed TECs, mean PEC quotient < 0.5 and pyrethroids< 1.0 TU	No Toxicity	Indications of alterations	Identify the most probable cause(s) of the alterations in biological community. Where impacts are under Permittee's control, take management actions to minimize the impacts causing physical habitat disturbance; initiate no later than the second fiscal year following the sampling event.
No chemicals exceed TECs, mean PEC quotient < 0.5 and pyrethroids< 1.0 TU	Toxicity	Indications of alterations	(1) Identify cause(s) of impacts and spatial extent. (2) Where impacts are under Permittee's control, take management actions to minimize impacts; initiate no later than the second fiscal year following the sampling event.
3 or more chemicals exceed PECs, the mean PEC quotient is > 0.5, or pyrethroids > 1.0 TU	No Toxicity	Indications of alterations	(1) Identify cause of impacts. (2) Where impacts are under Permittee's control, take management actions to minimize the impacts caused by urban runoff; initiate no later than the second fiscal year following the sampling event.
3 or more chemicals exceed PECs, the mean PEC quotient is > 0.5, or pyrethroids > 1.0 TU	Toxicity	No indications of alterations	(1) Take confirmatory sample for toxicity. (2) If toxicity repeated, attempt to identify cause and spatial extent. (3) Where impacts are under Permittee's control, take management actions to minimize upstream sources; initiate no later than the second fiscal year following the sampling event.
3 or more chemicals exceed PECs, the mean PEC quotient is > 0.5, or pyrethroids > 1.0 TU	No Toxicity	No Indications of alterations	If PEC exceedance is Hg or PCBs, address under TMDLs
3 or more chemicals exceed PECs, the mean PEC quotient is > 0.5, or pyrethroids > 1.0 TU	Toxicity	Indications of alterations	(1) Identify cause(s) of impacts and spatial extent. (2) Where impacts are under Permittee's control, take management actions to address impacts.

ATTACHMENT I

Provision C.8.
Standard Monitoring Provisions

All monitoring activities shall meet the following requirements:

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. [40 CFR 122.41(j)(1)]
2. Permittees shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, and copies of all reports required by this Order for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Water Board or USEPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge. [40 CFR 122.41(j)(2), CWC section 13383(a)]
3. Records of monitoring information shall include [40 CFR 122.41(j)(3)]:
   a. The date, exact place, and time of sampling or measurements;
   b. The individual(s) who performed the sampling or measurements;
   c. The date(s) analyses were performed;
   d. The individual(s) who performed the analyses;
   e. The analytical techniques or methods used; and,
   f. The results of such analyses.
4. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or both. [40 CFR 122.41(j)(5)]
5. Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified in the monitoring Provisions. [40 CFR 122.41(l)(4)(iii)]
6. All chemical, bacteriological, and toxicity analyses shall be conducted at a laboratory certified for such analyses by the California Department of Health Services or a laboratory approved by the Executive Officer.
7. For priority toxic pollutants that are identified in the California Toxics Rule (CTR) (65 Fed. Reg. 31682), the Permittees shall instruct its laboratories to establish calibration standards that are equivalent to or lower than the Minimum Levels (MLs) published in Appendix 4 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). If a Permittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Permittee must submit documentation from the laboratory to the Water Board for approval prior to raising the ML for any priority toxic pollutant.
8. The Clean Water Act provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-

compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than six months per violation, or by both. [40 CFR 122.41(k)(2)]

9. If the discharger monitors any pollutant more frequently than required by the Permit, unless otherwise specified in the Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the reports requested by the Water Board. [40 CFR 122.41(l)(4)(ii)]

Standard NPDES Stormwater Permit Provisions

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD SAN FRANCISCO BAY REGION

Standard Provisions and Reporting Requirements for NPDES Stormwater Discharge Permits

February 2009

A. GENERAL PROVISIONS

1. Neither the treatment nor the discharge of pollutants shall create a pollution, contamination, or nuisance as defined by Section 13050 of the California Water Code.

