EXECUTIVE SUMMARY

This study evaluates the transportation impacts of the Marketplace Redevelopment Project (Project), a mixed use development in the City of Emeryville.

PROJECT DESCRIPTION

The Project is a proposed mixed-use development containing residences, offices, a movie theater, retail shops and restaurants. The redevelopment plan would increase the retail/restaurant square footage by up to 77,000 square feet and provide up to 340 residential units in addition to structured parking and reconfiguration of the surface parking area. The project would be phased to ensure adequate parking supplies are provided for existing site uses during construction. The Project site is generally bound by 64th Street to the north, the Southern Pacific Railroad to the east, Powell Street to the south and Christie Avenue to the west. Project site access would be provided by driveways on Shellmound Street, Christie Avenue, and 64th Street.

STUDY INTERSECTIONS AND FORECAST SCENARIOS

Project impacts to the roadway system were identified by evaluating the morning (7:00 – 9:00 AM) and evening (4:00 – 6:00 PM) peak period operations of selected intersections (listed below) under six scenarios. The Saturday peak period (2:00 – 4:00 PM) was evaluated at 15 study intersections (these locations are noted below with an asterisk). Operations at the driveways that serve the site were also evaluated for the AM, PM, and Saturday peak periods. The following 28 study intersections were selected in consultation with the City of Emeryville staff, as these are considered most likely to experience traffic impacts resulting from the project:

1. Ashby Avenue/7th Street
2. Ashby Avenue/San Pablo Avenue
3. 65th Street/Christie Avenue*
4. 65th Street/Shellmound Street*
5. 65th Street/Overland Avenue*
6. 65th Street/Hollis Street
7. 64th Street/Christie Avenue*
8. 64th Street/Shellmound Street*
9. Shellmound Way/Christie Avenue*
10. Shellmound Way/Shellmound Street*
11. I-80 Hook Ramps/Frontage Road*
12. Powell Street/Frontage Road*
13. Powell Street/I-80 Eastbound Ramps*
14. Powell Street/Christie Avenue *
15. Christie Avenue/Shellmound Street*
16. Powell Street/Hollis Street*
17. Stanford Avenue/San Pablo Avenue
18. 40th Street/Horton Street
19. 40th Street/Hollis Street
20. 40th Street/Harlan Street
21. 40th Street/Emery Street*
22. 40th Street/San Pablo Avenue*
23. 40th Street/Adeline Street
24. Mandela Pkwy/Horton Street
25. MacArthur Boulevard/Emery Street
26. Adeline Street/San Pablo Avenue
27. 36th Street/San Pablo Avenue
28. 35th Street/San Pablo Avenue

1. ***Existing Conditions*** – Existing peak hour conditions based on recent traffic volumes and existing roadway network.
2. ***Future Year 2010 Conditions*** – Existing peak hour traffic volumes plus estimated trips from approved and pending projects in the vicinity of the study area which are likely to be constructed by 2010.
3. ***Future Year 2030 Conditions*** – Existing peak hour traffic volumes plus estimated trips from approved and pending projects in the vicinity of the study area which are likely to be constructed by 2030.

4. ***Existing Plus Project Conditions*** – Existing peak hour conditions as described above plus trips generated by the proposed project.
5. ***Future Year 2010 plus Project Conditions*** – Future Year 2010 Conditions as described above plus trips generated by the proposed project.
6. ***Future Year 2030 plus Project Conditions*** – Future Year 2030 Conditions as described above plus trips generated by the proposed project.

FINDINGS AND RECOMMENDATIONS

Off-Site Findings

Off-site impacts were identified for the Existing, 2010 and 2030 Plus Project condition and are summarized below:

Existing Plus Project

Impact Statement 1a: The ***I-80 EB Ramps/Powell Street*** intersection currently operates at LOS E during the PM peak hour and Saturday peak hour. The addition of project traffic would worsen the service level to LOS F during the PM peak hour and increase delay by 10 seconds. On Saturday, the addition of project traffic would increase delay by 8 seconds. The addition of project traffic would also increase the 95th percentile queue lengths for several approaches that currently exceed or are projected to exceed the available storage capacity during the weekday PM and Saturday afternoon peak hours. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 1a: Modify the intersection to:

a. Reconstruct the off-ramp to provide dual left-turn and dual right-turn lanes. The additional lane should be 600 to 900 feet, depending on design parameters stipulated by Caltrans.

b. Reconstruct the southeast corner of the Powell Street/I-80 Eastbound Ramps intersection improving the curb radii to 40 feet.

c. Widen the north side of Powell Street 12 to 14 feet between Christie Avenue and Eastbound I-80 Ramps to align westbound Powell Street through lanes across the intersection with Eastbound I-80 Ramps. This improvement will also allow the widening of the eastbound right-turn lane at the Powell Street/Christie Avenue intersection to 14 feet and construction of a pedestrian median refuge on the west side of the Powell Street/Christie Avenue intersection. This change requires right-of-way along the north side of Powell Street between Christie Avenue and the I-80 Eastbound On-Ramp.

This recommendation should be implemented with Mitigation Measure 3 to provide corridor benefits.

This impact also occurs in the 2010 and 2030 scenarios and can be attributed to existing traffic in the area, as well as traffic from approved, planned, and potential developments in and around Emeryville. Therefore, it is recommended that the City update the Traffic Impact Fee Program to include this recommendation, and that the Project Applicant contribute their fair share to these improvements through the payment of fees. Additionally, it should be noted that right-of-way for this improvement is reliant on the redevelopment of the adjacent parcels and the improvements can be phased to provide interim benefit as right-of-way becomes available.

The Project impact would be reduced to a ***less-than-significant*** level. However, as the intersection is within the Caltrans right-of-way and the City cannot assure the implementation of this measure, the impact may remain ***significant and unavoidable***.

Impact Statement 1b: Many elements of the project would help minimize the number of vehicle trips that could result from the proposed project and minimize the project's adverse impact on intersection operations. The project proposes to construct a mixture of uses, within a mixed use environment. Class II bicycle lanes are provided adjacent to the project site, with bicycle parking proposed. A minimum of ten foot side walks and marked pedestrian crossings would be provided as part of the project. The site is well served by transit. Shared parking between residential guest parking and retail parking is proposed to minimize the total parking supply. Implementation of a formal Transportation Demand Management Plan (TDM) could further minimize the project's impacts on traffic and circulation. However, the requirement to implement a formal Transportation Demand Management Plan (TDM) could further minimize the project's impacts on traffic and circulation.

Mitigation Measure 1b: Implementation of the following mitigation measure would minimize the project's impacts on intersection operation; however as it is difficult to quantify the effects of TDM measures implementation of this measure alone would not reduce project impacts to a less-than-significant level.

The project applicant shall prepare and implement a comprehensive transportation demand management (TDM) program that includes the following elements to encourage and enhance alternate modes of travel:

- Transit amenities, including bus pull-outs, transit information and ticket kiosks, and discounted transit passes for employees and residents.
- Carpool/vanpool support, including preferential parking spaces and ride-matching programs.
- Carshare support, including free parking spaces, on-site information and advertising, and discounted rates/long-term contracts.
- Bicycle amenities, including bicycle parking racks, pilot bicycle rental program, new bicycle paths, and shower/locker facilities.

In addition, the TDM plan should discourage automobile use by incorporating the following elements:

- Residential parking spaces should be unbundled from the units.
- All non-residential parking should be paid parking.
- Monthly parking permits should not be provided for employees.

Provision of car sharing facilities on-site could help reduce auto ownership amongst future residents/tenants of the building and encourage alternative modes for trips generated by the site. The TDM program shall be submitted to City staff for review and acceptance prior to approval of any Final Development Plans.

Impact Statement 2: The ***Shellmound Street/65th Street*** intersection currently operates at LOS E during the PM peak hour. With the addition of project traffic, the intersection would degrade to LOS F, resulting in a ***significant*** impact. However, a traffic signal was recently installed at this intersection, resulting in LOS B operations during the PM and Saturday peak hours with the addition of the project traffic. Therefore, as a traffic signal has been installed at this location, the project impact is ***less-than-significant***.

Mitigation Measure 2: No improvements are recommended.

Impact Statement 3: The ***Powell Street/Christie Avenue*** intersection operates at an acceptable service level, both without and with the Project. However, vehicle queue spillback affects overall intersection and system operations. The addition of project traffic would exacerbate existing queuing problems during the weekday PM and Saturday afternoon peak hours, contributing to poor operations on some intersection approaches. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 3: Modify the intersection to:

a. Reconstruct the westbound approach to provide a second left turn lane. The resulting two left turn lanes should be 250 feet in length. The south side of the Powell Street bridge would need to be widened by about 12 feet to accommodate the second left turn lane.

b. Reconstruct the southbound approach to provide a southbound left-turn lane (in addition to the shared left-through lane). The lane would extend from Powell Street back to Shellmound Way. This change would require widening the west side of Christie Avenue by about 12 feet. This change requires right-of-way along the west side of Christie Avenue.

c. Re-time the Powell/Christie Loop signalized intersections to coordinate the critical movements through the intersection.

These recommendations should be implemented with Mitigation Measures 1a and 1b to provide corridor benefits.

These improvements would reduce the queuing impact to a ***less-than-significant*** level. Each of the changes requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired.

This impact also occurs in the 2010 and 2030 scenarios and can be attributed to existing traffic in the area, as well as traffic from approved, planned, and potential developments in and around Emeryville. Therefore, it is recommended that the City update the Traffic Impact Fee Program to include this recommendation, and that the Project Applicant contribute their fair share to these improvements through the payment of fees. Additionally, it should be noted that right-of-way for this improvement is reliant on the redevelopment of the adjacent parcels and the improvements can be phased to provide interim benefit as right-of-way becomes available.

<u>2010 Plus Project</u>

Impact Statement 4: The ***I-80 EB Ramps/Powell Street*** intersection is projected to operate at F during the PM peak hour and Saturday peak hour in 2010. The addition of project traffic would increase delay by more than 4 seconds during both the PM and Saturday peak hours. The addition of project traffic would also increase the 95th percentile queue lengths for several approaches that currently exceed or are projected to exceed the available storage capacity during the weekday PM and Saturday afternoon peak hours. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 4: Implement Mitigation Measures 1a and 1b. Implementation of these measures would reduce the impact to a ***less-than-significant*** level. However, as the intersection is within the Caltrans right-of-way and the City cannot assure the implementation of this measure, the impact may remain ***significant and unavoidable***. This recommendation should be implemented with Mitigation Measure 3 to provide corridor benefits.

Impact Statement 5: The ***Shellmound Way/Christie Avenue*** intersection is projected to operate at an acceptable service level both without and with the project in 2010. However, the addition of project traffic would result in the westbound left-turn movements exceeding the available storage length and spilling back to Shellmound Street during the Saturday peak hour. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 5:*** Implement Mitigation Measures 1b and 3. Implementation of these measures would reduce the impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired.

Impact Statement 6: The ***Shellmound Way/Shellmound Street*** intersection is projected to operate at an acceptable service level both without and with the project in 2010. However, the addition of project traffic would result in the 95th percentile eastbound vehicle queues exceeding the available storage, resulting in vehicle queue spillback to Christie Avenue during the Saturday peak hour. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 6:*** Implement Mitigation Measures 1b and 3. Implementation of these measures would reduce the impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired.

Impact Statement 7: The ***Powell Street/Christie Avenue*** intersection operates at an acceptable service level, both without and with the Project. However, vehicle queue spillback affects overall intersection and system operations. The addition of project traffic would exacerbate existing queuing problems, contributing to poor operations for the southbound through movement, the westbound right-turn movement and the eastbound right-turn movement during the weekday PM and Saturday afternoon peak hours. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 7:*** Implement Mitigation Measures 1b and 3. Implementation of these measures would reduce the project impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired. This recommendation should be implemented with Mitigation Measure 1a to provide corridor benefits.

2030 Plus Project

Impact Statement 8: The ***Shellmound Street/65th Street*** and the ***Overland Street/65th Street*** will operate as one intersection in 2030 and is projected to operate at a service level F with an overall average delay of 96 seconds during the PM peak hour. The addition of project trips during the weekday PM peak hour would increase overall intersection delay to 102 seconds, a six second increase. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact. Additionally, the intersection would experience deficient operations when a train crosses over 65th Street.

> ***Mitigation Measure 8***: Modify signal operations to provide protected/permitted left-turns on the southbound Shellmound Street approach. Implementation of this measure would improve the overall intersection operations to LOS E in the PM peak hour in 2030, reducing the impact to a ***less-than-significant*** level.

This impact can be attributed to existing traffic in the area, as well as traffic from approved, planned, and potential developments in and around Emeryville. Therefore, it is recommended that the City update the Traffic Impact Fee Program to include this recommendation, and that the Project Applicant contribute their fair share to these improvements through the payment of fees.

Impact Statement 9: The ***Ashby Avenue/San Pablo Avenue*** intersection is projected to operate at a service level F with an overall average delay of 128 seconds during the PM peak hour in 2030. The addition of project trips during the weekday PM peak hour would increase overall intersection delay to 135 seconds, a seven second increase. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 9: To reduce this impact to a less than significant level, the intersection would have to modified, when traffic conditions warrant, to provide dual northbound left-turn lanes similar to the northbound left-turn lane design on San Pablo Avenue at 40th Street. Construction of this improvement would require elimination of on-street parking along San Pablo Avenue approaching the intersection. Relocation of bus stops for buses operating along San Pablo Avenue would also be required.

The applicant shall pay a fee based on its fair share of the project's anticipated growth in traffic to the intersection toward the cost to implement this improvement. The payment shall be made to the City of Emeryville, for the benefit of the City of Berkeley, prior to issuance of the temporary certificate of occupancy for the last building. However, this intersection is located in the City of Berkeley and is also under the jurisdiction of Caltrans, since both Ashby Avenue and San Pablo Avenue are state highways at this intersection. Therefore, the final selection of the appropriate intersection design, as well as implementation of the modifications, are not within the jurisdiction of the City of Emeryville. Therefore, this impact would remain ***significant and unavoidable***.

Impact Statement 10: The ***I-80 EB Ramps/Powell Street*** intersection is projected to operate at F during the PM peak hour and Saturday peak hour in 2030. The addition of project traffic would increase delay by more than 4 seconds during both the PM and Saturday peak hours. The addition of project traffic would also increase the 95th percentile queue lengths for several approaches that currently exceed or are projected to exceed the available storage capacity during both the PM and Saturday peak hours. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 10: Implement Mitigation Measure 1a and 1b. Implementation of this measure would reduce the project impact to a ***less-than-significant*** level. However, as the intersection is within the Caltrans right-of-way and the City cannot assure the implementation of this measure, the impact may remain ***significant and unavoidable***. This recommendation should be implemented with Mitigation Measure 3 to provide corridor benefits.

Impact Statement 11: The ***Powell Street/Hollis Street*** intersection is projected to operate at a service level F with an overall average delay of 114 seconds during the PM peak hour in 2030. The addition of project trips during the weekday PM peak hour would increase overall intersection delay to 120 seconds, a six second increase. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 11: Implement simultaneous left-turn signal phasing for the north/south left turn movements. This will require a five to six foot lane shift for northbound Hollis Street traffic approaching Powell Street and reconstruction of the southwest corner of the intersection to accommodate tractor-trailer trucks making a right-turn from Powell Street to Hollis Street. The lane shift will require right-of-way

along the west side of Hollis Street. Implementation of this measure would reduce the project impact to a ***less-than-significant*** level.

This impact can be attributed to traffic from approved, planned, and potential developments in and around Emeryville. Therefore, it is recommended that the City update the Traffic Impact Fee Program to include the recommendation, and that the Project Applicant contribute their fair share to these improvements through the payment of fees. Additionally, it should be noted that right-of-way for this improvement is reliant on the redevelopment of the adjacent parcels. Should the needed right-of-way not be acquired, the impact would remain ***significant and unavoidable***.

Impact Statement 12: The ***Shellmound Way/Christie Avenue*** intersection is projected to operate at an acceptable service level both without and with the project in 2030. However, the addition of project traffic would result in the westbound left-turn movements exceeding the available storage length and spilling back to Shellmound Street during the Saturday peak hour. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 12: Implement Mitigation Measures 1b and 3. Implementation of these measures would reduce the project impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired.

Impact Statement 13: The ***Powell Street/Christie Avenue*** intersection operates at an acceptable service level, both without and with the Project. However, vehicle queue spillback affects overall intersection and system operations. The addition of project traffic would exacerbate existing queuing problems, contributing poor operations on some intersection approaches during the Saturday peak hour. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 13: Implement Mitigation Measures 1a and 3. Implementation of these measures would reduce the project impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired. This recommendation should be implemented with Mitigation Measure 1a to provide corridor benefits.

Impact Statement 14: The addition of project traffic would result in deficient LOS F operations at the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway intersection as well as at the Woodfin Hotel driveway with buildout of the project parcels on the west side of Shellmound Street. This is a potentially ***significant impact***.

Mitigation Measure 14: In conjunction with construction on the Shellmound site, a traffic signal shall be installed at the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway intersection. The driveways shall be modified to provide sufficient vehicle storage to minimize vehicle queue spill back from impeding on-site circulation. Implementation of this measure would result in acceptable service levels during the peak hours. However, the 95th percentile queue for the northbound movements would periodically spillback through the pedestrian crossing and from the pedestrian crossing through the Woodfin Driveway, and Shellmound Way. Minimizing the effect of queue spillback could be achieved through monitoring of the signal timings. It should be noted that the Shellmound Street corridor from Shellmound Way through the Marketplace Driveway would operate better in the mitigated scenario than

the unmitigated scenario even though vehicle queues would periodically spill back through the corridor, resulting in a ***significant and unavoidable*** queuing impact on the Shellmound Street corridor.

