Table D-2
Summary of Historical Volatile Organic Compounds (EPA Methods 8240 and 8260*) in Groundwater Monitoring Wells
The Sherwin-Williams Company
Emeryville, California

Concentrations reported in milligrams per liter (mg/L)

Well Number	Date Sampled	1,1,1-TCA	1,2-DCA	1,2-DCP	2-Hexa-none	Acetone	Benzene	Chloro-benzene	Chloro-form	cis-1,2-DCE	Ethyl-benzene	Methyl Ethyl Ketone	PCE	Toluene	trans-1,2-DCE	TCE	Vinyl Chloride	Xylenes, Total

Data QA/QC performed by EW.

Notes:

* = Analysis changed from EPA Method 8240 to EPA Method 8260 beginning in February-March 1998 (First Quarter 1998).

< = Analyte was not detected at or greater than the detection limit reported.

ND = Not detected (no associated detection limit was reported)

na = Not analyzed

DUP = Duplicate sample (field duplicate)

(a) Concentrations for LF-B1 may not represent B-zone water quality because LF-B1 is screened in the aquitard between the A- and B-zones.

(b) Concentrations for LF-B5 may not represent B-zone water quality because LF-B5 is screened in the aquitard between the A- and B- zones.

(c) SBPA well monitored by SLR consulting.

(d) SBPA well monitored by EKI personnel.

RPD = Relative percent difference.

Abbreviations for analytes:

1,1,1-TCA = 1,1,1-Trichloroethane
1,1,2-TCA = 1,1,2-Trichloroethane
1,1-DCA = 1,1-Dichloroethane
1,1-DCE = 1,1-Dichloroethene
1,2,4-TMB = 1,2,4-Trimethylbenzene
1,2-DCA = 1,2-Dichloroethane
1,2-DCB = 1,2-Dichlorobenzene
1,2-DCP = 1,2-Dichloropropane
1,3,5-TMB = 1,3,5-Trimethylbenzene
cis-1,2-DCE = cis-1,2-Dichloroethene
PCE = Tetrachloroethene
trans-1,2-DCE = trans-1,2-Dichloroethene
TCE = Trichloroethene
MTBE = Methl teritary-butyl ether

Data qualifiers:

J= Concentration is estimated.

J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated because surrogate recoveries were outside of control limits.

J4 = Concentration is estimated because RPD was outside of control limit for laboratory control sample.

J10 = Concentration is estimated due to field duplicate RPD outside of control limit.

J11 = Concentration is estimated because it was reported at a concentration less than the detection limit.

R = Quantified as rejected.

U = Quantified as nondetect (U).

U5 = Quantified as nondetect (U) based on field blank contamination evaluation.

U6 = Quantified as nondetect (U) based on trip blank contamination evaluation.

U12 = Quantified as nondetect (U) based on source water contamination evaluation.

(1) = High responses were observed for sec-butylbenzene and p-isopropyltoluene in continuing calibration verification.

All notes are listed at the end of this table; see last page.

Table D-3
Summary of Historical Total Petroleum Hydrocarbons as Diesel and Gasoline and Motor Oil in Groundwater Monitoring Wells
The Sherwin-Williams Company, Emeryville, California
Concentrations reported in milligrams per liter (mglL)

Well Number	Notes	Date Sampled	Total Petroleum Hydrocarbons as Diesel	Total Petroleum Hydrocarbons as Gasoline	Total Petroleum Hydrocarbons as Motor Oil

Table D-3
Summary of Historical Total Petroleum Hydrocarbons as Diesel and Gasoline and Motor Oil in Groundwater Monitoring Wells
The Sherwin-Williams Company, Emeryville, California

Concentrations reported in milligrams per liter (mglL)

Well Number	Notes	Date Sampled	Total Petroleum Hydrocarbons as Diesel	Total Petroleum Hydrocarbons as Gasoline	Total Petroleum Hydrocarbons as Motor Oil

Data QA/QC performed by EW.

Notes:

< = Analyte was not detected at or greater than the detection limit reported.

DUP = Duplicate sample (field duplicate).
Y = Sample exhibits chromatographic pattern that does not resemble standard.
na/ND = Data from table provided by EKI and/or SES consultants. Volatile Organic Compounds (VOCs) were not detected above reporting limits; however, individual analyte reporting limits were not provided.

a = Concentrations for LF-B1 may not represent B-zone water quality because LF-B1 is screened in the aquitard between the A- and B-zones.

b = Concentrations for LF-B5 may not represent B-zone water quality because LF-B5 is screened in the aquitard between the A- and B-zones.

c = Unknown hydrocarbon mixture with peak patterns atypical of diesel is quantified as diesel for a range of n-C10 to n-C24.

d = Unknown hydrocarbon mixture with peak patterns atypical of gasoline is quantified as gasoline for a range of n-C07 to n-C12.
e = The concentration reported for diesel is due primarily to the presence of a heavier petroleum product, possibly motor oil.
f = The concentration reported for diesel is due primarily to the presence of a lighter petroleum product (range C06-C12), possibly gasoline.
g = The concentration reported for gasoline is due to the presence of a discrete hydrocarbon peak not indicative of gasoline.
h = The concentration reported for gasoline is due primarily to the presence of a heavier hydrocarbon peak not indicative of gasoline.
i = The concentration reported for diesel is due to the presence of a discrete hydrocarbon peak not indicative of diesel.

j = SBPA well monitored by SLR consulting.

k = SBPA well monitored by EKI personnel.

l = Sample exhibits chromatographic pattern that does not resemble standard for diesel.

Data qualifiers and notes for Total Petroleum Hydrocarbon data:

J= Concentration is estimated.
J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.
J2 = Concentration is estimated because the sample was analyzed outside of holding time.
J3 = Concentration is estimated because surrogate recoveries were outside of control limits.
U = Quantified as nondetect.

J11 = Concentration is estimated because it was reported at a concentration less than the detection limit.

Table D-4
Summary of Historical Inorganic Compounds in Groundwater Monitoring Wells
The Sherwin-Williams Company
Emeryville, California
Concentrations reported in milligrams per liter (mg/L)

Well Number	Notes	Date Sampled	Arsenic	Barium	Beryllium	Cadmium	Lead	Total Chromium	Mercury	Selenium	Silver	Vanadium	Zinc

Data QA/QC performed by EW.

Notes:

Samples were analyzed using EPA Method 200/6000/7000 series for selected metals.

< = Analyte was not detected at or greater than the detection limit reported. For some historical samples, detection limit was not available.

na = Not analyzed

DUP = Duplicate sample (field duplicate)

(a) Concentrations for LF-B1 may not represent B-zone water quality because LF-B1 is screened in the aquitard between the A- and B-zones.

(b) Concentrations for LF-B5 may not represent B-zone water quality because LF-B5 is screened in the aquitard between the A- and B-zones.

(c) The samples collected from wells LF-27 and LF-28 may have inadvertently been switched during field or laboratory procedures, as indicated by the concentrations of arsenic in these samples during the first quarter 2004 monitoring event.

(d) Results of split samples taken on behalf of CDM.

* Three groundwater samples were collected from well CDM-1 on 12/8/06 by Camp Dresser McKee, Inc. (CDM). According to CDM, two groundwater samples were collected from approximately 9.8 feet below top of casing (TOC); the samples were analyzed by two different laboratories by different analytical methods; reported dissolved arsenic concentrations were 9.8 and 11.8 mg/l, as analyzed by EPA Methods 6010B and 1637, respectively. The third groundwater sample (*) was collected from approximately 12.2 feet below TOC, was analyzed by EPA Method 1632, and the reported dissolved arsenic concentration was 12.08 mg/l.

MD-1 through MD-4 are wells monitored by SLR consulting, and MD-5 is monitored by EKI personnel.

Data Qualifiers:

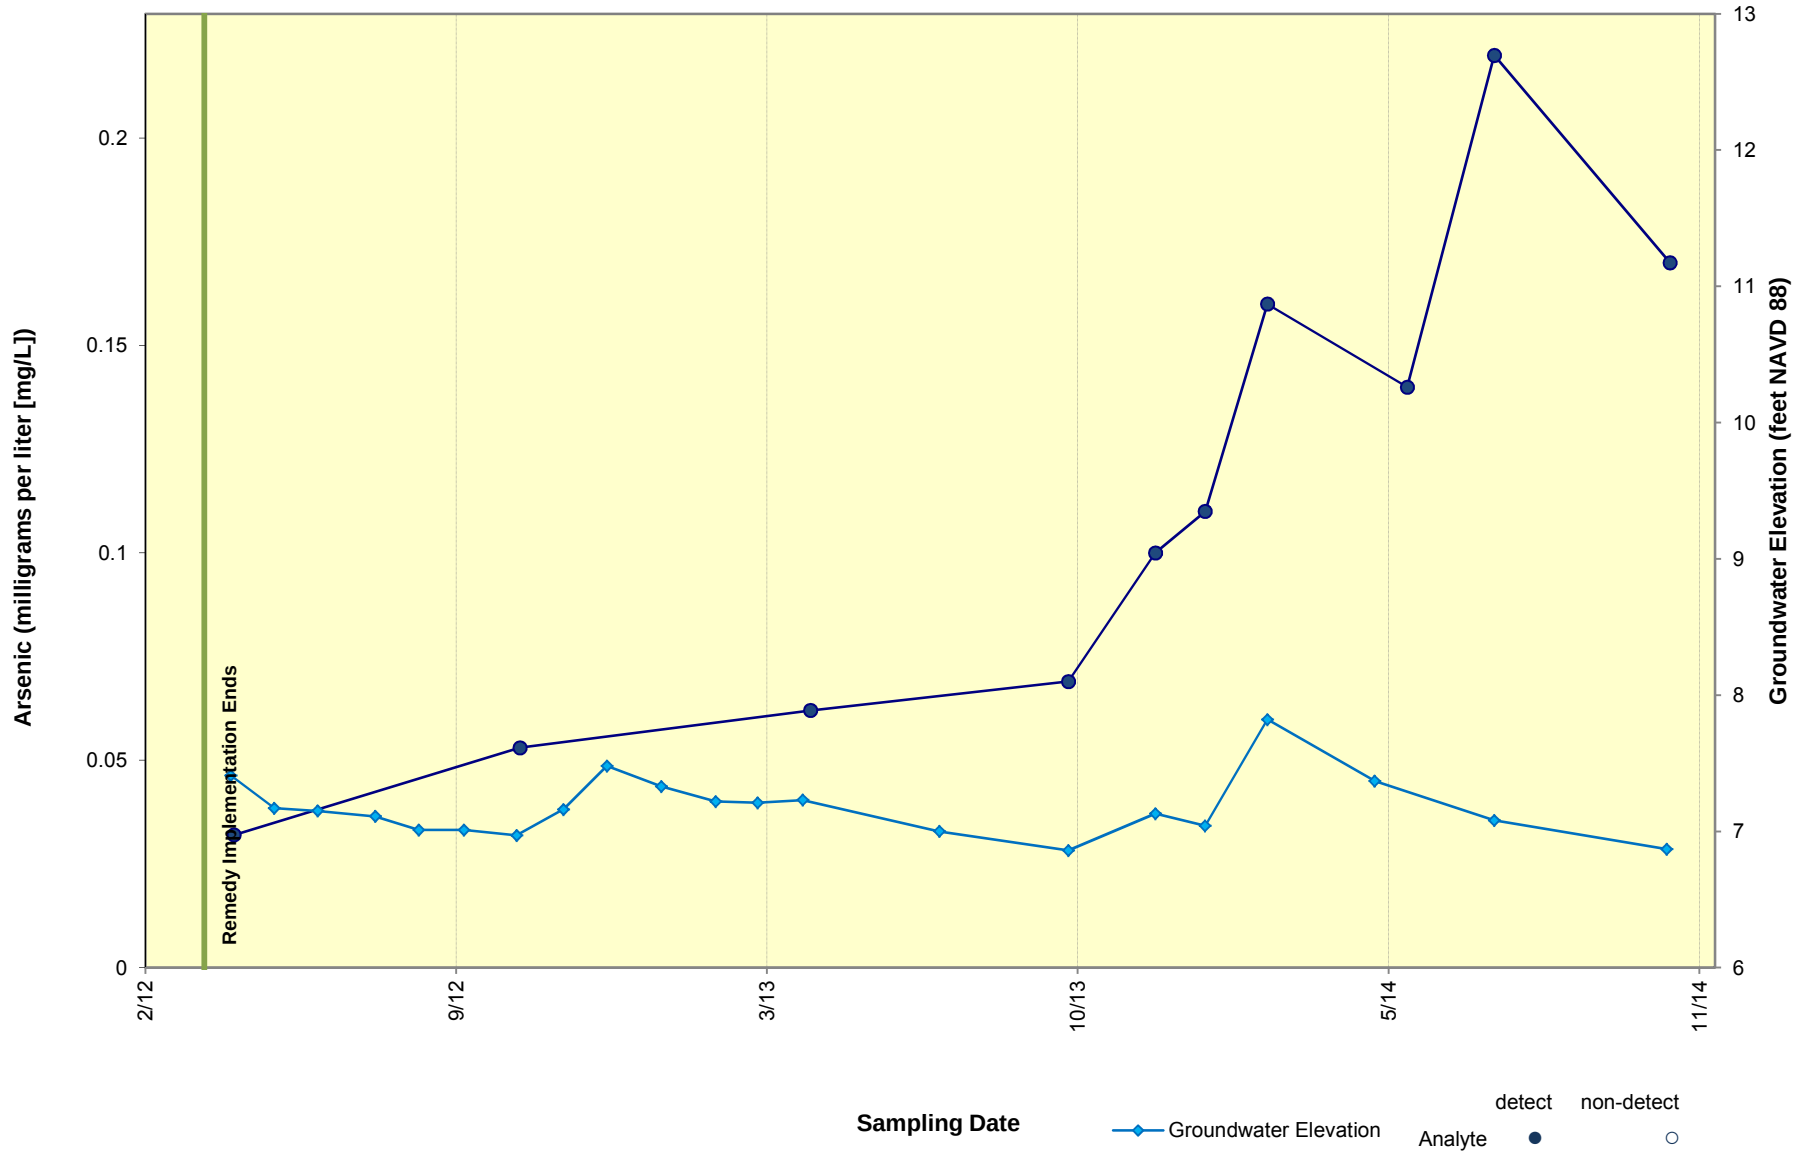
J = Concentration or detection limit is estimated.

U = Quantified as nondetect.

U5 = Qualified as nondetect (U) based on field blank contamination evaluation.

J8 = Concentration is estimated because laboratory control spike and/or laboratory control duplicate spike percent recoveries were outside of control limits.

UJ8 = Nondetected value is estimated because laboratory control spike and/or laboratory control duplicate spike percent recoveries were outside of control limits.



R = Rejected

F = Field Filtered

CASE NARRATIVE

Laboratory number:	**258777**
Client:	**Arcadis**
Project:	**EM002616.0014.00401**
Location:	**Sherwin Williams-Emeryville**
Request Date:	**07/08/14**
Samples Received:	**07/08/14**

This data package contains sample and QC results for five water samples, requested for the above referenced project on 07/08/14. The samples were received cold and intact. All data were e-mailed to Erica Whiting on 07/21/14.

Metals (EPA 6010B):
No analytical problems were encountered.

Client ARCADIS Project EM002616.0014.00404

Date Opened 7/8/14 By (print) MC (sign)
Date Logged in " By (print) " (sign) "

1. Did cooler come with a shipping slip (airbill, etc) ____ YES (NO)
Shipping info ____

2A. Were custody seals present? .... ☐ YES (circle) on cooler on samples ☒ NO
How many ____ Name ____ Date ____
2B. Were custody seals intact upon arrival? ____ YES NO N/A
3. Were custody papers dry and intact when received? ____ YES NO
4. Were custody papers filled out properly (ink, signed, etc)? ____ YES NO
5. Is the project identifiable from custody papers? (If so fill out top of form) YES NO
6. Indicate the packing in cooler: (if other, describe) ____

☒ Bubble Wrap ☐ Foam blocks ☐ Bags ~~☒ None~~ MC 7/8
☐ Cloth material ☐ Cardboard ☐ Styrofoam ☐ Paper towels

7. Temperature documentation: * Notify PM if temperature exceeds 6°C

Type of ice used: ☒ Wet ☐ Blue/Gel ☐ None Temp(°C) 3.1

☐ Samples received on ice & cold without a temperature blank; temp taken with IR gun

☐ Samples received on ice directly from the field. Cooling process had begun

8. Were Method 5035 sampling containers present? ____ YES (NO)
If YES, what time were they transferred to freezer? ____
9. Did all bottles arrive unbroken/unopened? ____ (YES) NO
10. Are there any missing / extra samples? ____ YES (NO)
11. Are samples in the appropriate containers for indicated tests? ____ (YES) NO
12. Are sample labels present, in good condition and complete? ____ ~~YES~~ NO
13. Do the sample labels agree with custody papers? ____ ~~YES~~ NO
14. Was sufficient amount of sample sent for tests requested? ____ ~~YES~~ NO
15. Are the samples appropriately preserved? ____ YES NO N/A
16. Did you check preservatives for all bottles for each sample? ____ YES NO N/A
17. Did you document your preservative check? ____ YES NO N/A
18. Did you change the hold time in LIMS for unpreserved VOAs? ____ YES NO N/A
19. Did you change the hold time in LIMS for preserved terracores? ____ YES NO N/A
20. Are bubbles > 6mm absent in VOA samples? ____ YES NO N/A
21. Was the client contacted concerning this sample delivery? ____ YES (NO)
If YES, Who was called? ____ By ____ Date: ____

CASE NARRATIVE

Laboratory number:	**262026**
Client:	**Arcadis**
Project:	**EM002616.0014.00401**
Location:	**Sherwin Williams-Emeryville**
Request Date:	**10/27/14**
Samples Received:	**10/27/14**

This data package contains sample and QC results for four water samples, requested for the above referenced project on 10/27/14. The samples were received cold and intact. All data were e-mailed to Erica Whiting on 11/03/14.

Metals (EPA 6010B):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**262086**
Client:	**Arcadis**
Project:	**EM002616.0014.00401**
Location:	**Sherwin Williams-Emeryville**
Request Date:	**10/29/14**
Samples Received:	**10/29/14**

This data package contains sample and QC results for nine water samples, requested for the above referenced project on 10/29/14. The samples were received cold and intact. All data were e-mailed to Erica Whiting on 11/14/14.

Volatile Organics by GC/MS (EPA 8260B):
Many analytes were detected between the MDL and the RL in the method blank for batch 217173; these analytes were not detected in samples at or above the RL. No other analytical problems were encountered.

Metals (EPA 6010B):
No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Curtis & Tompkins, Ltd.

Login # 262086 Date Received 10/29/14 Number of coolers 1
Client ARCADIS Project EM002616.0004.00401

Date Opened 10/29 By (print) MC (sign)
Date Logged in 1 By (print) (sign)

1. Did cooler come with a shipping slip (airbill, etc) YES (NO)
Shipping info

2A. Were custody seals present? .... ☐ YES (circle) on cooler on samples ☒ NO
How many Name Date
2B. Were custody seals intact upon arrival? YES NO (N/A)
3. Were custody papers dry and intact when received? (YES) NO
4. Were custody papers filled out properly (ink, signed, etc)? (YES) NO
5. Is the project identifiable from custody papers? (If so fill out top of form) (YES) NO
6. Indicate the packing in cooler: (if other, describe)

☒ Bubble Wrap ☒ Foam blocks ☐ Bags ☐ None
☐ Cloth material ☐ Cardboard ☐ Styrofoam ☐ Paper towels

7. Temperature documentation: * Notify PM if temperature exceeds 6°C

Type of ice used: ☒ Wet ☐ Blue/Gel ☐ None Temp(°C) 2 1

☐ Samples Received on ice & cold without a temperature blank; temp. taken with IR gun

☐ Samples received on ice directly from the field. Cooling process had begun

8. Were Method 5035 sampling containers present? YES (NO)
If YES, what time were they transferred to freezer?
9. Did all bottles arrive unbroken/unopened? (YES) NO
10. Are there any missing / extra samples? YES (NO)
11. Are samples in the appropriate containers for indicated tests? (YES) NO
12. Are sample labels present, in good condition and complete? (YES) NO
13. Do the sample labels agree with custody papers? (YES) NO
14. Was sufficient amount of sample sent for tests requested? (YES) NO
15. Are the samples appropriately preserved? (YES) NO N/A
16. Did you check preservatives for all bottles for each sample? YES NO (N/A)
17. Did you document your preservative check? YES NO (N/A)
18. Did you change the hold time in LIMS for unpreserved VOAs? YES NO (N/A)
19. Did you change the hold time in LIMS for preserved terracores? YES NO (N/A)
20. Are bubbles > 6mm absent in VOA samples? (YES) NO N/A
21. Was the client contacted concerning this sample delivery? YES (NO)
If YES, Who was called? By Date:

COMMENTS

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

POLYCHLORINATED BIPHENYLS

Division of Toxicology ToxFAQs™ **February 2001**

This fact sheet answers the most frequently asked health questions (FAQs) about polychlorinated biphenyls. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Polychlorinated biphenyls (PCBs) are a mixture of individual chemicals which are no longer produced in the United States, but are still found in the environment. Health effects that have been associated with exposure to PCBs include acne-like skin conditions in adults and neurobehavioral and immunological changes in children. PCBs are known to cause cancer in animals. PCBs have been found in at least 500 of the 1,598 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are polychlorinated biphenyls?

Polychlorinated biphenyls are mixtures of up to 209 individual chlorinated compounds (known as congeners). There are no known natural sources of PCBs. PCBs are either oily liquids or solids that are colorless to light yellow. Some PCBs can exist as a vapor in air. PCBs have no known smell or taste. Many commercial PCB mixtures are known in the U.S. by the trade name Aroclor.