2. All discharges authorized by this Order shall be consistent with the terms and conditions of this Order.

3. Duty to Comply

a. If a toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is established under Section 307(a) of the Clean Water Act, or amendments thereto, for a toxic pollutant which is present in the discharge authorized herein and such standard or prohibition is more stringent than any limitation upon such pollutant in a Board adopted Order, discharger must comply with the new standard or prohibition. The Board will revise or modify the Order in accordance with such toxic effluent standard or prohibition and so notify the discharger.

b. If more stringent applicable water quality standards are approved pursuant to Section 303 of the Clean Water Act, or amendments thereto, the discharger must comply with the new standard. The Board will revise and modify this Order in accordance with such more stringent standards.

c. The filing of a request by the discharger for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition. [40 CFR 122.41(f)]

4. Duty to Mitigate

The discharger shall take all reasonable steps to minimize or prevent any discharge in violation of this order and permit which has a reasonable likelihood of adversely affecting public health or the environment, including such accelerated or additional monitoring as requested by the Board or Executive Officer to determine the nature and impact of the violation. [40 CFR 122.41(d)]

5. Pursuant to U.S. Environmental Protection Agency regulations the discharger must notify the Water Board as soon as it knows or has reason to believe (1) that they have begun or expect to begin, use or manufacture of a pollutant not reported in the permit application,

or (2) a discharge of toxic pollutants not limited by this permit has occurred, or will occur, in concentrations that exceed the limits specified in 40 CFR 122.42(a).

6. The discharge of any radiological, chemical, or biological warfare agent waste is prohibited.

7. All facilities used for transport, treatment, or disposal of wastes shall be adequately protected against overflow or washout as the result of a 100-year frequency flood.

8. Collection, treatment, storage and disposal systems shall be operated in a manner that precludes public contact with wastewater, except where excluding the public is inappropriate, warning signs shall be posted.

9. Property Rights

This Order and Permit does not convey any property rights of any sort or any exclusive privileges. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the discharger from liabilities under federal, state or local laws, nor create a vested right for the discharge to continue the waste discharge or guarantee the discharger a capacity right in the receiving water. [40 CFR 122.41(g)]

10. Inspection and Entry

The Board or its authorized representatives shall be allowed:

a. Entry upon premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of the order and permit;

b. Access to and copy at, reasonable times, any records that must be kept under the conditions of the order and permit;

c. To inspect at reasonable times any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under the order and permit; and

d. To photograph, sample, and monitor, at reasonable times for the purpose of assuring compliance with the order and permit or as otherwise authorized by the Clean Water Act, any substances or parameters at any locations. [40 CFR 122.41(i)]

11. Permit Actions

This Order and Permit may be modified, revoked and reissued, or terminated in accordance with applicable State and/or Federal regulations. Cause for taking such action includes, but is not limited to any of the following:

a. Violation of any term or condition contained in the Order and Permit;

b. Obtaining the Order and Permit by misrepresentation, or by failure to disclose fully all relevant facts;

c. Endangerment to public health or environment that can only be regulated to acceptable levels by order and permit modification or termination; and

d. Any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

12. Duty to Provide Information

The discharger shall furnish, within a reasonable time, any information the Board may request to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit. The discharger shall also furnish to the Board, upon request, copies of records required to be kept by its permit. [40 CFR 122.41(h)]

13. Availability

A copy of this permit shall be maintained at the discharge facility and be available at all times to operating personnel.

14. Continuation of Expired Permit

This permit continues in force and effect until a new permit is issued or the Board rescinds the permit. Only those dischargers authorized to discharge under the expiring permit are covered by the continued permit.

B. GENERAL REPORTING REQUIREMENTS

1. Signatory Requirements

a. All reports required by the order and permit and other information requested by the Board or USEPA Region 9 shall be signed by a principal executive officer or ranking elected official of the discharger, or by a duly authorized representative of that person. [40 CFR 122.22(b)]

b. Certification

All reports signed by a duly authorized representative under Provision E.1.a. shall contain the following certification:
"I certify under penalty of law that this document and all attachments are prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who managed the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations. [40 CFR 122.22(d)]

2. Should the discharger discover that it failed to submit any relevant facts or that it submitted incorrect information in any report, it shall promptly submit the missing or correct information. [40 CFR 122.41(l)(8)]

3. False Reporting

Any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or noncompliance shall be subject to enforcement procedures as identified in Section F of these Provisions.

4. Transfers

a. This permit is not transferable to any person except after notice to the Board. The Board may require modification or revocation and reissuance of the permit to change the name of the Permittee and incorporate such other requirements as may be necessary under the Clean Water Act.

b. Transfer of control or ownership of a waste discharge facility under an National Pollutant Discharge Elimination System permit must be preceded by a notice to the Board at least 30 days in advance of the proposed transfer date. The notice must include a written agreement between the existing discharger and proposed discharger containing specific dates for transfer of responsibility, coverage, and liability between them. Whether an order and permit may be transferred without modification or revocation and reissuance is at the discretion of the Board. If order and permit modification or revocation and reissuance is necessary, transfer may be delayed 180 days after the Board's receipt of a complete application for waste discharge requirements and an NPDES permit.