Impact Statement 15: The addition of project traffic would worsen side street operations at the Shellmound Street/Woodfin Hotel/Marketplace Driveway intersection to LOS F with buildout of the project. This is a potentially ***significant impact***.

Mitigation Measure 15: The driveway serving the Woodfin Hotel cannot accommodate significant additional traffic flows. It is recommended that the parking area serving the new land uses on the Shellmound site be designed to orient the majority of outbound traffic, about 80 percent, away from the shared driveway. Alternatively, this driveway could be restricted right-in/right-out operation. With right-in/right-out operation, the worst movement would operate at LOS C and the intersection would operate at an overall LOS A during both the weekday PM and Saturday afternoon peak hours. However, restricting access to this parcel could potentially create circuitous travel through the area, and would reduce access to/from the Woodfin Hotel. Therefore, access restrictions are not recommended, resulting in a ***significant and unavoidable*** impact.

Impact Statement 16: Vehicle queues at the pedestrian crossing are expected to increase as pedestrian activity increases around the project site. This queuing contributes to deficient operations at the Shellmound Street/Woodfin Hotel/Marketplace Driveway and the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway. This is a potentially ***significant impact***.

Mitigation Measure 16: Install a pedestrian signal at the pedestrian crossing on Shellmound Street. Through design treatments, such as sidewalk railings and landscaping, consolidate pedestrian activity from the Shellmound Street/Woodfin Hotel/Marketplace Driveway and the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway to the pedestrian crossing. The pedestrian signal shall be interconnected and coordinated with the signal at the Shellmound Street/Shellmound Way intersection and the Shellmound Street/Marketplace Driveway/ Shellmound Garage intersection. Implementation of this measure would reduce the project impact to a ***less-than-significant*** level. It should be noted that the Shellmound Street corridor from Shellmound Way through the Marketplace Driveway would operate better in the mitigated scenario than the unmitigated scenario even though vehicle queues would periodically spill back through the corridor, resulting in a ***significant and unavoidable*** queuing impact on the Shellmound Street corridor. However, the installation of a pedestrian signal would improve pedestrian safety across Shellmound Street as traffic volumes increase through the corridor, reducing the pedestrian impact to a ***less-than-significant*** level.

Impact Statement 17: With signalization of the Shellmound Street/Shellmound Site Garage Driveway/ Marketplace Driveway intersection, the design of the garage entry would not provide sufficient vehicle storage. Additionally, as vehicles queue internally, access to parking areas could be blocked, creating the potential for vehicle queues onto Shellmound Street. This is a potentially ***significant impact***.

Mitigation Measure 17: Redesign the Shellmound building garage entrance area to minimize vehicle conflicts and provide sufficient vehicle storage at the access intersection. Implementation of this measure would reduce the project impact to a ***less-than-significant*** level.

Alternative Mode Findings

Transit, pedestrian and bicycle access to and around the site was reviewed. The following are recommendations to improve alternative mode access to the site:

- The project applicant shall continue contributions to the Emery Go Round system, as currently performed under the Property based Business Improvement District (PBID). Contributions are based on building square footage. Therefore, as development occurs, contributions would increase.

- Reorient Route 57 through the study area in conjunction with providing a formal layover with bathroom facilities for AC Transit drivers. Provide a bus layover on the south side of 64th Street, with bathroom access provided to AC Transit drivers at the proposed retail portion of the 64th & Shellmound building. Provide a bus stop with a pullout on the east side of Shellmound Street, north of the pedestrian crossing, for northbound buses. Provide a southbound bus stop on the west side of Shellmound Street, south of the Shellmound Street/Marketplace driveway.

- Concentrate pedestrian crossing movements through design treatments to the mid-block crossing on Shellmound Street. Provide a pedestrian signal at the mid-block Shellmound Street crosswalk to consolidate pedestrian movements and maintain vehicle flows through the corridor. Construct sidewalks a minimum of 10 feet wide and provide appropriate landscaping along Shellmound Street to maintain pedestrian visibility and sight distance.

- Reorient the crosswalk across Shellmound Street at the Woodfin Hotel/Marketplace driveway intersection perpendicular to the travel way to reduce pedestrian exposure.

- The Shellmound Building elevators proposed to serve the Amtrak pedestrian bridge should be large enough to accommodate bicyclists.

- As the project is developed, the provision of additional bicycle parking spaces is recommended as demand warrants. Three distinct types of bicycle parking shall be provided: 1) secured bicycle lockers on the upper levels of the garage reserved for resident use only; 2) secured bicycle lockers on the lower levels of the garage for employee parking; and 3) bicycle parking on the ground floor reserved for retail patrons.

On-Site Findings

On-site circulation was reviewed in terms of driveway operations, delivery vehicle access, parking stall dimensions, parking garage design. Recommendations to improve site access and circulation are below.

- In conjunction with construction on the Shellmound site, a traffic signal shall be installed at the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway intersection. The driveways shall be modified to provide sufficient vehicle storage to minimize vehicle queue spill back from impeding on-site circulation. Implementation of this measure would result in acceptable service levels during the peak hours. However, the 95th percentile queue for the northbound movements would periodically spillback through the pedestrian crossing and from the pedestrian crossing through the Woodfin Driveway, and Shellmound Way. Minimizing the effect of queue spillback could be achieved through monitoring of the signal timings. It should be noted that the Shellmound Street corridor from Shellmound Way through the Marketplace Driveway would operate better in the mitigated scenario than the unmitigated scenario even though vehicle queues would periodically spill back through the corridor.

- The driveway serving the Woodfin Hotel cannot accommodate significant additional traffic flows. It is recommended that the parking area serving the new land uses on the Shellmound site be designed to orient the majority of traffic, about 80 percent, away from the shared driveway. Alternatively, this driveway could be restricted right-in/right-out operation.

- Install a pedestrian signal at the pedestrian crossing on Shellmound Street. Using design treatments, consolidate pedestrian activity from the Shellmound Street/Woodfin Hotel/Marketplace Driveway and the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway to the pedestrian crossing. The pedestrian signal shall be interconnected and coordinated with the signal at the Shellmound Street/Shellmound Way intersection and the Shellmound Street/Marketplace Driveway/Shellmound Garage intersection. It should be noted that the Shellmound Street corridor from Shellmound Way through the Marketplace Driveway would operate better in the mitigated scenario than the unmitigated scenario even though vehicle queues would periodically spill back through the corridor. Additionally, the installation of a pedestrian signal would improve pedestrian safety across Shellmound Street as traffic volumes increase through the corridor.

- Reconfigure the parking area adjacent to retail pad #2 to provide sufficient space for vehicles to back out of the last spaces in each row.

- Review delivery vehicle access prior to approval of the final site plan.

- Redesign assigned resident parking stalls to meet standard City dimensions, as some reserved resident stalls are designated compact.

- Review the ramping system of the 64th & Christie building garage during permit approval to ensure compliance with City of Emeryville design guidelines.

- Design the parking garages with roll up gates as an improperly parked or oversized vehicle could interfere with the function of a swinging or sliding gate.

- Relocate the residential gates to minimize dead-end drive aisles or provide sufficient space for a vehicle turn around.

- Redesign the Shellmound building garage entrance area to minimize vehicle conflicts and provide sufficient vehicle storage at the access intersection.

- Reconfigure guest parking in the Shellmound Street garage to provide sufficient space for vehicles to back out of the last spaces in each row.

- Install a parking space counting system at the Shellmound building garage to minimize excessive circulation through the site.

1. INTRODUCTION

This report presents the findings, recommendations, and conclusions of the Transportation Impact Analysis (TIA) for the Marketplace Redevelopment project (the "Project") in Emeryville, California. This chapter discusses the study purpose, analysis methods, criteria used to identify significant impacts, and report organization.

STUDY PURPOSE

The study purpose is to evaluate the transportation impacts of the proposed Marketplace Redevelopment project, a mixed-use development containing offices, a movie theater, retail shops and restaurants. The redevelopment plan would increase the retail/restaurant square footage by up to 77,000 square feet and provide up to 340 residential units in addition to structured parking and reconfiguration of the surface parking area. The project would be phased to ensure adequate parking supplies are provided for existing site uses during construction. The Project site is generally bound by 64th Street to the north, the Southern Pacific Railroad to the east, Powell Street to the south and Christie Avenue to the west, as shown on Figure 1. The conceptual site plan is shown on Figure 2. Project site access would be provided by driveways on Shellmound Street, Christie Avenue, and 64th Street.

STUDY INTERSECTIONS AND FORECAST SCENARIOS

Project impacts to the roadway system were identified by evaluating the morning (7:00 – 9:00 AM) and evening (4:00 – 6:00 PM) peak period operations of selected intersections (listed below) under six scenarios. The Saturday peak period (2:00 – 4:00 PM) was evaluated at 15 study intersections (these locations are noted below with an asterisk). Operations at the driveways that serve the site were also evaluated for the AM, PM, and Saturday peak periods. The following 28 study intersections (shown on Figure 1) were selected in consultation with the City of Emeryville staff, as these are considered most likely to experience traffic impacts resulting from the project:

1. Ashby Avenue/7th Street
2. Ashby Avenue/San Pablo Avenue
3. 65th Street/Christie Avenue*
4. 65th Street/Shellmound Street*
5. 65th Street/Overland Avenue*
6. 65th Street/Hollis Street
7. 64th Street/Christie Avenue*
8. 64th Street/Shellmound Street*
9. Shellmound Way/Christie Avenue*
10. Shellmound Way/Shellmound Street*
11. I-80 Hook Ramps/Frontage Road*
12. Powell Street/Frontage Road*
13. Powell Street/I-80 Eastbound Ramps*
14. Powell Street/Christie Avenue *
15. Christie Avenue/Shellmound Street*
16. Powell Street/Hollis Street*
17. Stanford Avenue/San Pablo Avenue
18. 40th Street/Horton Street
19. 40th Street/Hollis Street
20. 40th Street/Harlan Street
21. 40th Street/Emery Street*
22. 40th Street/San Pablo Avenue*
23. 40th Street/Adeline Street
24. Mandela Pkwy/Horton Street
25. MacArthur Boulevard/Emery Street
26. Adeline Street/San Pablo Avenue
27. 36th Street/San Pablo Avenue
28. 35th Street/San Pablo Avenue

1. ***Existing Conditions*** – Existing peak hour conditions based on traffic volumes collected in 2005 and 2006 and the existing roadway network in place at the time of data collection.
2. ***Future Year 2010 Conditions*** – Existing peak hour traffic volumes plus estimated trips from approved and pending projects in the vicinity of the study area which are likely to be constructed by 2010.

3. ***Future Year 2030 Conditions*** – Existing peak hour traffic volumes plus estimated trips from approved and pending projects in the vicinity of the study area which are likely to be constructed by 2030.
4. ***Existing Plus Project Conditions*** – Existing peak hour conditions as described above plus trips generated by the proposed project.
5. ***Future Year 2010 plus Project Conditions*** – Future Year 2010 Conditions as described above plus trips generated by the proposed project.
6. ***Future Year 2030 plus Project Conditions*** – Future Year 2030 Conditions as described above plus trips generated by the proposed project.

Other intersections were considered for this analysis, including:

- Christie Avenue/Powell Street Way
- Shellmound Street/Ohlone Way
- Shellmound Street/Bay Street
- Shellmound Street/Ikea Exit
- Shellmound Street/Ikea Entrance

Other studies prepared by Fehr & Peers evaluated these intersections, which are all projected to operate acceptability through 2030 with the addition of traffic from planned and pending projects, including the Marketplace project, and regional growth. As these intersections are projected to operate at acceptable service levels, no additional analysis was performed.

LEVEL OF SERVICE METHODS

Traffic operations at intersections are typically described in terms of "Level of Service" (LOS). LOS is a qualitative measure of the effect of several factors on traffic operating conditions including speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort, and convenience. It is generally measured in terms of vehicular delay and described using a scale that ranges from LOS A to F, where LOS A represents free-flow conditions and LOS F indicates over-capacity conditions with substantial congestion and delay. The analysis of operating conditions at the study intersections was conducted using methods documented by the Transportation Research Board (TRB) in the 2000 *Highway Capacity Manual (HCM)*. For intersections, LOS is based on "control delay." Control delay is defined as the delay directly associated with the traffic control device (i.e., a stop sign or a traffic signal) and specifically includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. These delay estimates are considered meaningful indicators of driver discomfort and frustration, fuel consumption and lost travel time.

Micro-simulation was considered to evaluate operations on the Powell-Christies loop where vehicle queue spill-back can impact the operation of adjacent intersections during periods of peak congestion. Micro-simulation models follow the behavior of individual vehicles through the entire system, which is what generally makes them superior to macroscopic models such as Synchro. However, when vehicle demand exceeds the vehicle capacity of the system, which is what is expected in Emeryville in the future, the micro-simulation model begins to meter traffic flow entering the system. When traffic demand is metered into the system, the results from the simulation model often become meaningless. The study area is fairly large and as a result there is one major unintended consequence of using simulation to present the results. As vehicle demand exceeds vehicle capacity at the intersections located at the edges of the simulated roadway network, the amount of traffic getting into the system

begins to get metered. As the vehicle demand grows, the less traffic gets into the simulated roadway network. Therefore, it is possible that an intersection located inside the system will operate better due to effects of metering at the network edges. Using simulation under this occurrence can result in a misrepresentation of a project's impacts if the analyst does not fully understand the implications of using a system-wide approach to determine levels of service or project impacts at specific intersections.

The Synchro 6.0 software, which evaluates intersection operating conditions using the 2000 HCM methods, was used to evaluate operating conditions at unsignalized and signalized study intersections. Vehicle queuing was also evaluated at critical study intersections within the Powell/Christie Loop to quantify the affects of queue spillback on adjacent intersection operations.

Unsignalized Intersections

For unsignalized (all-way stop-controlled and side-street stop-controlled) intersections, the 2000 HCM method for unsignalized intersections is used. For side-street stop-controlled intersections, the level of service is based on the average control delay per vehicle (measured in seconds) for each movement that must yield the right of way (movements on the stop-sign controlled approaches and left turns from the major street for side-street stop-controlled intersections), and is calculated individually. The largest experienced approach delay and average delay for the whole intersection are reported. For all-way stop-controlled intersections, the average control delay is calculated for the intersection as a whole. This incorporates delay associated with deceleration, acceleration, stopping and moving up in the queue. Table 1 summarizes the relationship between delay and LOS for unsignalized intersections.

TABLE 1
UNSIGNALIZED INTERSECTION LEVEL OF SERVICE DEFINITIONS USING AVERAGE CONTROL DELAY

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Little or no delays	< 10.0
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays with intersection capacity exceeded	> 50.0

Source: *Highway Capacity Manual*, Transportation Research Board, 2000.

Signalized Intersections

For signalized intersections, the average control delay is calculated for the intersection as a whole. This incorporates delay associated with deceleration, acceleration, stopping and moving up in the queue. Table 2 summarizes the relationship between delay and LOS for signalized intersections.

REGULATORY SETTING

General Plan

The City of Emeryville General Plan was reviewed. General Plan Circulation Policy L calls for the establishment of "a citywide network of interconnected pedestrian and bicycle routes to provide access to major features, attractions and activities of the City, thus providing recreational benefits and reducing dependence on automobiles." To accomplish this goal, Policy L-2 calls for routes that minimize auto hazards and avoid heavily trafficked streets; Policy L-3 calls for integration of routes into regional networks.

TABLE 2
SIGNALIZED INTERSECTION LEVEL OF SERVICE DEFINITIONS
USING AVERAGE CONTROL DELAY

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	≤ 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, and high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	55.1 to 80.0
F	Operations with delays unacceptable to most drivers occurring due to over-saturation, poor progression, or very long cycle lengths.	> 80.0

Source: *Highway Capacity Manual*, Transportation Research Board, 2000.