PCBs have been used as coolants and lubricants in transformers, capacitors, and other electrical equipment because they don't burn easily and are good insulators. The manufacture of PCBs was stopped in the U.S. in 1977 because of evidence they build up in the environment and can cause harmful health effects. Products made before 1977 that may contain PCBs include old fluorescent lighting fixtures and electrical devices containing PCB capacitors, and old microscope and hydraulic oils.

What happens to PCBs when they enter the environment?

❑ PCBs entered the air, water, and soil during their manufacture, use, and disposal; from accidental spills and leaks during their transport; and from leaks or fires in products containing PCBs.

❑ PCBs can still be released to the environment from hazardous waste sites; illegal or improper disposal of industrial wastes and consumer products; leaks from old electrical transformers containing PCBs; and burning of some wastes in incinerators.

❑ PCBs do not readily break down in the environment and thus may remain there for very long periods of time. PCBs can travel long distances in the air and be deposited in areas far away from where they were released. In water, a small amount of PCBs may remain dissolved, but most stick to organic particles and bottom sediments. PCBs also bind strongly to soil.

❑ PCBs are taken up by small organisms and fish in water. They are also taken up by other animals that eat these aquatic animals as food. PCBs accumulate in fish and marine mammals, reaching levels that may be many thousands of times higher than in water.

How might I be exposed to PCBs?

❑ Using old fluorescent lighting fixtures and electrical devices and appliances, such as television sets and refrigerators, that were made 30 or more years ago. These items may leak small amounts of PCBs into the air when they get hot during operation, and could be a source of skin exposure.

❑ Eating contaminated food. The main dietary sources of PCBs are fish (especially sportfish caught in contaminated lakes or rivers), meat, and dairy products.

❑ Breathing air near hazardous waste sites and drinking contaminated well water.

❑ In the workplace during repair and maintenance of PCB transformers; accidents, fires or spills involving transformers, fluorescent lights, and other old electrical devices; and disposal of PCB materials.

How can PCBs affect my health?

The most commonly observed health effects in people exposed to large amounts of PCBs are skin conditions such as acne and rashes. Studies in exposed workers have shown changes in blood and urine that may indicate liver damage. PCB exposures in the general population are not likely to result in skin and liver effects. Most of the studies of health effects of PCBs in the general population examined children of mothers who were exposed to PCBs.

Animals that ate food containing large amounts of PCBs for short periods of time had mild liver damage and some died. Animals that ate smaller amounts of PCBs in food over several weeks or months developed various kinds of health effects, including anemia; acne-like skin conditions; and liver, stomach, and thyroid gland injuries. Other effects

of PCBs in animals include changes in the immune system, behavioral alterations, and impaired reproduction. PCBs are not known to cause birth defects.

How likely are PCBs to cause cancer?

Few studies of workers indicate that PCBs were associated with certain kinds of cancer in humans, such as cancer of the liver and biliary tract. Rats that ate food containing high levels of PCBs for two years developed liver cancer. The Department of Health and Human Services (DHHS) has concluded that PCBs may reasonably be anticipated to be carcinogens. The EPA and the International Agency for Research on Cancer (IARC) have determined that PCBs are probably carcinogenic to humans.

How can PCBs affect children?

Women who were exposed to relatively high levels of PCBs in the workplace or ate large amounts of fish contaminated with PCBs had babies that weighed slightly less than babies from women who did not have these exposures. Babies born to women who ate PCB-contaminated fish also showed abnormal responses in tests of infant behavior. Some of these behaviors, such as problems with motor skills and a decrease in short-term memory, lasted for several years. Other studies suggest that the immune system was affected in children born to and nursed by mothers exposed to increased levels of PCBs. There are no reports of structural birth defects caused by exposure to PCBs or of health effects of PCBs in older children. The most likely way infants will be exposed to PCBs is from breast milk. Transplacental transfers of PCBs were also reported In most cases, the benefits of breast-feeding outweigh any risks from exposure to PCBs in mother's milk.

How can families reduce the risk of exposure to PCBs?

❑ You and your children may be exposed to PCBs by eating fish or wildlife caught from contaminated locations. Certain states, Native American tribes, and U.S. territories have issued advisories to warn people about PCB-contaminated fish and fish-eating wildlife. You can reduce your family's exposure to PCBs by obeying these advisories.

❑ Children should be told not play with old appliances, electrical equipment, or transformers, since they may contain PCBs.

❑ Children should be discouraged from playing in the dirt near hazardous waste sites and in areas where there was a transformer fire. Children should also be discouraged from eating dirt and putting dirty hands, toys or other objects in their mouths, and should wash hands frequently.

❑ If you are exposed to PCBs in the workplace it is possible to carry them home on your clothes, body, or tools. If this is the case, you should shower and change clothing before leaving work, and your work clothes should be kept separate from other clothes and laundered separately.

Is there a medical test to show whether I've been exposed to PCBs?

Tests exist to measure levels of PCBs in your blood, body fat, and breast milk, but these are not routinely conducted. Most people normally have low levels of PCBs in their body because nearly everyone has been environmentally exposed to PCBs. The tests can show if your PCB levels are elevated, which would indicate past exposure to above-normal levels of PCBs, but cannot determine when or how long you were exposed or whether you will develop health effects.

Has the federal government made recommendations to protect human health?

The EPA has set a limit of 0.0005 milligrams of PCBs per liter of drinking water (0.0005 mg/L). Discharges, spills or accidental releases of 1 pound or more of PCBs into the environment must be reported to the EPA. The Food and Drug Administration (FDA) requires that infant foods, eggs, milk and other dairy products, fish and shellfish, poultry and red meat contain no more than 0.2-3 parts of PCBs per million parts (0.2-3 ppm) of food. Many states have established fish and wildlife consumption advisories for PCBs.

Hi Nina, I'm working on the Draft EIR for the proposed development of the Sherwin-Williams site in Emeryville. Could you clarify whether the LUC require that a soil vapor survey and indoor air evaluation be performed prior to construction or development would also apply to the existing building on-site (Build 31), which is currently proposed to be renovated and used for commercial purposes.

Thanks,

-Cem

Subject: UPRR Parcel D
Attachments: Emeryville Site Status 060115.doc

Earl and Joy – hope you are well. A couple of things related to UPRR Parcel D.

First the City is preparing an EIR for the proposed development of the Sherwin Williams site and a development option includes incorporating UPRR Parcel D into the site design/development and thus the EIR consultant needs the background information on the site history that is in the Phase I ESA that you did back in 2006 or thereabouts. The City has the hardcopy but would prefer to provide the consultant an electronic copy if possible. Can you please check your files to see if you can provide that and if so please coordinate with Miroo Desai, City Planner, who is copied here. As noted below the final site cleanup plan is on DTSC's envirostor website.

Also, with respect to UPRR Parcel D, I seem to recall we had completed the completion report but DTSC could not concur without a land use covenant. See attached monthly reports from Susan Coleman – this one was dated June 1, 2015. To finalize the land use covenant I believe I need an exhibit to show those areas of the site that were not remediated because of the need to maintain a slope along the property lines abutting the railroad right-of-way and the Technichem building. I believe there is an exhibit that shows these areas in the completion report, but I need to review that exhibit to see if it can be turned into an actual legal description of the area impacted.

Can you please send me an electronic copy of the completion report for UPRR Parcel D, along with the various attachments to it, and perhaps we can have a brief conversation sometime this week to see if we can get someone at EKI or a surveyor to prepare the legal description, provided it is something that can be described in a legal description. Thanks.

Mike

FIRE HAZARD SEVERITY ZONES

Local Responsibility Area	State or Federal Responsibility Area
VHFHSZ	VHFHSZ
Non-VHFHSZ	Non-VHFHSZ

Incorporated Cities

Government Code 51175-89 directs the California Department of Forestry and Fire Protection (CAL FIRE) to identify areas of very high fire hazard severity zones within Local Responsibility Areas (LRA). Mapping of the areas, referred to as Very High Fire Hazard Severity Zones (VHFHSZ), is based on data and models of, **potential** fuels over a 30-50 year time horizon and their associated expected fire behavior, and expected burn probabilities to quantify the likelihood and nature of vegetation fire exposure (including firebrands) to buildings. Details on the project and specific modeling methodology can be found at http://frap.fire.ca.gov/projects/hazard/fhz.html. Local Responsibility Area VHFHSZ maps were initially developed in the mid-1990s and are now being updated based on improved science, mapping techniques, and data.

In late 2005 to be effective in 2008, the California Building Commission adopted California Building Code Chapter 7A requiring new buildings in VH FHSZs to use ignition resistant construction methods and materials. These new codes include provisions to improve the ignition resistance of buildings, especially from firebrands. The updated very high fire hazard severity zones will be used by building officials for new building permits in LRA. The updated zones will also be used to identify property whose owners must comply with natural hazards disclosure requirements at time of property sale and 100 foot defensible space clearance. It is likely that the fire hazard severity zones will be used for updates to the safety element of general plans.

This specific map is based on a geographic information system dataset that depicts final CAL FIRE recommendations for Very High FHSZs within the local jurisdiction. The process of finalizing these boundaries involved an extensive local review process, the details of which are available at http://frap.cdf.ca.gov/projects/hazard/bInet/ (click on "Continue as guest without logging in"). Local government has 120 days to designate, by ordinance, very high fire hazard severity zones within its jurisdiction after receiving the recommendation. Local government can add additional VHFHSZs. There is no requirement for local government to report their final action to CAL FIRE when the recommended zones are adopted. Consequently, users are directed to the appropriate local entity (county, city, fire department, or Fire Protection District) to determine the status of the local fire hazard severity zone ordinance.

Section 1
Introduction

On behalf of The Sherwin Williams Company (S-W), CDM Smith Inc. (CDM Smith) has prepared this *Updated Soil Gas Data Summary and Evaluation Report* (Report) for the S-W property, located at 1450 Sherwin Street in Emeryville, California, and a portion of the adjacent former Rifkin property, located at 4525 - 4563 Horton Street, to which hazardous substances have migrated from the S-W property. Collectively, the S-W property and this portion of the former Rifkin property are referred to as the "Site" within this Report. Novartis Vaccines and Diagnostics, Inc. (Novartis) is the current owner of the former Rifkin property. **Attachment A** presents the Site plan.

This Report updates CDM Smith's March 14, 2013 report which presented results from the first two post-remedy implementation soil gas sampling events, which were conducted in June 2012 and January 2013 (CDM Smith, 2013). There has not been any change in this Report to the presentation of the results from the first two post-remedy implementation soil gas sampling events from the March 14, 2013 report. The March 14, 2013 report recommended conducting an additional round of post-remedy implementation soil gas sampling in June 2013 (the third event). This Report updates the previous report with the results from the June 2013 third event and presents fresh conclusions and recommendations.

With the completion of the third post-remedy implementation soil gas sampling event, sufficient data have been collected to evaluate soil vapor intrusion concerns as a part of the future redevelopment plans for both the S-W and former Rifkin properties.

1.1 Purpose

The purpose of this Report is to document the results of the June 2012, January 2013, and June 2013 soil gas collection and analysis, specifically to:

- Describe the field work activities for the June 2012 soil gas monitoring point (SGMP) installations.
- Describe the field work activities for the June 2012, January, 2013, and June 2013 soil gas sampling events.
- Summarize the soil gas sample results for volatile organic compounds (VOCs) and evaluate the results against California Human Health Screening Levels (CHHSLs) in soil gas under residential use (Cal/EPA, 2009).
- Present conclusions regarding presence of VOCs in soil gas and recommendations for further evaluation.

The California Environmental Protection Agency (Cal/EPA) does not have quantitative soil gas standards. The O&M Plan establishes cleanup goals for Site contaminants of concern, including those in soil gas. The soil gas cleanup goals for the Site are defined by DTSC to be the residential CHHSLs. CHHSLs were developed by California Office of Environmental Health Hazard Assessment (OEHHA) on behalf of Cal/EPA. They represent concentrations of select contaminants that under standard exposure assumptions and chemical toxicity could trigger an unacceptable risk to human health, defined by an

excess lifetime cancer risk of one-in-a-million and a hazard quotient of 1.0 for noncancer health effects. Presence of these contaminants of concern in soil gas below their corresponding residential CHHSLs would indicate that the soil gas does not pose an unacceptable health risk to future people who may live or work at the Site nor would it require an environmental restriction be established for the Site.

1.2 Scope of Work

The scope of work for the June 2012 and January 2013 soil gas sampling activities was presented in the Site's *Operation and Maintenance Plan* (O&M Plan), dated December 11, 2012 (CDM Smith, 2012b). The O&M Plan is for the continued management of the remedy implemented at the Site and residual contaminants of concern (COCs) remaining at the Site. The O&M Plan was approved by California Department of Toxic Substances Control (DTSC) in their letter dated December 17, 2012 (DTSC, 2012b). The remedy implemented at the Site has been documented in the *Remedy Implementation Completion Report* (Completion Report), dated July 25, 2012 (CDM Smith, 2012a). The Completion Report was approved by DTSC in their letter dated August 6, 2012 (DTSC, 2012a).

The scope of work for the June 2013 soil gas sampling activities was presented in the March 14, 2013 report, which was to sample each SGMP for a third event consistent with the O&M Plan and the first two events (CDM Smith, 2013). The March 14, 2013 report was approved by DTSC in their letter dated April 15, 2013 (DTSC, 2013).

The scope of work for the June 2012, January 2013, and June 2013 activities consisted of the following key elements:

June 2012 – SGMP Installations

- Obtained drilling permits from Alameda County Public Works for the S-W property and former Rifkin property.
- Notified Underground Service Alert (USA) and Novartis about SGMP installations and had locations cleared of underground utilities by a private utilities locator.
- Installed the 12 planned SGMPs (9 on the S-W property and 3 on former Rifkin property). **Table 1** presents the construction details for the SGMPs. **Attachment A** presents the locations of the SGMPs on the Site plan.
- Completed well reports and submitted them to Alameda County Public Works.

June 2012, January 2013, and June 2013 – Soil Gas Sampling Events

- Performed vacuum shut-in and leak check tests to check seals on each SGMP and fittings for sample train before sampling.
- Purged minimum three (3) volumes of soil gas from each SGMP, measured for helium, oxygen, and total VOCs using hand-held meters.
- Connected a 1-liter Summa canister coupled with a flow controller to the sample train and collected soil gas sample at each SGMP.
- Set up and collected an ambient air sample with a 6-liter Summa canister coupled with a flow controller.

- Collected one (1) duplicate sample and maintained one (1) trip blank sample for each event.
- Recorded field measurements and data in log book and on field data sheets.
- Submitted samples to analytical laboratory under chain-of-custody protocols.

As presented in the O&M Plan, the SGMPs were installed at locations in proximity to previous soil gas sample locations, which occurred in November and December 2006, and is further discussed in **Section 1.4**.

1.3 Deviations from O&M Plan

SGMP installations and soil gas sample collection occurred in general accordance with the objectives, methodology, and procedures presented in the O&M Plan (CDM Smith, 2012b). The following deviations from the O&M Plan occurred:

1. O&M Plan states the second sampling event was to be December 2012. The second sampling event occurred in January 2013. The event was moved with DTSC notification due to issues with canisters procurement, helium availability, and precipitation events in December 2012.

2. DTSC guidelines specify 5 feet as an appropriate depth to collect soil gas samples in order to minimize effects from atmospheric conditions, including changes in barometric pressure, temperature, and/or breakthrough of ambient air from the surface. Due to anticipated shallow groundwater at portions of the Site, DTSC accepted the provision in the O&M Plan to allow installation of SGMPs as shallow as 3.0 feet. SGMP-01, -03, -07, -08, and -09 were installed at depths between 3 and 4 feet due to the depth of groundwater table at time of installation. The other SGMPs were installed at depths of 5 feet.

3. The O&M Plan states that for the shut-in test the soil gas was to be purged using a 200 milliliters per min (ml/min) flow regulator and a vacuum canister. For the three soil gas sampling events, disposable syringes were used to purge the soil gas, maintaining a purge rate of less than 200 ml/min.

4. The O&M states that each SGMP will be sampled during each sampling event. During the January 2013 event, SGMP-02 and -08 could not be sampled due to the presence of groundwater. During installation in June 2012, the groundwater table was lower and the SGMPs were installed above the groundwater table (at that time) and sampled. Based on groundwater levels measured from on Site groundwater monitoring wells, the groundwater table rose approximately 1.5 feet from June 2012 to January 2013. Each SGMP was sampled during the June 2012 and June 2013 events.

5. O&M Plan states the SGMPs were to be abandoned after the second sampling event. Given the results from the June 2012 event, and subsequent to the O&M Plan completion, it was decided by DTSC and S-W to not abandon them during the January 2013 event.

6. The O&M Plan states that the analytical laboratory was to analyze for oxygen and nitrogen from the samples submitted. For the January 2013 sampling event, the laboratory could not analyze for oxygen and nitrogen from the samples; for this event, oxygen was measured using a helium/oxygen detector during sampling and nitrogen was not analyzed. For the June 2013 sampling event, the laboratory did analyze for oxygen from the samples and nitrogen was not analyzed. For the June 2012 event, the laboratory did analyze for oxygen and nitrogen from the samples.

7. The O&M Plan states the soil gas samples were to be analyzed using EPA Method TO-15 for VOCs. For the January 2013 sampling event, samples from three locations (SGMP-03, -06, and -07) were analyzed for VOCs using EPA Method 8260B because these samples could not be diluted into the TO-15 calibration range. The other samples during this event were analyzed for VOCs using EPA Method TO-15. It is the analytical laboratory's policy to analyze these samples using EPA Method 8260B under these circumstances. EPA Method 8260B is a more rigorous method with lower method detection limits compared to EPA Method TO-15. The June 2012 and June 2013 samples were analyzed for VOCs using EPA Method TO-15.

1.4 Pre-Remedy Soil Gas Investigation

In November/December 2006, CDM Smith conducted a soil gas investigation at the Site. This work was performed in accordance with the work plan submitted to the DTSC on November 3, 2006 and DTSC's approval letter provided to CDM Smith on November 14, 2006. Soil gas was sampled from locations CDM-SB54 through CDM-SB61, CDM-SB65, CDM-SB67, and CDM-SB71 to CDM-SB74. See **Attachment A** for their locations. The results from the November/December 2006 investigation yielded the following conclusions:

- VOCs were present in soil gas at the Site, as previously inferred from vadose zone soil and shallow groundwater sample results. The southern portion of the former Rifkin property and the adjacent western portion of the former raised cap area had the highest VOCs in soil gas concentrations.
- The presence of these VOCs in the subsurface were attributed to historic releases of raw materials at the northwest corner of the former raised cap area, historic operations by various businesses formerly present on the former Rifkin property, and historic releases on properties located upgradient of the Site and migration of impacted groundwater from these properties to the Site.
- The only VOC detected above its residential CHHSL on both the S-W and former Rifkin properties was benzene in 6 of the 9 samples considered representative of soil gas quality. [Some samples were considered not be representative of soil gas quality due to elevated concentrations of the leak check gas, helium, in the samples.]
- In addition to benzene, 1,2-dichloroethane (1,2-DCA) was detected above its residential CHHSL in one (1) sample from the former Rifkin property.
- Methane in soil gas was detected in samples collected at both the S-W and former Rifkin properties. The methane at these areas is attributed to pervasive methanogenic conditions within the silt/clay zones, which is typical of the bay muds, and localized methanogenic conditions within underlying groundwater in sandy zones that have been impacted with organic compounds. Because the detected methane is naturally occurring, it is not governed by Cal/EPA (DTSC).

The results from this investigation were presented to DTSC in a report dated January 18, 2007 (CDM, 2007) and supported the development of the Site remedy. The Site remedy was implemented between March 2011 and April 2012 and documented in the Remedy Implementation Completion Report (CDM Smith, 2012a).

1.5 Report Organization

This Report is organized into 5 sections of text and references, plus tables and attachments. A brief description of each section is below.

Section 1 – Introduction: This section introduces the purpose, report organization, scope of work, deviations from the O&M Plan, and a summary of the pre-remedy implementation soil gas investigation in 2006 and its findings.

Section 2 – Investigation Methodology and Procedures: This section describes the methodology and procedures used during the June 2012, January 2013 and June 2013 field work.

Section 3 – Results and Findings: This section presents the sample and quality assurance/quality control results and findings from the June 2012, January 2013 and June 2013 sampling events.

Section 4 – Conclusions and Recommendations: This section provides conclusions from the soil gas results and recommendations for further evaluation.

Section 5 – References: This section presents references used in this Report.

Section 2

Investigation Methodology and Procedures

Soil gas monitoring points (SGMPs) were installed and sampled at 12 locations at the Site in June 2012. In January 2013, these SGMPs were sampled during a second event, except SGMP-02 and -08. In June 2013, all 12 SGMP were sampled during a third event.

2.1 Permitting, Utility Clearance, and Access

Prior to installation of the SGMPs, installation permits were obtained by from Alameda County Public Works Agency (ACPWA). Underground Service Alert (USA) was contacted at least 72 hours prior to installation to determine the locations of any subsurface utilities. Subtronic Corporation, a private utilities locator, determined the locations of subsurface utilities at the Site. Prior to the beginning of fieldwork, CDM Smith personnel coordinated with S-W and Novartis personnel for access to the properties and to clear locations of underground utilities.

2.2 Soil Gas Monitoring Point Installation

Methods to penetrate the subsurface for installation of SGMPs consisted of Concrete Coring (where appropriate) and Direct Push drilling. Concrete Coring prior to drilling was necessary at 6 locations due to concrete or paved asphalt overlying the soil. Vickers Concrete Sawing, Inc., a subcontracted coring company and CDM Smith personnel were on Site to core the 6 locations.

CDM Smith personnel and a subcontracted drilling company, TEG, Inc., were on Site during installation and sampling activities. A direct push rig with 1.5-inch outside diameter steel rods was used to penetrate through the soil to the target total depth. Total depth varied by location depending on the depth to groundwater at the location. Rods were retracted slightly to expose the soil formation and set the SGMP. Soil cores were not collected during installation.