5. Compliance Reporting

a. Planned Changes

The discharger shall file with the Board a report of waste discharge at least 120 days before making any material change or proposed change in the character, location or volume of the discharge.

b. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final compliance dates contained in any compliance schedule shall be submitted within 10 working days following each scheduled date unless otherwise specified within this order and permit. If reporting noncompliance, the report shall include a description of the reason for failure to comply, a description and schedule of tasks necessary to achieve compliance and an estimated date for achieving full compliance. A final report shall be submitted within 10 working days of achieving full compliance, documenting full compliance

c. Non-compliance Reporting (Twenty-four hour reporting:)

i. The discharger shall report any noncompliance that may endanger health or the environment. All pertinent information shall be provided orally within 24 hours from the time the discharger becomes aware of the circumstances. A written submission shall also be provided within five working days of the time the discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

C. ENFORCEMENT

1. The provision contained in this enforcement section shall not act as a limitation on the statutory or regulatory authority of the Board.

2. Any violation of the permit constitutes violation of the California Water Code and regulations adopted hereunder and the provisions of the Clean Water Act, and is the basis for enforcement action, permit termination, permit revocation and reissuance, denial of an application for permit reissuance; or a combination thereof.

3. The Board may impose administrative civil liability, may refer a discharger to the State Attorney General to seek civil monetary penalties, may seek injunctive relief or take other appropriate enforcement action as provided in the California Water Code or federal law for violation of Board orders.

4. It shall not be a defense for a discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this order and permit.

5. A discharger seeking to establish the occurrence of any upset (See Definitions, G. 24) has the burden of proof. A discharger who wishes to establish the affirmative defense of any upset in an action brought for noncompliance shall demonstrate, through properly signed contemporaneous operating logs, or other relevant evidence that:

a. an upset occurred and that the Permittee can identify the cause(s) or the upset;

b. the permitted facility was being properly operated at the time of the upset;

c. the discharger submitted notice of the upset as required in paragraph E.6.d.; and

d. the discharger complied with any remedial measures required under A.4.

No determination made before an action for noncompliance, such as during administrative review of claims that noncompliance was caused by an upset, is final administrative action subject to judicial review.
In any enforcement proceeding, the discharger seeking to establish the occurrence of any upset has the burden of proof. [40 CFR 122.41(n)]

D. DEFINITIONS

1. DDT and Derivatives shall mean the sum of the p,p' and o,p' isomers of DDT, DDD (TDE), and DDE.

2. Duly authorized representative is one whose:

a. Authorization is made in writing by a principal executive officer or ranking elected official;

b. Authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as general manager in a partnership, manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.); and

c. Written authorization is submitted to the USEPA Region 9. If an authorization becomes no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements above must be submitted to the Board and USEPA Region 9 prior to

or together with any reports, information, or applications to be signed by an authorized representative.

3. Hazardous substance means any substance designated under 40 CFR 116 pursuant to Section 311 of the Clean Water Act.

4. HCH shall mean the sum of the alpha, beta, gama (Lindane), and delta isomers of hexachlorocyclohexane.

5. Overflow is defined as the intentional or unintentional spilling or forcing out of untreated or partially treated wastes from a transport system (e.g. through manholes, at pump stations, and at collection points) upstream from the plant headworks or from any treatment plant facilities.

6. Priority pollutants are those constituents referred to in 40 CFR S122, Appendix D and listed in the USEPA NPDES Application Form 2C, (dated 6/80) Items V-3 through V-9.

7. Storm Water means storm water runoff, snow melt runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

8. Toxic pollutant means any pollutant listed as toxic under Section 307(a)(1) of the Clean Water Act or under 40 CFR S401.15.

9. Total Identifiable Chlorinated hydrocarbons (TICH) shall be measured by summing the individual concentrations of DDT, DDD, DDE, aldrin, BHC, chlordane, endrin, heptachlor, lindane, dieldrin, PCBs and other identifiable chlorinated hydrocarbons.

10. Waste, waste discharge, discharge of waste, and discharge are used interchangeably in this order and permit. The requirements of this order and permit are applicable to the entire volume of water, and the material therein, which is disposed of to surface and ground waters of the State of California.