Significance Criteria

The City of Emeryville defines the acceptable service level for intersections as LOS D. A significant project impact would result if the project causes one of the following conditions to occur:

- The addition of project traffic degrades an intersection currently operating at LOS D or better to LOS E or LOS F
- The addition of project traffic degrades an intersection currently operating at LOS E to LOS F
- The addition of project traffic causes the average vehicle delay to increase by more than four seconds at an intersection operating at LOS E or LOS F
- The addition of project traffic results in the 95th percentile vehicle queue exceeding the available vehicle storage or at locations where vehicle queues would exceed the available storage space the project increases the 95th percentile vehicle queue

- The project would cause a roadway segment on the Metropolitan Transportation System to operate at LOS F or would increase the V/C ratio by more than five (5) percent for a roadway segment that would operate at LOS F without the project
- A substantial increase in hazards due to a design feature or incompatible land uses
- Inadequate emergency access
- Inadequate parking capacity
- If construction traffic from the project would have a significant, though temporary, impact on the environment or if project construction would substantially affect traffic flow and circulation, parking, and pedestrian safety
- Fundamentally conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle routes)
- Generate added transit ridership that would
    - increase the average ridership on AC Transit lines by five (5) percent at bus stops where the average load factor with the project in place would exceed 125 percent over a peak thirty minute period
    - increase the peak hour average ridership on BART by five (5) percent where the passenger volume would exceed the standing capacity of BART trains
    - increase the peak hour average ridership at a BART station by five (5) percent where average waiting time at fare gates would exceed one minute

REPORT ORGANIZATION

This report is divided into eight chapters, including this introductory chapter, as described below:

- ***Chapter 1*** – ***Introduction*** discusses the purpose and organization of this report.
- ***Chapter 2*** – ***Existing Setting*** describes the project vicinity including the surrounding roadway network, weekday morning (AM), evening (PM), and Saturday afternoon peak-hour vehicle traffic volumes, and intersection service levels.
- ***Chapter 3*** – ***Project Characteristics*** presents relevant project information, such as project components and project trip generation, distribution, and assignment.
- ***Chapter 4*** – ***Traffic Forecasts*** describes the method used to determine baseline traffic volumes for the 2010 and 2030 scenarios.
- ***Chapter 5*** – ***Off-Site Impacts and Recommendations*** addresses future conditions with the addition of project traffic.
- ***Chapter 6*** – ***Alameda County Congestion Management Agency (ACCMA) MTS Roadway Analysis*** presents the impacts of the Project on the Metropolitan Transportation System (MTS) roadway system.
- ***Chapter 7*** – ***Pedestrian, Bicycle, and Transit Impacts*** addresses impacts to alternative modes of transportation in the study area.
- ***Chapter 8*** – ***Site Access, Circulation, and Parking*** describes project access, circulation, and parking issues as they relate to the project.
- ***Chapter 9 – Project Alternatives*** provides a quantitative assessment of the relative impacts of three alternatives to the proposed Project.

2. EXISTING SETTING

This section describes the existing roadway network and intersection operations as well as transit, bicycle and pedestrian facilities in the study area.

EXISTING ROADWAY NETWORK

The Marketplace Redevelopment project site is located south of 64th Street, east of Christie Avenue and along Shellmound Street just north of Shellmound Way in Emeryville. Existing land uses near the project site are primarily residential and commercial. A hotel is located south of the project site. A description of roadways in the project vicinity is provided below. Regional access to the project site is provided by Interstate 80 (I-80) and Interstate 580 (I-580), while a number of arterials and local roads provide local access. Existing lane configurations and traffic controls are shown on Figure 3 for each study intersection. The lane configurations shown on Figure 3 represent conditions when the traffic counts were collected.

I-80 connects the San Francisco Bay Area with the Sacramento region and continues east across the United States. In Emeryville, I-80 has a north/south orientation and provides four mixed-flow lanes and a high occupancy vehicle (HOV) lane in each direction at the Ashby Avenue/Shellmound Street interchange (Emeryville/Berkeley border). Access from I-80 to Emeryville is provided via interchanges at Powell Street and Ashby Avenue. This segment of I-80 through Emeryville is also known as I-580.

I-580 extends in an east/west direction, from San Rafael toward Tracy and the San Joaquin Valley. In the vicinity of Emeryville, I-580 parallels the southern city boundary with five lanes in each direction. Access to Emeryville from I-580 westbound is provided at West Street via ramps along 35th and 36th Streets; access to Emeryville from I-580 eastbound is provided via a left-hand exit to Emery and Adeline Streets.

Christie Avenue is generally a two-lane, north/south road extending north from Shellmound Street to 65th Street. Existing land uses along Christie Avenue include office, retail and residential.

64th Street is a two-lane east/west road extending east from Lacoste Street to Shellmound Street. On-street parking is allowed on the section of roadway near the study area. The roadway terminates at Shellmound Street due to railroad tracks but continues east of the tracks to San Pablo Avenue.

Shellmound Street is a two- to four-lane north/south road with on-street parking at select locations. Shellmound Street becomes 40th Street to the south of the railroad overcrossing, continuing east beyond the MacArthur BART station. Shellmound Street continues as Bay Street north of Ashby Avenue, where access to I-80 is provided.

Shellmound Way is a short four-lane east/west road street connecting Christie Avenue and Shellmound Street. On-street parking is prohibited on Shellmound Way.

Powell Street is an east/west road, generally with four lanes, with an interchange at I-80. It extends west from I-80 to the Emeryville Marina, and east from I-80 to west of San Pablo Avenue, where it becomes Stanford Avenue and continues to Adeline Street.

65th Street is a two-lane, east/west road extending east from Lacoste Street. Land uses along 65th Street include residential, commercial, and office, and on-street parking is generally available. An at-grade signalized railroad crossing is located just east of Shellmound Street. Approximately 55 trains per day use this crossing. An accident occurred at this location in 2002 when an auto collided with a passenger train. One injury was reported.

FIGURE 3B

Hollis Street is a two-lane, north/south road, with on-street parking that begins in Oakland at Peralta Street and ends in Berkeley at Folger Avenue. North of Folger Avenue, Hollis Street becomes 7th Street extending northward through Berkeley.

EXISTING TRAFFIC VOLUMES

Intersection operations were analyzed for the weekday AM (7:00 to 9:00 AM), PM (4:00 to 6:00 PM) and Saturday afternoon (2:00 to 4:00 PM) peak periods. Intersection operations were evaluated for the one hour during each count period with the highest measured traffic volumes. Intersection counts were conducted in the spring of 2005 and Fall of 2006 on clear days with area schools in normal session. Existing peak-hour traffic volumes at each study intersection are shown on Figure 4 for the weekday peak hours and Figure 5 for the Saturday peak hours. Traffic counts at the study intersections are provided in Appendix A.

EXISTING TRANSIT SERVICE

Transit service in the vicinity of the project site is provided by a local service called Emery Go Round, Alameda-Contra Costa Transit (AC Transit), Bay Area Rapid Transit (BART), and Amtrak.

Emery Go Round

The Emery Go Round, operated by the Emeryville Transit Management Association, provides free wheelchair accessible shuttle bus service connecting major employment, retail, and residential centers in Emeryville to the MacArthur BART and Emeryville Amtrak stations and other points in Emeryville throughout the day. Two weekday and two weekend routes serve the Emeryville area.

The weekday ***Hollis*** and ***Powell*** routes generally operate from 5:45 AM to 10:30 PM on 10- to 12-minute headways, scheduled to meet BART trains at the MacArthur BART Station. The weekday Powell route travels along Shellmound Street, 65th Street, Christie Avenue, Powell Street and Shellmound Way. The Powell route serves destinations including the Bay Street retail area, Pacific Park Plaza and Watergate Condominiums. Stops are provided on Christie Avenue, south of 64th Street along the project frontage. The Hollis route provides service to the Amtrak station and major employers including Pixar and Chiron. The Hollis route travels along 65th Street and Hollis Street in the study area.

Two routes serve the major retail areas of Emeryville, including the project site, on weekends. The weekend ***Shopper*** route operates on 30-minute headways from 9:20 AM to 9:50 PM on Saturdays and 40-minute headways from 10:20 AM to 7:00 PM on Sundays. The ***Saturday City Loop*** route operates on 40-minute headways from 10:20 AM to 7:00 PM on Saturdays. Both routes serve the MacArthur BART station. The Shoppers Express provides service to the project site along Christie Avenue and Shellmound Street and also serves the Bay Street retail area. The City Loop serves destinations on Hollis Street and Powell Street, including the Amtrak Station, Pacific Park Plaza and Watergate Condominiums. Stops along the project frontage are provided on Christie Avenue south of 64th Street.

AC Transit

AC Transit operates three local routes and one Transbay route in the vicinity of the project study area. Two routes (Route 57, Route Z, and Route 9) operate along the project frontage.

Route 57 operates around the project site on Shellmound Way, Christie Avenue, 64th Street and Shellmound Street in a clockwise direction, providing service between the Emeryville Marketplace and the MacArthur BART station via 40th Street in the study area. Weekday service is provided from 4:00 AM to 1:00 AM with 10- to 15-minute headways. Weekend service is provided from 4:30 AM to 1:00 AM with 15- to 30-minute headways. A layover area is provided on 64th Street in the project vicinity, with stops located on Christie Avenue and Shellmound Street that serve the project site.

Route Z provides weekday Transbay service between the San Francisco Transbay Terminal and the City of Albany. In the study area, Route Z operates on 65th Street, Christie Avenue and Powell Street. Eastbound service is provided from 7:00 to 9:00 AM and westbound service is provided from 4:30 to 7:00 PM on 30-minute headways. A stop in the study area is provided near the Powell Avenue/Christie Avenue intersection.

Route 19 connects the North Berkeley BART and Fruitridge BART stations via Hollis Street in the study area. Daily service is provided between 6:00 AM and 10:00 PM on 30-minute headways. Access to the project site from this transit line would be provided via the pedestrian over-crossing at the Amtrak station.

Route C provides weekday Transbay service between the San Francisco Transbay Terminal and Piedmont. In the study area, Route C operates on Shellmound Street, Shellmound Way, Christie Avenue and Powell Street. Westbound service is provided from 5:00 AM to 12:30 AM, generally on 30-minute headways. Eastbound service is not provided in Emeryville. A stop in the study area is provided near the Powell Avenue/Christie Avenue intersection.

Route F provides weekday and weekend Transbay service between the San Francisco Transbay Terminal and the City of Berkeley. In the study area, Route F operates on Shellmound Street, Shellmound Way, Christie Avenue and Powell Street. Westbound service is provided from 5:00 AM to 12:30 AM, generally on 30-minute headways. Eastbound service is provided from 5:45 AM to 12:30 AM, generally on 30-minute headways. A stop in the study area is provided near the Powell Avenue/Christie Avenue intersection.

Route J provides weekday Transbay service between the San Francisco Transbay Terminal and the City of Berkeley. In the study area, Route J operates on Christie Avenue. Westbound service is provided between 6:00 and 8:45 AM. Eastbound service is not provided in Emeryville.

Bay Area Rapid Transit (BART)

BART provides regional rail commuter transit service. The closest station to the site is the MacArthur BART Station, located approximately 2 miles east of the project site on 40th Street. Three of BART's five lines pass through the MacArthur Station, providing direct service from MacArthur to Richmond, Bay Point, Fremont, San Francisco, and Millbrae without transferring. BART service from Fremont/Daly City and Dublin/Pleasanton/SFO does not pass through the MacArthur Station.

Amtrak

A pedestrian overcrossing connects the project site to the Emeryville Amtrak train station and is located near Horton Street/59th Street. Four Amtrak routes serve this station, including the Capitol Corridor and San Joaquin commuter service routes. The Capitol Corridor route connects San Jose to the Sacramento region with approximately 24 trains per day, and the San Joaquin route connects the Oakland/Emeryville area to Bakersfield, with approximately 8 trains per day. The Coast Starlight route (which connects Seattle to Los Angeles) and the

California Zephyr route (which connects the Oakland/Emeryville area to Chicago, Illinois) also serve the Emeryville Station, each with one train per day.

EXISTING BICYCLE AND PEDESTRIAN FACILITIES

Bicycle Facilities

Bicycle facilities can be classified in three categories:

- Class I (Bike Paths) – A Class I bicycle facility provides a bicycle path for the exclusive use of bicycles and pedestrians, separate from the auto travel-way. The State standard for minimum width of a two-way bicycle path is eight feet with a two-foot shoulder on either side.
- Class II (Bike Lanes) – A Class II bicycle facility is an on-street bicycle lane, with painted markings and signs designating the lane's bicycle-only use. The bicycle lane is separated from vehicle and pedestrian traffic, but the route may be interrupted by pedestrian crossings, vehicle turning movements or parked vehicles. The width for a one-way bicycle lane varies depending upon on-street parking facilities and the type of curb and gutter, but is generally 5 feet or greater.
- Class III (Bike Routes) – A Class III bicycle facility is a route for bicyclists usually shared by either vehicles or pedestrians. The facility is designated by signs or other markings, and is usually provided when a Class I or Class II facility cannot be provided.

In Emeryville, the San Francisco Bay Trail follows the shoreline south from the Berkeley border to the EmeryCove Marina. The Class I facility veers east on Powell Street and terminates at the Powell Street/Christie Avenue intersection. The trail then continues south as a Class II facility on Shellmound Street. At this time, there are no bicycle facilities provided on Christie Avenue between Powell Street and Shellmound Way.

The pedestrian overcrossing connecting the project site and the Amtrak station is accessible to bikes via elevators, connecting to a Class II facility on 59th Street from Horton Street to Hollis Street. Class II Bike Lanes are provided on Shellmound Street through the site as well as on 65th Street from Shellmound Street to Overland Avenue. Horton Street from 62nd Street to 53rd Street is also a Class II facility. North of 62nd Street, a Class III Bike Route is provided on Overland Avenue to 65th Street. Bike lanes are not provided on Hollis Street; although it is not uncommon for bicyclists to use the corridor. Horton Street from 40th street to the northern City limits has been designated as a bicycle boulevard to encourage bicycle trips and discourage vehicle trips on this roadway.

The City's bicycle and pedestrian plan identifies proposed bicycle facility improvements on 65th Street, 59th Street and Powell Street. The Class II facility on 65th Street and the Class III facility on 59th Street would extend east of Vallejo Street, past the city's boundary. An extension of the Class I facility on Powell Street from its existing termination point at Christie Avenue to Shellmound Street is proposed. This would provide a continuous bicycle network from the San Francisco Bay Trail to the Class II facility on Shellmound Street.

Pedestrian Facilities

Pedestrian facilities in the study area are comprised of sidewalks, crosswalks and pedestrian signal heads. A pedestrian overcrossing connecting the Amtrak Station to the Public Market provides access to the Marketplace site. High levels of mid-day pedestrian activity are present on this overcrossing and other nearby crosswalks on Shellmound Street. Of the three available crosswalks near the Public Market, the northern, all-way stop controlled intersection is the most heavily used followed by the striped crosswalk and finally, the southern

intersection just north of the Shellmound Street/Shellmound Way intersection. Generally, mid-day pedestrians arrive at and cross Shellmound Street in random groups, disrupting vehicular traffic flows. This is particularly noticeable at the all-way stop controlled intersection where pedestrian crossings reduce vehicle efficiency through the intersection. In addition to crosswalks at the intersections, a striped crosswalk on Christie Avenue provides access between the City Park and the Pacific Park Plaza. Pedestrian facilities are also provided on the Powell Street bridge, south of the Woodfin Hotel.

Extensive pedestrian facilities are provided on the existing Marketplace site. Generally, sidewalks and striping provide clear signage of pedestrian paths through the parking lot. A tree-shaded walkway crossing the parking lot is provided from the Marketplace Building to the UA Theater. However, there are some existing deficiencies on the project site, such as the sidewalk along the northern edge of the Marketplace Building which is discontinuous and does not connect to the City Park pathway. These deficiencies would be improved with the project.

EXISTING INTERSECTION OPERATING CONDITIONS

The existing traffic volumes with existing lane configurations and traffic control were used to analyze existing peak hour operating conditions at the study intersections. As shown in Table 3 below, all study intersections currently operate at acceptable service levels during the weekday AM and PM, and Saturday peak hours, except for the I-80 EB Ramps/Powell Street and Shellmound Steet/65th Street intersections. A traffic signal has been installed at the Shellmound Steet/65th Street intersection, which was recently activated. However, as the traffic counts were collected when the intersection was unsignalized, that configuration was used in the intersection analysis. With signalization, this intersection would operate at LOS B during the PM peak hour. Detailed LOS calculation worksheets can be found in Appendix B.

TABLE 3
EXISTING PEAK HOUR INTERSECTION OPERATING CONDITIONS

1. SSSC = side-street stop-controlled intersection; AWSC = all-way stop-controlled intersection; Signal = signalized intersection.
2. Average intersection control delay reported for signalized and all-way stop-controlled intersections. Average intersection delay and (worst case approach delay) reported for side-street stop-controlled intersections.
3. Intersection counts were conducted prior to signal activation.

Source: Fehr & Peers, 2007.

Traffic operations at the I-80 EB Ramps/Powell Street and Christie Avenue/Powell Street intersections are highly influenced by lane utilization imbalances. This occurs when vehicles do not equally distribute across all traffic lanes for a specific movement. For example, drivers exiting eastbound I-80 tend to queue in the outside or curb lane when making a right turn onto Powell Street rather than use the second lane which also allows for right turn movements onto Powell Street.

The small turning radius for the off-ramp right-turn traffic is one reason that drivers prefer the curb lane. Many drivers exiting I-80 eastbound are destined to the right turn onto Christie Avenue at Powell Street. The small turning radius for off-ramp right-turning traffic does not permit vehicles to enter directly into the exclusive eastbound right-turn lane at the Christie Avenue/Powell Street intersection. Instead, vehicles generally enter into the shared eastbound through/right-turn lane, forcing drivers in the second off-ramp right-turn lane to turn into either the left turn lanes or possibly one of the through lanes at the Christie Avenue/Powell Street intersection. The resulting condition causes lane utilization imbalances at the off-ramp causing long delays and vehicle queues at the off-ramp. Similar lane imbalances occur on eastbound Powell Street approaching Christie Avenue.

Lane imbalances also occur on westbound Powell Street between Christie Avenue and Frontage Road. These imbalances occur because drivers are unsure which lane to use to access westbound I-80 toward San Francisco. The severe lane offset (about 12 feet) on westbound Powell Street through the I-80 EB Ramp traffic signal combined with the overhead sign structure direct drivers to the outside most lane; whereas, drivers could use either the outside most lane or the second lane to access Frontage Road and the I-80 westbound on ramp to San Francisco. The inside most lane or third lane is used by drivers destined for the marina area. The lane imbalances have secondary impacts at the Shellmound Way/Christie Avenue intersection, north of Powell Street.