A SGMP with a 6-inch stainless steel soil gas implant screen was set and a measured length of 1/8-inch outside diameter Nylaflow tubing was attached. The SGMP was installed through the rods and set 1-foot above the bottom of the borehole. The SGMP was surrounded with #2/12 filter sand to 2-feet above the bottom of the borehole; with the SGMP centered in the sand. Bentonite chips were placed above the sand, and then a hydrated bentonite slurry was place to the surface. The bentonite sealed the SGMP from the ground surface. The Alameda County grout inspector was on Site to view the sealing of the SGMPs. **Table 1** provides a summary of construction details of the installed SGMPs.

2.3 Soil Gas Sampling – June 2012, January 2013 , and June 2013

The soil gas sampling methodology is in accordance with the O&M Plan and is consistent with applicable portions of the following guidance documents:

- Advisory – Soil Gas Investigations. California Environmental Protection Agency, Department of Toxic Substances Control, Los Angeles Regional Water Quality Control Board, and San Francisco Regional Water Quality Control Board. April 2012.

- Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance). California Environmental Protection Agency, Department of Toxic Substances Control, October 2011.

Attachment A shows a schematic of the sampling train utilized for each sampling event. Swagelock® fittings were used for the connections. After assembly, and prior to each sample collection, the train was tested for leaks. After the train was tested, sample collection occurred. Quality assurance and quality control field samples were also taken. These samples were submitted to the analytical laboratory for analysis. These procedures are described in the O&M Plan and summarized in this section.

2.3.1 Pre-Sampling Tests and Results

The sample train was tested for leaks by performing a vacuum shut-in test, purge test, and leak check test.

2.3.1.1 Vacuum Shut-in Test

At each SGMP, after the sample train was assembled, a vacuum shut-in test was performed. The shut-in test checked for any leaks within the sample train. Each vacuum shut-in test was successful in demonstrating there were no leaks within the sample train.

For each test, the valve to the downhole tubing was closed and the remainder of the valves in the train were opened. A disposable syringe was connected at one end of the train and a Summa canister under vacuum at the other end. The vacuum gauge on the Summa canister was used to check the change in vacuum within the sample train caused by pulling on the syringe. The vacuum in the sample train was checked for about one minute. For the three sampling events, the vacuum was maintained with no change in pressure observed on the gauges for each sample train.

2.3.1.2 Leak Check Test and Purge Test

After the vacuum shut-in test, a shroud was placed over the SGMP and shut off valve. The valve to the Summa canister was closed and the valve to the sampling port was opened. The shroud was filled with helium. Helium was used as a leak check compound to ensure that the bentonite seal was intact. The shroud was placed completely against the ground surface, surrounding the SGMP and sample train, to maintain a constant helium concentration in the atmosphere around the sampling location. The concentration of helium under the shroud was monitored with a portable helium/oxygen detector.

Once a percent of helium higher than 30% was detected under the shroud, the SGMP was purged. A minimum of three (3) volumes of soil gas were purged from each location with a clean disposable syringe. The syringe drew a volume of soil gas from the sample port through the sample train and the soil gas was released to the atmosphere. After 1.5 purge volumes, the soil gas that was pulled with the syringe from the port was pushed through the helium/oxygen detector to check for helium.

During the June 2012 sampling event, helium was detected during purge testing of four (4) SGMPs. At SGMP-03, a 2.5% concentration of helium was detected; at SGMP-06, a 0.30% concentration was detected; at SGMP-07, a 2.9% concentration was detected; and, at SGMP-11, a 1.67% concentration was detected. The SGMPs were inspected thoroughly and no sources for leaks were noted in the construction of the SGMPs or the sample train. The helium concentrations were less than 5%, the acceptable presence of helium (leak-test gas) without compromising sample integrity and representiveness of soil gas, per Cal/EPA Advisory - Active Soil Gas Investigation (April 2012). During

the January 2013 event, SGMP-06 was the only SGMP where helium was detected during the purge test (at 3.0%). During the June 2013 event, SGMP-09 was the only SGMP where helium was detected during the purge test (at 0.30%).

2.3.2 Sample Collection

After the completion of the leak tests and purge test, soil gas was collected in a 1-liter Summa canister using a flow regulator of 50 mL/min. Each sample location had a uniquely designated, clean Summa canister and flow regulator supplied by the analytical laboratory. The Summa canister consisted of a stainless steel canister that was under absolute vacuum (-30 in Hg). At the time of sample collection the valves were opened up and the Summa canister that was attached to the end of the sample train was opened and allowed to fill until the vacuum gauge read -5 in Hg. A schematic of the sampling train is shown in **Attachment A**. Once the canister was filled, it was closed and put in its original, laboratory supplied box. At the end of each event, the canisters were submitted to the laboratory for analysis under chain-of-custody protocols.

In June 2012, Test America Laboratory was used and in January 2013 and June 2013 McCampbell Analytical was used to supply the canisters and analyze the samples. Laboratory analytical reports in **Attachment B** include initial and final vacuum for the Summa canisters, sample times, canister serial numbers, flow regulator serial numbers for the samples.

Samples were not collected at SGMP-02 and SGMP-08 during the January 2013 sampling event due to the presence of groundwater in these monitoring points; all other SGMPs were sampled during this event. Each SGMP was sampled during the June 2012 and June 2013 events.

2.3.3 Sample Analyses

Soil gas samples were analyzed within 14 days of collection by the analytical laboratories. The samples were analyzed for VOCs using EPA Method TO-15, except for a few samples during the January 2013 sampling event. During the January 2013, sampling event, samples from SGMP-07, SGMP-03, and SGMP-06 were analyzed for VOCs using EPA Method 8260B (as discussed in **Section 1.3**). Samples were also analyzed for helium, carbon dioxide, and methane by ASTM D-1946 during the three events and for oxygen and nitrogen by ASTM D-1946 during the June 2012 event. During the January 2013 sampling event, the samples were not analyzed for oxygen and nitrogen (as discussed in **Section 1.3**); oxygen was measured in the field using a portable detector. During the June 2013 sampling event, the samples were not analyzed for nitrogen (as discussed in **Section 1.3**); they were analyzed for oxygen by ASTM D-1946.

2.3.4 Quality Assurance and Quality Control Field Samples

Per the O&M Plan, field Quality Assurance/Quality Control (QA/QC) samples were collected and analyzed to establish confidence in sample collecting procedures. One duplicate sample was collected during each soil gas sampling event. SGMP-10 was sampled in duplicate during the three events. The duplicate sample was analyzed by the same methods as the original parent sample. A trip blank was maintained during each event to ensure the integrity of the sample canisters during the shipping and handling. The trip blank was a 1-liter Summa canister that traveled from the laboratory to the Site, remained on Site during each sampling event, and traveled back to the laboratory for analysis. The trip blank was not exposed to the atmosphere.

Section 3
Results and Discussion

This section presents the sample results, quality assurance/quality control field sample results, and data validation from the June 2012, January 2013 and June 2013 post-remedy implementation soil gas sampling events.

3.1 Sample Results

A summary of the fixed gas (helium, oxygen, nitrogen, carbon dioxide, and methane) results from the three sampling events are presented in **Table 2**. A summary of the VOC results from the three sampling events are presented in **Table 3**. **Table 3** presents those VOCs detected above residential CHHSLs, along with selected others including those that were detected. The complete results from the three soil gas sampling events (June 2012, January 2013, and June 2013) are provided in the laboratory analytical reports in **Attachment B**.

3.2.1 June 2012 Sampling Event

The following are the findings from the June 2012 sample results:

- Helium was detected in three (3) SGMP samples, ranging from less than reporting limit of 0.020% to detections up to 0.38%. Reporting limits and detections were less than 5%, the acceptable presence of helium (leak-test gas) without compromising sample integrity and representiveness of soil gas, per Cal/EPA Advisory - Active Soil Gas Investigation (April 2012).

- Methane was detected within its lower and upper explosion limits (LEL/UEL) of 4.4 to 17 % in one sample from the S-W property (SGMP-07 at 12%) and one sample from the former Rifkin property (SGMP-11 at 4.6%). It was detected above its UEL in the sample from SGMP-03 (at 40%) on the S-W property. Other detections and reporting limits for methane were less than its LEL. Methane, as a naturally occurring chemical substance, is not governed by Cal/EPA (DTSC).

- Benzene was detected in soil gas above its residential CHHSL of 36.2 micrograms per cubic meter (µg/m^3) in samples from both the S-W property and the former Rifkin property. Only S-W property sample from SGMP-01 had a detection lower than its CHHSL (at 18 µg/m^3). Benzene was detected above its industrial / commercial CHHSL of 122 µg/m^3 at S-W property samples from SGMP-04, -05, and -06 and former Rifkin samples from SGMP-10, -11, and -12. Benzene was not detected in the sample from SGMP-07 with an elevated reporting limit of 2,300 µg/m^3.

- Ethylbenzene was detected in soil gas above its residential CHHSL of 420 µg/m^3 and industrial/commercial CHHSL of 1,400 µg/m^3 in the sample from SGMP-06 (at 11,000 µg/m^3). Ethylbenzene was not detected in the sample from SGMP-07 with an elevated reporting limit of 4,200 µg/m^3. Other detections and reporting limits for ethylbenzene were less than its residential CHHSL.

- No other VOC was detected above its residential CHHSL, as established. VOCs detected in one or more sample less than their respective residential CHHSLs were toluene, xylenes, and cis-1,2-dichloroethene (cDCE). Elevated reporting limits for naphthalene, tetrachloroethene (PCE), 1,2-

DCA, vinyl chloride, and carbon tetrachloride from SGMP-03, -06, -07, -08, and/or -12 were higher than their respective residential CHHSLs.

- Several other VOCs were detected that do not have established CHHSLs for soil gas (see Table 3).

3.2.2 January 2013 Sampling Event

The following are the findings from the January 2013 sample results:

- Helium was detected in the sample from SGMP-01 at 0.023%. Reporting limits and this detection were less than 5%, the acceptable presence of helium (leak-test gas) without compromising sample integrity and representiveness of soil gas, per Cal/EPA Advisory - Active Soil Gas Investigation (April 2012).
- Methane was detected within its lower and upper explosion limits (LEL/UEL) of 4.4 to 17 % in one sample from the S-W property (SGMP-07 at 8.4%). It was detected above its UEL in two samples on the S-W property (SGMP-06 at 19% and SGMP-03 at 33%). Other detections and reporting limits for methane were less than its LEL. Methane, as a naturally occurring chemical substance, is not governed by Cal/EPA (DTSC).
- Benzene was detected in soil gas above its residential CHHSL of 36.2 $\mu g/m^3$ and industrial/commercial CHHSL of 122 $\mu g/m^3$ in one S-W property sample (SGMP-06 at 2,700 $\mu g/m^3$). Other detections and reporting limits for benzene were less than its residential CHHSL.
- Ethylbenzene was detected in soil gas above its residential CHHSL of 420 $\mu g/m^3$ and industrial/commercial CHHSL of 1,400 $\mu g/m^3$ in one S-W property sample (SGMP-06 at 61,000 $\mu g/m^3$). Other detections and reporting limits for ethylbenzene were less than its residential CHHSL.
- No other VOC was detected above its residential CHHSL, as established. VOCs detected in one or more sample less than their respective residential CHHSLs were toluene, xylenes, MTBE, and cDCE. Reporting limits for VOCs not detected were less than their respective residential CHHSLs, as established.
- Several other VOCs were detected that do not have established CHHSLs for soil gas (see Table 3).

3.2.3 June 2013 Sampling Event

The following are the findings from the June 2013 sample results:

- Helium was detected in the SGMP samples ranging from 0.010 to 0.32%. Reporting limits and the detections were less than 5%, the acceptable presence of helium (leak-test gas) without compromising sample integrity and representiveness of soil gas, per Cal/EPA Advisory - Active Soil Gas Investigation (April 2012).
- Methane was detected within its lower and upper explosion limits (LEL/UEL) of 4.4 to 17 % in one samples from the S-W property (SGMP-07 at 7.8%). It was detected above its UEL in the sample from SGMP-03 (at 49%) on the S-W property. Other detections and reporting limits for methane were less than its LEL. Methane, as a naturally occurring chemical substance, is not governed by Cal/EPA (DTSC).

- Benzene was detected in soil gas above its residential CHHSL of 36.2 µg/m^3 in one former Rifkin property sample (SGMP-12 at 88 µg/m^3). Other detections and reporting limits for benzene were less than its residential CHHSL, except two locations (SGMP-03 and -07, both were non-detect with elevated reporting limits of 520 µg/m^3 each).
- Naphthalene was detected in soil gas above its residential CHHSL of 31.9 µg/m^3 in two former Rifkin property samples (SGMP-10 at 33 µg/m^3 and SGMP-11 at 46 µg/m^3) and one S-W property sample (SGMP-08 at 76 µg/m^3). Other detections and reporting limits for naphthalene were less than its residential CHHSL, except three locations (SGMP-03 and -07, both were non-detect with elevated reporting limits of 880 µg/m^3 each, and SGMP-06, non-detect with an elevated reporting limit of 44 µg/m^3). Naphthalene was below its residential CHHSL at SGMP-10 and SGMP-11 during the June 2012 and January 2013 events. SGMP-08 was not sampled in January 2013 due to presence of moisture and its results from June 2012 had an elevated reporting limit for naphthalene of 780 µg/m^3.
- No other VOC was detected above its residential CHHSL, as established. Elevated reporting limits for ethylbenzene, tetrachloroethene (PCE), trichloroethene (TCE), 1,2-DCA, vinyl chloride, and carbon tetrachloride from SGMP-03, -06, and/or -07 were higher than their respective residential CHHSLs.
- Several other VOCs were detected that do not have established CHHSLs for soil gas (see Table 3).

3.3 Quality Assurance and Quality Control Field Sample Results

QA/QC sample results are summarized in **Table 2** and **Table 3**, along with the field samples and include the duplicate field samples from SGMP-10, ambient air sample, and trip blank. The following is a summary of the QA/QC sample results:

- The duplicate sample results from SGMP-10 were within 5% of the parent sample results, except for two results. The January 2013 results for trichlorofluoromethane between the parent and duplicate samples had a differential of 17% (detections of 17 and 20 µg/m^3 from the parent and duplicate samples) and the June 2013 results for naphthalene between the parent and duplicate samples had a differential of 36% (detections of 33 and 21 µg/m^3 from the parent and duplicate samples). The duplicate results indicate appropriate field sampling accuracy and precision was achieved.
- Two constituents were detected in the June 2012 trip blank: methane at 0.00014% and 2-butanone at 1.2 µg/m^3. These concentrations are considered to be negligible compared to detections found in field samples, which were up to 40% for methane and 20 µg/m^3 for 2-butanone. A CHHSL for 2-butanone has not been established. The trip blank results indicate that neither sample collection procedures nor field conditions affected field sample quality.
- Helium was detected in the January 2013 trip blank at 0.016%. This concentration is considered to be negligible compared to detections found in field samples, which were up to 0.38% . Methane and VOCs were not detected in the January 2013 and June 2013 trip blanks. The trip blank results indicate that neither sample collection procedures nor field conditions affected field sample quality.

- Several VOCs were detected in the ambient air samples from the three events. The three VOCs detected above their respective CHHSLs in the soil gas samples (benzene, ethylbenzene, and naphthalene) were not detected in the June 2012 and June 2013 ambient air samples. Benzene was detected in the January 2013 ambient air sample, at 1.3 µg/m^3; ethylbenzene and naphthalene were not detected in this sample. Other VOCs detected in any of the ambient air samples were toluene, trichlorofluoromethane, chloromethane, and methylene chloride. The ambient air sample results indicate that ambient conditions did not affect field sample quality.

3.4 Data Validation

According to the QA/QC data provided by both laboratories, results from laboratory QA/QC samples were within their acceptable ranges. See laboratory analytical reports in **Attachment B**.

Section 4
Conclusions and Recommendations

This section presents the conclusions and recommendations based on the June 2012, January 2013, and June 2013 post-remedy implementation soil gas sampling events.

4.1 Conclusions

- With the completion of the third soil gas sampling event, sufficient data have been collected to evaluate soil vapor intrusion concerns as a part of the future redevelopment plans for both the S-W and former Rifkin properties.
- Benzene, ethylbenzene, and/or naphthalene were the only VOCs detected above their respective residential CHHSLs in the sampling events. Several VOCs had elevated reporting limits above their respective residential CHHSL during the June 2012 and June 2013 events; reporting limits were less than their respective residential CHHSL during the January 2013 event.
- During the June 2012 event, benzene was detected from 11 of the 12 sampling locations with 10 of the 11 detections exceeding its residential CHHSL; at SGMP-07, benzene was not detected, however the reporting limit was above its residential CHHSL. During the January 2013 event, benzene was detected above its residential CHHSL from SGMP-06, with detections and reporting limits for other samples less than its residential CHHSL. During the June 2013 event, benzene was detected above its residential CHHSL in the sample from SGMP-12; at two locations (SGMP-03 and SGMP-07), benzene was not detected, however the reporting limit was above its residential CHHSL. The sample results for the locations, except SGMP-06, demonstrate a substantial decrease of benzene concentrations, to less than reporting limits at most locations between the June 2012 and January 2013 events. At SGMP-06, benzene was reported to increase from 600 to 2,700 µg/m^3 between the first two events, and decreased to less than 26 µg/m^3 during the third event. SGMP-12 was the only location to report an increase for benzene between the January 2013 and June 2013 events, from 25 to 88 µg/m^3.
- Similar to benzene, ethylbenzene decreased to less than reporting limits from June 2012 to January 2013, with the exception of SGMP-06. During the June 2012 event, ethylbenzene was detected at 11 of the 12 sampling locations with 1 location exceeding its residential CHHSL (SGMP-06); at SGMP-07, ethylbenzene was not detected, however the reporting limit was above its residential CHHSL. During the January 2013 event, ethylbenzene continued to be detected above its residential CHHSL at SGMP-06, with detections and reporting limits for other samples less than its residential CHHSL. At SGMP-06, ethylbenzene was reported to increase from 11,000 to 61,000 µg/m^3 between the first two events, and then decreased to 64 µg/m^3 during the June 2013 event (less than its residential CHHSL).
- Similar to benzene and ethylbenzene, toluene and xylenes concentrations also decreased from June 2012 to January 2013, again with the exception of SGMP-06. At SGMP-06, toluene was reported to increase from 380 to 2,500 µg/m^3 and total xylenes from 18,330 to 73,000 µg/m^3

between the first two events, and then decreased to less than 31 µg/m^3 and less than 110 µg/m^3, respectively, during the June 2013 event.

- Naphthalene was detected sporadically at concentrations less than its residential CHHSL, at several locations during the June 2012 and January 2013 event, between 8.4 and 16 µg/m^3, In June 2013, it was detected above its residential CHHSL at three locations (SGMP-08, -10, and -11 up to 76 µg/m^3).
- The observed decreases in VOC in soil gas concentrations observed between the June 2012 and January 2013 events (with the exception of SGMP-06) may be attributed to the changes in the groundwater table during and after remedy implementation. The dewatering operations during remedy implementation depressed the groundwater table within and surrounding the excavation, including the vicinity of the SGMPs . The Site groundwater monitoring program results indicate that resaturation of the Site shallow aquifer occurred sometime in late 2012 after precipitation events in fall of 2012. This observation about resaturation is confirmed by the lack of groundwater in SGMP-02 and SGMP-08 in June 2012 and its presence in January 2013. The depression of the groundwater table prior to and during the June 2012 event created a temporary additional thickness in the vadose zone. Benzene and other VOCs potentially adsorbed to these exposed sediments surrounding the excavation would have had the opportunity to partition to a vapor phase. This would have resulted in the higher concentrations observed during the June 2012 sampling event. The subsequent resaturation of the aquifer in late 2012 submerged this temporary vadose zone, significantly reducing the potential for partitioning from an adsorbed phase to a vapor phase, and resulting in the lower concentrations observed during the January 2013 sampling event.
- Further decreases in VOC in soil gas concentrations were observed between the January 2013 and June 2013 events (with the exception of naphthalene) are also be attributed to continued stabilization of conditions after resaturation of the shallow aquifer. The range of total VOC concentrations from the SGMPs (excluding SGMP-06) decreased over the three events:
  - June 2012: total VOCs ranged between 82 and 15,000 µg/m^3.
  - January 2013: total VOCs ranged between non-detect and 1,434 µg/m^3.
  - June 2013: total VOCs ranged between non-detect and 399 µg/m^3.
- For SGMP-06, total VOCs have varied over the three events:
  - June 2012: total VOCs of 35,830 µg/m^3.
  - January 2013: total VOCs of 148,000 µg/m^3.
  - June 2013: total VOCs of 188 µg/m^3.
- Benzene and ethylbenzene were the primary VOCs detected from SGMP-06. The observed lag in reduction in concentrations of benzene and ethylbenzene at SGMP-06 indicates potential for one or more differentiators from the other SGMPs:
  - The source of VOCs in this vicinity of SGMP-06 may be from both vadose zone soil and groundwater (unlike the other locations where VOCs in soil gas are currently attributed

solely to groundwater ,with most of these other locations within the remedy excavation / backfill portion of the Site, surrounded by clean backfill.

- Resaturation of the aquifer may have taken longer in the vicinity of SGMP-06, given the presence of the slurry wall nearby (see **Attachment A**).

- There may be a seasonal variation in the VOC concentrations in the vicinity of SGMP-06, likely due to seasonal changes in groundwater movement pattern in the vicinity of the slurry wall.

- Benzene in soil gas at SGMP-12 and naphthalene in soil gas concentrations at SGMP-10, -11, and -12 increased to above their respective residential CHHSLs between the first two events (January 2013) and third event (June 2013). These three SGMPs are located on the former Rifkin property. VOC concentrations on the former Rifkin property during June 2013 event are observed to be two to three orders of magnitude lower compared to those during the 2006 soil gas sampling event (see **Section 1.4** and **Table 4**).

4.2 Recommendations

- CDM Smith recommends abandonment of the following SGMPs: SGMP-01, -02, -03, -04, -05, -07, and -09. According to the most recent groundwater monitoring report (ARCADIS, 2013), resaturation of the shallow aquifer has been achieved at the Site since late 2012; and, based on the results from the January 2013 and June 2013 soil gas sampling events, VOCs in soil gas concentrations at these SGMPs are understood to be less than residential CHHSLs. Additional soil gas sampling is not needed at these locations.