Order No. R2-2009-0074
Municipal Regional Stormwater Permit
Attachment B

HMP susceptibility map

Alameda Countywide
Clean Water Program
January 26, 2007
(Sept. 2009 correction)

LEGEND (see text also)

- Major highways
- Major watersheds
- County boundary
- Streets

Channel type

- Natural creek or stream (susceptible)
- Earthen channel or connector
- Engineered channel - materials unknown
- Engineered channel - concrete
- Enclosed pipe or culvert

- Special consideration - San Lorenzo & Alameda Creeks
- Special consideration - Codornices Creek
- Hill or high slope region (susceptible)
- Tidally influenced / depositional - exempt
- Not included in HMP

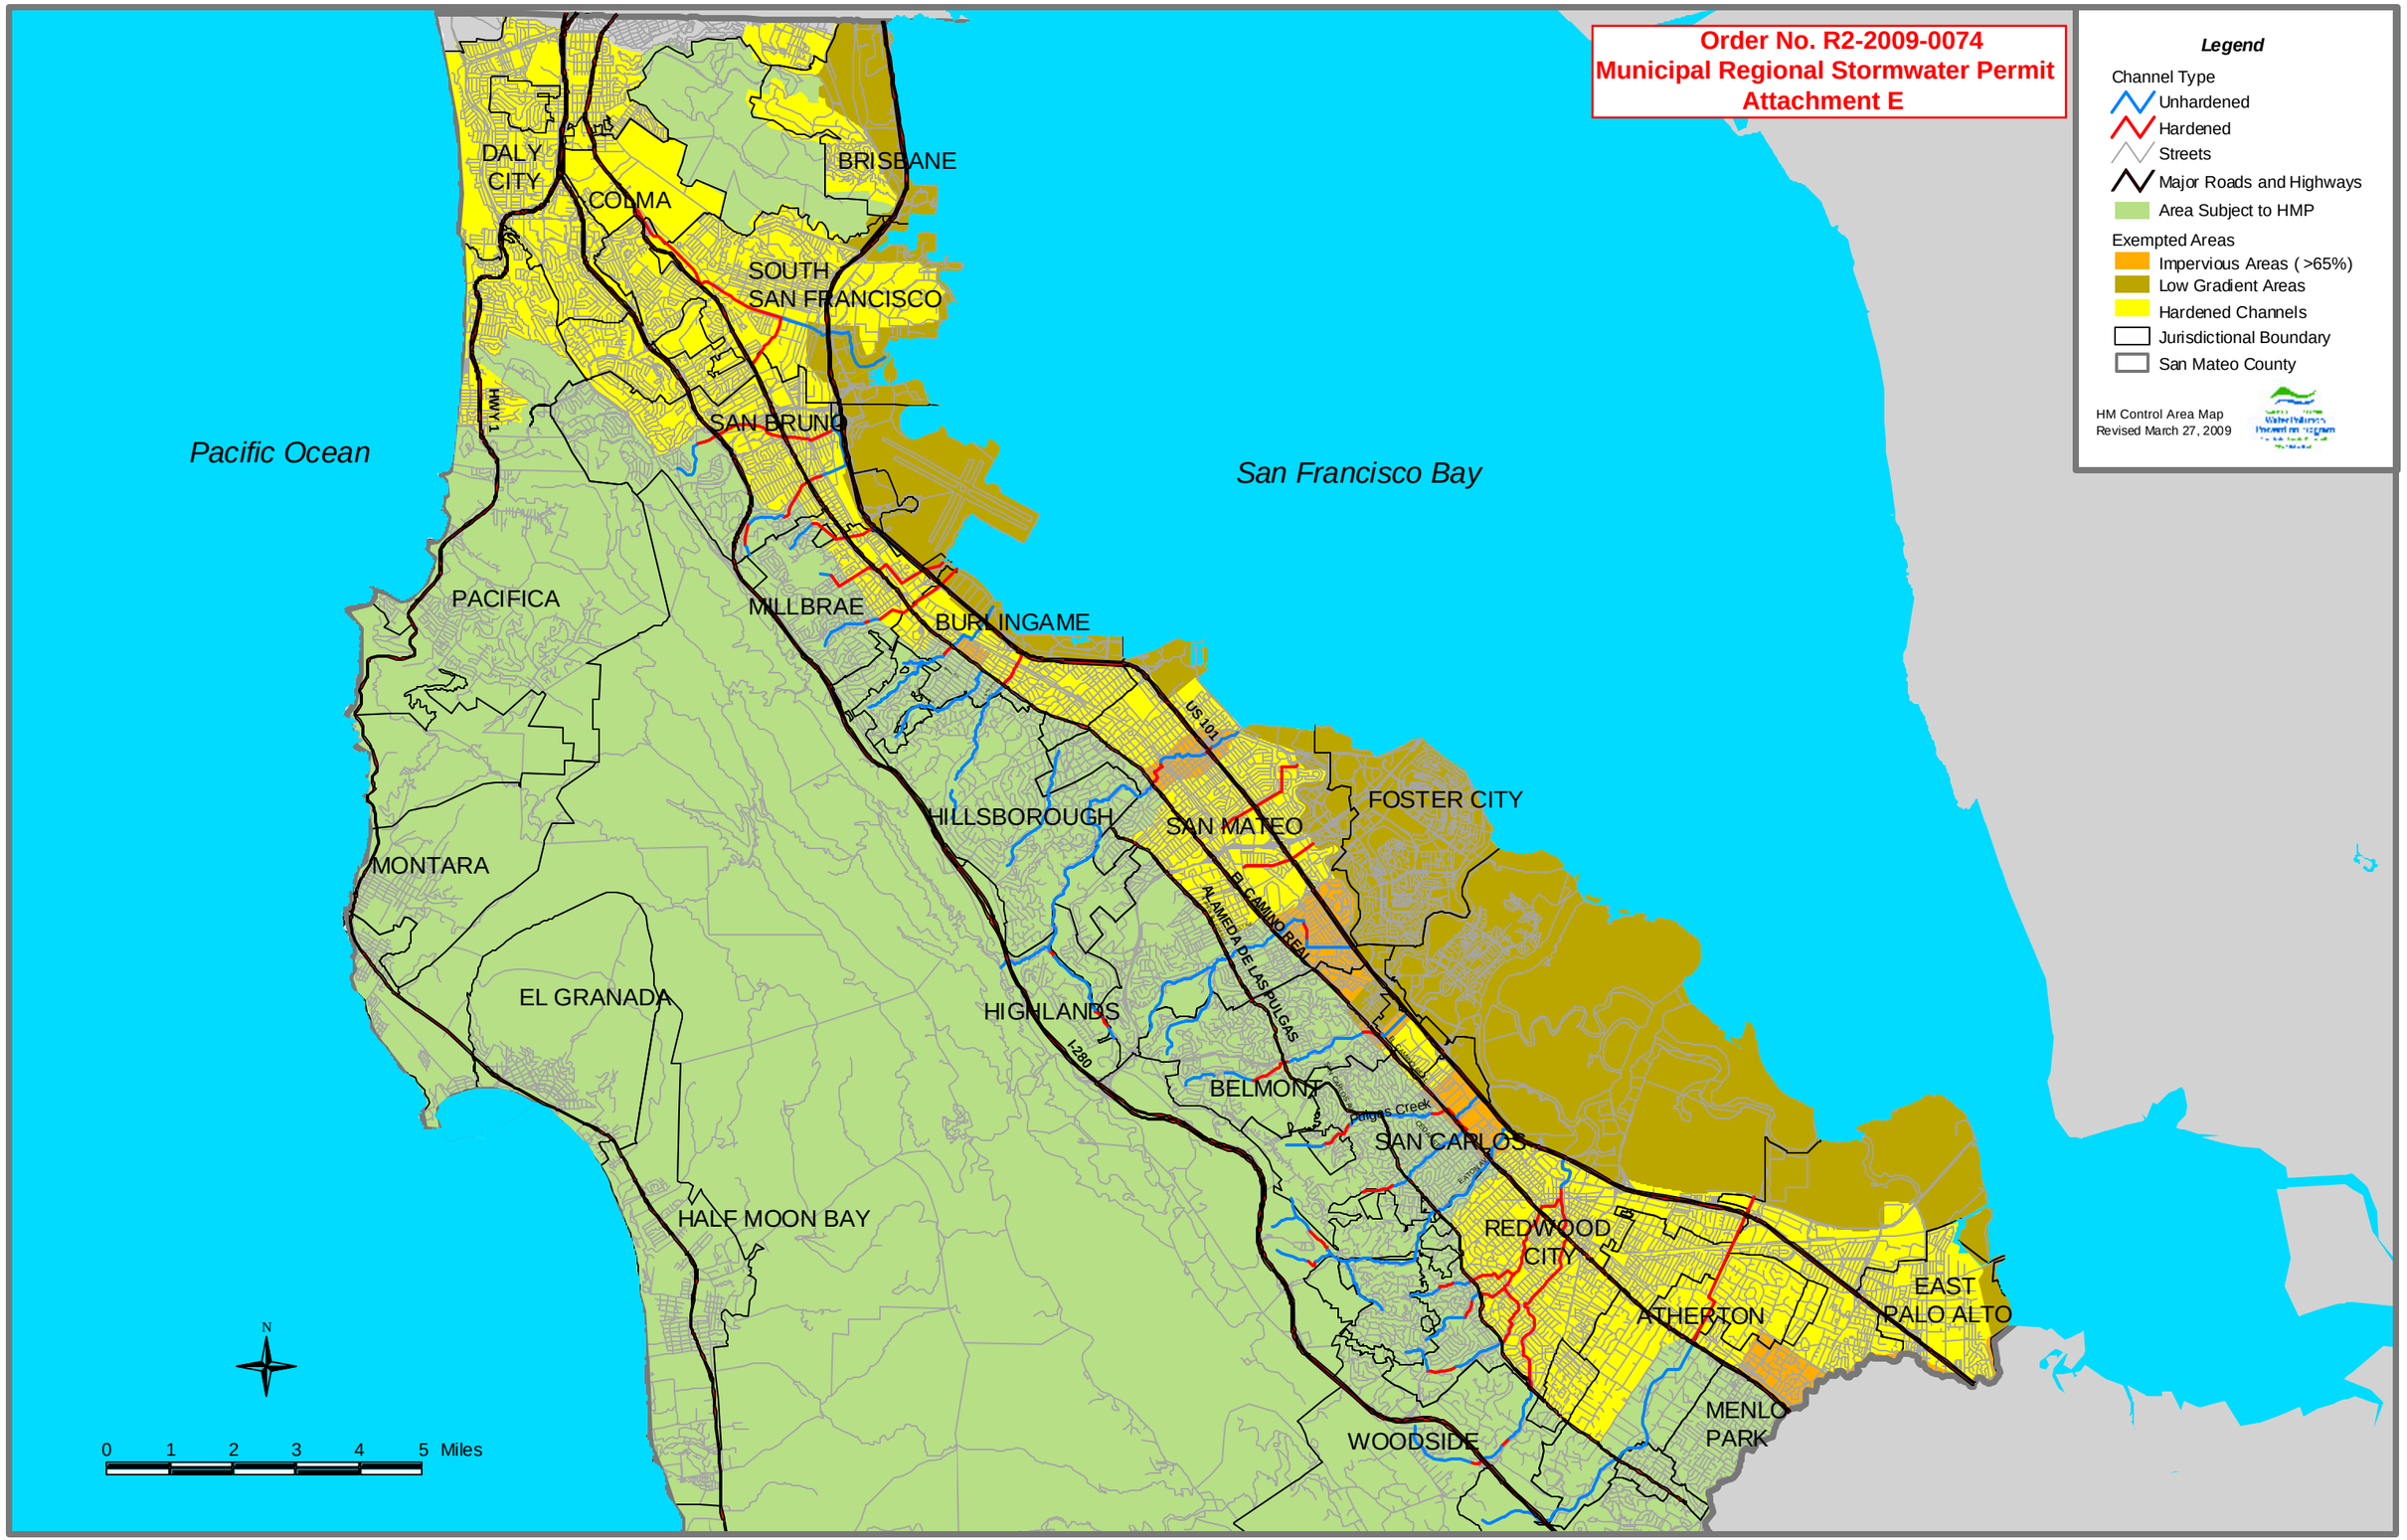
Basemap data provided by Fairfield-Suisun Sewer District. Note that the roads layer does not include the most recently urbanized areas, as shown in the aerial photo.



Balance Hydrologics, Inc.

Figure 3. Map showing HMP channel Classification for the Ledgewood Creek watershed. The mid- to upper reaches include all channels within the watershed that are susceptible to hydromodification effects (dotted and gray-shaded channels on this map), however areas outside the City of Fairfield are not included in this permit unless annexed by the city. The non-developed areas within the current city limits are designated open space in relatively steep terrain, and are unlikely to be converted to urban areas however the HMP still applies in these areas.