Drivers trying to avoid congestion on I-80 exit the freeway at Powell Street and travel through the intersection to re-enter the freeway via the on-ramp. While this occurrence is minimal during the AM and Saturday peak hours, traffic counts during the PM peak hour indicate that over 200 vehicles exit the freeway, only to re-enter. This occurrence was verified during field observations and tends to occur more when I-80 is operating at capacity.

This occurrence contributes to congestion at the I-80 EB Ramps/Powell Street intersection and reduces the capacity for left and right-turning vehicles at the off-ramp.

Capacity constraints also occur at the Powell Street/Christie Avenue intersection. The southbound Christie Avenue approach between Shellmound Way and Powell Street has two exclusive right-turn lanes and a shared through/left-turn lane. There is excess demand for the combination through/left-turn lane so drivers often use one of the exclusive right-turn lanes to travel straight through the intersection; thereby reducing the right turning vehicle capacity. The eastbound to southbound left-turn lane from Powell Street onto Christie Avenue toward Powell Plaza is a single lane. Vehicle queues were observed extending beyond the storage area for left turning traffic, thereby blocking westbound traffic through the intersection.

A queue spillback analysis was conducted, as shown on Table 4. The 95th percentile vehicle queue, as calculated by Synchro 6.0, is shown for critical intersections in the Powell/Christie Loop that could be potentially impacted by the proposed project. The vehicle queues as calculated by Synchro generally coincide with field observed queues. Detailed queuing worksheets are provided in Appendix C.

TABLE 4
EXISTING VEHICLE QUEUES

3. PROJECT CHARACTERISTICS

This chapter describes the procedure used to develop project traffic estimates, including project trip generation, distribution, and assignment characteristics. The results are used to evaluate potential impacts the project would have on the surrounding roadway network.

PROJECT DESCRIPTION

The Marketplace Redevelopment project is the coordinated redevelopment of the Marketplace site and the adjacent 64th & Christie site in Emeryville, California. The project area is generally bound by 64th Street to the north, the Southern Pacific Railroad to the east, Powell Street to the south and Christie Avenue to the west. Construction would occur on five sites: Shellmound Building, Retail Pad #1, Retail Pad #2, Retail Pad #3, and 64th & Christie building, as shown previously on Figure 2.

Development in the Shellmound building would consist of up to 55,000 square feet of retail and 160 residential units in addition to structured parking. Up to 7,500 square feet of retail/restaurant would be constructed on Pad #1 (adjacent to Borders book store), up to 7,500 square feet of retail/restaurant would be constructed on Pad #2 (adjacent to City Park), and up to 7,500 square feet of retail/restaurant would be constructed on Pad #3, south of the UA Cinema and adjacent to Shellmound Street. The combined total size of pads 1, 2, and 3 would not exceed 16,000 square feet. On the 64th & Christie site, the project includes construction of a mixed residential/ retail building with structured parking, including 180 residential units in addition to 6,000 square feet of ground floor retail. This reflects the maximum development on the site. The actual project would likely be smaller due to space constraints on the site and market conditions. As restaurant uses could potentially occupy the retail space, it was assumed that 11,000 square feet of restaurants would be developed.

PROJECT TRIP GENERATION

Project trip generation refers to the process for estimating the amount of vehicular traffic a project would add to the surrounding roadway system. First, estimates of the total amount of traffic entering and exiting the project driveways are calculated for an average weekday. Separate estimates are created for the peak one-hour periods during the morning and evening commute periods when traffic volumes on the surrounding streets are highest. At retail establishments such as the proposed project, driveway traffic comprises: (1) new traffic generated by the project, (2) traffic that would otherwise already be on the adjacent roadways but the driver decides to stop at the site (e.g., to purchase an item on their way home from work), and (3) traffic on other nearby roadways, but the driver decides to take a short detour to stop at the site. The trips in Item 2 are referred to as “pass-by” trips and the trips in Item 3 are referred to as “diverted-link” trips.

Estimates for the shopping center portion of the project were developed by using trip generation rates contained in the Institute of Transportation Engineers (ITE), *Trip Generation,* (7th Edition) (Land Use Code 820 – Shopping Center). Information contained in the ITE *Trip Generation Handbook*, June 2004, was used to estimate pass-by and diverted-link trips. For shopping centers, the average pass-by rate is 34 percent, and the average diverted-link trip rate is 16 percent. In other words, at a typical shopping center, approximately 50 percent of the traffic entering and exiting the site is already on the surrounding roadway system. A 30 percent pass-by reduction was applied to the retail trip generation for the PM peak hour and a 15 percent pass-by reduction was applied for the Saturday afternoon peak hour. For the restaurant uses, a 40 percent pass-by reduction was applied to the AM, PM, and afternoon peak hour trip generation.

For the residential portion of the project, average ITE trip generation rates for condominiums/townhomes (Land Use Code 230) was selected. The vehicle trip generation rates were then adjusted to account for transit use and non-motorized travel. Based on data from the 2000 Census, 54 percent of Emeryville residents drive alone to work (compared to a Bay Area average of 68 percent), while 20 percent take transit (compared to a Bay Area average of 10 percent), 8 percent bicycle or walk (compared to a Bay Area average of 4 percent), and 6 percent work at home (compared to a Bay Area average of 4 percent). Given the commute characteristics of Emeryville residents and the proximity of the site to transit and pedestrian/bicycle corridors, it is likely that more residents, on average, would travel during peak commute hours via transit or non-motorized modes of travel than is accounted for in standard ITE trip generation rates.

As the existing Marketplace project contains a mix of uses (retail, office, restaurants, and movie theater) it is also likely that some patrons to the site would visit more than one use. With the construction of residential uses adjacent to the site, it is also likely that residents of the site would patronize the commercial portions of the site. A 5 percent reduction factor was selected and applied to the average rates for retail, restaurant and residential uses to account for transit use and internal trips between the restaurant, retail and residential portions of the project. The resulting trip generation rates are presented in Table 5.

TABLE 5
PROJECT TRIP GENERATION RATES

Land Use	AM Peak Hour			PM Peak Hour			Saturday Peak Hour		
	In	Out	Total	In	Out	Total	In	Out	Total
Residential Condos/Townhomes	0.07	0.35	0.42	0.33	0.16	0.49	0.24	0.21	0.45
Shopping Center	0.60	0.38	0.98	1.20	1.30	2.50	2.09	1.93	4.02
Restaurant	3.41	3.15	6.56	3.80	2.43	6.23	7.18	4.22	11.40

Source: *Trip Generation*, 7th Edition (ITE) and Fehr & Peers, 2007.

These rates were applied to the size of each project component, as presented in Table 6. At buildout, the project is anticipated to generate a maximum of 281 AM, 459 PM, and 544 Saturday afternoon peak hour trips. The project's maximum trip generation was used to assess project impact to present a conservative "worst-case" analysis of potential project impacts. Due to site limitations, actual development size would likely be less.

PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

The project trip distribution, summarized in Table 7, was developed based on nearby land uses and demographics, as well as existing turning movement counts at the intersections. The project trip distribution considers non-residential projects for Chiron, Pixar and Sherwin-Williams and the location of complimentary land uses in surrounding jurisdictions. Although census data indicates about 20 percent of Emeryville residents live and work in Emeryville, the distribution assumes workers employed in Emeryville would reside outside of the city, providing a conservative analysis. Project trips were assigned to the roadway network using the trip generation and distribution described and is shown on Figures 6a and 6b for the Existing and 2010 condition and Figures 6c and 6d for the 2030 condition. Project trip distribution for the 2030 condition takes into consideration interchange improvements at the Ashby Avenue/Shellmound Street/I-80 interchange.

TABLE 6
PROJECT TRIP GENERATION

Project Component	Size	AM Peak Hour			PM Peak Hour			Saturday Peak Hour		
		In	Out	Total	In	Out	Total	In	Out	Total
Shellmound Building Residential	160 dwelling units	11	56	67	53	26	79	38	34	72

4. FUTURE 2010 AND 2030 CONDITIONS

This chapter describes the methods used to develop 2010 and 2030 traffic volumes and future intersection operating conditions.

TRAFFIC FORECASTS

To forecast Future 2010 and 2030 without project traffic volumes, peak hour trips from potential developments and estimates of trips traveling through the City of Emeryville were assigned to the roadway network and added to existing peak hour traffic volumes. Trips traveling through the City (without a destination in the City of Emeryville) were obtained from the Alameda County Congestion Management Agency (ACCMA) travel demand forecasting model.

A list of all City of Emeryville approved, planned and potential developments was provided by city staff. The development levels on this list, found in Appendix D, are consistent with land use data provided to the Alameda County CMA from local jurisdictions for its use in regional planning and is currently being used to update the City of Emeryville traffic impact fee program. The list was divided into developments with expected completion dates prior to 2010 and those with expected completion dates between 2010 and 2030. Trips generated by developments with expected completion dates prior to 2010 were included in Future 2010 traffic volumes. Future 2010 peak hour traffic volumes are shown on Figure 7 for the weekday peak hours and Figure 8 for the Saturday peak hour. Future 2030 volumes include trips generated by all developments expected to be completed by 2030. Future 2030 peak hour traffic volumes without the project are shown on Figure 9 for the weekday peak hours and Figure 10 for the Saturday peak hour.

FUTURE ROADWAY IMPROVEMENTS

The analysis of future (2010 and 2030) conditions considers the new MacArthur on-ramp to I-580, which was recently opened. This connection was not considered in the analysis of existing conditions as it was not in place at the time traffic counts were collected. Existing traffic that might be expected to use the ramp was shifted from other interchanges in the area, such as the Powell Street interchange. Added traffic from new developments in the City was also assigned to the new roadway connection.

The analysis of future (2010 and 2030) conditions considers the signalization of the 65th Street/Shellmound Street and 65th Street/Overland Avenue intersection along with a redistribution of existing traffic from the Hollis Street to Overland Avenue corridor. These signals and roadway extension were not operational at the time traffic count data was collected.

Improvements to the Ashby Avenue/Shellmound Street/I-80 interchange were assumed to be in place for the analysis of 2030 conditions, as it is reasonably foreseeable that this improvement would be in place by 2030. Planned improvements would increase interchange capacity and provide a direct connection to/from Shellmound Street to I-80. Traffic volumes were adjusted to reflect the potential travel changes as capacity is increased at the Ashby interchange and congestion increases at the Powell Street interchange.

FUTURE 2010 INTERSECTION OPERATING CONDITIONS

Intersection operating conditions in 2010 were analyzed using the traffic forecasts described above and the lane configurations and traffic control shown on Figure 11. As shown on Table 8, seven intersections are projected to operate at unacceptable service levels (i.e. LOS E or F) during at least one peak hour:

- Ashby Avenue/San Pablo Avenue (PM Peak Hour)
- I-80 EB Ramps/Powell Street (PM and Saturday Peak Hour)
- Christie Avenue/Powell Street (PM and Saturday Peak Hour)
- Powell Street/Hollis Street (PM Peak Hour)
- Stanford Avenue/San Pablo Avenue (PM Peak Hour)
- 40th Street/San Pablo Avenue (PM Peak Hour)
- 36th Street/San Pablo Avenue (PM Peak Hour)

The remaining study intersections are projected to operate at acceptable service levels in 2010.

Vehicle queues were calculated at the key study intersections within the Christie/Powell Loop. Locations where the 95th percentile vehicle queue is expected to exceed the available storage length for a turning movement and where the through movement is expected to spill back through the adjacent intersection and impede roadway network operations is shown on Table 9. AM peak hour vehicle queue congestion is limited to the eastbound traffic flow on Powell Street approaching Christie Avenue. This congestion occurs because of the incoming commute traffic to Emeryville employment centers. The amount of queue congestion increases during the PM peak hour, especially at the Powell Street/Christie Avenue intersection where queue congestion will occur on all but the northbound approach to the intersection. The I-80 eastbound off-ramp at Powell Street will also experience substantial vehicle queues as drivers use the off-ramp in an effort to bypass freeway traffic congestion. Vehicle queues during the Saturday peak hour will generally occur at the same intersection approaches as during the PM peak hour with additional queue congestion occurring on Shellmound Way between Christie Avenue and Shellmound Street.

Railroad Preemption

Although the 65th Street/Shellmound Street and 65th Street/Overland Street intersection is projected to operate at an acceptable level in 2010, the intersection will operate deficiently when a train is present, as vehicle queues could impeded north/south travel on Shellmound Street. Up to 55 trains per day travel over 65th Street at Shellmound Avenue based on information provided by the Federal Railroad Administration (http://safetydata.fra.dot.gov/officeofsafety/). To reduce the effects of vehicle queuing when trains travel over 65th Street, improvements to increase the length of the northbound right-turn lane and southbound left-turn lane should be considered by the City as adjacent properties redevelop. These improvements would permit vehicles to queue in the turn lane as opposed to the travel lane on Shellmound Street.

FUTURE 2030 INTERSECTION OPERATING CONDITIONS

Peak hour intersection operating conditions in 2030 were analyzed using the traffic forecasts described above and the lane configurations and traffic control shown on Figure 11. As shown on Table 10, 16 study intersections are projected to operate at deficient service levels during at least one peak hour by 2030.

- Ashby Avenue/7th Street (PM Peak Hour)

- Ashby Avenue/San Pablo Avenue (PM Peak Hour)
- 65th Street/Shellmound Street and 65th Street/Overland Street (PM Peak Hour)
- I-80 EB Ramps/Powell Street (PM and Saturday Peak Hour)
- Christie Avenue/Powell Street (AM, PM and Saturday Peak Hour)
- Powell Street/Hollis Street (PM Peak Hour)
- Stanford Avenue/San Pablo Avenue (PM Peak Hour)
- 40th Street/Horton Street (PM Peak Hour)
- 40th Street/Hollis Street (PM Peak Hour)
- 40th Street/Harlan Street (PM Peak Hour)
- 40th Street/Emery Street (PM Peak Hour)
- 40th Street/San Pablo Avenue (PM and Saturday Peak Hour)
- Mandela Parkway/Horton Street (PM Peak Hour)
- MacArthur Street/Emery Street (PM Peak Hour)
- 36th Street/San Pablo Avenue (PM Peak Hour)
- 35th Street/San Pablo Avenue (PM Peak Hour)

The remaining study intersections are projected to operate at acceptable service levels in 2030.

Locations where the 95th percentile vehicle queue is expected to exceed the available storage length for a turning movement and where the through movement is expected to spill back through the adjacent intersection and impede roadway network operations is shown on Table 11. The level and type of vehicle queues expected in year 2010 would continue in 2030 with some minor differences associated with the redistribution of traffic from the Powell interchange to the reconstructed Ashby interchange.

Railroad Preemption

The 65th Street/Shellmound Street and 65th Street/Overland Street intersection is projected to operate at LOS F during the PM peak hour in 2030. The LOS F conditions would worsen when a train travels over 65th Street. Deficient operations would also occur when trains are present during the other times of day.

5. OFF-SITE IMPACTS AND MITIGATION MEASURES

This chapter describes off-site traffic impacts and associated mitigation measures under Existing, 2010 and 2030 with Project conditions. Operations at the project driveways and on-site circulation are discussed in Chapter 8.

PROJECT IMPACTS

Existing Plus Project

The peak hour project traffic volumes were added to the existing traffic volumes to determine the Existing Plus Project traffic volumes, as shown on Figure 12 for the weekday peak hours and Figure 13 for the Saturday peak hour. The Existing Plus Project analysis results are shown on Table 12. The addition of project traffic would increase delay by more than four seconds at two intersections which operate at a deficient LOS E prior to the addition of project traffic.

- Shellmound Street/65th Street (weekday PM peak hour, Saturday afternoon peak hour)
- Powell Street/I-80 Eastbound Ramps (weekday PM peak hour)

Vehicle queues at the study intersections within the Powell/Christie Loop were calculated with the addition of project traffic, as shown on Table 13. The addition of project traffic would increase the 95th percentile vehicle queue at two intersections where the existing 95th percentile vehicle queue currently exceeds the available storage:

- Powell Street/I-80 Eastbound Ramps
- Powell Street/Christie Avenue

Increasing vehicle queue spillback is a potentially significant impact as vehicles queued outside of turn-pockets can impede other movements at the intersection, lead to poor lane utilization, and degrade the operation of the intersection, as well as the roadway system. These are potentially significant impacts.

Future 2010

The peak hour project traffic volumes were added to the 2010 Without Project (Figure 7) volumes to determine Future 2010 traffic volumes with the project, as shown on Figure 14 for the weekday peak hours and Figure 15 for the Saturday peak hour. The 2010 conditions analysis results are shown in Table 14. The project would increase delay by more than 4 seconds at one intersection projected to operate at a deficient LOS E or F prior to the addition of project traffic.

- Powell Street/I-80 Eastbound Ramps (weekday PM peak hour, Saturday afternoon peak hour)

Vehicle queues at the study intersections within the Powell/Christie Loop were also calculated with the addition of project traffic, as shown on Table 15. The addition of project traffic would increase the 95th percentile vehicle queue at the four intersections within the Loop where the existing 95th percentile vehicle queue currently exceeds the available storage. These are potentially significant impacts.