- Based on the findings from the soil gas sampling events at the following SGMPs, CDM Smith recommends conducting evaluations of soil vapor intrusion concerns as a part of the future redevelopment plans based on the results on each property:

  - S-W property: SGMP-06 for benzene and ethylbenzene and SGMP-08 for naphthalene.

  - Former Rifkin property: SGMP-10, -11, and -12 for benzene and naphthalene.

- Given neither the S-W property nor the former Rifkin property have buildings overlying the abovementioned areas of VOC impacts in soil gas, evaluations of current conditions are not needed. These evaluations should be incorporated into their respective future property redevelopment plans for City of Emeryville approval and soil and/or groundwater management plans for DTSC approval. This approach is consistent with the existing Covenant To Restrict Use of Property, recorded for the S-W property, which states that prior to construction or other development of the S-W property, the owner shall submit to DTSC an evaluation of soil gas conditions and indoor air quality.

- CDM Smith recommends that SGMP-06, -08, -10, -11, and -12 be maintained in case future evaluations can benefit from additional data collection.

Notes:
v/v = volume over volume ratio
NS = SGMP not sampled due to presence of moisture
NR = not reported by laboratory
NA = not analyzed
Bold indicates detection above method detection limit (MDL).
Detections below laboratory reporting limit (RL) presented with J flag following result value.
Samples collected on June 6 and 7, 2012; January 17 and 18, 2013; and, June 3, 2013.

1 - Oxygen concentration for January 2013 samples were measured with a handheld meter during sampling and not from the sample by ASTM-D1946
Action Levels based on the following:
Lower and Upper Explosion Limit (LEL/UEL) for methane at 25 degrees Celsius.
Acceptable presence of helium (leak-test gas) without compromising sample integrity and representiveness of soil gas, per Cal/EPA Advisory - Active Soil Gas Investigation (April 2012)
Yellow highlight indicates detection above action level.
Grey highlight indicates methane detected above UEL.

Notes:

ug/m3 = micrograms per cubic meter
NR = not reported by laboratory
Bold indicates detection above method detection limit (MDL).
Samples collected on June 6 and 7, 2012; January 17 and 18, 2013; and, June 3, 2013.
NS = SGMP not sampled due to presence of moisture
NA = not analyzed
VOCs detected above action levels presented above, along with selected others.
Detections below laboratory reporting limit (RL) presented with J flag following result value.

1 - SGMP-03, -06, -07, and -08 samples from June 2012 have elevated reporting limits due to high organic content; suspected to be elevated methane levels detected in these samples (see Table 2).

2 - SGMP-03, -06, and -07 samples from January 2013 were analyzed for VOCs using EPA Method 8260B because these samples could not be diluted into the TO-15 calibration range.

3 - SGMP-03, -06, and -07 samples from June 2013 have elevated reporting limits due to high organic content; suspected to be elevated methane levels detected in these samples (see Table 2).

Action Levels based on the following:

California Human Health Screening Levels (CHHSLs) for VOCs in soil gas under residential use, where applicable, per Cal/EPA guidance document (January 2005, revised November 2009). Xylenes, Total results compared to lower action level of that for m,p-Xylene and o-Xylene.

Yellow highlight indicates detection above CHHSL under residential use.
Grey highlight indicates reporting limit above CHSSL.
Green highlight indicates detection above CHHSL under industrial/commercial use (122 ug/m3 for benzene and 1400 ug/m3 for ethylbenzene).

Notes:
CDM-SB series and SGMP pairs are located within 20 feet of each other.
Soil gas samples from temporary borings (CDM-SB series) collected on November 30 and December 19 - 21, 2006.
Soil gas monitoring point (SGMP) samples collected on June 6 and 7, 2012; January 17 and 18, 2013; and, June 3, 2013.
-- = not a cluster pair location (only CDM-SB series or SGMP sample location present)
ug/m3 = micrograms per cubic meter
NS = SGMP not sampled due to presence of moisture
Only those VOCs detected above action levels presented in this table.
Bold indicates detection above method detection limit (MDL).
Detections below laboratory reporting limit (RL) presented with J flag following result value.

Action Levels based on the following:
California Human Health Screening Levels (CHHSLs) for VOCs in soil gas under residential or industrial/commercial use, where applicable, per Cal/EPA guidance document (January 2005, revised November 2009).
Yellow highlight indicates detection above CHHSL under residential use.
Green highlight indicates detection above CHSSL under industrial/commercial.
Grey highlight indicates reporting limit above CHHSL.

Qualifiers

GC VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD exceeds the control limits
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

Job Narrative
340-2373-1

This report has been revised to include Naphthalene, client request.

Receipt
The samples were received on 6/9/2012 9:00 AM; the samples arrived in good condition.

Air - GC VOA
No analytical or quality issues were noted.

Air - GC/MS VOA
Method(s) TO-15: The continuing calibration verification (CCV) for Bromoform (32%D) associated with batch 1873 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) TO-15: Surrogate recovery for the following sample(s) was outside control limits: SGMP-03-20120606 (340-2373-2). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) TO-15: The following sample(s) was diluted due to the abundance of non-target analytes: SGMP-06-20120606 (340-2373-5), SGMP-07-20120606 (340-2373-6), SGMP-08-20120606 (340-2373-7). Elevated reporting limits (RLs) are provided.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for 3 analytes per QC batch to recover outside criteria for this method when a full list spike is utilized. The following analytes associated with the following batches were outside control limits but within the marginal exceedence limits. The RPDs were also within the acceptable limits. The results for bromoform may be biased high.

QC Batch 1863
LCS Bromoform 132% (within marginal exceedence 70-150%)
LCSD Bromoform 135% (within marginal exceedence 70-150%) RPD 2

QC Batch 1873
LCS Bromoform 138% (within marginal exceedence 70-150%)
LCSD Bromoform 143% (within marginal exceedence 70-150%) RPD4

No other analytical or quality issues were noted.

Client Sample ID: SGMP-02-20120606 — Lab Sample ID: 340-2373-1

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	N/A	
Cooler Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

GC VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 340-2374-1

Laboratory: TestAmerica Costa Mesa

Narrative

Job Narrative
340-2374-1

Receipt
The samples were received on 6/9/2012 9:00 AM; the samples arrived in good condition.

Air - GC VOA
No analytical or quality issues were noted.

Air - GC/MS VOA
No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	N/A	
Cooler Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

Analytical Report

CDM Smith	Client Project ID: #13452-92207.TK29.SG2; Sherwin Williams	Date Sampled: 01/17/13-01/18/13
		Date Received: 01/18/13
100 Pringle Avenue Ste. 300	Client Contact: Dawan Sharma	Date Reported: 01/30/13
Walnut Creek, CA 94596	Client P.O.:	Date Completed: 01/30/13

WorkOrder: 1301458

February 13, 2013

Dear Dawan:

Enclosed within are:

1) The results of the **12** analyzed samples from your project: **#13452-92207.TK29.SG2; Sherwin Williams,**
2) QC data for the above samples, and
3) A copy of the chain of custody.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing

McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager
McCampbell Analytical, Inc.

The analytical results relate only to the items tested.

CASE NARRATIVE REGARDING TO-15 ANALYSIS

All summa canisters are EVACUATED 5 days after the reporting of the results. Please call or email if a longer retention time is required.

In an effort to attain the lowest reporting limits possible for the majority of the TO-15 target list, high level compounds may be analyzed using EPA Method 8260B.

Polymer (Tedlar) bags are not recommended for TO15 samples. The disadvantages are listed in Appendix B of the DTSC Advisory of April 2012.

%SS3:	114		

Comments:

*soil vapor samples are reported in µg/m³.

ND means not detected above the reporting limit/method detection limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

%SS = Percent Recovery of Surrogate Standard
DF = Dilution Factor

J) analyte detected below quantitation limits

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

* MS and / or MSD spike recoveries may not be near 100% or the RPDs near 0% if: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) if that specific sample matrix interferes with spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.
NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

Analytical Report

CDM Smith	Client Project ID: #13452-92207.TK29.SG2; Sherwin Williams	Date Sampled: 01/18/13
		Date Received: 01/18/13
100 Pringle Avenue Ste. 300	Client Contact: Dawan Sharma	Date Reported: 01/28/13
Walnut Creek, CA 94596	Client P.O.:	Date Completed: 01/28/13

WorkOrder: 1301460

January 28, 2013

Dear Dawan:

Enclosed within are:

1) The results of the **1** analyzed sample from your project: **#13452-92207.TK29.SG2; Sherwin Williams,**
2) QC data for the above sample, and
3) A copy of the chain of custody.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing

McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager
McCampbell Analytical, Inc.

The analytical results relate only to the items tested.

CASE NARRATIVE REGARDING TO-15 ANALYSIS

All summa canisters are EVACUATED 5 days after the reporting of the results. Please call or email if a longer retention time is required.

In an effort to attain the lowest reporting limits possible for the majority of the TO-15 target list, high level compounds may be analyzed using EPA Method 8260B.

Polymer (Tedlar) bags are not recommended for TO15 samples. The disadvantages are listed in Appendix B of the DTSC Advisory of April 2012.

QC SUMMARY REPORT FOR ASTM D 1946-90

W.O. Sample Matrix: Indoor Air | QC Matrix: Air | BatchID: 74223 | WorkOrder: 1301460

EPA Method: ASTM D 1946-90 **Extraction: ASTM D 1946-90** **Spiked Sample ID: N/A**

Analyte	Sample	Spiked	MS	MSD	MS-MSD	LCS	Acceptance Criteria (%)		
	µL/L	µL/L	% Rec.	% Rec.	% RPD	% Rec.	MS / MSD	RPD	LCS
Carbon Dioxide	N/A	100	N/A	N/A	N/A	89	N/A	N/A	70 - 130
Methane	N/A	100	N/A	N/A	N/A	71.1	N/A	N/A	70 - 130

All target compounds in the Method Blank of this extraction batch were ND less than the method RL with the following exceptions:
NONE

BATCH 74223 SUMMARY

Lab ID	Date Sampled	Date Extracted	Date Analyzed	Lab ID	Date Sampled	Date Extracted	Date Analyzed
1301460-001A	01/18/13 7:10 AM	01/24/13	01/24/13 4:15 PM				

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Ethyl acetate	N/A	25	N/A	N/A	N/A	92.6	N/A	N/A	60 - 140
Ethyl tert-butyl ether (ETBE)	N/A	25	N/A	N/A	N/A	106	N/A	N/A	60 - 140
Ethylbenzene	N/A	25	N/A	N/A	N/A	87.1	N/A	N/A	60 - 140

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

* MS and / or MSD spike recoveries may not be near 100% or the RPDs near 0% if: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) if that specific sample matrix interferes with spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.
NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

Analytical Report

CDM Smith	Client Project ID: Sherwin Williams	Date Sampled: 06/03/13
		Date Received: 06/04/13
100 Pringle Avenue Ste. 300	Client Contact: Pawan Sharma	Date Reported: 06/12/13
Walnut Creek, CA 94596	Client P.O.:	Date Completed: 06/12/13

WorkOrder: 1306077

June 13, 2013

Dear Pawan:

Enclosed within are:

1) The results of the **14** analyzed samples from your project: **Sherwin Williams,**
2) QC data for the above samples, and
3) A copy of the chain of custody.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager
McCampbell Analytical, Inc.

The analytical results relate only to the items tested.

CASE NARRATIVE REGARDING TO-15 ANALYSIS

All summa canisters are EVACUATED 5 days after the reporting of the results. Please call or email if a longer retention time is required.

In an effort to attain the lowest reporting limits possible for the majority of the TO-15 target list, high level compounds may be analyzed using EPA Method 8260B.

Polymer (Tedlar) bags are not recommended for TO15 samples. The disadvantages are listed in Appendix B of the DTSC Advisory of April 2012.

Surrogate Recoveries (%)

%SS1:	106	%SS2:	96
%SS3:	---#		

Comments: a3,c1

*vapor samples are reported in µg/m³.

ND means not detected above the reporting limit/method detection limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or surrogate coelutes with another peak.

%SS = Percent Recovery of Surrogate Standard
DF = Dilution Factor

a3) sample diluted due to high organic content.
c1) surrogate recovery outside of the control limits due to dilution / matrix interference / coelution / presence of surrogate compound in the sample

Surrogate Recoveries (%)

%SS1:	103	%SS2:	97
%SS3:	97		

Comments:

*vapor samples are reported in µg/m³.

ND means not detected above the reporting limit/method detection limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or surrogate coelutes with another peak.

%SS = Percent Recovery of Surrogate Standard
DF = Dilution Factor

a3) sample diluted due to high organic content.
c1) surrogate recovery outside of the control limits due to dilution / matrix interference / coelution / presence of surrogate compound in the sample

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

1306077-009A	06/03/13 3:04 PM	06/11/13	06/11/13 4:57 PM				

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

* MS and / or MSD spike recoveries may not be near 100% or the RPDs near 0% if: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) if that specific sample matrix interferes with spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.
NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

WorkOrder: 1306078

June 11, 2013

Dear Pawan:

Enclosed within are:

1) The results of the **1** analyzed sample from your project: **Sherwin Williams,**
2) QC data for the above sample, and
3) A copy of the chain of custody.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager
McCampbell Analytical, Inc.

The analytical results relate only to the items tested.

CASE NARRATIVE REGARDING TO-15 ANALYSIS

All summa canisters are EVACUATED 5 days after the reporting of the results. Please call or email if a longer retention time is required.

In an effort to attain the lowest reporting limits possible for the majority of the TO-15 target list, high level compounds may be analyzed using EPA Method 8260B.

Polymer (Tedlar) bags are not recommended for TO15 samples. The disadvantages are listed in Appendix B of the DTSC Advisory of April 2012.

NONE

BATCH 78170 SUMMARY

Lab ID	Date Sampled	Date Extracted	Date Analyzed	Lab ID	Date Sampled	Date Extracted	Date Analyzed
1306078-001A	06/03/13 7:30 AM	06/07/13	06/07/13 5:58 PM	1306078-001A	06/03/13 7:30 AM	06/11/13	06/11/13 1:51 PM

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

RE: Certification Letter for the Remedy Implementation Completion Report
The Sherwin-Williams Company: 1450 Sherwin Avenue,
Emeryville, California

Dear Mr. Mencin:

The intent of this letter is to summarize the design components and remedial activities performed by Envirocon in executing our contract for The Sherwin-Williams Company (S-W) property located at 1450 Sherwin Avenue in Emeryville, California and in doing so, certify that these activities were performed in accordance with the Remedial Design and Implementation Plan.

- Design Assistance with formalizing the Final Remedial Design Implementation Report (RDIP), dated June 29, 2011, included:

    - Heave Management Plan and Earthwork Requirements, prepared by TRC Solutions, dated January 24, 2011: *Geotechnical Recommendations, Remedial Design and Implementation Plan (RDIP), Former Sherwin-Williams Coating Facility, Emeryville, California*;

    - Temporary Shoring Design along Horton Street and Building 31 to support excavation to depths of -11 FT NAVD88, prepared by Condon Johnson, dated February 10, 2011: *Temporary Shoring Plans;*

    - Dust and Vapor Control Plan to mitigate public concerns at the Site perimeter, prepared by KUMA Corporation, dated May 2011: *Dust and Vapor Control Plan V1.6;*

    - Noise and Vibration Monitoring and Mitigation Plan to compare background levels to high energy construction equipment; prepared by Eilar Associates, Inc., dated January 20, 2011, *Noise and Vibration Monitoring Plan*;

- Stability Analysis to support the excavation(s) of each: Slurry Wall Extension, Slurry Wall Breaches, and the Interceptor Trench, prepared by Envirocon, dated October 25, 2011: *Trench Stability Calculation for SWE* (Submittal No. 004.c.1), November 7, 2011: *Trench Stability Calculations for Slurry Wall Breaches* (Submittal No. 011.b), and November 23, 2011: *Interceptor Trench Stability Calculations* (submittal No. 014.f);

- Excavation Design Plan developed to incorporate boring logs from historical and recent data into a 3-dimensional excavation plan that could be utilized to segregate the excavation into 8 separate categories; prepared by Envirocon, dated March 19, 2011: *Excavation Design Plan*(s).

- Pre-mobilization activities including submittal of workplans and acquiring construction related permits;

- Installation and operation of a temporary soil vapor extraction and treatment system to remove volatile organics from excavation area vadose zone soils;

- Relocation of high-pressure natural gas line from adjacent to the excavation, under the western sidewalk along Horton Street, to the other side of the street;

- Removal and offsite disposal of aboveground and underground structures, pipes, and debris containing arsenic, lead, and/or organic contaminants, primarily consisting of the raised cap and former water treatment plant;

- Excavation and offsite disposal of vadose zone soil containing arsenic, lead, and/or organic contaminants to support future potential residential use of the Site;

- Excavation and offsite disposal of saturated zone soil containing arsenic, lead, and/or organic contaminants to support long-term protection of groundwater underlying the Site;

- Excavation dewatering, onsite treatment, and discharge to sanitary sewer;

- Backfill of excavation areas to control groundwater movement within the Site;

- Placement of backfill and gravel cover to re-grade the Site to facilitate storm water drainage;

- Extension of the existing slurry wall along the southwestern portion of the Site;

Envirocon

- Installation of a membrane barrier and interceptor trench to prevent movement of groundwater from the S-W property to the Novartis property;

- Removal of portions of the existing slurry wall to facilitate groundwater movement from the Site to offsite, downgradient (western) areas;

- Abandonment of a former underground storage tank (UST) at the Site.

The remedial activities listed above including those items specifically identified to support the design assistance were, to the best of my knowledge and belief, performed in general accordance with the Final Remedial Design and Implementation Plan (RDIP) and its associated documents including Department of Toxic Substances Control (DTSC) approved variances, as described and documented in the Remedy Implementation Completion Report prepared by CDM Smith, dated July 25, 2012.

Further, my review of the project data and quality control procedures and my assessment of the persons directly responsible for gathering QA/QC information pertaining to construction of the remedy elements associated with the RDIP indicate that these activities were, to the best of my knowledge and belief, conducted in general accordance with applicable industry standards and the Site specific Quality Control/Quality Assurance Project Plan.

Respectfully submitted,

Tino Maestas, P.E.
Senior Engineer
Envirocon, Inc.

Cc Peter Joy, Envirocon Director of Operations
Jeff Rankin, Envirocon Project Director

Executive Summary

This Remedy Implementation Completion Report (Completion Report) has been prepared for The Sherwin-Williams Company (S-W) property located at 1450 Sherwin Avenue in Emeryville, California and a portion of the adjacent former Rifkin property, located at 4525 – 4563 Horton Street, to which hazardous substances have migrated from the S-W property. Collectively the S-W property and this portion of the former Rifkin property are referred to as the "Site" within this document. The Site consists of approximately 10 acres. Novartis Vaccines and Diagnostics, Inc. (Novartis) is the current owner of the former Rifkin property.

This Completion Report is consistent with the description of report contents presented in Section 14.2.1 of the Remedial Design Implementation Plan (RDIP), dated June 29, 2011 (CDM, 2011), and with the Department of Toxic Substances Control (DTSC) Imminent and Substantial Endangerment Determination and Order and Remedial Action Order No. 05/06-007 (the Order) and the Remedial Action Plan (RAP), dated May 10, 2006 and June 14, 2010, respectively (DTSC, 2006 and CDM, 2010). The RAP and RDIP were approved by DTSC in their letters dated June 14, 2010 and June 30, 2011, respectively (DTSC, 2010 and DTSC, 2011a). DTSC had previously provided conditional approval to proceed with soil excavation after partial review of the RDIP in their letter dated June 8, 2011(DTSC, 2011b). The RAP and RDIP provide summaries of the Site location, background, geology/hydrogeology, and history, and previous project remedial investigation results and actions.

The remedy implementation has achieved the project remedial action objectives (RAOs). The following presents the RAOs that were established for the Site in the RAP and remedy component that fulfills the RAO:

Remedial Action Objective (RAO)	*Remedy Component*
▪ Minimize direct contact/ingestion by humans with Site soil containing chemicals of concern (COCs) at concentrations exceeding the cleanup goals.	▪ Removal of vadose zone soil with COC concentrations above cleanup goals. ▪ Development and recording of the land use covenant (LUC). ▪ Monitor for unknown contamination in areas outside existing removal areas, as identified in the project operation, maintenance and monitoring (OM&M) plan and/or subsequent DTSC-approved modifications. ▪ Monitor soil gas conditions, as identified in the OM&M plan and/or subsequent DTSC-approved modifications.
▪ Minimize migration of and/or inhalation of airborne dust by humans from the Site containing COCs at concentrations exceeding the cleanup goals.	▪ Removal of vadose zone soil with COC concentrations above cleanup goals. ▪ Development and recording of the LUC, controlling intrusive activity at the S-W property.

Remedial Action Objective (RAO)	*Remedy Component*
▪ Minimize exposure to and inhalation by humans of volatile organic COCs at concentrations in indoor air exceeding the cleanup goals.	▪ Removal of vadose zone soil with COC concentrations above cleanup goals. ▪ Development and recording of the LUC. ▪ Monitor for unknown contamination in areas outside existing removal areas, as identified in the OM&M plan and/or subsequent DTSC-approved modifications. ▪ Monitor soil gas conditions, as identified in the OM&M plan and/or subsequent DTSC-approved modifications.
▪ Minimize risk to down-gradient ecological receptors from off-site groundwater migration containing COCs at concentrations exceeding the cleanup goals.	▪ Removal of saturated zone soil with COC concentrations identified as source material. ▪ Backfill to control groundwater movement. ▪ Installation of slurry wall breaches and extension; maintain key portions of existing slurry wall. ▪ Monitor groundwater conditions, as identified in the OM&M plan and/or subsequent DTSC-approved modifications.
▪ Minimize on-site human contact with groundwater containing COCs at concentrations exceeding the cleanup goals.	▪ Removal of saturated zone soil with COC concentrations identified as source material. ▪ Development and recording of the LUC.

Vadose zone soils with chemicals of concern above cleanup goals have been removed. Confirmation samples were collected from the vadose zone excavation sidewalls to demonstrate conformance with the cleanup goals as established in the RAP.

The remedy implementation occurred between March 2011 and April 2012, and consisted of the following key components:

- Installation and operation of an air monitoring system and air sampling program to evaluate the effectiveness of Site controls in maintaining the safety of the surrounding community.
- Installation and operation of a temporary soil vapor extraction and treatment system to remove volatile organics from the most impacted vadose zone excavation area.
- Relocation of a high-pressure natural gas line, from under the western sidewalk of Horton Street (i.e., adjacent to the excavation) to the other side of the street.
- Removal and offsite disposal of aboveground and underground structures, pipes, and debris containing arsenic, lead, and/or organic contaminants, primarily consisting of the raised cap and former water treatment plant.

- Excavation and offsite disposal of vadose zone soil containing arsenic, lead, and/or organic contaminants to support future potential residential use of the Site.
- Excavation and offsite disposal of saturated zone soil containing arsenic, lead, and/or organic contaminants to support long-term protection of groundwater.
- Excavation dewatering, and onsite pre-treatment and discharge to sanitary sewer of extracted water.
- Backfill of excavation areas to control groundwater movement within the Site.
- Placement of backfill and gravel cover to re-grade the Site to facilitate storm water drainage.
- Extension of the existing slurry wall along the southwestern portion of the Site.
- Installation of a membrane barrier and interceptor trench to prevent movement of groundwater from the S-W property to the Novartis property.
- Removal of portions of the existing slurry wall to control groundwater movement from the Site to offsite, downgradient (western) areas.
- Abandonment of a former underground storage tank (UST) at the Site.
- Abandonment of selected existing groundwater wells no longer required for the project.
- Installation of new groundwater wells required for the post-remedy implementation groundwater monitoring program.

The remedy implementation was completed by S-W's contractors, Envirocon Inc., Waste Solutions Group, and CDM Smith Inc., and their subcontractors.

This Completion Report provides summaries of the completed remedy components; documents variances in their implementation from that described in the RDIP; presents actual amounts and dispositions of waste; presents the results of the air monitoring and sampling; presents selected photographic documentation of pre- and post-remedy Site conditions; and, presents locations and plans for protection and monitoring of installed remedy components.

Variances from the RDIP are identified in this Completion Report with reference to the RDIP sections. For reference, the RDIP Table of Contents is included with this Completion Report as Attachment A.

This page is intentionally left blank.

Section 1

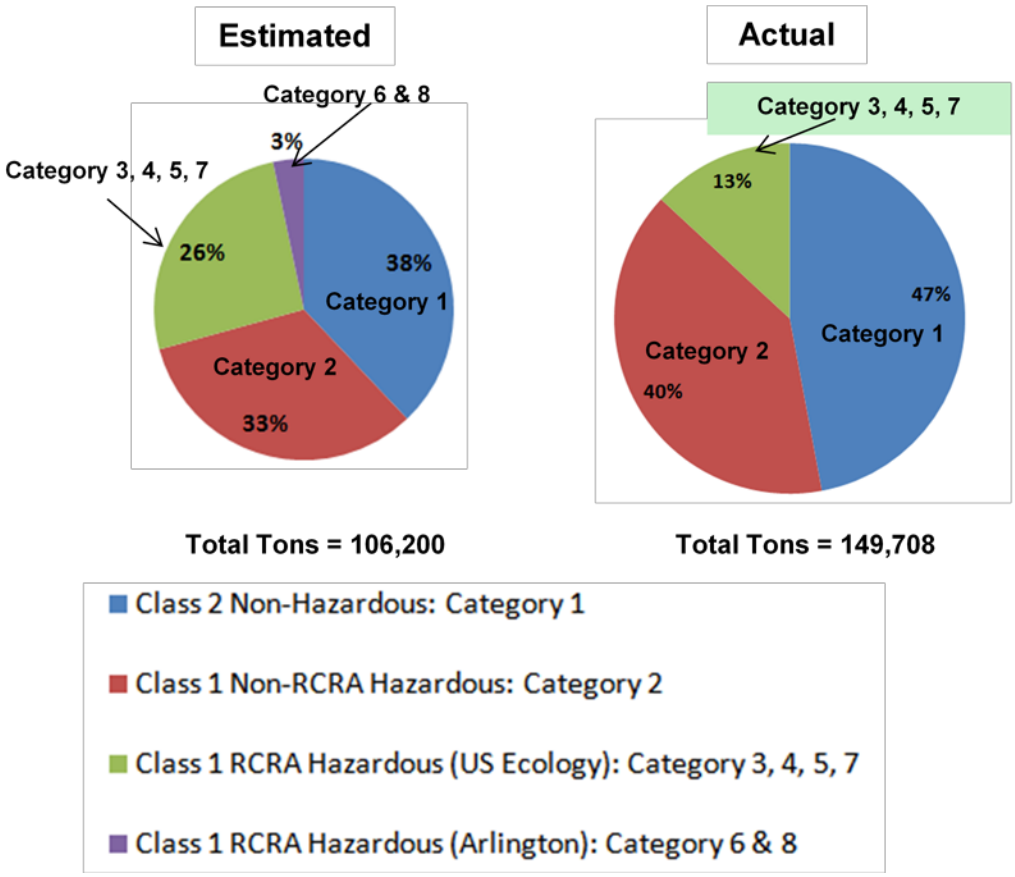
Documentation of Results

1.1 Locations and Quantities of Excavated Soil

The Asbuilt Drawings in Attachment B illustrate the final spatial boundaries of the excavation areas. Based on the actual weigh tickets returned from receiving landfills, 149,708 tons of soil and debris were removed from the Site. Of this amount, approximately 139,600 tons were removed to support the remedy; the preliminary estimate for waste disposal amount during remedy planning was 106,200 tons. The larger final quantity for soil removal to support the remedy is due to (1) the expanded excavation boundary in the main excavation area and (2) higher amounts of debris/concrete encountered resulting in relatively higher density to the excavation volume removed.

The approximately 20,148 tons of additional soil and debris removed from the Site were from activities that developed from the remedy implementation but did not directly support the RAOs, including:

- removal of underground utility pipes and overlying soils encountered during excavation, slurry wall extension, and activities pertaining to slurry wall breaches,
- removal of pavement, vadose zone soil, and buried concrete foundations within the northern portions of the S-W property to support storm water drainage, and
- removal of the water treatment plant (WTP), and underlying vadose zone soils, after completion of dewatering activities.

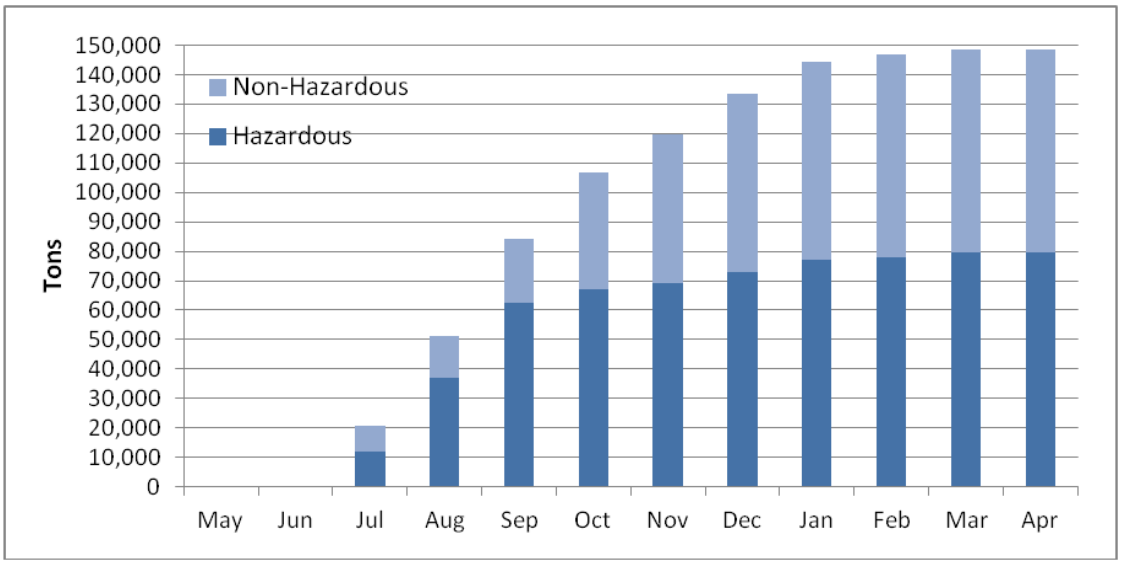


1.2 Amounts Disposed by Waste Characterization Profile

The RDIP identified eight possible project waste categories from the excavation, based on evaluation of in place sample results and state/federal hazardous waste regulations. The U.S. EPA waste classification for each category is described as follows:

- Category 1 - Class 2, non-hazardous waste.
- Category 2 - Class 1, non-RCRA hazardous waste.
- Categories 3 through 8 - Class 1, RCRA hazardous waste of various types.

The RDIP estimated amounts of materials for each of these eight categories. The materials for Categories 1 through 5 and 7 (see below) were transported to their designated facilities listed in the RDIP. Anticipated RCRA hazardous waste containing metal and organic underlying hazardous constituents with total volatile organic compounds at or greater than 500 mg/kg (Category 6 and 8) were not identified during stockpile characterization. No material was transported to the designated disposal facility for these two categories (in Arlington, OR). Hazardous waste was shipped under manifests with S-W EPA generator identification number CAD003934601. Non-RCRA and RCRA waste manifests are presented in Attachment J1 and Attachment J2, respectively.



The two pie charts shown below reflect the percentages of waste disposal by category, as estimated in the RDIP and the actual disposition.

Final waste amounts removed from the Site are presented by their waste characterization results below and are based on reported weights received by the disposal facilities.

Waste Characterization	*Project Waste Category*	*Amount (Tons)*
Class 2 Non-Hazardous	1	69,671
Class 1 Non-RCRA Hazardous	2	60,650
Class 1 RCRA Hazardous (US Ecology)	3, 4, 5, 7	19,387
Class 1 RCRA Hazardous (Arlington)	6 & 8	0

The following chart presents excavated materials transported offsite (in accumulated tons by month):

The following summarizes total truck loads and rail cars by waste type:

Total trucks with non-hazardous waste loads out:	2,670
Total trucks with non-RCRA hazardous waste loads out	302
Total trucks with RCRA hazardous waste loads out:	4
Total rail cars with RCRA hazardous waste loads out	180
Total rail cars with non-RCRA hazardous waste loads out:	502

1.3 Soil Vapor Extraction and Treatment

In accordance with the RDIP and the Bay Area Air Quality Management District (BAAQMD) operation permit, the soil vapor extraction and treatment (SVET) system was operated prior to excavation activities. The extraction wells were installed between April 25 and 29, 2011 under an Alameda County Public Works Agency (ACPWA) permit, and the treatment system assembled during that same timeframe. The wells and treatment system were built in accordance with the RDIP. Startup of the system occurred May 2, 2012 and it operated for approximately six weeks until total VOC levels in the soil gas stabilized and DTSC approved the commencement of excavation activities. The wells were abandoned under an ACPWA permit by removal during excavation. Site permits are included in Attachment F.

Attachment D1 presents a summary of the daily total flow rate and total VOC measurements during the SVET operation. Total VOC measurements were one to three orders of magnitude higher than that anticipated in the RDIP. The constructed treatment system was able to handle this additional mass rate. Per the BAAQMD permit, bi-weekly samples were collected from the SVET system effluent stream. No VOCs were detected in any of these samples and reporting limits were below permit requirements. Site permits are included in Attachment F.

1.4 Air Quality Monitoring Results

Throughout the remediation activities, as described in RDIP Section 14, air quality on and surrounding the Site was monitored and the results submitted to DTSC in weekly and monthly reports, and in daily reports for the first several weeks. Air quality monitoring reports submitted were posted to the DTSC website where they are available for review (DTSC Envirostor, 2012) and are provided in Attachment C.

The airborne concentrations of Total Volatile Organic Compounds (TVOC) and Respirable Particulate Matter of 10 microns or less (RPM10) for the air monitoring stations were below the project action levels as presented in the charts in Attachment D2.

RPM10 readings from the air monitoring stations ranged from 0.0 micrograms per cubic meter ($\mu g/m^3$) to 432 $\mu g/m^3$ and averaged less than acute RPM10 action levels for any 4-hour period as established for the phases of the excavation: raised cap removal, vadose zone soil removal, and saturated soil removal. During the monitoring, the running average for RPM10 readings from the start of the project was less than the subchronic RPM10 action level (see charts in Attachment D2).

TVOC readings from the air monitoring stations ranged from 0.0 parts per million volume (ppmv) to 12.8 ppmv and averaged less than 1.80 ppmv for any one 24-hour period, which is less than the acute TVOC action level. During the monitoring, the running average for TVOC readings from the start of the project was less than the subchronic TVOC action level (see charts in Attachment D2).

Shortly after startup it was determined the perimeter misters, being used for odor and vapor control, located adjacent to the air monitoring stations were impacting the RPM10 readings. The very low particle sizes of the mist were being included in the monitor's readings. Through a DTSC-approved protocol for daily calibration of the incremental increase in RPM10 readings due to the effects of the misters, a daily adjustment to the action level for AMS #3 was applied. Near the end of October, as the misters were no longer in use, calibration and daily adjustment of the action level were discontinued. As the RPM10 chart indicates this adjusted action level had no relevance to the running average over the length of the project. The correspondence with DTSC regarding the daily calibration of the AMS#3 action level is provided in Attachment D2.

During the first six weeks of excavation, daily air samples were collected at several of the AMS locations for laboratory analysis of arsenic, lead and volatile organic compounds in conjunction with the real time monitoring of TVOC and RPM10 readings at seven AMS locations. These laboratory results verified that the derivations of the action levels for real-time monitoring were protective of the surrounding community. The daily collection of air samples was discontinued, with DTSC approval, after demonstrating that Site controls were keeping chemical concentrations in perimeter air below established performance standards. In addition, the real-time TVOC and RPM10 monitoring at the seven AMS location was determined to be acceptable for assessing air quality and protection of surrounding community. The DTSC approval letter is provided in Attachment D2.

On March 5, 2012, the perimeter air monitoring system was taken offline and replaced with local air monitoring using handheld units. This modification to the air monitoring program was previously approved by DTSC on March 1, 2012. The perimeter air monitoring system was subsequently decommissioned and demobilized from the Site in March 2012.

Local air monitoring was conducted within the Site during waste handling activities in March 2012, at breathing level heights outside and downwind of the exclusion zone. The local air monitoring during

this period and its results are discussed below; no action levels were exceeded during the activities. No waste handling activities requiring local air monitoring occurred in April 2012. Wastes materials transported offsite in April 2011 were in closed drums or boxes without potential for dust or vapor generation.

RPM10 readings during waste handling activities in March 2012 from handheld units ranged from 0.0 µg/m^3 to 490 µg/m^3 and averaged less than 45 µg/m^3 for any 4-hour period, which is less than the acute RPM10 action levels for activities: vadose zone soil removal and saturated soil removal. The readings maintain the running average for RPM10 since the start of the project to be less than the subchronic RPM10 action level.

TVOC readings during waste handling activities in March 2012 from handheld units ranged from 0.0 ppmv to 11.8 ppmv and averaged less than 0.40 ppmv for any one 24-hour period, which is less than the acute TVOC action level. The readings maintain the running average for TVOCs since the start of the project to be less than the subchronic TVOC action level.

1.5 Vadose Zone Soil Confirmation Sample Results

Vadose zone soil confirmation samples were collected and analyzed for arsenic, and compared to its cleanup goals for two areas of the Site:

- The main excavation area, and
- The four "hot spots" and former UST excavation areas.

The cleanup goal consists of the 95UCL of the arsenic results from the confirmation samples be less than 24 mg/kg, with no arsenic result exceeding 100 mg/kg. The results confirmed that the final excavation extents had removed vadose zone soils with arsenic above the cleanup goal. Confirmation samples collected from the vadose zone excavation sidewalls demonstrate conformance with the cleanup goal. A summary of these two sets of data is presented in Attachment D3.

Samples were collected from the excavation sidewalls in accordance with the RDIP. See Attachment B for Asbuilt Drawings showing the main excavation vadose soil confirmation sample locations. Attachment D3 presents the sidewall location information for each "hot spot" excavation vadose zone soil confirmation sample.

For the main excavation area, one sample was collected approximately every 50 feet along the sidewalls at random depths. Samples were collected during two separate events.

Around mid-September 2011, with DTSC approval, it was attempted to demonstrate attainment of the vadose zone cleanup goal prior to completing the western vadose zone excavation design extent presented in the RDIP; design excavation had been completed along Horton Street and the northern and southern extents. As such, 19 sample locations – spaced approximately every 50 feet – were identified around the perimeter of the excavation extents at this time, with location 1 in the southeast corner, along Horton Street, moving clockwise to location 19 in the northeast corner of the excavation, again along Horton Street. Results from samples 1 to 5 and 15 to 19 were below the cleanup goal, with arsenic results ranging from 3.8 mg/kg to 31 mg/kg. Results from samples 6 to 10 and 13 to 14 are no longer representative because further excavation was conducted in response to the high arsenic results from samples 8, 9, 10, 13, and 14, which ranged from 52 mg/kg to 1,100 mg/kg. Given

these high results, samples from locations 11 and 12 were not collected and additional excavation was conducted at these areas.

After the additional excavation, vadose zone confirmation samples were collected along this new western extent in late November 2011, at locations 20 to 29. Results from samples 21 to 29 were below the cleanup goal, with arsenic results ranging from 4.1 mg/kg to 54 mg/kg. Result from sample 20 is no longer representative because further excavation was conducted in response to its high arsenic result of 115 mg/kg.

Four "hot spots" were located and sampled based on previous soil boring sample results exceeding 100 mg/kg arsenic in the vadose zone outside the main excavation, as presented in the RDIP. "Hot spots" were named based on these previously associated soil borings: SA-BH-04, SA-AH-01, CDM-SB50, and SB-7AB. The locations of these four "hot spot" excavations are presented in Attachment B.

The results for the north, east, and west wall sidewall samples from "hot spot" SA-BH-04 were below the cleanup goal. The arsenic results ranged from 5.4 mg/kg to 29 mg/kg. The south wall sample result of this "hot spot" exaction is no longer representative due to subsequent additional excavation conducted for an underground pipe removal. No additional sample was collected along the south wall as the excavation progressed to the Sherwin-Williams property line with the City of Emeryville Parcel D site, where soils had been removed previously by the City of Emeryville and replaced with imported backfill.

Results for sidewall samples from "hot spot" SA-AH-01 were below the cleanup goal. Arsenic results ranged from 7.7 mg/kg to 9.4 mg/kg.

Initial north, east, and west sidewall samples from "hot spot" CDM-SB50 were above the cleanup goal, with arsenic ranging from 50 to 370 mg/kg. The south sidewall sample was below the cleanup goal, at 21 mg/kg. Additional excavation was conducted towards the north, east, and west, and this "hot spot" was incorporated into the main excavation toward excavation to the east. After the additional excavation, vadose zone confirmation samples were collected along these new extents to the north and west. These results were below the cleanup goal, with arsenic of 21 mg/kg and 9.9 mg/kg, respectively. The eastern extent of the "hot spot" was connected to the main excavation, and there no longer was an eastern sidewall to sample.

Initial results for south sidewall samples from "hot spot" SB-7AB did not meet cleanup goal, with arsenic ranging from 55 to 77 mg/kg. After further excavation of the south sidewall, an arsenic result of 24 mg/kg was obtained. With the north, east, and west sidewall arsenic results of 9.6 mg/kg to 29 mg/kg, the final sidewall sample results were below the cleanup goal.

Due to changes in the extent of the main excavation (discussed further in Section 2), one of the "hot spot" excavation areas was incorporated into the main excavation ("hot spot" excavation for boring CDM-SB50) for comparison to its cleanup goal.

At DTSC's direction, sidewall samples from the former UST excavation for arsenic were incorporated with those from the "hot spot" excavation areas for comparison to its cleanup goal.

1.6 Groundwater Monitoring and Sample Results

In accordance with the RDIP, monthly depth to groundwater measurements and quarterly groundwater samples were collected from specified wells. A summary of these results are presented in Attachment D4.

The monthly water levels demonstrated the affects from the excavation dewatering activities as lowered groundwater elevations were observed in wells away from the excavation extents. These results were part of the rationale used to eliminate the need for the French drain and continue to meet the objectives of excavation and backfill (further discussed in Section 2).

Quarterly sampling consisted of analysis for arsenic and VOCs. The RAP established two triggers during remedy implementation for additional post-remedy action:

1. If arsenic exceeds 500 µg/L in any sample/well during remedy implementation, an additional well on former Rifkin well would need to be installed (as specified in RDIP Figure 13-1).

2. If arsenic exceeds its historical maximum detection during remedy implementation, quarterly sampling of that well would be maintained until stable or decreasing trend is determined.

The first trigger did not occur; therefore, an additional well was not installed on the former Rifkin property.

The second trigger occurred at wells RP-1, RP-4, and MW-3 during the remedy implementation, as presented in Attachment D4. These three wells are identified for quarterly sampling in the project OM&M plan.

1.7 Underground Storage Tank Abandonment

Working with DTSC and Alameda County Department of Environmental Health (ACDEH), a tank closure plan was developed for the former UST. The closure plan was developed during an onsite meeting on February 22, 2012. At that time, it was understood that the former UST had been abandoned in place during the slurry wall installation in 1993, as previously reported. Excavation was conducted around the former UST to determine if it would be feasible to remove the abandoned UST, presumed to have been previously filled with grout. However, it was discovered that the former UST had not been abandoned in place. In addition, it was observed that a portion of the former UST was underneath the Site transformer and therefore could not be removed without providing structural support to the transformer. The top of former tank was measured at El. 13.3 ft North American Vertical Datum of 1988 (NAVD88).