Future 2030

The peak hour project traffic volumes (Figure 5) were added to the 2030 Without Project (Figure 8) volumes to determine Future 2030 traffic volumes with the project, as shown on Figure 16 for the weekday peak hours and Figure 17 for the Saturday peak hour. The 2030 conditions analysis results are shown in Table 16. The project would increase delay by more that 4 seconds at three intersections projected to operate at a deficient LOS E or F prior to the addition of project traffic.

- Ashby Avenue/San Pablo Avenue (weekday PM peak hour)
- 65th Street/Shellmound Street and 65th Street/Overland Street (weekday PM Peak Hour)
- Powell Street/I-80 Eastbound Ramps (weekday PM peak hour, Saturday afternoon peak hour)
- Powell Street/Hollis Street (weekday PM peak hour)

Vehicle queues at the study intersections within the Powell/Christie Loop were calculated with the addition of project traffic, as shown on Table 17. The addition of project traffic would increase the 95th percentile vehicle queue at the critical intersections in the Powell/Christie loop where the projected 95th percentile vehicle queue exceeds the available storage. These are potentially significant impacts.

MITIGATION MEASURES

The projects contribution to impacted intersections is presented in Table 18.

Existing Plus Project

Impact Statement 1: The ***I-80 EB Ramps/Powell Street*** intersection currently operates at LOS E during the PM peak hour and Saturday peak hour. The addition of project traffic would worsen the service level to LOS F during the PM peak hour and increase delay by 10 seconds. On Saturday, the addition of project traffic would increase delay by 8 seconds. The addition of project traffic would also increase the 95th percentile queue lengths for several approaches that currently exceed or are projected to exceed the available storage capacity during the weekday PM and Saturday afternoon peak hours. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 1a: Modify the intersection to:

a. Reconstruct the off-ramp to provide dual left-turn and dual right-turn lanes. The additional lane should be 600 to 900 feet, depending on design parameters stipulated by Caltrans.

b. Reconstruct the southeast corner of the Powell Street/I-80 Eastbound Ramps intersection improving the curb radii to 40 feet.

c. Widen the north side of Powell Street 12 to 14 feet between Christie Avenue and Eastbound I-80 Ramps to align westbound Powell Street through lanes across the intersection with Eastbound I-80 Ramps. This improvement will also allow the widening of the eastbound right-turn lane at the Powell Street/Christie Avenue intersection to 14 feet and construction of a pedestrian median refuge on the west side of the Powell Street/Christie Avenue intersection. This change requires

right-of-way along the north side of Powell Street between Christie Avenue and the I-80 Eastbound On-Ramp.

This recommendation should be implemented with Mitigation Measure 3 to provide corridor benefits.

This impact also occurs in the 2010 and 2030 scenarios and can be attributed to existing traffic in the area, as well as traffic from approved, planned, and potential developments in and around Emeryville. Therefore, it is recommended that the City update the Traffic Impact Fee Program to include this recommendation, and that the Project Applicant contribute their fair share to these improvements through the payment of fees. Additionally, it should be noted that right-of-way for this improvement is reliant on the redevelopment of the adjacent parcels and the improvements can be phased to provide interim benefit as right-of-way becomes available.

The Project impact would be reduced to a ***less-than-significant*** level. However, as the intersection is within the Caltrans right-of-way and the City cannot assure the implementation of this measure, the impact may remain ***significant and unavoidable***.

Impact Statement 1b: Many elements of the project would help minimize the number of vehicle trips that could result from the proposed project and minimize the project's adverse impact on intersection operations. The project proposes to construct a mixture of uses, within a mixed use environment. Class II bicycle lanes are provided adjacent to the project site, with bicycle parking proposed. A minimum of ten foot side walks and marked pedestrian crossings would be provided as part of the project. The site is well served by transit. Shared parking between residential guest parking and retail parking is proposed to minimize the total parking supply. Implementation of a formal Transportation Demand Management Plan (TDM) could further minimize the project's impacts on traffic and circulation.

Mitigation Measure 1b: Implementation of the following mitigation measure would minimize the project's impacts on intersection operation; however as it is difficult to quantify the effects of TDM measures implementation of this measure alone would not reduce project impacts to a less-than-significant level.

The project applicant shall prepare and implement a comprehensive transportation demand management (TDM) program that includes the following elements to encourage and enhance alternate modes of travel:

- Transit amenities, including bus pull-outs, transit information and ticket kiosks, and discounted transit passes for employees and residents.
- Carpool/vanpool support, including preferential parking spaces and ride-matching programs.
- Carshare support, including free parking spaces, on-site information and advertising, and discounted rates/long-term contracts.
- Bicycle amenities, including bicycle parking racks, pilot bicycle rental program, new bicycle paths, and shower/locker facilities.

In addition, the TDM plan should discourage automobile use by incorporating the following elements:

- Residential parking spaces should be unbundled from the units.
- All non-residential parking should be paid parking.
- Monthly parking permits should not be provided for employees.

Provision of car sharing facilities on-site could help reduce auto ownership amongst future residents/tenants of the building and encourage alternative modes for trips generated by the site. The TDM program shall be submitted to City staff for review and acceptance prior to approval of any Final Development Plans.

Impact Statement 2: The ***Shellmound Street/65th Street*** intersection currently operates at LOS E during the PM peak hour. With the addition of project traffic, the intersection would degrade to LOS F, resulting in a ***significant*** impact. However, a traffic signal was recently installed at this intersection, resulting in LOS B operations during the PM and Saturday peak hours with the addition of the project traffic. Therefore, as a traffic signal has been installed at this location, the project impact is ***less-than-significant***.

Mitigation Measure 2: No improvements are recommended.

Impact Statement 3: The ***Powell Street/Christie Avenue*** intersection operates at an acceptable service level, both without and with the Project. However, vehicle queue spillback affects overall intersection and system operations. The addition of project traffic would exacerbate existing queuing problems during the weekday PM and Saturday afternoon peak hours, contributing to poor operations on some intersection approaches. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 3: Modify the intersection to:

a. Reconstruct the westbound approach to provide a second left turn lane. The resulting two left turn lanes should be 250 feet in length. The south side of the Powell Street bridge would need to be widened by about 12 feet to accommodate the second left turn lane.

b. Reconstruct the southbound approach to provide a southbound left-turn lane (in addition to the shared left-through lane). The lane would extend from Powell Street back to Shellmound Way. This change would require widening the west side of Christie Avenue by about 12 feet. This change requires right-of-way along the west side of Christie Avenue.

c. Re-time the Powell/Christie Loop signalized intersections to coordinate the critical movements through the intersection.

These recommendations should be implemented with Mitigation Measures 1a and 1b to provide corridor benefits.

These improvements would reduce the queuing impact to a ***less-than-significant*** level. Each of the changes requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired.

This impact also occurs in the 2010 and 2030 scenarios and can be attributed to existing traffic in the area, as well as traffic from approved, planned, and potential developments in and around Emeryville. Therefore, it is recommended that the City update the Traffic Impact Fee Program to include this recommendation, and that the Project Applicant contribute their fair share to these improvements through the payment of fees. Additionally, it should be noted that right-of-way for this improvement is reliant on the redevelopment of the adjacent parcels and the improvements can be phased to provide interim benefit as right-of-way becomes available.

2010 Plus Project

Impact Statement 4: The ***I-80 EB Ramps/Powell Street*** intersection is projected to operate at F during the PM peak hour and Saturday peak hour in 2010. The addition of project traffic would increase delay by more than 4 seconds during both the PM and Saturday peak hours. The addition of project traffic would also increase the 95th percentile queue lengths for several approaches that currently exceed or are projected to exceed the available storage capacity during the weekday PM and Saturday afternoon peak hours. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 4:*** Implement Mitigation Measures 1a and 1b. Implementation of these measures would reduce the impact to a ***less-than-significant*** level. However, as the intersection is within the Caltrans right-of-way and the City cannot assure the implementation of this measure, the impact may remain ***significant and unavoidable***. This recommendation should be implemented with Mitigation Measure 3 to provide corridor benefits.

Impact Statement 5: The ***Shellmound Way/Christie Avenue*** intersection is projected to operate at an acceptable service level both without and with the project in 2010. However, the addition of project traffic would result in the westbound left-turn movements exceeding the available storage length and spilling back to Shellmound Street during the Saturday peak hour. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 5:*** Implement Mitigation Measures 1b and 3. Implementation of these measures would reduce the impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired.

Impact Statement 6: The ***Shellmound Way/Shellmound Street*** intersection is projected to operate at an acceptable service level both without and with the project in 2010. However, the addition of project traffic would result in the 95th percentile eastbound vehicle queues exceeding the available storage, resulting in vehicle queue spillback to Christie Avenue during the Saturday peak hour. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 6:*** Implement Mitigation Measures 1b and 3. Implementation of these measures would reduce the impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired.

Impact Statement 7: The ***Powell Street/Christie Avenue*** intersection operates at an acceptable service level, both without and with the Project. However, vehicle queue spillback affects overall intersection and system operations. The addition of project traffic would exacerbate existing queuing problems, contributing to poor operations for the southbound through movement, the westbound right-turn movement and the eastbound right-turn movement during the weekday PM and Saturday afternoon peak hours. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 7:*** Implement Mitigation Measures 1b and 3. Implementation of these measures would reduce the project impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired. This recommendation should be implemented with Mitigation Measure 1a to provide corridor benefits.

2030 Plus Project

Impact Statement 8: The ***Shellmound Street/65th Street*** and the ***Overland Street/65th Street*** will operate as one intersection in 2030 and is projected to operate at a service level F with an overall average delay of 96 seconds during the PM peak hour. The addition of project trips during the weekday PM peak hour would increase overall intersection delay to 102 seconds, a six second increase. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact. Additionally, the intersection would experience deficient operations when a train crosses over 65th Street.

> ***Mitigation Measure 8***: Modify signal operations to provide protected/permitted left-turns on the southbound Shellmound Street approach. Implementation of this measure would improve the overall intersection operations to LOS E in the PM peak hour in 2030, reducing the impact to a ***less-than-significant*** level.
>
> This impact can be attributed to existing traffic in the area, as well as traffic from approved, planned, and potential developments in and around Emeryville. Therefore, it is recommended that the City update the Traffic Impact Fee Program to include this recommendation, and that the Project Applicant contribute their fair share to these improvements through the payment of fees.

Impact Statement 9: The ***Ashby Avenue/San Pablo Avenue*** intersection is projected to operate at a service level F with an overall average delay of 128 seconds during the PM peak hour in 2030. The addition of project trips during the weekday PM peak hour would increase overall intersection delay to 135 seconds, a seven second increase. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 9:*** To reduce this impact to a less than significant level, the intersection would have to modified, when traffic conditions warrant, to provide dual northbound left-turn lanes similar to the northbound left-turn lane design on San Pablo Avenue at 40th Street. Construction of this improvement would require elimination of on-street parking along San Pablo Avenue approaching the intersection. Relocation of bus stops for buses operating along San Pablo Avenue would also be required.
>
> The applicant shall pay a fee based on its fair share of the project's anticipated growth in traffic to the intersection toward the cost to implement this improvement. The payment shall be made to the City of Emeryville, for the benefit of the City of Berkeley, prior to issuance of the temporary certificate of occupancy for the last building. However, this intersection is located in the City of Berkeley and is also under the jurisdiction of Caltrans, since both Ashby Avenue and San Pablo Avenue are state highways at this intersection. Therefore, the final selection of the appropriate intersection design, as well as implementation of the modifications, are not within the jurisdiction of the City of Emeryville. Therefore, this impact would remain ***significant and unavoidable***.

Impact Statement 10: The ***I-80 EB Ramps/Powell Street*** intersection is projected to operate at F during the PM peak hour and Saturday peak hour in 2030. The addition of project traffic would increase delay by more than 4 seconds during both the PM and Saturday peak hours. The addition of project traffic would also increase the 95th percentile queue lengths for several approaches that currently exceed or are projected to exceed the available storage capacity during both the PM and Saturday peak hours. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

> ***Mitigation Measure 10:*** Implement Mitigation Measure 1a and 1b. Implementation of this measure would reduce the project impact to a ***less-than-significant*** level. However, as the intersection is within the Caltrans right-of-way and the City cannot assure the implementation of this measure, the impact may

remain ***significant and unavoidable***. This recommendation should be implemented with Mitigation Measure 3 to provide corridor benefits.

Impact Statement 11: The ***Powell Street/Hollis Street*** intersection is projected to operate at a service level F with an overall average delay of 114 seconds during the PM peak hour in 2030. The addition of project trips during the weekday PM peak hour would increase overall intersection delay to 120 seconds, a six second increase. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 11: Implement simultaneous left-turn signal phasing for the north/south left turn movements. This will require five to six foot lane shift for northbound Hollis Street traffic approaching Powell Street and reconstruction of the southwest corner of the intersection to accommodate tractor-trailer trucks making a right-turn from Powell Street to Hollis Street. The lane shift will require right-of-way along the west side of Hollis Street. Implementation of this measure would reduce the project impact to a ***less-than-significant*** level.

This impact can be attributed to traffic from approved, planned, and potential developments in and around Emeryville. Therefore, it is recommended that the City update the Traffic Impact Fee Program to include the recommendation, and that the Project Applicant contribute their fair share to these improvements through the payment of fees. Additionally, it should be noted that right-of-way for this improvement is reliant on the redevelopment of the adjacent parcels. Should the needed right-of-way not be acquired, the impact would remain ***significant and unavoidable***.

Impact Statement 12: The ***Shellmound Way/Christie Avenue*** intersection is projected to operate at an acceptable service level both without and with the project in 2030. However, the addition of project traffic would result in the westbound left-turn movements exceeding the available storage length and spilling back to Shellmound Street during the Saturday peak hour. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 12: Implement Mitigation Measures 1b and 3. Implementation of these measures would reduce the project impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired.

Impact Statement 13: The ***Powell Street/Christie Avenue*** intersection operates at an acceptable service level, both without and with the Project. However, vehicle queue spillback affects overall intersection and system operations. The addition of project traffic would exacerbate existing queuing problems, contributing poor operations on some intersection approaches during the Saturday peak hour. Based on the City of Emeryville significance criteria, this is considered a ***significant*** impact.

Mitigation Measure 13: Implement Mitigation Measures 1a and 3. Implementation of these measures would reduce the project impact to a ***less-than-significant*** level. However, the measure requires right-of-way acquisition to implement. Thus, the impact may remain ***significant and unavoidable*** until sufficient right-of-way can be acquired. This recommendation should be implemented with Mitigation Measure 1a to provide corridor benefits.

6. ALAMEDA COUNTY CONGESTION MANAGEMENT AGENCY (ACCMA) MTS ROADWAY ANALYSIS

This chapter outlines the ACCMA roadway analysis, which considers the impact of the Project on freeways, major arterials, and other major roadways in Alameda County. Main items of discussion include the notice of preparation (NOP) comments from the ACCMA, the geographic scope of the ACCMA roadway analysis, the analysis method, and the results for 2010 and 2025. Impacts to the transit system, including BART and AC Transit, are discussed in Chapter 7.

NOP COMMENTS

The ACCMA made the following statements in a NOP comment letter dated December 14, 2005:

> *Potential impacts of the project on the Metropolitan Transportation System (MTS) need to be addressed. (See 2005 CMP Figures 1 and 2). The DEIR should address all potential impacts of the project on the MTS roadway and transit systems. These include I-80, I-580, I-880, I-980, SR 24, SR 13/Ashby Avenue, Powell Street and San Pablo Avenue as well as BART and AC Transit. Potential impacts of the project must be addressed for 2010 and 2025 conditions.*
>
> - *Please note that the ACCMA does not have a policy for determining a threshold of significance for Level of Service for the Land Use Analysis Program of the CMP. Professional judgment should be applied to determine the significance of project impacts (Please see chapter 6 of the 2003 CMP for more information).*
> - *In addition, the adopted 2003 CMP requires the use of the 1985 Highway Capacity Manual* for freeway capacity standards.

Based on these comments, Fehr & Peers completed an analysis of the MTS roadways, as requested by the ACCMA.

ACCMA ROADWAY ANALYSIS STUDY AREA

As requested by the ACCMA, freeway and surface street segments in Emeryville and other areas of Alameda County were analyzed. The complete list of freeway and roadway segments from the NOP letter was included in the analysis. The following freeway and roadway segments were analyzed:

- I-80/I-580 (3 segments)
- I-580 (1 segment)
- I-880 (3 segments)
- I-980 (1 segment)
- SR 24 (1 segment)
- SR 13/Ashby Avenue (2 segments)
- Powell Street (2 segments)
- San Pablo Avenue (4 segments)

TRAFFIC FORECASTS

Fehr & Peers used the ACCMA model to forecast 2010 and 2025 traffic volumes on the MTS roadway system. The forecasts for the MTS system differ from the intersection forecasts previously discussed in the following aspects:

- The land use data sets used for the intersection forecasts and the MTS forecasts are different. The intersection forecasts, which are used to assess project traffic impacts on City of Emeryville intersections, are based on land use data developed by the City of Emeryville, which differs from the data in the ACCMA model.

- The MTS roadway analysis reports the outputs of the ACCMA model directly on a roadway segment level.

Due to the differences in the land use data and future volume development, the results from the two analyses (intersection and roadway segment) are not directly comparable.

The results of the ACCMA model were used to forecast the No Project condition for 2010 and 2025. Project trips were manually distributed to the MTS roadway segments (including both freeways and surface streets) identified above using the project trip distribution presented in Chapter 3. The distribution of project trips onto the MTS segments results in the With Project volumes for 2010 and 2025.