As agreed upon by DTSC and ACDEH, the former UST closure consisted of abandoning it in place. As instructed by ACDEH, the tank interior was rinsed to remove sludge and to clean the interior walls. The former UST was filled with neat cement on February 24, 2012. An ACDEH representative observed the tank cleaning, documented that the tank interior was sufficiently cleaned, and observed the filling with neat cement. Approximately 12 cubic yards of neat cement were poured into the former tank, which is consistent with the dimensions of the former UST. During filling of the former tank, lighter material coming to the surface from the former tank interior was not observed, confirming the former UST had been cleaned sufficiently.

At the direction of DTSC, potential impacted vadose zone soils were excavated around the former UST to approximately El. 10 ft NAVD88: north along the transformer pad, east toward the Site building until underground water lines were encountered, south into the arsenic "hot spot" excavation, and west into the existing excavation for railroad and storm sewer demolition. Excavation surrounding the former UST was conducted to the extent possible with the engineering constraints of the transformer pad, existing waterlines and Site building. See Attachment B for Asbuilt Drawings showing the footprint of the excavation around the former UST.

Vadose zone soil samples were collected along the north, east, northwest and northeast sidewalls of the excavation. Soil samples on the southern portion of the excavation were collected as part of the arsenic "hot spot" excavation. One groundwater sample was collected on western, downgradient side of the former UST by creating a two-foot sump in this area of the excavation bottom (i.e., below the vadose zone soil). Groundwater elevation was approximately El. 9.7 ft NAVD88 at the time of sample collection.

As directed by DTSC, sidewall vadose zone soil and groundwater grab samples were collected for analysis of arsenic, lead, total petroleum as gasoline (TPH-g), diesel (TPH-d), and motor oil (TPH-mo), volatile organic compounds (VOCs), and semi-volatile organic compounds (SVOCs). With DTSC approval, TPH-d and TPH-mo analyses were conducted with silica gel cleanup.

The arsenic results from the sidewall vadose zone soil samples are discussed in Section 1.6 along with the other vadose zone soil confirmation results. These results conform to the Site cleanup goal. Attachment D5 presents a summary of the other results from the sidewall soil samples and the groundwater sample, and provides a comparison to the Site cleanup goals. Of these other results, TPH-d in soil and TPH-g, TPH-d, TPH-mo, and arsenic in groundwater were found above their Site cleanup goals.

After sample collection, the former UST excavation was backfilled consistent with other vadose zone excavation areas at the Site.

1.8 CEQA Mitigation Measures

Two CEQA mitigation measures were identified for the project and were monitored during the remedy implementation as described below.

1.8.1 Cultural Resources Monitoring Results

Archaeological monitoring was undertaken during soil-disturbing activities, when excavating from El. 18 ft NAVD88 to El. 6 ft NAVD88, including removal of asphalt caps and buried concrete and debris and removal of existing slurry walls and groundwater monitoring wells at the Site from July 1-August 8, 2011. Archaeological monitoring during soil-disturbing activities did not identify prehistoric or historic archaeological materials with a potential for significance under CEQA. The Archaeological Monitoring Report, prepared for S-W by the archaeological monitors at URS, is included with this Completion Report as Attachment E.

1.8.2 Park Avenue Street Beautification Project

Due to project-related truck-traffic, the City of Emeryville Park Avenue Street Beautification Project was impacted by the legally loaded truck traffic travelling along the City of Emeryville truck route over the recently finished Park Avenue and Halleck Street intersection. A set of bricks inlaid in the pavement at this intersection were prematurely damaged (chips and cracks) due to the increased

truck-traffic. This assessment was based on comparing the conditions of these bricks after remedy implementation to pre-remedy photographic documentation. The damaged bricks were replaced with new bricks during the week of June 11, 2012. The City of Emeryville provided the new bricks and specifications for installation.

1.9 Permits and Clearances Obtained

1.9.1 RDIP Section 2.2, Permitting

Envirocon or CDM Smith obtained the following permits, which are included in Attachment F, associated with the remedy implementation work:

Permit	*Permit Number*
Alameda County Department of Environmental Health-Underground Tank Closure Permit	SR0020135
Alameda County Public Works Agency-Water Resources Well Permit	W2011-0213 to W2011-0264, W2011-0398, W2011-0399, W2012-0105 to W2012-0107, W2012-0126 to W2012-0139, W2012-0159
BAAQMD Permit to Operate for Soil Vapor Extraction and Abatement System	Application: 23044 Condition: 24917 Plant: 20614
BAAQMD Permit to Operate for Facility-Wide Soil Excavation Project	Application: 23244 Condition: 24986 Plant: 20716
BAAQMD Notification for Water Treatment Plant Demolition and Acknowledgement	Regulation 11, Rule 2
City of Emeryville Grading Permit	G2011-0001
City of Emeryville Shoring Permit	B2011-0031
City of Emeryville Water Treatment Plant Demolition Permit	B2011-0257
City of Emeryville Encroachment Permits	21105121, 21105122, and 21107136
East Bay Municipal Utility District Wastewater Discharge Permit	50372992
OSHA Excavation Notification Permit	2011-904305
Water Quality Control Board, San Francisco Bay Region, Notice of Intent for Coverage under the General Construction Storm Water permit	Application: 415037 WDID: 2 01c361055

Work was conducted in compliance with the requirements and/or conditions established in these permits. City of Emeryville permits were closed with and signed by the City of Emeryville. Other permits were terminated with the respective agency or not renewed at the end of the project.

1.9.2 RDIP Section 2.3.2, Community Safety Plan

The Community Safety Plan, approved as part of the RDIP and included as Appendix B of the RDIP, was successfully implemented during the phases of the remediation activities.

A toll-free, 24-hour community complaint telephone answering service was activated as part of the Community Safety Plan. During the course of the remediation activities, the service logged over 50 calls from 10 individuals within the neighborhood. The project team personally responded to each call by calling the individual the same day. In several cases phone messages were left in lieu of

reaching the caller. In such cases follow up calls with the individual were done within the next day. The responses to the community calls were done in coordination with DTSC as appropriate. The calls were responded to and no open issues are remaining.

The calls and responses were documented in the monthly status reports.

1.9.3 RDIP Section 3.4, Clearance and Relocation of Utilities

Underground Service Alert (USA) was contacted according to the RDIP procedures. The following USA ticket numbers were obtained for the clearances performed:

USA Clearance Area	*Ticket Number*
For asphalt removal and replacement on Halleck Street	080637
For Parcel D excavation	342110
For excavation along Horton Street	047933
For monitoring well installation	0041212, 0073275, 0073316
For BAAQMD construction and operation of SVE system	0111814

Section 2
Variances from RDIP

The RDIP presented engineering and monitoring details regarding the planned remedy implementation activities as anticipated with the information available at the time. Based on field conditions encountered at the time of implementation, some of the engineering and monitoring details were modified in order to maintain the effectiveness of the remedy. The information presented in this section identifies only those details that varied in some way from RDIP. Section references presented here identify the specific sections of the RDIP, and in some cases refer to additional information in attachments to this Completion Report.

For reference, the RDIP Table of Contents is included with this Completion Report as Attachment A. Only RDIP Sections with variances are presented below.

2.1 RDIP Section 3 – Pre-Excavation Activities

2.1.1 RDIP Section 3.2, Groundwater Monitoring Well Abandonment

Table 3-1 of the RDIP listed the groundwater wells planned for abandonment. These wells were abandoned under permit and reports for the abandonments were submitted to ACPWA, except well LF-6. LF-6 was determined to have been previously abandoned and its status was confirmed with ACPWA. Copies of these reports are included in Attachment G1. Site permits are included in Attachment F. One deviation from the RDIP was that in addition to abandonment of wells by (1) drill out with tremie grout backfill or (2) in-place abandonment via tremie grout and removal of well vault, some wells were removed completely during excavation. This was approved by ACPWA. .

2.1.2 RDIP Section 3.6, Subsurface Vapor Extraction and Treatment

The SVE system was installed and operated in accordance with the RDIP. The original schedule for operation of the SVE system was estimated for no more than 4 weeks. However, the system operated for 6.5 weeks in order to remove additional mass of subsurface organic vapors.

2.2 RDIP Section 4 – Raised Cap Removal and Shoring

2.2.1 RDIP Section 4.1, Removal of Raised Cap

The actual sequencing of Raised Cap removal differed from the RDIP text (see last paragraph of this particular RDIP section) to accommodate scheduling changes for the shoring installation subcontractor and overall excavation logistics on the Site.

2.2.2 RDIP Section 4.3, Shoring along Horton Street and Building 31

Two of the installed soldier beams (beams numbered 2 and 3) for the shoring wall met refusal while being vibrated into place. These two beam installations were reviewed by the project structural engineer and approved as installed.

Timber lagging for the shoring wall was not necessary in the bottom five feet of the deepest excavation areas due to a change in the excavation sequence. Excavations along these areas were originally to be conducted in the middle of the main excavation activities. It was actually conducted at the end and removed in small sections and backfilled immediately, allowing for sufficient support of

the shoring wall at these depths. Sumps at both ends of the deep excavation area were installed and continuous pumping was conducted to lower the hydraulic gradient along the shoring wall.

The RDIP allowed for the installation of tie-backs. It was initially planned, during the RDIP preparation, that tie-backs would not be allowed by the City of Emeryville to be left in place once the excavation was completed. Therefore, the RDIP indicated that "No shoring elements will remain". However, during finalization of the RDIP, the City of Emeryville approved and permitted the use of tie-backs, and for them to be left in place. These tie-backs were cut, during removal of the shoring wall, and the portions under Horton Street were left in place. Locations of the remaining portions are presented in Attachment B. Site permits are included in Attachment F.

2.3 RDIP Section 5 – Excavation and Dewatering

2.3.1 RDIP Section 5.1, Excavation Dewatering

The RDIP text in this section included an estimate that excavation water would be pumped at an average steady state rate up to 10 gallons per minute (gpm) following the initial higher flow rate at the start of excavation. In using a series of sumps with interconnecting ditches, the actual dewatering rate averaged 30 to 35 gpm, with periods of peak flow around 60 gpm. The higher actual dewatering rates encountered during remedy implementation, compared to the RDIP steady-state estimate, are due to the following factors:

- Dewatering operations conducted on an episodic basis with shutdowns during night shift and over other down times. [1]
- RDIP steady-state estimate included only groundwater flow from the A-aquifer and did not estimate process wastewater, water from daily dust control and misting operations, storm water, or surface water component. Significant flow rates of storm water were experienced during the remedy implementation, particularly in October and November 2011.
- RDIP steady-state estimate did not include any vertical groundwater leakage induced from the B-aquifer into the excavation. The dewatering operations maintained significant drawdown of the water levels in the A-aquifer within the excavation and in the surrounding cone of depression, and increased vertical movement from the B-aquifer into A-aquifer.

With inherent uncertainty in all modeled geologic settings, the higher than estimated dewatering rate could indicate hydrogeologic characteristics may need to be reevaluated to understand post-remedy implementation groundwater flow pathways.

The post-remedy implementation groundwater monitoring program (discussed in Section 2.10 of this report) is structured to provide the data necessary for evaluating flow direction and hydraulic gradient. As the A-aquifer reaches equilibrium re-saturation, the groundwater flow conditions will be compared to the projected design groundwater model conditions for the remedy. If the assessment determines that groundwater movement patterns differ significantly from projected design

[1] A total of 4,892,618 gallons were pre-treated and discharged to the sewer between the start of continuous dewatering operations (22 July 2011) and when the maximum depth of the excavation was reached (30 November 2011). Over this 132 day period, an average discharge rate of 25.7 gpm was observed.

conditions, S-W will provide written recommendation to DTSC for either implementation of additional monitoring/investigation steps or a contingency action.

During the remedy implementation, over five million gallons of water in total were pre-treated and discharged to East Bay Municipal Utility District (EBMUD) under permit. Quarterly reports were submitted to EBMUD to document the results from dewatering and pre-treatment system and adherence to their permit, and are included in Attachment H. Site permits are included in Attachment F.

2.3.2 RDIP Section 5.3, Soil Excavation and Handling

Actual soil removal sequencing varied from the plan presented in the RDIP text to accommodate improved Site logistics for rail car transport; high-pressure natural gas transmission line relocation; excavation dewatering; and soil stockpile handling. Due to the spatial variability of the waste categories it became crucial to excavate areas of similar categories to meet rail car transport requirements. Also, the mass excavation of similar waste categories lowered the potential for cross contamination of soils with differing preliminary categories. These objectives required modifying the RDIP method of "strip" excavation spanning the entire length of the excavation across multiple waste categories.

The RDIP described installation of a temporary "French drain" at the bottom of the excavation along the northern S-W property line with the Novartis parking lot (the former Rifkin property). The intent of this drain line was a safety measure to control groundwater seepage in the open excavation and prevent it from migrating northward across the property line into newly placed clean backfill. Subsequent calculations, modified excavation and backfilling methods, and discussions with Novartis and DTSC determined that this temporary drain line was not required to control groundwater migration during the short amount of time the excavation depth was exposed. The groundwater gradient was maintained in a positive direction away from the Novartis property and verified by increased monitoring of the potentiometric water surface in wells, sumps and at the seepage face elevations. Groundwater monitoring data are provided in Attachment D4.

The final soil excavation areal footprint is illustrated on the Asbuilt Drawings provided in Attachment B. The final bottom excavation contours are also provided in the Attachment B Asbuilt Drawings.

2.3.3 RDIP Section 5.3.1, Vadose Zone

As described in this RDIP section, additional vadose zone soil removal was anticipated if data from soil sample analyses indicated continued high arsenic or other constituent concentrations. Actual excavation included extending soil removal beyond RDIP preliminary projected extents to areas containing arsenic concentrations above the cleanup goal. The additional vadose zone soil removal included the areas northwest and west area of the RDIP identified area. The removal of vadose material in these areas was also to facilitate the removal of additional saturated soil as discussed below. Conversely, several "cells" of in-place soil were not excavated according to the RDIP plan because soil sample results confirmed that in-place constituent concentrations already met the cleanup goals.

Vadose zone soils within the four "hot spot" excavations were removed per the RDIP. The lateral extend of a number of the sidewalls in these locations coincided with other soil removal for utility demolition, rail spur demolition and slurry wall extension. In these cases the remaining sidewalls were confirmed below the cleanup goals. As such, the "hot spot" excavation for boring CDM-SB50 was

merged with the main excavation, and included in that soil sample results set. The three other "hot spot" excavations continued to be evaluated independently.

Confirmation soil sample results demonstrating conformance with the cleanup goals are presented in Attachment D3.

2.3.4 RDIP Section 5.3.2, Saturated Zone

The RDIP presented a concern regarding heaving of the excavation floor at the top of the A/B aquitard (El. -11 ft NAVD88), which resulted in the preparation and inclusion of a Heave Management Plan (RDIP Appendix I-2). As discussed above in RDIP Section 5.3.1, mass excavation of similar category waste was utilized for saturated soil excavation rather than the "strip excavation" presented in the RDIP. However, this did not affect the excavation conformance to the RDIP objective of minimizing the exposed areal floor of the excavation above the aquitard to no more than 5,000 square feet at any moment. The bottom five feet of saturated soil above the aquitard was excavated and backfilled concurrently, never leaving more than 5,000 square feet of the top of aquitard exposed.

The exposed lithology during saturated soil excavation was observed to confirm final source area removal extents for permeable materials along the sidewalls of the excavation. Portions of the western extent of the design excavation boundary had greater than 4 feet of sand/gravel (permeable materials) in areas identified with having arsenic concentrations in groundwater above 1 mg/L prior to the remedy implementation. As such, additional saturated soils were removed in these areas until total permeable material amounts were less than 4 feet. At the other extents of the excavation, less than 4 feet of sand/gravel were observed. The final extents of the saturated soil excavation are presented in Attachment B.

2.3.5 Section 5.5, Waste Stockpiles Management

The project simultaneously tracked and managed in excess of over 160 waste stockpiles. The RDIP estimated that approximately 5,000 cubic yards of stockpiled waste material may be on Site at any one time, as inventory staged between placement, characterization, and load out. Due to the segregation of eight different potential waste streams from the excavation and to avoid unwanted delays for rail car transport, the stockpiled volumes maintained onsite increased up to approximatly12,700 cubic yards for short periods of time. On average, stockpiled waste amounts were much smaller, close to the RDIP estimate of 5,000 cubic yards.

Due to the limitations of space and to avoid extending the project schedule any further than necessary, every effort was made to minimize the amount of stockpiled waste present onsite at any given time. Waste characterization turnaround times were accelerated from planned RDIP schedules in an effort to minimize the onsite stockpiling of material. Much of the stockpiled volume was due to the separate stockpiling of multiple categories of waste, while limited to the loading of a single waste category in multiple train cars (unit trains) intended for a single location.

2.3.6 RDIP Section 5.6, Vadose Zone Soil Confirmation Sampling

The only variance to the RDIP sampling procedures described in this section was that some samples were also collected using 8 oz. jars, instead of sample tubes. Sampling materials were sample specific so no equipment blanks were necessary. Confirmation soil sample results demonstrating conformance with the cleanup goals are presented in Attachment D3.

2.4 RDIP Section 6 – Excavation Backfilling

2.4.1 RDIP Section 6.4, Backfill Placement, Compaction and Interceptor Trench

The variance to the RDIP is that the width of the curtain wall for the inceptor trench was reduced from 36 inches to 30 inches. A sensitivity analysis on this modification did not show any significant change to the modeled groundwater flow paths.

2.4.2 RDIP Section 6.5, Membrane Barrier and Trench Installation, RDIP Section 6.5.1, Selection of Material

Busan 1058 was used instead of Busan 1059WS Biostat (Dazomet) for extension of the biopolymer slurry used during installation of the membrane barrier.

As part of the HDPE Membrane Barrier installation, Envirocon also installed a geonet HDPE drain fabric on the HDPE panels to help protect the panels against punctures from the placed drain gravel. The drain gravel selected for the trench had both the required natural filtering requirements for the hydraulic design of the trench and a consistent particle size. This minimized "layering" of the gravel during placement in the bio-polymer slurry. The selected gravel had a slight angular shape; it was anticipated to be well rounded in the RDIP. The geonet was installed to protect the membrane liner from potential damage from the drain gravel. The geonet is expected to have a higher transmissivity than the drain rock and therefore reduce the hydraulic pressure on the membrane, further protecting the membrane.

SDR 17, 6-inch diameter rigid HDPE, pipe was installed at the base of the interceptor trench, instead of the proposed flexible pipe stated in the RDIP. This rigid pipe was required as it had sufficient pipe strength to work with the installation method and selected gravel.

2.4.3 RDIP Section 6.7, Panel Placement

The Curtain Wall panels (fabricated by GSE Lining Technology) that comprise the membrane barrier system were installed as intended, to depths below the top of the aquitard in order to prevent movement of A-zone groundwater from the S-W property toward the Novartis property at this shared property line. The bottom of the panel elevations ranged between El. -12 ft NAVD88 to El. -14.5 ft NAVD88. The top of the aquitard is at approximately El. -11 ft NAVD88 in the project area.

The RDIP Section 6.5 indicates that "[t]he bottom of the membrane barrier will be placed adjacent to the north wall of the excavation as to achieve direct contact with the undisturbed soil or compacted backfill." During field installation activities, the steel frames holding the panels during placement were lowered adjacent to the north wall of the excavation trench and were lowered to depths equal to or greater than the top of the aquitard. Each panel placement, subsequent to the first one, was joined to adjacent panels, in accordance with the specifications. Due to the method of placement and the required use of the biopolymer slurry, however, actual "direct contact" of the panels with the trench bottom could not be confirmed by direct observation.

In lieu of direct observation, the bottom elevations of the placed panels were compared to the target trench bottom elevation using the following measurements: GPS surveys of the tops of installed panels and surrounding ground surface, previously measured panel heights, and depths to the trench bottom (conducted prior to panel placement using a weighted rope). Measurements for 5 of the 11 panels that comprise the membrane barrier system indicated that the panels were lowered to the target trench bottom elevation when released from their frames. For 6 of the 11 panels, measurements

could not confirm that the bottom of the panel frames reached the actual trench bottom. Fine-grained deposits, from the compacted backfill trench sidewalls, settling out from the slurry and accumulating at the trench bottom during panel installation is believed to have affected the assessment for reaching the target trench bottom elevation at these six panels. For all panel placements, however, the panel frame bottoms were determined to reach depths below the top of the aquitard at El. -11 ft NAVD88.

2.4.4 RDIP Section 6.8, Drain Pipe and Gravel Backfill Placement

A pea gravel (3/8 inch minus) material was used for the bedding material beneath the interceptor trench drain pipe. This was a modification from the RDIP specified "drain gravel" gradation specification. Due to the placement of pipe bedding being dropped from the top of the trench in the presence of the bio-polymer slurry, a pea gravel material was used. The pea gravel has a more uniform particle size and can achieve the desired compaction values compared to the more "well graded" drain gravel as specified in the RDIP for permeability and self-filtering design, as installed.

2.5 RDIP Section 7 – Slurry Wall Breach

2.5.1 RDIP Section 7.3, Slurry Wall Breach

The final design of the three slurry wall breaches varied from the design presented in the RDIP, to accommodate improved constructability and to avoid installing the northwestern breach across the western property boundary with Union Pacific Railroad. The breach design revisions maintained the required transmissivity necessary per the groundwater flow modeling. The location of Breach 3 was moved to the east in order for it to be in adjacent with saturated soil excavation. The asbuilt design and locations of the slurry wall breaches are included in Attachment B. This change was reviewed and approved by DTSC.

2.5.2 RDIP Section 7.5, Trench Excavation

Actual trench excavation procedures differed from the RDIP text due to the redesign of the slurry wall breaches, therefore reference to biopolymer slurry in the cross trenches and the up- and down-gradient trenches are no longer applicable. See Attachment B for the asbuilt design and locations of the installed breaches.

2.5.3 RDIP Section 7.6, Backfill Placement

References in the RDIP text to the up and down gradient and cross trench backfilling are no longer applicable due to the breach redesign.

2.6 RDIP Section 8 – Slurry Wall Extension

2.6.1 RDIP Section 8.4, Slurry Wall Extension

The actual slurry wall extension was 675 feet long; the RDIP estimated a length of 494 feet. The extension was brought into the existing slurry wall further north than originally designed to accommodate installation closer to the property line (further west). This change was reviewed and approved by DTSC.

The actual slurry wall thickness, in accordance with approved design modifications, was 30 inches; the RDIP text indicated a minimum wall thickness of 36 inches. A sensitivity analysis on this modification did not show any significant change to the modeled groundwater flow paths.

The slurry wall extension also included design and installation of a slurry wall cap, to protect the bentonite-based slurry wall from damage due to future active surface loads. The slurry wall cap was also of similar low permeable clay soil to allow for a higher impermeable wall height. See Attachment B for the slurry wall extension asbuilt location and installation details.

2.7 RDIP Section 9 – Waste Profiling, Transport and Disposal

Aside from the sample tubes presented in the RDIP for stockpile sample collection, 8 oz. glass jars were also used. In discussions with the lab, En Core® and Terra Core® samplers from the Site could not be composited without losing significant VOCs that may be present. The laboratory recommended that samples for VOCs be taken from the tubes or jars and composited the same day in EnCore® samplers by the laboratory. The sampling materials were designated to each sample and no sampling equipment was re-used, so no QC samples were taken or necessary.

The amount of truck loads/tons and rail car loads/tons exceeded the original estimate. A variance to the RDIP is that truck beds were not lined with plastic or straw when trailers were being loaded with non-hazardous material. Material was placed onto truck beds directly and covered for exporting. The non-hazardous material being placed in the truck trailers passed the wet paint filter test and passed through the decontamination pad where the loads were inspected prior to leaving the Site.

Another variance to the RDIP is that dry decontamination methods were used when trucks exited the Site. Stiff brushes were used to clean tires while stopped on the decontamination pad. The trucks being loaded for export of waste material were limited to hard surface travel and daily removal of spilled soil from the truck route was performed. MEC sprayers were used to spray tires while on the decontamination pad on rainy days or days with an excess of mud on the truck path.

At the final stages of the project it became necessary to begin removal of the Site rail line and spur track at the north end of the property to begin final backfill and grading in these areas. Without the access to the adjacent Union Pacific rail yard, final loads of non-RCRA hazardous waste (California regulated) were loaded on trucks for transport to the San Francisco Bay Railroad (SFBR) for loading onto rail cars for final transport. This transportation variance was approved by DTSC and the community was informed of this activity.

During loading of non-hazardous waste to the local Class 2 non-hazardous waste landfill, approximately 20 loads of non-RCRA hazardous waste were mistakenly transported by truck to the Class 2 landfill. The transport of this material was identified within hours of leaving the Site, and arrangements with the landfill were made to isolate and contain the waste for removal and transport to the SFBR for transport by train to the appropriate landfill facility. A total of 334.26 tons of waste were initially delivered to the Class 2 landfill. In order to assure complete removal of this waste, approximately 12 tons of additional material around and beneath it were excavated; totaling 342.41 tons. This waste was taken to the SFBR for transport by train to the appropriate landfill.

Final waste amounts removed from the Site were based on stockpile sample results and are presented by their waste characterization results below, based on reported weights received by the disposal facilities.

Waste Characterization	*Project Waste Category*	*Amount (Tons)*
Class 2 Non-Hazardous	1	69,671
Class 1 Non-RCRA Hazardous	2	60,650
Class 1 RCRA Hazardous (US Ecology)	3, 4, 5, 7	19,387
Class 1 RCRA Hazardous (Arlington)	6 & 8	0

Attachment D6 provides a summary of the stockpile sample results and their determined waste characterizations. Section 1 provides a chart presenting excavated materials transported offsite (in accumulated tons by month).

2.8 RDIP Section 10 – Non-Remedial Activities

In addition to the spur track removal and storm sewer removal activities anticipated and presented in the RDIP, Envirocon also encountered and removed other inactive subsurface utility pipes and buried concrete foundations associated with former railroad activities, former S-W operations, or other historic operations. See Attachment B for Asbuilt Drawings showing areas where piping was encountered and removed.

2.9 RDIP Section 11 – Soil Gas Evaluation

The RDIP text indicates the anticipated schedules for post-remediation activity installation and sampling of soil gas occurring in February/March, and August/September 2012, assuming a completion of remediation activities in November 2011. These dates for soil gas evaluation are now anticipated to occur in June 2012 and November 2012. Soil gas evaluation strategy is further discussed in the project OM&M plan. The soil gas evaluation strategy is consistent with Section 11 of the RDIP, with the following modifications:

- Additional investigation location near the former UST area.
- Additional investigation location downgradient of the former UST area and within the former water treatment plant area.
- Re-location of one sampling location from near slurry wall Breach 3 to upgradient of the breach.

2.10 RDIP Section 13 – Groundwater Monitoring Program

2.10.1 RDIP Section 13.1, Groundwater Monitoring Well Locations

The project OM&M plan includes the groundwater monitoring program for the project after remedy implementation. This groundwater monitoring program is consistent with Section 13 of the RDIP, with the following modifications:

- Slight movement of actual new well installations based on field conditions.

- Installation of additional well, CDM-113, upgradient of current location of slurry wall breach #3 (breach moved east to connect with saturated soil excavation).
- Installation of additional well CDM-114 at RDIP-identified piezometer location, downgradient of the former UST area and upgradient to the existing slurry wall.
- Re-numbering of piezometers based on above change.
- Contingent well not needed on former Rifkin property.
- Modification to sampling frequency of wells RP-1, RP-4, and MW-3 based on groundwater monitoring results during the remedy implementation.
- Addition of existing monitoring well MD-5 at downgradient offsite property for periodic depth to groundwater measurements.
- Change frequency of depth to groundwater measurements to annually for downgradient wells LF-24 and LF-25 on Union Pacific Railroad property.

Wells installed during remedy implementation were installed under permit and reports for the completions were submitted to ACPWA. Copies of these reports are included in Attachment G2. A summary of their construction and surveyed coordinates are also included in Attachment G2. The locations for these newly installed wells and other remaining wells are presented in Attachment B. Site permits are included in Attachment F.

The first post-remedy implementation groundwater monitoring report will be submitted by July 31, 2012 to DTSC and Novartis. It will include data from March 2012, April 2012, May 2012, and June 2012, monthly water levels and sample results from April 2012. April 2012 sampling/analysis conforms to the annual sampling requirements for the project.

2.10.2 RDIP Section 13.2.1, Groundwater Quality Sampling and Analysis during Remedy Implementation

Groundwater sampling and analysis were conducted in accordance with the RDIP. The results were used to assess potential impacts to the former Rifkin property from the potential spreading of upgradient, offsite plumes and, to evaluate any arsenic concentration changes during remedy implementation. The results from the activities are presented in Attachment D4.

2.10.3 RDIP Section 13.2.2, Depth to Groundwater Measurements during Remedy Implementation

Depth to groundwater measurements were conducted in accordance with the RDIP. The results were used to assess potential impacts to the former Rifkin property from the potential spreading of upgradient, offsite plumes and, to evaluate any arsenic concentration changes during remedy implementation. The results from the activities are presented in Attachment D4.

Section 1
Introduction

This Operation and Maintenance (O&M) Plan is for the continued management of remedy implemented and for the residual contaminants of concern (COCs) remaining at The Sherwin-Williams Company (S-W) property located at 1450 Sherwin Avenue in Emeryville, California and a portion of the adjacent former Rifkin property, located at 4525 – 4563 Horton Street, to which hazardous substances have migrated from the S-W property. Collectively the S-W property and this portion of the former Rifkin property are referred to as the "Site" within this document. The Site consists of approximately 10 acres. Novartis Vaccines and Diagnostics, Inc. (Novartis) is the current owner of the former Rifkin property.

An O&M Agreement, containing provisions regarding the activities, notification, submittals, emergency response, and communication procedures, will be entered into by S-W and DTSC to implement this O&M Plan.

The remedy implemented at the Site has been documented in the project's Remedy Implementation Completion Report (Completion Report), dated July 25, 2012 (CDM Smith, 2012). The remedy was implemented in accordance with the California Department of Toxic Substances Control (DTSC) Imminent and Substantial Endangerment Determination and Order and Remedial Action Order No. 05/06-007 (the Order) and the Remedial Action Plan (RAP), dated June 14, 2010, and Remedial Design Implementation Plan (RDIP), dated June 29, 2011, for the Site (DTSC, 2006; CDM 2010; and, CDM, 2011). The RAP, RDIP, and Completion Report were approved by DTSC in letters dated June 14, 2010, June 30, 2011, and August 6, 2012, respectively (DTSC, 2010; DTSC, 2011; and, DTSC, 2012a).

The remedy implementation occurred between March 2011 and April 2012, and consisted of the following key components:

- Installation and operation of an air monitoring system and air sampling program to evaluate the effectiveness of Site controls in maintaining the safety of the surrounding community.
- Installation and operation of a temporary soil vapor extraction and treatment system to remove volatile organics from the most impacted vadose zone excavation area.
- Relocation of a high-pressure natural gas line, from under the western sidewalk of Horton Street (i.e., adjacent to the excavation) to the other side of the street.
- Excavation and offsite disposal of vadose zone soil containing arsenic, lead, and/or organic contaminants to support future potential residential use of the Site.
- Removal and offsite disposal of aboveground and underground structures, pipes, and debris containing arsenic, lead, and/or organic contaminants, primarily consisting of the raised cap and former water treatment plant.
- Excavation dewatering, and onsite pre-treatment and discharge to sanitary sewer of extracted water.

- Excavation and offsite disposal of saturated zone soil containing arsenic, lead, and/or organic contaminants to support long-term protection of groundwater.
- Backfill of excavation areas to control groundwater movement within the Site.
- Placement of backfill and gravel cover to re-grade the Site to facilitate storm water drainage.
- Extension of the existing slurry wall along the southwestern portion of the Site.
- Installation of a membrane barrier and interceptor trench to prevent movement of groundwater from the S-W property to the former Rifkin property.
- Removal of portions of the existing slurry wall to control groundwater movement from the Site to offsite, downgradient (western) areas.
- Abandonment of a former underground storage tank (UST) at the Site.
- Abandonment of selected existing groundwater wells no longer required for the project.
- Installation of new groundwater wells required for the post-remedy implementation groundwater monitoring program.
- Development and recording of a Covenant and Agreement by DTSC with Alameda County Clerk-Recorder's Office to protect present or future human health or safety or the environment (Covenant) through identifying specific restrictions and requirements associated with the residual COCs at the S-W property and for maintaining and preserving the integrity of the remedy, as presented in the RAP, RDIP, Completion Report, and this O&M Plan.

The remedy implementation has achieved the project remedial action objectives (RAOs). The following presents the RAOs that were established for the Site in the RAP and remedy component that fulfills the RAO:

Remedial Action Objective (RAO)	*Remedy Component*
▪ Minimize direct contact/ingestion by humans with Site soil containing contaminants of concern (COCs) at concentrations exceeding the cleanup goals.	▪ Removal of vadose zone soil with COC concentrations above cleanup goals. ▪ Development and recording of the Covenant and Agreement to restrict the use of the S-W property (Covenant). ▪ Monitor for possible contamination in areas outside existing removal areas, as identified in this Operation and Maintenance (O&M) Plan and/or subsequent DTSC-approved modifications. ▪ Monitor soil gas conditions, as identified in this O&M Plan and/or subsequent DTSC-approved modifications.
▪ Minimize migration of and/or inhalation of airborne dust by humans from the Site containing COCs at concentrations exceeding the cleanup goals.	▪ Removal of vadose zone soil with COC concentrations above cleanup goals. ▪ Development and recording of the Covenant, controlling intrusive activity at the S-W property.

Remedial Action Objective (RAO)	*Remedy Component*
▪ Minimize exposure to and inhalation by humans of volatile organic COCs at concentrations in indoor air exceeding the cleanup goals.	▪ Removal of vadose zone soil with COC concentrations above cleanup goals. ▪ Development and recording of the Covenant for the S-W property. ▪ Monitor for possible contamination in areas outside existing removal areas, as identified in this O&M Plan and/or subsequent DTSC-approved modifications. ▪ Monitor soil gas conditions, as identified in this O&M Plan and/or subsequent DTSC-approved modifications.
▪ Minimize risk to down-gradient ecological receptors from offsite groundwater migration containing COCs at concentrations exceeding the cleanup goals.	▪ Removal of saturated zone soil with COC concentrations identified as source material. ▪ Backfill to control groundwater movement. ▪ Installation of slurry wall breaches and extension and maintain key portions of existing slurry wall to control groundwater movement. ▪ Grading of the Site to minimize storm water infiltration and prevent ponding. ▪ Monitor groundwater conditions, as identified in this O&M Plan and/or subsequent DTSC-approved modifications.
▪ Minimize onsite human contact with groundwater containing COCs at concentrations exceeding the cleanup goals.	▪ Removal of saturated zone soil with COC concentrations identified as source material. ▪ Development and recording of the Covenant.

Vadose zone soils with COCs above cleanup goals have been removed. Confirmation samples were collected from the vadose zone excavation sidewalls to demonstrate conformance with the cleanup goals as established in the RAP.

The RAOs were met through the implementation of the remedy. The remedy components that remain and require protection in order to maintain and preserve the integrity of the remedy are:

- Portions of Existing Slurry Wall to control groundwater movement
- Slurry Wall Extension to control groundwater movement
- Slurry Wall Breaches to control groundwater movement
- Interceptor Trench to control groundwater movement
- Membrane Barrier to control groundwater movement
- Selective Placement of Low- and High-Permeability Backfill to control groundwater movement

- Grading of the Site to minimize storm water infiltration and prevent ponding
- Groundwater Monitoring Wells to monitor groundwater conditions and evaluate remedy effectiveness

The locations of these components are presented in Attachment A, Drawing 1. All components are located below grade and not visible at the Site surface, except the groundwater monitoring wells, soil gas monitoring points and the Site grading. The tops of groundwater monitoring wells and soil gas monitoring points are visible at the Site surface.

Attachment A, Drawing 4 presents vadose zone confirmation soil sample locations. Attachment B presents the range of COCs in vadose zone samples identified at the Site and their respective cleanup goals. No remaining sample has a COC concentration above its respective cleanup goal.

Groundwater within the Site is expected to continue having COC concentrations above cleanup goals. Groundwater will be monitored, as identified in this O&M Plan and/or subsequent DTSC-approved modifications. Periodic groundwater monitoring reports will be prepared and submitted to DTSC (see Section 3.4.1 for reporting).

Soil gas within the Site will be monitored, as identified in this O&M Plan and/or subsequent DTSC-approved modifications. Periodic soil gas monitoring reports will be prepared and submitted to DTSC (see Section 3.4.1 for reporting).

The following presents the COCs identified for the S-W property and, their cleanup goals by media.

Contaminant of Concern	*DTSC-Approved Cleanup Goals*				
	Vadose Zone Soil (mg/kg)		*Soil Gas (ug/m3)*

Notes:
mg/kg – milligrams per kilogram
ug/m3 – microgram per cubic meter
mg/L – milligram per liter
NA - not applicable; contaminant is not of concern in this media

The cleanup goals for the contaminants of concerns were established in the Remedial Action Plan (RAP) and approved by the DTSC. For vadose zone soil, cleanup goals are compared to the 95% upper confidence limits of the averages of the detections (95 UCL) from Site samples to demonstrate conformance with the cleanup goals. For soil gas and groundwater, cleanup goals are compared to detections in samples from Site monitoring points. With DTSC's approval of the Remedy Implementation Completion Report, DTSC confirmed that the vadose zone soil cleanup goals at the Site have been met.

Section 2
Site Operations

The operations of the remedy components that remain at the Site are passive and predominately underground. These remedy components are listed in Section 1 of this O&M Plan. By passive, it is meant that the components are static and do not require any power. However, they must remain whole in order to continue operating as designed. Future construction, development, and/or operations at the Site cannot constrain the objectives of each component without first evaluating its effects and obtaining DTSC approval prior to any modifications to the components, as provided in the Covenant.

The current Site conditions and operations require the placement of a Covenant on the S-W property to protect present or future human health or safety or the environment, and identify specific restrictions and requirements associated with the residual COCs at the S-W property and for maintaining and preserving the integrity of the remedy.

An assessment will be conducted annually to assure that Site construction/operations are not impacting the effectiveness of the remedy components. This assessment shall be made by every April and a report will be submitted to DTSC (see Section 3.4.1 for assessment reporting).

Section 3

Site Maintenance and Monitoring

3.1 Site Maintenance

The remedy components as described in Section 1.0 are passive and require no regular maintenance, except for the groundwater well and soil gas monitoring points. However, they must remain whole in order to continue operating as designed. Future construction, development, and/or operations at the Site cannot constrain the objectives of each component without first evaluating its effects and obtaining DTSC approval prior to any modifications to the components, as provided in the Covenant.

Monitoring Network Inspection and Maintenance

At the time of water level measurement, groundwater sampling, and/or soil gas sampling, the condition of each monitoring point will be documented in a field book, or an equivalent document. Condition items may be identified through visual inspection of the monitoring point, changes in monitoring point performance from those observed during previous monitoring events, and/or unexplained changes in field parameter measurements. Deficiencies or problems identified for a given monitoring point will be addressed within an appropriate timeframe.

Routine maintenance items (i.e., items that require minimal effort) will be addressed in a timely manner. Examples of routine items include darkening the datum mark for a monitoring point, replacement of bolts or seals, and lock replacement. Non-routine maintenance items typically require more extensive effort. Examples of non-routine items include repair of concrete pads surrounding the monitoring point, grading, and cracked casings; and for groundwater monitoring wells possible redevelopment. Items requiring more extensive effort, and that are not addressed in this O&M Plan, will be evaluated on an individual monitoring point basis and may require preparation of a work plan for DTSC review and approval.

In addition to the monitoring point inspection, the total depth of conventional monitoring points without dedicated equipment will be measured at least triennially. Total depth of conventional monitoring points with dedicated equipment will be measured if the equipment is removed from the casing or if there is an indication of a problem with the point. Total depth measurements will be documented in the field log book, or equivalent field document. The total depth will be compared against the depth listed in Appendix B and Appendix D, and previous total depth measurements. If significant sediment accumulation is observed, the point may warrant redevelopment.

3.2 Groundwater Monitoring

Attachment A, Drawing 2 presents the project groundwater well locations. Attachment C presents the groundwater monitoring program.

As needed, the program will be revised based on the Site conditions after DTSC approval.

3.3 Soil Gas Evaluation

Attachment A, Drawing 3 presents the project soil gas monitoring point locations. Attachment D presents the soil gas evaluation strategy.

After completion of the remedy implementation activities, soil gas monitoring wells were installed to collect and analyze soil gas samples. Soil gas samples have been collected in June 2012 and their results presented in Attachment D. The next scheduled soil gas monitoring event is in December 2012. After the December 2012 event, the June and December 2012 results will be evaluated and a report submitted to DTSC. After evaluation of the soil gas conditions, DTSC and Sherwin-Williams will determine whether additional action is needed.

3.4 Reporting

The following presents anticipated post-remedy implementation reporting for the Site through the first Five-Year Review in 2016.

3.4.1 Groundwater

The first post-remedy implementation groundwater monitoring report was submitted to DTSC on July 30, 2012, for the reporting period of March 1, 2012 through June 30, 2102 (ARCADIS, 2012). DTSC approved this report on September 25, 2012 (DTSC, 2012b). Subsequent reports will be provided to DTSC per the following schedule and annually thereafter unless modified through DTSC approval letter:

Groundwater Reporting Period	Submittal of Report to DTSC
July 1, 2012 through December 31, 2012	January 31, 2013
January 1, 2013 through June 30, 2013	July 31, 2013
July 1, 2013 through December 31, 2013	January 31, 2014
January 1, 2014 through June 30, 2014	July 31, 2014
July 1, 2014 through June 30, 2015	July 31, 2015
July 1, 2015 through June, 2016	July 31, 2016

The groundwater monitoring reports will include all information collected from assessment and monitoring events during the previous period. As needed, submittals may be made more frequently on individual topics to maintain the protection of the remedy and/or if the effectiveness of the remedy is in question. The reports will contain summaries of the monitoring program, groundwater elevation data, groundwater quality data, sampling methods utilized, and quality control and quality assurance data. The reports will include figures presenting interpreted groundwater movement and spatial representation of the dissolved arsenic in groundwater sample data. As appropriate with the collection of sufficient data over time, the reports will assess the effectiveness of the remedy.

3.4.2 Soil Gas

Following the collection and analysis of soil gas samples from the December 2012 event, a data summary and evaluation report will be submitted to DTSC. The report will be submitted by the later of January 31, 2013 or within six weeks after receipt of all analytical reports from the laboratory. The report will contain summaries of the monitoring program, deviations, if any, from the strategy and/or methodology presented in this O&M Plan, and soil gas sample results. The report will evaluate if the results are above cleanup goals and, if needed, present recommendations for continued soil gas evaluation.

3.4.3 Five-Year Review

The first Five-Year Review for the remedial action will be conducted for the period from remedy implementation through December 31, 2015. The purpose of the review is to determine if human health and the environment are being protected by the remedial action.

A draft work plan for the Five-Year Review will be submitted to DTSC by September 1, 2015 so that a final work plan can be completed and approved by DTSC by December 31, 2015. The work plan will present

- an outline for the Five-Year Review report,
- information on Site background
- information on Site construction, development, changes, and/or planned future use,
- a summary of the data and information gathered and documents/records completed since remedy implementation,
- a summary of additional remedial actions implemented, if any,
- deviations from the O&M Plan, if any, and
- a preliminary discussion of remedy effectiveness/protectiveness, including the remedy components, controls, and Covenant restrictions and requirements.