ANALYSIS METHOD

Operations of the MTS freeway and surface street segments were assessed based on volume-to-capacity (V/C) ratios. For freeway segments, a per-lane capacity of 2,000 vehicles per hour was used. This capacity is consistent with the 2003 and 2004 *Congestion Management Plan* documents. For surface streets, a per-lane capacity of 800 vehicles per hour was used. Roadway segments with a V/C ratio greater than 1.0 are assigned LOS F.

SIGNIFICANCE CRITERIA

According to the significance criteria presented previously in Chapter 1, the addition of project traffic causes a significant impact on an MTS roadway segment if:

1. The addition of project traffic causes a segment's operation to degrade to LOS F.
2. The addition of project trips causes the V/C ratio to increase by more than 5 percent on a segment that already operates at LOS F without the project traffic.

ANALYSIS RESULTS

The MTS AM and PM peak hour roadway segment analysis under 2010 and 2025 conditions are summarized in Tables 19 through 22. The addition of project trips would not cause any of the studied roadway or freeway segment to degrade to LOS F or increase the V/C ratio of a segment already operating at LOS F by more than three percent. Thus, the proposed project would not cause a significant impact on any MTS roadway segments.

7. ALTERNATIVE MODES ANALYSIS

This chapter documents the alternative modes analysis which considers project affects to transit, pedestrians and bicycles.

TRANSIT ACCESS AND CIRCULATION

Impacts to transit were identified by estimating additional transit ridership associated with the project to determine if added ridership could be accommodated by the current transit system. A review of the AC Transit publication, *Designing With Transit – Making Transit Integral to East Bay Communities,* was also reviewed to ensure that the proposed project would not conflict with policies. Transit impacts were evaluated with the following criteria:

- Generate added transit ridership that would
  - increase the average ridership on AC Transit lines by five (5) percent at bus stops where the average load factor with the project in place would exceed 125 percent over a peak thirty minute period
  - increase the peak hour average ridership on BART by five (5) percent where the passenger volume would exceed the standing capacity of BART trains
  - increase the peak hour average ridership at a BART station by five (5) percent where average waiting time at fare gates would exceed one minute
- Fundamentally conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle routes)

Ridership Estimates

Transit ridership associated with the project was calculated based on the project vehicle trip generation estimates, as presented in Chapter 3. Trip generation rates for the proposed project were reduced by 5 percent to account for alternative mode use (transit, bicycling, and walking) as well as internal interaction between the residential and commercial portions of the project. Census data indicates that approximately 20 percent of Emeryville residents commute to work via transit. For the residential portion of the project, transit trips were assumed to account for an additional 10 percent of peak hour project trips for the weekday, and 5 percent of additional trips during the Saturday peak hour. For the retail and restaurant portion of the project, transit trips were assumed to account for an additional 5 percent of weekday and Saturday peak hour trips. This equates to about 17 additional AM peak hour transit trips, 31 PM peak hour transit trips, and 47 afternoon peak hour transit trips, as shown on Table 23.

TABLE 23
PEAK-HOUR TRANSIT TRIP GENERATION

AC Transit routes 57 and Z, and the Emery Go Round Powell route directly serve the project site. AC Transit route Z provides service to Emeryville from San Francisco during the AM peak hour and reverse service during the PM peak hour. Given this, it was assumed that no new transit riders would be added to Route Z from the proposed project. All new riders were equally distributed between AC Transit Route 57 and the Emery Go Round Powell Route. These routes each provide five buses per hour to the project site during the AM and PM peak periods, with AC Transit Route 57 providing 4 buses during the Saturday peak hour, and the Emery Go Round providing 2 buses during the Saturday peak hour. This equates to approximately 2 new riders per bus during the AM peak hour, 3 new riders per bus during the PM peak hour, and 5 new riders per bus during the Saturday peak hour.

Based on information from AC Transit, Route 57 has additional capacity during the peak 30-minute period within the AM, PM and Saturday peak hours, and the additional transit riders would not result in load factors exceeding 125 percent. Emery Go Round buses operate at or over capacity for portions of the route during peak periods and the proposed project could increase transit ridership on the Emery Go Round system. The project applicant should continue contributions to the Emery Go Round system, as currently performed under the Property based Business Improvement District (PBID). Contributions are based on building square footage. Therefore, as development occurs, contributions would increase.

Of the total transit trips, it is assumed that 50 percent of new transit trips would use the BART system at some point during the journey, as both AC Transit Route 57 and the Emery Go Round serve the MacArthur BART station. This equates to 9 new AM, 15 new PM, and 14 new Saturday peak hour riders on the BART system. With over 30 BART trains that pass through the MacArthur station during the AM and PM peak hours and 12 BART trains during the Saturday peak hour, less than one additional rider would be added per train during the weekday and approximately one additional rider per train during the Saturday peak hour. Each BART train has between three and ten cars and each BART car has a capacity of about 70 passengers.

AC Transit Design Guidelines

In 2004, AC Transit published *Designing With Transit – Making Transit Integral to East Bay Communities*. The document is intended to help implement AC Transit Policy 520 (Encouraging the Promotion of Public Transit in Land Use Developments within AC Transit's Service Area), passed by the AC Transit Board of Directors in 1994 and amended in 1997. Policies and Practices are sub-divided into transit-based communities, safe routes to transit and transit friendly streets.

Transit-based communities have high levels of transit, a mixture of uses and a network of safe routes. The proposed project is served by Emery Go Round and AC Transit routes. These bus routes provide access to major employment and commercial centers, residential areas as well as rail transit at the BART and Amtrak stations. The Amtrak station is located on Horton Street at 59th Street with a pedestrian overcrossing providing direct access to the Amtrak station from the site. The project replaces parking facilities and light industrial uses with mixed-use residential and retail, increasing transit ridership opportunities. Given the nearby transit facilities and the proposed uses on the site, the project is consistent with the policies for transit-based communities.

Safe routes to transit consist of an integrated network of sidewalks and paths, maximizing circulation opportunities. The project would maintain the existing pedestrian overcrossing connecting the Amtrak station to the Public Market and pedestrian facilities on Christie Avenue, facilitating transit access to and from the project site for residents, employees and visitors. Therefore, the project is consistent with policies for safe routes to transit.

Transit friendly streets consist of streets that are of appropriate width with adequate turn radii to support buses, where signal timing is supportive of bus operations and traffic calming measures do not interfere with bus operations. Other elements include the placement and design of transit stops, which are preferred at curb-site, not pullouts, stops that are long enough for the buses that use them, bus shelters with appropriate amenities, and sidewalks that are wide enough to support a bus stop. Generally, transit friendly streets surround the project site. The current routing of Route 57 does not contribute to a transit friendly environment around the project site because its layover occurs prior to reaching major transit destinations.

In the study area, Route 57 operates in a clockwise direction on Shellmound Way, Christie Avenue, 64th Street, and Shellmound Street. Currently, buses layover on Christie Avenue, south of 64th Street. A bus layover area is a designed space for bus driver breaks, typically with bathroom accommodations for drivers. The current Route 57 layover occurs prior to reaching major transit destinations, the Amtrak station and main Marketplace entrance, requiring those transit patrons to wait for the duration of the layover prior to reaching their desired destination.

Route 57 should be reoriented through the study area in conjunction with providing a formal layover with bathroom facilities for AC Transit drivers. The proposed routing is shown on Figure 18. A bus layover should be provided on the south side of 64th Street, with bathroom access provided to AC Transit drivers at the proposed retail portion of the 64th & Shellmound building. A bus stop with a pullout on the east side of Shellmound Street, north of the pedestrian crossing, should be provided for northbound buses. A southbound bus stop on the west side of Shellmound Street, south of the Shellmound Street/Marketplace driveway, should be provided.

PEDESTRIAN ACCESS AND CIRCULATION

This section considers off-site pedestrian circulation and access from 64th Street, Shellmound Street and Christie Avenue as well as on-site pedestrian facilities. Sidewalks, crosswalks and walking paths facilitate pedestrian circulation. Recommendations to improve pedestrian both to and around the site are summarized on Figure 19.

Off-Site Pedestrian Facilities

As part of the proposed project, one driveway on Shellmound Street would be eliminated and one driveway would be relocated, reducing the number of driveways on the Shellmound Street project frontage to three. This minimizes the number of conflict points between vehicles and pedestrians. All other existing pedestrian facilities, sidewalks and crosswalks, on the west side of Shellmound Street would be maintained.

Pedestrian access to the Amtrak pedestrian overcrossing would be redirected through the mixed-use Shellmound building. The design of the Shellmound Street building would orient pedestrians from the pedestrian overcrossing to the Shellmound Street mid-block pedestrian crossing, as stairs and an elevator to the pedestrian crossing would be provided at the base of the mid-block crossing. Construction of the Shellmound Building would also increase the high pedestrian traffic across Shellmound Street where protected pedestrian facilities are not provided. Concentrating pedestrian crossing movements through design treatments to the mid-block crossing on Shellmound Street and providing a pedestrian signal at the mid-block Shellmound Street crosswalk would consolidate pedestrian movements and maintain vehicle flows through the corridor. Additionally, sidewalk railing should be constructed to direct pedestrian crossing movements through the mid-block crossing in conjunction with 10-foot sidewalks and appropriate landscaping along Shellmound Street to maintain pedestrian visibility and sight distance.

A diagonal crosswalk is proposed across Shellmound Street at the Woodfin Hotel/Marketplace driveway intersection. The diagonal orientation of the crosswalk increases pedestrian exposure to vehicles. The crosswalk should be reoriented perpendicular to the travel way to reduce pedestrian exposure.

In conjunction with the construction of the 64th & Christie Building, curb bulb-outs are proposed on 64th Street and Christie Street. The purpose of these bulb-outs is threefold: (1) extensions reduce the pedestrian crossing distance, thus reducing pedestrian exposure to traffic; (2) increases pedestrian visibility; and (3) defines and contains the parallel parking on Christie Avenue and 64th Street.

Two driveways, one on 64th Street and one on Christie Street, would provide direct access to the parking areas (surface and structured) for the 64th & Christie Building. No new curb cuts are proposed on either 64th Street or Christie Street.

On-Site Pedestrian Facilities

Current on-site pedestrian amenities include a landscaped path connecting the Marketplace Tower building to the UA Theater building, sidewalks around the northern, eastern and southern building frontage. A breezeway is also provided on the main site between the Marketplace Tower and Marketplace Building, connecting to the sidewalk on the eastern frontage. Additional pedestrian improvements include an additional landscaped path through the parking area connecting the sidewalk along the east side of the Marketplace Tower to the UA Theater. The existing sidewalk on the northern edge of the Marketplace Tower, which is currently not ADA accessible, would be extended, providing a continuous pedestrian connection to the City Park. These improvements facilitate safe and continuous on-site pedestrian paths. Fehr & Peers has identified several locations for improved pedestrian connectivity through the site, as identified on Figure 19 (see also recommendations 16 and 17).

BICYCLE ACCESS AND CIRCULATION

Bicycle circulation encompasses designated bicycle routes as well as other facilities used by bicyclists. A variety of pavement treatments can be used to delineate on-street bike facilities including lane lines to define a bike lane, stencils that indicate bikes are to share the road, and stencils that indicate the general location within the travel way bicycles are to use. Safe facilities are continuous, well delineated with striping and signs, and designed to accommodate the expected bicycle speeds. Class II bicycle facilities (bike lanes) are provided on Shellmound Street in the study area. These lanes would not be removed or altered as part of the project. Additionally, the removal of a curb cut on Shellmound Street would reduce the number of potential vehicle/bicyclist conflict locations. Other regional bicycle facilities, such as the bicycle boulevard on Horton Street can be accessed from the pedestrian overcrossing to the Amtrak station. Access to this pedestrian bridge would be provided through the new Shellmound building. The Shellmound Building elevators proposed to serve the Amtrak pedestrian bridge should be large enough to accommodate bicyclists. Should access to the pedestrian bridge through the Shellmound Building not accommodate bicyclists, increased vehicle/bicycle conflicts could arise as bicyclists use the garage ramping system to access the pedestrian bridge. Bicycle parking is dispersed through the parking areas and may be difficult for a bicyclist to locate, potentially resulting in bicycle parking demand exceeding supply in some areas of the site. As the project is developed, the provision of additional bicycle parking spaces is recommended as demand warrants. Three distinct types of bicycle parking shall be provided: 1) secured bicycle lockers on the upper levels of the garage reserved for resident use only; 2) secured bicycle lockers on the lower levels of the garage for employee parking; and 3) bicycle parking on the ground floor reserved for retail patrons.

TRANSIT, PEDESTRIAN AND BICYCLE RECOMMENDATIONS

The following recommendations should be considered to improve site access and circulation for transit, pedestrians and bicyclists.

- Concentrate pedestrian crossing movements across Shellmound Street through design treatments to the mid-block crossing on Shellmound Street. Provide a pedestrian signal at the mid-block Shellmound Street crosswalk to consolidate pedestrian movements and maintain vehicle flows through the corridor. Additional sidewalk railing should be constructed to direct pedestrian crossing movements through the mid-block crossing. Construct sidewalks a minimum of 10 feet wide and provide appropriate landscaping along Shellmound Street to maintain pedestrian visibility and sight distance.

- Reorient the crosswalk perpendicular to the travel way across Shellmound Street at the Woodfin Hotel/Marketplace driveway intersection to reduce pedestrian exposure.

- The project applicant shall continue contributions to the Emery Go Round system, as currently performed under the Property based Business Improvement District (PBID). Contributions are based on building square footage. Therefore, as development occurs, contributions would increase.

- Reorient Route 57 through the study area in conjunction with providing a formal layover with bathroom facilities for AC Transit drivers. The proposed routing is shown on Figure 18. Provide a bus layover on the south side of 64th Street, with bathroom access provided to AC Transit drivers at the proposed retail portion of the 64th & Shellmound building. Provide a bus stop with a pullout on the east side of Shellmound Street, north of the pedestrian crossing, for northbound buses. Provide a southbound bus stop on the west side of Shellmound Street, south of the Shellmound Street/Marketplace driveway.

- The Shellmound Building elevators proposed to serve the Amtrak pedestrian bridge should be large enough to accommodate bicyclists.

- As the project is developed, the provision of additional bicycle parking spaces is recommended as demand warrants. Three distinct types of bicycle parking shall be provided: 1) secured bicycle lockers on the upper levels of the garage reserved for resident use only; 2) secured bicycle lockers on the lower levels of the garage for employee parking; and 3) bicycle parking on the ground floor reserved for retail patrons.

RECOMMENDED PEDESTRIAN ENHANCEMENTS

FIGURE 19

8. VEHICULAR SITE ACCESS, ON-SITE CIRCULATION AND PARKING

This chapter focuses on vehicular site access, on-site circulation and parking. Bicycle and pedestrian access and circulation were discussed in the previous chapter.

SITE ACCESS

Vehicular access to the site would be provided at six locations. A driveway on Christie Avenue that currently serves the site would be realigned opposite a driveway serving the Pacific Park Plaza, and Pinnacles development, which is under construction. This driveway would primarily provide access to the 64th & Christie building, the UA Theater, and the retail pad adjacent to City Park. Two driveways on 64th Street would serve the 64th & Christie building and UA Theater. The first driveway would serve the proposed parking garage of the 64th & Christie building, while the second driveway would serve the UA Theater surface parking area as well as provide access to an on-site garage entry to the 64th & Christie building.

On Shellmound Street, four driveways currently serve the site. The driveway located between the UA Theater entrance and the main Marketplace entrance would be eliminated as part of this project and the northernmost driveway would be shifted south approximately 50 feet, with a corresponding decrease in left-turn pocket length, to align with the driveway on Christie Avenue. The Market Place/Shellmound Building Driveway would remain the same, although it would serve the proposed parking structure on the east side of Shellmound Street. A driveway which provides access to the Woodfin Hotel and parking supplies on the west side of Shellmound Street is located south of the pedestrian crossing on Shellmound Street.

Fehr & Peers evaluated the peak hour operation of the driveways serving the site in both the 2010 and 2030 conditions, assuming full buildout of the project, as presented in Table 24. It should be noted that future vehicle queues for the northbound left-turn pocket at the UA Theater entrance on Shellmound Street would be accommodated within the reduced pocket length. With project buildout in 2010 and 2030, deficient operations are projected at two intersections: Shellmound Street/Shellmound Site Garage Driveway/Marketplace Driveway and Shellmound Street/Woodfin Hotel/Marketplace Driveway. The Shellmound Street/Shellmound Site Garage Driveway/Marketplace Driveway is projected to operate at LOS F during the PM peak hour with all-way stop-control. The side-street at the Shellmound Street/Woodfin Hotel/Marketplace Driveway is projected to operate at a deficient LOS F during the PM peak hour in both 2010 and 2030, although the intersection would operate at an overall acceptable service level. The analysis of Shellmound Street/ Shellmound Site Garage Driveway/Marketplace Driveway and Shellmound Street/Woodfin Hotel/Marketplace Driveway was conducted using the traffic analysis tool SimTraffic which takes into consideration interaction between vehicles and pedestrian movements across Shellmound Street.

Vehicle queue spillback was also evaluated, as presented in Table 25 for 2010 conditions and Table 26 for 2030 conditions both without and with mitigation, for the Shellmound Street/Shellmound Site Garage Driveway/ Marketplace Driveway, Shellmound Street/Pedestrian Crossing and the Shellmound Street/Woodfin Hotel/ Marketplace Driveway intersections. Results of the analysis show that vehicle queue spillback from the Shellmound Street/Shellmound Site Garage Driveway/Marketplace Driveway as well as at the pedestrian crosswalk contribute to unacceptable conditions at the Woodfin Hotel Driveway. The increases in vehicle traffic combined with increased pedestrian activity across Shellmound Street contribute to unacceptable operations on the Shellmound Street corridor along the project's frontage.

TABLE 24
FUTURE PEAK HOUR DRIVEWAY OPERATING CONDITIONS

Intersection	Control[1]	Peak Hour	Future 2010 with Project		Future 2030 with Project

	Eastbound	85	75	50	85	**125**

Notes: 1. Maximum queue in feet as calculated by SimTraffic 6.0.
Source: Fehr & Peers, 2007.

Impact Statement 14: The addition of project traffic would result in deficient LOS F operations at the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway intersection as well as at the Woodfin Hotel driveway with buildout of the project parcels on the west side of Shellmound Street. This is a potentially ***significant impact***.

Mitigation Measure 14: In conjunction with construction on the Shellmound site, a traffic signal shall be installed at the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway intersection. The driveways shall be modified to provide sufficient vehicle storage to minimize vehicle queue spill back from impeding on-site circulation. Implementation of this measure would result in acceptable service levels during the peak hours. However, the 95th percentile queue for the northbound movements would periodically spillback through the pedestrian crossing and from the pedestrian crossing through the Woodfin Driveway, and Shellmound Way. Minimizing the effect of queue spillback could be achieved through monitoring of the signal timings. It should be noted that the Shellmound Street corridor from Shellmound Way through the Marketplace Driveway would operate better in the mitigated scenario than the unmitigated scenario even though vehicle queues would periodically spill back through the corridor, resulting in a ***significant and unavoidable*** queuing impact on the Shellmound Street corridor.

Impact Statement 15: The addition of project traffic would worsen side street operations at the Shellmound Street/Woodfin Hotel/Marketplace Driveway intersection to LOS F with buildout of the project. This is a potentially ***significant impact***.

Mitigation Measure 15: The driveway serving the Woodfin Hotel cannot accommodate significant additional traffic flows. It is recommended that the parking area serving the new land uses on the Shellmound site be designed to orient the majority of outbound traffic, about 80 percent, away from the shared driveway. Alternatively, this driveway could be restricted right-in/right-out operation. With right-in/right-out operation, the worst movement would operate at LOS C and the intersection would operate at an overall LOS A during both the weekday PM and Saturday afternoon peak hours. However, restricting access to this parcel could potentially create circuitous travel through the area, and would reduce access to/from the Woodfin Hotel. Therefore, access restrictions are not recommended, resulting in a ***significant and unavoidable*** impact.

Impact Statement 16: Vehicle queues at the pedestrian crossing are expected to increase as pedestrian activity increases around the project site. This queuing contributes to deficient operations at the Shellmound Street/Woodfin Hotel/Marketplace Driveway and the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway. This is a potentially ***significant impact***.

Mitigation Measure 16: Install a pedestrian signal at the pedestrian crossing on Shellmound Street. Through design treatments, such as sidewalk railings and landscaping, consolidate pedestrian activity from the Shellmound Street/Woodfin Hotel/Marketplace Driveway and the Shellmound Street/Marketplace Driveway/Shellmound Garage driveway to the pedestrian crossing. The pedestrian signal shall be interconnected and coordinated with the signal at the Shellmound Street/Shellmound Way intersection and the Shellmound Street/Marketplace Driveway/Shellmound Garage intersection. It should be noted that the Shellmound Street corridor from Shellmound Way through the Marketplace Driveway would operate better in the mitigated scenario than the unmitigated scenario even though vehicle queues would periodically spill back through the corridor, resulting in a ***significant and unavoidable*** queuing impact on the Shellmound Street corridor. However, the installation of a pedestrian signal would improve pedestrian safety across Shellmound Street as traffic volumes increase through the corridor, reducing the pedestrian impact to a ***less-than-significant*** level.

ON-SITE CIRCULATION

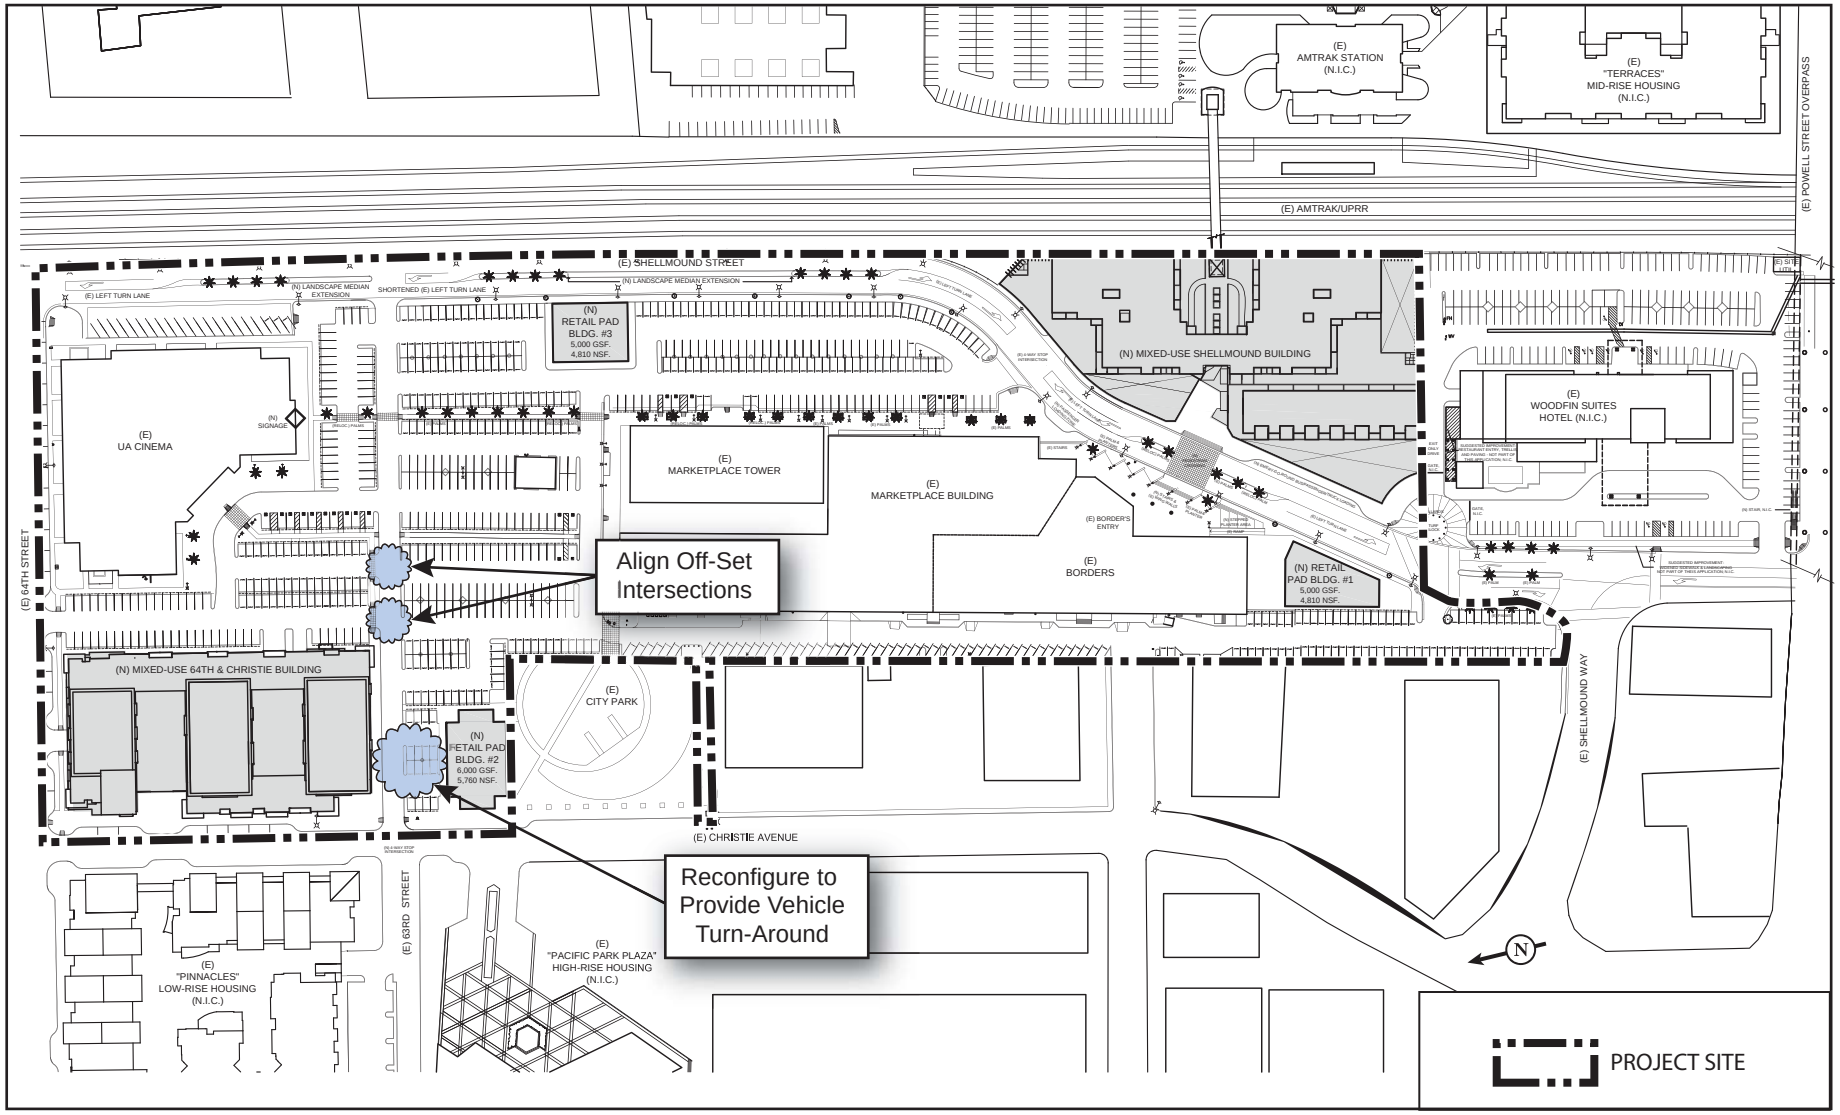
On-site circulation for the surface parking area and parking structures were reviewed. Recommendations to improve on-site circulation are summarized on Figure 14.

Surface Parking Lot

Drive Aisles

Two east-west drive aisles would be provided. The northernmost east-west drive aisle connects Shellmound Street with Christie Avenue. The second east-west drive aisle is located approximately 200 feet south of the northernmost east-west drive aisle. Both aisles are at least 22 feet wide, the minimum drive aisle width allowed by the City of Emeryville. Parking is not provided on either east-west drive aisle.

Six north-south aisles would be provided, all of which provide access to parking. The aisles are at least 22 feet wide, the minimum drive aisle width allowed by the City of Emeryville. The intersections of two north-south aisles (as illustrated on Figure 20) across the northernmost east-west driveway are off-set, creating a potentially confusing intersection.



Marketplace Redevelopment EIR

FEHR & PEERS
TRANSPORTATION CONSULTANTS

February 2007
Graphics\Feb07 PDFs\WC05-2272_20

ON-SITE CIRCULATION RECOMMENDATIONS

FIGURE 20

Dead End Drive Aisles

Dead end drive aisles are parking aisles obstructed at one end, thereby increasing navigational difficultly through the drive aisles. Two dead end drive aisles adjacent to the retail pad #2 (adjacent to City Park) are proposed, serving approximately 20 parking spaces. As the depth of these parking areas is approximately 35 feet, vehicles wanting to park in this area would be able to see if spaces were available. However, it appears that vehicles parked in the last stall of each row could have difficultly exiting the space, especially if an oversized vehicle is parked in the opposite stall. Vehicles parked in the dead end drive aisles adjacent to retail pad #2 could have difficultly exiting the space. Reconfigure the parking area adjacent to the retail pad #2 to provide sufficient space for vehicles to back out of the last spaces in each row.

Vehicle/Pedestrian Conflicts

Locations of vehicle and pedestrian conflicts were discussed in the pedestrian circulation section and recommendations to increase pedestrian visibility and reduce vehicle/pedestrian conflicts were summarized on Figure 13.

Dimensions of Parking Spaces

The City of Emeryville municipal code provides guidelines for parking space dimensions (9-4.55.7). Standard perpendicular parking stalls for retail uses should be 8 and 1/2 feet wide by 18 feet long, with 8 feet of overhead clearance (for stalls within a garage). Compact stalls can be 7 and 1/2 feet wide by 16 feet long. When a vehicle overhang is provided, parking stall lengths can be reduced by 2 feet. Parking stalls throughout the surface parking area conform to these standards. For residential uses, parking stalls should be 9 feet wide and 18 feet long.

Delivery Vehicles

Insufficient detail is provided on the site plan to evaluate delivery vehicle access. However, based on City Code requirements (9-4.55.8), no formal loading area would be required for the three proposed retail pads, or the 64th & Shellmound retail. Two loading spaces would potentially be required on the Shellmound site. Additionally, deliveries and garbage collection should be scheduled for off-peak times to minimize potential conflicts. Insufficient detail is provided to evaluate delivery vehicle access. Delivery vehicle access should be reviewed prior to approval of the final site plan.

Parking Structure Design

This parking structure design review includes the 64th & Christie building and Shellmound Building parking structures. It considers consistency with accepted design standards for parking structures as well as a qualitative review of the circulation plan to identify potential conflict locations. Design standards for parking are set by the *City of Emeryville Municipal Code* in section 9-4.55.7. Generally, parking stall and drive aisle dimensions in the proposed garages meet City standards. However, stalls in the resident only areas of the 64th & Christie building and Shellmound buildings garages are designated as compact stalls. The minimum dimensions of an assigned resident stall are 9 feet wide by 18 feet long. Although City Code does permit some compact stalls in residential developments, residents assigned to a compact space may not have a compact vehicle, impeding vehicle circulation through the lot. Assigned resident parking stalls should be redesigned to meet standard City dimensions.

In a parking structure, the maximum permitted ramp slope is 20 percent. Should a ramp slope exceed 10 percent, transitions between ramp and floor of at least eight feet in length are recommended. Ramp slopes in the Shellmound garage do not exceed 5 percent. The ramp slope in the 64th & Christie building are not provided on the site plan. Insufficient detail is provided on the site plan to evaluate the ramping system of the 64th & Christie building garage. The ramping system of the 64th & Christie building garage should be reviewed during permit approval to ensure compliance with City of Emeryville design guidelines.

Circulation and parking stall designations were also reviewed for both structures.

64th & Christie building Parking Structure

The 64th Street and Christie Avenue Building parking structure would provide approximately 286 spaces to serve 180 residential units and 6,000 square feet of retail. Of the parking spaces, approximately 221 would be reserved for resident use (with 72 tandem spaces) as required by City Code, with the remaining spaces shared between retail and resident guest parking. Tandem parking spaces are shown on the parking garage layout. These spaces must be designated as reserved resident spaces, assigned to the same unit.

The spaces available for retail and guest parking are located on the lower garage level and are proposed to be separated from reserved residential spaces by a gate system. Operations of the gate system separating the open parking from reserved parking could be impeded by improperly parked or oversized vehicles. Designing the parking garage with roll up gates could reduce the interference of an improperly parked or oversized vehicle with the function of a swinging or sliding gate.

The parking aisles provided for retail/guest parking terminate at the residential gates, creating a dead-end drive aisle with no vehicle turn around. This can create difficulties for vehicles navigating the garage. The proposed location of the residential gates creates dead-end drive aisles with no vehicle turn around provided. Additionally, vehicles parked in spaces adjacent to the gates would have difficulties exiting the parking space. Relocating the residential gates to minimize dead-end drive aisles or provide sufficient space for a vehicle turn around would minimize parking difficulties.

Shellmound Building Parking Structure

The Shellmound Building Parking Structure is a 3-level parking structure with a total of 540 spaces including retail and residential parking. Full vehicular access to the parking structure is provided on the first level on Shellmound Street at the main Marketplace entry. A separate exit only driveway, connecting to the Woodfin Suites parking lot, is located on the south side of the structure. Upon entry into the Shellmound building garage, access to two aisles is immediately provided, creating a confusing intersection where vehicle conflicts would occur. This area should be redesigned to reduce vehicle conflicts.

With buildout of the proposed project, a traffic signal would be warranted at the Shellmound Street/Shellmound Site Garage Driveway/Marketplace Driveway intersection. With installation of a traffic signal, the design of the garage entrance would not provide sufficient vehicle storage to ensure efficient signal operations.

> ***Impact Statement 17:*** With signalization of the Shellmound Street/Shellmound Site Garage Driveway/Marketplace Driveway intersection, the design of the garage entry would not provide sufficient vehicle storage. Additionally, as vehicles queue internally, access to parking areas could be blocked, creating the potential for vehicle queues onto Shellmound Street. This is a potentially ***significant impact***.

Mitigation Measure 17: Redesign the Shellmound building garage entrance area to minimize vehicle conflicts and provide sufficient vehicle storage at the access intersection. Implementation of this measure would reduce the project impact to a ***less-than-significant*** level.

The parking aisles provided for retail/guest parking terminate at the residential gates, creating a dead-end drive aisle with no vehicle turn around. This can create difficulties for vehicles navigating the garage. Relocating the residential gates to minimize dead-end drive aisles or provide sufficient space for a vehicle turn around would minimize navigational difficulties.

On the third parking level, several parking stalls are provided adjacent to a wall, with no space provided for a vehicle to back-out of the stall. This parking area should be reconfigured to provide sufficient space for vehicles to back out of the last spaces in each row.

Bicycle parking cages are located on all three levels of the parking structure. To access bicycle parking cages on the second and third levels, bicycles would circulate through the garage, increasing conflicts between the various modes of transportation, as noted in the bicycle circulation discussion. Bicycle spaces on the upper levels should be reserved for resident use and located adjacent to the elevator system.

PARKING SUPPLY AND DEMAND

At project buildout a total of 1,516 on-site parking spaces would be provided in surface and structured parking for the Marketplace site and Shellmound building. This represents an increase of 449 spaces over the current supply of 1,067 spaces. An additional 286 structured parking spaces would be constructed for the 64th & Christie building. The proposed on-site parking supply was compared to both City Code parking requirements and ITE parking demand rates. Additionally, parking demand/supply during the construction phase of the project was also reviewed.

City Code

City Code parking requirements were reviewed to ensure that the proposed project provides sufficient parking for the new project uses. The City of Emeryville requires:

- One reserved resident space for every studio and one bedroom residential unit
- One and one-half reserved resident space for every two and three bedroom residential unit
- One-quarter guest space for every unit
- One space for every 250 square feet of regional retail
- One space for every 333 square feet of local retail

A reduction in the building square-footage used to calculate parking of up to 20 percent is allowed to account for non-usable interior area and common areas. As shown in Table 27, sufficient parking would be provided to satisfy code requirements for project uses.

TABLE 27
CITY CODE AUTOMOBILE PARKING REQUIREMENTS

Land Use Type	Size	Parking Code Requirement[1]	Parking Spaces Required
Marketplace Site			
Shellmound Building			
Reserved Residential Spaces	39 – Studio Units	1.0 per unit	39

Shared Parking Analysis

Current tenants of the Marketplace site, as well as the Woodfin Hotel, have an existing shared parking agreement. Shared parking on the site would continue to occur with additional development on the site and the Shellmound site (the 64th & Christie site would provide all its required parking on site and would not share parking with the Marketplace site). Therefore, a shared parking analysis was completed to determine if sufficient parking would be provided on the Marketplace site to accommodate existing demand, as well as future demand, at project buildout.

Existing weekday and weekend parking demand for the Marketplace site were documented by Watry Design, Inc in their letter dated October 5, 2005 (copy provided in Appendix D). That study showed maximum observed parking occupancies of 65 percent. Parking demand rates, as presented in ITE's *Parking Generation* (3rd Edition), the Urban Land Institute publication *Shared Parking* (2nd Edition), and City of Emeryville parking code requirements were used to estimate peak parking demands for the Marketplace portion of the Project. Existing parking demand for the site, which includes hotel, retail, restaurant, office and theater uses, was compared to the theoretical demand for site calculated from information contained in the aforementioned publications. Adjustments to the base demand rates were made so that the calculated peak demand coincided with actual observed peak demand, resulting in a weekday retail/restaurant demand rate of 2.95 and a weekend demand rate of 3.52 spaces per 1,000 square feet. The calculated rates for the existing retail/restaurant were used to estimate peak parking demand for the retail portions of the project. Emeryville City Code requirements were used for the residential portion of the project, as parking spaces would generally be assigned to each unit. Monthly and hourly adjustment factors were applied to the calculated maximum demand rates to develop hourly parking demand for each use on the Marketplace site (existing and proposed).

The results are summarized on Figure 21 for weekends in June and Figure 22 for weekdays in June. June was selected as the analysis month as existing parking demand data was collected during this month. Results of the analysis show that proposed parking supplies would be sufficient to accommodate future parking demand. On a Saturday in June, the maximum demand is projected to be 1,214 spaces, which represents a parking occupancy of 80 percent, or a twenty percent surplus. On a Weekday in June, the maximum demand is projected to be 1,074 spaces, which represents a 71 percent occupancy rate, or a 29 percent surplus. For a mixed-use project a surplus of about 15 percent is desirable to limit the amount of circulation through the site. Additionally, as parking supplies would be located throughout the site, it is recommended that a parking space counting system be installed at the garage to minimize circulation throughout the garage.

Parking during Construction

As businesses are in operation on the Marketplace site, adequate parking supplies must be maintained during the project construction period. Based on parking surveys conducted by Watry Design, Inc., excess parking is currently available on the site during peak parking periods. The current supply is 1,067 spaces, with an observed maximum occupancy of approximately 65 percent. It is assumed that parking demand would generally not increase during the construction period.

Prior to the start of construction on the site, the parking lot on the Marketplace site would be configured to provide an additional 183 parking spaces. Additionally, valet parking would be in place providing an additional 162 spaces. Construction on the Shellmound site would require the removal of 251 parking spaces. Construction of retail pad #2, adjacent to City Park, requires the permanent removal of 28 parking spaces. Up to 20 additional spaces adjacent to retail pad #2 may be used for construction staging. With construction of retail pad #3, adjacent to Shellmound Street, approximately 33 spaces would be permanently removed, with up to 20 additional spaces used for construction staging purposes. No existing marketplace parking supplies would be removed with construction of the 64th & Christie building or retail pad #1, adjacent to Boarders. Assuming all portions of the project are constructed concurrently, approximately 1,060 parking spaces would be available during the construction period. As existing parking demand is much less than current supply, reflecting the mixed-use nature of the proposed project, the loss of 7 spaces during the construction period is not considered significant. Therefore, the impact to parking during the construction period would be less-than-significant impact.

SUMMARY OF VEHICULAR SITE ACCESS, ON-SITE CIRCULATION AND PARKING RECOMMENDATIONS

The following summarizes vehicular site access, circulation and parking recommendations for the proposed project:

- Reconfigure the parking area adjacent to the retail pad #2 to provide sufficient space for vehicles to back out of the last spaces in each row
- Review delivery vehicle access prior to approval of the final site plan
- Redesign assigned resident parking stalls to meet standard City dimensions
- Review the ramping system of the 64th & Christie building garage during permit approval to ensure compliance with City of Emeryville design guidelines
- Design the 64th & Christie building parking garage with roll up gates as an improperly parked or oversized vehicle could interfere with the function of a swinging or sliding gate
- Relocate the residential gates in the 64th & Christie building garage to minimize dead-end drive aisles or provide sufficient space for a vehicle turn around
- Redesign the entry on of the Shellmound building garage on Shellmound Street to eliminate conflicts at the entry intersection
- Relocate the residential gates in the Shellmound building garage to minimize dead-end drive aisles or provide sufficient space for a vehicle turn around
- Install a parking space counting system at the Shellmound building garage to minimize excessive circulation through the site
- On the third parking level of the Shellmound building garage, redesign the parking stalls adjacent to a wall to provide sufficient space for vehicles to back out of the last spaces in each row

9. ALTERNATIVES ANALYSIS

This chapter evaluates the Alternatives to the proposed Project.

DESCRIPTION OF ALTERNATIVES

Four alternatives to the Project were evaluated, as described below.

Alternative 1 – No project

Under the "no project" alternative, no development would occur. The site would remain as it is today.

Alternative 2 – Reduced Project

The reduced project alternative would reduce the number of housing units, reduce the amount of retail space, and develop office uses. The reduced project components are listed below:

- 140 dwelling units
- 157,000 square feet of office space
- 28,560 square feet of retail space
- 5,040 Square feet of restaurant space

The size of the Shellmound Building would be reduced and additional surface level parking would be provided, as shown on Figure 23.

Alternative 3 – Tower

The Tower alternative would increase the number of housing units and increase the amount of retail space. The Tower alternative components are listed below:

- 388 dwelling units
- 211,960 square feet of retail space
- 37,410 square feet of restaurant space

This alternative assumes redevelopment of the UA Theater site with additional retail/restaurant uses, as shown on Figure 24.

Alternative 4 – Main Street

The Main Street alternative would increase the number of housing units, increase the amount of retail space, and develop office uses.

- 388 dwelling units
- 415,000 square feet of office space
- 179,360 square feet of retail space
- 31,640 square feet of restaurant space

This alternative also assumes the redevelopment of the UA Theater Site. Shellmound Street would also be realigned through the existing Marketplace parking lot, connecting to its existing alignment approximately 350 feet south of 64th Street as part of this alternative, as shown on Figure 28.

TRIP GENERATION COMPARISONS

Trip generation estimates for the proposed Project and Project Alternatives are presented in Table 25, with detailed trip generation tables provided in Appendix F. Project Alternative 1 would not generate any additional trips for the site. Project Alternative 2 would generate more AM peak hour trips, due to the addition of the office component. PM and Saturday peak hour trip generation would decrease with Alternative 2; however, in the PM peak hour the amount outbound traffic would increase as compared to the proposed project, due to the addition of the office component whose PM peak hour trip generation is mostly outbound trips. Project Alternative 3 would almost triple the AM and Saturday peak hour vehicle trip generation as compared to the proposed project, and double PM peak hour trip generation. Project Alternative 4 would result in a 5 fold increase in AM peak hour trip generation and triple PM and Saturday trip generation.

TABLE 28
PROJECT ALTERNATIVE
TRIP GENERATION COMPARISON

Project Alternative	AM Peak Hour			PM Peak Hour			Saturday Peak Hour		
	In	Out	Total	In	Out	Total	In	Out	Total
Proposed Project	71	148	219	261	198	459	298	246	544
Project Alternative 1	0	0	0	0	0	0	0	0	0
Project Alternative 2	247	103	350	136	256	392	164	134	298
Project Alternative 3	282	334	616	523	429	952	806	648	1,454
Project Alternative 4	776	379	1,155	564	863	1,427	783	635	1,418

LEVEL OF SERVICE SUMMARY

Operations at the study intersections were evaluated using the same level of service calculations discussed previously. Results of the analysis are presented in Table 29 for the Existing condition, Table 30 for the 2010 condition and Table 31 for the 2030 condition. Table 32 summaries the significant impacts of each project alternative for locations where at least one Project alternative would result in a significant impact. A level of service summary table for all study intersections is provided in Appendix F.

PROJECT ALTERNATIVES MITIGATION MEASURES

Additional mitigation measures would be required for the project alternatives to mitigate their additional impacts.

Alternative 2

The reduced project alternative would result in one additional significant impact as compared to the Proposed Project, primarily due to the increased number of outbound trips during the PM peak hour. Alternative 2 would also result in similar queuing impact as compared to the Proposed Project. Mitigation measures developed for the Proposed Project would need to be implemented in condition with additional measures discussed below:

40th Street/Hollis Street – Retime the traffic signals on the 40th Street corridor.

Alternative 3

Alternative 3 would result in eight additional intersection impacts. Alternative 3 would likely exacerbate the queuing impacts identified for the Proposed Project. Project Mitigation measures developed for the Proposed Project would need to be implemented in condition with additional measures discussed below:

65th Street/Hollis Street – Retime the traffic signal.

64th Street/Shellmound Street – Install a traffic signal when warranted by actual conditions.

Powell Street/Christie Street – Modify the intersection to provide dual westbound left-turn lanes, an exclusive southbound left-turn lane (in addition to the shared left-through lane), increase the storage length of the westbound right-turn pocket. These improvements would require widening of Powell Street and Christie Avenue and would also increase pedestrian crossing distance for the intersection.

40th Street/Horton Street – Retime the traffic signals on the 40th Street corridor.

40th Street/Hollis Street – Retime the traffic signals on the 40th Street corridor.

40th Street/Emery Street – Retime the traffic signals on the 40th Street corridor.

40th Street/San Pablo Avenue – Implement the planned improvements to the 40th Street/San Pablo Avenue intersection, including the provision of an eastbound right turn lane. Install this improvement with a right turn overlap phase and retiming of the signals on the 40th Street and San Pablo Avenue corridors, taking into account BRT operation. San Pablo Avenue is a Caltrans facility and implementation of this measure cannot be assured by the City of Emeryville.

Mandela Parkway/Horton Street – Install a traffic signal and left-turn pockets when warranted by actual conditions. This intersection is in the City of Oakland and implementation of this measure cannot be assured by the City of Emeryville.

Alternative 4

Alternative 4 would result in nine additional intersection impacts. Alternative 4 would likely exacerbate the queuing impacts identified for the Proposed Project. Some measures identified to mitigate the impacts of the Proposed Project may not be sufficient to mitigate the impacts of Alternative 4, and additional measures should be considered. Project Mitigation measures developed for the Proposed Project would need to be implemented in condition with additional measures discussed below:

65th Street/Hollis Street – Retime the traffic signal.

64th Street/Shellmound Street – Install a traffic signal when warranted by actual conditions.

I-80 Hook Ramps/Frontage Road – Provide a second southbound through lane. This intersection is a Caltrans facility and implementation of this measure cannot be assured by the City of Emeryville.

Powell Street/Christie Street – Modify the intersection to provide dual westbound left-turn lanes, an exclusive southbound left-turn lane (in addition to the shared left-through lane), increase the storage length of the westbound right-turn pocket. These improvements would require widening of Powell Street and Christie Avenue and would also increase pedestrian crossing distance for the intersection.

40th Street/Horton Street – Retime the traffic signals on the 40th Street corridor.

40th Street/Hollis Street – Retime the traffic signals on the 40th Street corridor.

40th Street/Emery Street – Retime the traffic signals on the 40th Street corridor.

40th Street/San Pablo Avenue – Implement the planned improvements to the 40th Street/San Pablo Avenue intersection, including the provision of an eastbound right turn lane. Install this improvement with a right turn overlap phase and retiming of the signals on the 40th Street and San Pablo Avenue corridors, taking into account BRT operation. San Pablo Avenue is a Caltrans facility and implementation of this measure cannot be assured by the City of Emeryville.

Mandela Parkway/Horton Street – Install a traffic signal when warranted by actual conditions. This intersection is in the City of Oakland and implementation of this measure cannot be assured by the City of Emeryville.

In addition to the intersection impacts identified above, the intersection of 63rd Street/Shellmound Street could experience some operational difficulties given the amount of traffic expected to use this intersection, its skewed orientation and provision of a ramp to the parking garage. Relocating the ramp to the parking structure opposite 62nd Street should be considered to improve traffic flow on Shellmound Street with this alternative. Additionally, the provision of on-street parking on Shellmound Street would decrease the capacity of this corridor, reducing potential traffic shifts to the Ashby Avenue interchange, resulting in additional impacts at the Powell Street interchange.

Other measures that should be considered with Alternative 4 include converting Shellmound Street and Christie Street to a one-way loop system; improving the amount and frequency of public transit to the site; limiting the amount of parking that could be constructed with the project; improving bicycle and pedestrian connections throughout the area; and providing a car-share service on-site to minimize auto ownership/use among residents and employees of the site.

HCM Average Control Delay	**32.0**
HCM Level of Service	**C**

NOTE:

Approach Delays computed using Sychro 6.0 with a single controller for these two intersections.

Synchro output sheets are attached.

HCM Calculation does not include WB approach at Intersection of 65th/Shellmound nor the EB approach at 65th/Overland.

HCM Signalized Intersection Capacity Analysis
1004&1005: 65th/Shellmound/Overland Single Controller

Emeryville Marketplace Redevelopment
2010 Plus Project Saturday Peak Hour

Intersection	1004: 65th St & Shellmound St												1005: 65th St & Overland Ave					
Movement	EBL	EBT	EBR	WBL	WBT	WBR	NBL	NBT	NBR	SBL	SBT	SBR	EBT	EBR	WBL	WBT	NBL	NBR
Volume	73	45	13	128	66	23	13	408	227	17	302	39	346	23	39	249	60	13

Approach	EB	WB	NB	SB	EB	WB	NB
Volume	131	217	648	358	369	288	73
Delay	42.0	0.6	31.5	19.3	1.3	42.8	42.6
LOS	D	A	C	B	A	D	D

HCM Average Control Delay	**32.2**
HCM Level of Service	**C**

NOTE:

Approach Delays computed using Sychro 6.0 with a single controller for these two intersections.

Synchro output sheets are attached.

HCM Calculation does not include WB approach at Intersection of 65th/Shellmound nor the EB approach at 65th/Overland.

Approach Delays computed using Sychro 6.0 with a single controller for these two intersections.

Synchro output sheets are attached.

HCM Calculation does not include WB approach at Intersection of 65th/Shellmound nor the EB approach at 65th/Overland.

HCM Average Control Delay	**53.1**
HCM Level of Service	**D**

NOTE:

Approach Delays computed using Sychro 6.0 with a single controller for these two intersections.

Synchro output sheets are attached.

HCM Calculation does not include WB approach at Intersection of 65th/Shellmound nor the EB approach at 65th/Overland.

Approach	EB	WB	NB	SB	EB	WB	NB
Volume	110	240	221	361	236	206	69
Delay	31.2	0.4	18.6	19.6	0.3	38.3	31.3
LOS	C	A	B	B	A	D	C

HCM Average Control Delay	**25.5**
HCM Level of Service	**C**

NOTE:

Approach Delays computed using Sychro 6.0 with a single controller for these two intersections.

Synchro output sheets are attached.

HCM Calculation does not include WB approach at Intersection of 65th/Shellmound nor the EB approach at 65th/Overland.