A draft Five-Year Review report will be submitted to DTSC by the later of (1) February 28, 2016 or (2) 45 days following DTSC approval of the work plan. The draft report will include a protectiveness statement, provide recommendations for continued evaluation, propose follow-up actions (if any), and outline future reporting requirements. It is anticipated the final report will be completed and approved by DTSC by June 30, 2016.

Section 4

Soil and/or Groundwater Management

Prior to intrusive activities at the Site, the following regulatory agencies must be notified and/or consulted:

- DTSC
- Bay Area Air Quality Management District (BAAQMD), depending on the scope of the proposed activities.

During such intrusive activities (i.e., drilling, well sampling, re-development of the Site properties, etc.) soil and/or groundwater potentially containing residual COCs may be encountered. In addition, the activities may have the potential to affect infiltration rate of storm water to underlying groundwater.

After notification/consultation with the above regulatory agencies, a soil and/or groundwater management plan may be required prior to implementing any activities, as provided in the Covenant. The plan could include, but not be limited to, the following elements:

- Dust and vapor controls,
- Storm water controls,
- Excavated soil stockpile management,
- Stockpile soil sampling procedures,
- Soil and/or groundwater disposal procedures, and
- Groundwater dewatering, treatment, and/or discharge.

Health and Safety

Attachment E presents health and safety plans (HASPs) for workers conducting activities presented in this O&M Plan, excluding management of potentially impacted soils during implementation of future activities. Those implementing such future activity will be responsible for preparing a specific HASP in accordance with Occupational Health and Safety Administration (OSHA) 29 CFR 1910.120 guidelines and Title 8 CCR Section 5192.

Zinc	610000	23000	84	84	29	4070	--

Notes:

mg/kg - milligram per kilogram

ND - not detected

The cleanup goals for the chemicals of concerns, except arsenic, are site-specific risk-based threshold levels presented in the Remedial Action Plan (RAP).

The cleanup goal for arsenic in soil is its naturally occurring background concentration, as presented in RAP.

Site analyses were for total chromium (sum of +3 and +6 species); maximum total chromium detection is less than both chromium cleanup goals.

For chemicals of concern with maximum detections above their respective cleanup goals, the 95% upper confidence limits of the averages of the detections (95 UCL) are presented to demonstrate conformance with the cleanup goals; "--" is presented where this analysis is not warranted. This approach is consistent with the cleanup goals presented in the RAP.

Attachment C

Groundwater Monitoring Program

Attachment C

Groundwater Monitoring Program

The Groundwater Monitoring Program outlines provisions for a long term groundwater monitoring program to collect data to evaluate the effectiveness of the soil excavation, backfill, and slurry wall breaches/extension. The effectiveness of the final remedy will be evaluated based on its ability: (1) to promote natural attenuation of residual chemicals of concern (COCs) in groundwater, primarily arsenic; (2) to achieve Site cleanup goals within a reasonable timeframe; and (3) to control groundwater movement through the Site without producing long-term groundwater mounding.

The groundwater monitoring program consists of:

- Designation of a well network;
- Collection and evaluation of depths to groundwater and concentrations of COCs in groundwater in the well network;
- Development of criteria and methodologies to evaluate data that are collected; and
- Development of contingency actions with a decision framework for their initiation.

Statistical analysis will be used to evaluate trends in the concentration data. The depth to groundwater, and COC concentrations and concentration trends will be evaluated to determine if contingency action(s) are needed to achieve Site cleanup goals (see Section 1 of this Operation and Maintenance (O&M) Plan).

Based on the timing and nature of future redevelopment and future construction activities, and/or results from the groundwater monitoring program, it may be necessary to modify the groundwater monitoring network or monitoring requirements at some point in the future. As such, at any time after implementation of the remedy, The Sherwin-Williams Company (S-W) may request modifications to the groundwater monitoring program presented in this document. S-W will implement the changes to the groundwater monitoring program only after approval by the California Department of Toxic Substances Control (DTSC).

C.1 Groundwater Monitoring Well Locations

Attachment A, Drawing 2 of this Operation and Maintenance (O&M) Plan presents the locations of these monitoring wells and piezometers. Table C-1 provides a summary of construction details and a summary of the monitoring program after remedy implementation.

C.2 Monitoring Frequency and Sample Analysis

This section presents the monitoring and analysis programs 1) during remedy implementation and 2) for the first four years after remedy implementation.

C.2.1 Groundwater Quality Sampling and Analysis

Site groundwater monitoring program for the first four years after remedy implementation will be in accordance with Table C-1, and/or subsequent DTSC-approved modifications.

With the exception of wells CDM-112, CDM-113, and CDM-114, which will be sampled annually, S-W will sample all new monitoring wells installed on the S-W property on a semi-annual basis for the first two years after remedy implementation. Following these two years, S-W will use the data from the well samples and the data quality objectives to determine if semi-annual sampling should continue or whether the frequency can be reduced to annual.

Rifkin Guard Well RP-1 and RP4, and well MW-3, will be sampled for arsenic analysis on a quarterly basis as the arsenic concentrations at these wells during remedy implementation increased above their respective historical maximum detections. Quarterly sampling for each of these three wells will continue until statistical analysis of the results demonstrates that the arsenic concentration for each respective well is stable or decreasing; the frequency of sampling for the well will then be adjusted to semi-annual.

S-W will collect groundwater samples in accordance with the methodology for well sampling presented in the existing project Groundwater Monitoring Plan Assessment (LFR, 2006a) and Quality Assurance Project Plan (LFR, 2006b). The samples will be sent to a certified laboratory chosen by S-W and analyzed for arsenic by EPA Method 6010B, volatile organic compounds (VOCs) by EPA Method 8260B, and/or total petroleum hydrocarbons (TPH) as gasoline (TPH-G) by EPA Method 8260 and TPH as diesel and motor oil (TPH-D/MO) by EPA Method 8015M with silica gel cleanup (SGC). In addition, S-W will measure the following field parameters during purging and sample collection:

- Temperature
- pH
- Turbidity
- Dissolved Oxygen
- Specific Conductivity
- Oxidation-Reduction Potential

S-W will use field parameter results to support the representativeness of the well samples and monitor the relative distribution of oxidizing/reducing conditions.

C.2.2 Depth to Groundwater Measurements

Site groundwater monitoring program for the first four years after remedy implementation will be in accordance with Table C-1, and/or subsequent DTSC-approved modifications.

As the remedy has been designed to control groundwater movement, S-W will collect groundwater elevation data monthly for the first year from monitoring wells and piezometers to monitor whether groundwater movement patterns are consistent with projected design groundwater model conditions for the remedy, as presented in the Feasibility Study (FS) (CDM, 2009). S-W will use the first year's data set to evaluate the effectiveness of the slurry wall segments to divert groundwater, and the effectiveness of the slurry wall breaches to facilitate groundwater movement. After the first year, if groundwater

elevations and movement patterns are consistent with projected design conditions, the frequency of groundwater elevation monitoring will be revised to quarterly. S-W will utilize the quarterly elevation monitoring data sets to continue evaluation of potential seasonal variation in groundwater movement. S-W will evaluate the frequency of groundwater elevation monitoring annually.

Should future construction activities affect groundwater movement or rates of infiltration (e.g., redevelopment of the former Rifkin property or S-W property), S-W will initiate monthly monitoring during and post-construction for a period of at least one year to monitor whether groundwater movement patterns continue to be consistent with projected design groundwater model conditions. If groundwater elevations and movement patterns are consistent with projected design conditions, groundwater elevation monitoring will return to its previously established frequency.

Changes to the frequency of groundwater elevation monitoring resulting from a determination that groundwater movement patterns are inconsistent with projected design conditions are further discussed in Section C.5.3.

C.3 Groundwater Quality Effectiveness Criteria

S-W will analyze the analytical results from sampling of the groundwater monitoring wells to evaluate the effectiveness of the remedy. Table C-2 provides a summary of the groundwater quality effectiveness criteria that S-W will utilize to evaluate the effectiveness of the remedy. The criteria are discussed below.

C.3.1 Excavated and Backfilled Area on Former Rifkin Property

It is anticipated that COC concentrations in groundwater within this area will fluctuate after remedy implementation, as the groundwater comes into equilibrium with the backfill material and surrounding groundwater conditions. S-W will collect analytical samples from wells CDM-101 and CDM-102. Analytical results from a certified laboratory will be used to evaluate whether COC concentrations in groundwater in this area are stable or decreasing by no later than four years after remedy implementation. In addition, S-W will use analytical data of samples from these wells to evaluate whether arsenic concentrations in this area are less than 5,000 micrograms per liter (µg/L) by no later than four years after remedy implementation.

C.3.2 Excavated and Backfilled Area on S-W Property

It is anticipated that COC concentrations in groundwater within this area will fluctuate after remedy implementation, as the groundwater comes into equilibrium with the backfill material and surrounding groundwater conditions. Therefore, S-W will use analytical results of samples from wells CDM-103 and CDM-104 to evaluate whether COC concentrations in groundwater in this area are stable or decreasing by no later than four years after remedy implementation.

C.3.3 North Side on Former Rifkin Property

S-W will analyze analytical results of samples from the Rifkin Guard Wells to evaluate whether arsenic concentration trends are statistically stable or decreasing after remedy implementation.

C.3.4 Central Site on S-W Property

S-W will analyze analytical results of samples from wells CDM-105 and CDM-106 to determine if there is potential movement of COCs in groundwater toward the west side groundwater monitoring wells CDM-107 and CDM-108.

S-W will analyze results of analytical samples from wells CDM-110, CDM-111, CDM-113, and CDM-114 to determine if there is potential change in groundwater quality outside of the area affected by the excavated and backfilled area.

C.3.5 West Side on S-W Property

S-W will analyze results of analytical samples from wells CDM-107 and CDM-108 to evaluate whether trends of COC concentrations in groundwater migrating offsite through the slurry wall breaches toward the Union Pacific Railroad property are statistically stable or decreasing, and whether arsenic concentrations exceed 250 µg/L for CDM-107 or 500 µg/L for CDM-108. These arsenic concentration criteria are based on protection of Temescal Creek channel and further discussed in Section C.6.1.2.

S-W will analyze results of analytical samples from well CDM-109 to evaluate the effectiveness of the slurry wall extension in containing the onsite groundwater plume and to evaluate whether trends of COC concentrations in groundwater present outside the slurry wall are statistically stable or decreasing.

C.3.6 West Side on Union Pacific Railroad Property

S-W will analyze results of analytical samples from wells LF-24 and LF-25 to evaluate whether COC concentrations in groundwater near the Temescal Creek channel are less than Site cleanup goals or whether their trends are statistically stable or decreasing. Since installation in 1996, arsenic concentrations in samples from these wells have been stable or decreasing. Arsenic concentrations in samples from monitoring well LF-24 since the time of installation in 1996 have been less than 36 µg/L. Arsenic concentrations for LF-25 have been less than 36 µg/L since 2006 and are currently demonstrating a decreasing trend.

C.3.7 North Side on S-W Property

S-W will analyze results of analytical samples from well LF-18 to evaluate whether COC concentrations in groundwater near the Temescal Creek channel are less than Site cleanup goals or whether their trends are statistically stable or decreasing.

C.3.8 South Side on Sherwin Avenue

S-W will analyze results of analytical samples from well CDM-112 to evaluate whether COC concentrations in groundwater in this area are less than Site cleanup goals or whether their trends are statistically stable or decreasing.

C.4 Groundwater Movement Effectiveness Criteria

Table C-2 provides a summary of the groundwater movement criteria to be utilized to monitor the effectiveness of the remedy. The criteria are further discussed below.

C.4.1 Groundwater Movement Patterns

S-W will monitor the measurements of depths to groundwater in Site wells to determine if long-term groundwater movement patterns within the S-W property are consistent with projected design groundwater model conditions for the remedy, as presented in the FS (CDM, 2009), and are included at the end of this Attachment C. These projected design conditions include groundwater movement towards the slurry wall breaches and the absence of long-term, localized groundwater mounding.

C.4.2 Depths to Groundwater

S-W will evaluate groundwater elevation measurements to determine if the depths to groundwater are sufficient to minimize potential inundation of subsurface utility corridors.

C.4.3 Arsenic Mass Flux between CDM-101, CDM-102, CDM-104, and PZ-101

S-W will evaluate groundwater elevation measurements, along with concentrations of arsenic in groundwater, from CDM-101, CDM-102, CDM-104, and/or PZ-101 to determine if the net arsenic mass flux within the excavated and backfilled area between the locations of these proposed wells is towards the S-W property west of the former Rifkin property.

As appropriate, the criterion of net mass flux towards the S-W property could be evaluated using other COCs.

C.5 Remedy Effectiveness Evaluation

After remedy implementation, S-W will utilize the groundwater monitoring data sets to evaluate the effectiveness of the remedy and determine if contingency action(s) are needed to achieve Site cleanup goals. The following text summarizes the evaluation process and criteria to be used to determine the need for contingency actions.

C.5.1 Groundwater Quality for Wells CDM-101 thru CDM-104, CDM-107 thru CDM-109, CDM-112, LF-18, LF-24, LF-25, and Rifkin Guard Wells

S-W will evaluate COC concentration trends for these 17 wells by statistical testing, including but not limited to the Mann-Kendall (Gilbert, 1997) nonparametric statistical test. Consistent with U.S. EPA guidance (EPA, 1994), S-W will use a significance level of 0.05 (i.e., a 95% confidence level) in applying the Mann-Kendall nonparametric test. If an increasing COC concentration trend is found, S-W will increase the frequency of monitoring for the well to monthly for three months and use the 95% UCL concentrations from these four events (the previous scheduled event and subsequent three monthly events) in the Mann-Kendall nonparametric test in place of the previous quarterly event result. If this re-evaluation demonstrates a return to a stable or decreasing COC concentration trend, S-W will return the frequency of monitoring for the well to its previously established frequency listed in Table C-1. Otherwise, S-W will provide written recommendations to DTSC for implementation of a contingency action (see Section C.6).

If during establishment of a statistical arsenic concentration trend for wells CDM-107 and CDM-108, arsenic concentrations exceed 250 µg/L for CDM-107 or 500 µg/L for CDM-108, S-W will provide written recommendations to DTSC for implementation of a contingency action (see Section C.6). These arsenic concentration criteria are based on protection of Temescal Creek channel and are further discussed in Section C.6.1.

C.5.2 Groundwater Quality for Wells CDM-101 and CDM-102

If four years after remedy implementation the arsenic concentration threshold criterion of 5,000 µg/L is exceeded in samples from either wells CDM-101 or CDM-102, S-W will provide written recommendations to DTSC for implementation of a contingency action (see Section C.6).

C.5.3 Groundwater Movement Patterns

S-W will perform an estimate of groundwater flow direction and hydraulic gradient following each groundwater elevation monitoring event. S-W will then compare the groundwater flow direction and

measured hydraulic gradient to the projected design groundwater model conditions for the remedy, as presented in the FS (CDM, 2009), or as updated during preparation of the RDIP, and are included at the end of this Attachment C. As discussed in Section C.2, S-W will conduct the first assessment of this criterion after the first year of monthly groundwater elevation monitoring. The groundwater movement conditions that will be monitored as part of the annual assessment will include:

- The slurry wall extension controls groundwater movement to the north and south, in the area of CDM-111 and CDM-113;
- Net groundwater movement within the Excavated and Backfilled Area on S-W property is toward the interceptor trench or the wall breaches near the Union Pacific Railroad property, and not toward Horton Street;
- Net groundwater movement within Excavated and Backfilled Area on former Rifkin property is to the north-northwest;
- Net groundwater movement from the high permeability fill area surrounding CDM-104 is toward the slurry wall breaches near the Union Pacific Railroad property, and not toward the former Rifkin property; and
- Mounding of groundwater, to the extent it occurs, is seasonal and generally follows above average precipitation events and does not result in net groundwater movement toward the Rifkin property, movement of water over the top of the slurry wall, or flow around the slurry wall extension.

If the first assessment determines that groundwater movement patterns are consistent with projected design conditions and DTSC concurs, S-W will perform groundwater elevation monitoring quarterly as discussed in Section C.2.

If the first assessment or any subsequent annual assessment determines that groundwater movement patterns differ significantly from projected design conditions, S-W will provide written recommendation to DTSC for either implementation of additional monitoring/investigation steps or a contingency action.

Additional monitoring/investigation may include but is not limited to continued/return to monthly groundwater monitoring for an additional year, at which time a follow up assessment would be made and the monitoring revised as appropriate. Possible contingency action is discussed in Section C.6.

C.5.4 Depths to Groundwater

If one year after remedy implementation the depth to groundwater in any well is measured at or less than four (4) feet bgs, S-W will reinitiate monthly monitoring for the well to determine if depth to groundwater is exhibiting a rising trend. If the depth to groundwater from three consecutive monthly events is greater than four (4) feet bgs, S-W will return the frequency of monitoring for the well to its previously established frequency. Otherwise, monthly monitoring will continue. If the depth to groundwater in any well is measured at or less than three (3) feet bgs, S-W will provide written recommendations to DTSC for implementation of a contingency action (see Section C.6).

C.5.5 Arsenic Mass Flux between CDM-101, CDM-102, CDM-104, and PZ-101

The projected groundwater model design conditions are intended to prevent long-term (steady-state) groundwater and residual COC movement within the excavated and backfilled area between the

locations of these proposed wells towards the former Rifkin property. This additional criterion for monitoring the effectiveness of the remedy includes maintaining a positive mass flux from the former Rifkin property to the S-W property for each COC. As discussed in Section C.4.3, this criterion is anticipated to apply only to arsenic.

After each groundwater elevation monitoring event for the three wells and one piezometer, S-W will calculate the hydraulic gradient within the excavated and backfilled area on the former Rifkin property and the contiguous backfilled area to the west, on the S-W property. S-W will use the transect method (API, 2003) to calculate the arsenic mass flux in groundwater through the cross-sectional area underlying the Rifkin/S-W property line between these wells for each event using the following equation:

$w = (C)(K)(i)(A)(CF)$

where, w = chemical mass flux through the transect (g/day)

C = concentration of chemical through the transect (mg/L)

K = hydraulic conductivity at the transect (cm/sec)

i = hydraulic gradient at the transect (cm/cm)

A = cross-sectional area associated with the transect (ft3)

CF = conversion factor, 80.3 (ft/cm)/(sec/day)(L/ft3)(g/mg)

The calculated mass flux, w, value for each event will include both the magnitude and direction. The direction will be based on assigning a positive hydraulic gradient, i, if groundwater movement is toward Rifkin and negative for movement away from Rifkin. The concentration, C, for each event will be either (1) the concentration of CDM-104 if the groundwater movement is toward Rifkin, or (2) the average of the arsenic concentration of CDM-101 and CDM-102 if groundwater movement is away from Rifkin.

Due to the uncertainty introduced by variations in percent recovery; quality control; and matrix interferences, there will be inherent variations in the precision and bias of laboratory analytical results for the groundwater samples from the wells used in the flux calculations. Therefore, S-W will use a default tolerance limit of 20 percent to determine if concentrations are considered different for use in calculating mass flux, i.e., mass flux, w, will be set at zero for each event where arsenic concentrations from wells CDM-101, 102, and CDM-104 differ by or less than 20 percent. As appropriate, S-W will apply this criterion to other COCs, if concentrations of other COCs for these three wells differ by more than 20 percent.

After the first year of monthly groundwater monitoring, S-W will sum the monthly arsenic mass flux values to calculate the annual net arsenic mass flux. Each of the monthly mass flux values will represent an approximately equal duration (i.e., one month). If this first year net arsenic mass flux is negative (movement of arsenic away from Rifkin), S-W will proceed to quarterly groundwater monitoring, as discussed in Section C.2.

If the net arsenic mass flux during the first year or any subsequent year is positive (movement of arsenic toward Rifkin), S-W will provide written recommendation to DTSC for either implementation of additional monitoring/investigation steps or a contingency action.

Additional monitoring/investigation may include, but is not limited to, continued/return to monthly groundwater monitoring at these wells for an additional year, at which time a follow up assessment would be made and the monitoring revised as appropriate. Possible contingency action is discussed in Section C.6.

If the net arsenic mass flux during the first year or any subsequent year exceeds the equivalent to arsenic concentrations of 500 µg/L with a groundwater migration rate of 1 foot/day, S-W will provide written recommendation to DTSC for contingency action (see Section C.6).

C.6 Contingency Action

Section C.5 presented the criteria for which written recommendations to DTSC for contingency action will be required. The recommendations for contingency action will be consistent with best engineering practices to minimize the potential for any further spread of the COCs and to strive to restore a stable or decreasing groundwater plume. Such contingency action may include, but not be limited to: additional soil excavation and backfill; modifications to permeability of placed fill; in-situ groundwater treatment or in-place geochemistry modifications within the Site or at the slurry wall breaches; modification to the groundwater containment system; and/or active groundwater extraction and treatment.

The submittal to DTSC for the recommended contingency action would also include effectiveness evaluation criteria for the contingency action. S-W would implement the contingency action after approval by DTSC.

C.6.1 Active Groundwater Extraction and Treatment

Criteria for Rifkin Guard Wells

If verified arsenic concentrations in samples from any Rifkin Guard Well during evaluation of the contingency action exceed the criteria listed in Table C-3, S-W will provide written recommendations to DTSC to implement active groundwater extraction and treatment with disposal/reuse of treated water. The objective of the groundwater extraction contingency action, to address exceedance of the Rifkin Guard Well criteria, would be to prevent further migration of arsenic contaminated groundwater onto the former Rifkin property. For this action, further arsenic migration is defined as northerly groundwater movement across the alignment of the Rifkin Guard Wells.

The submittal to DTSC for active groundwater extraction would also include criteria for evaluating the effectiveness of the extraction. Consistent with existing DTSC procedures, S-W would implement active groundwater extraction and evaluate its effectiveness. This evaluation would include consideration of (1) terminating active groundwater extraction and returning to the original remedy (i.e., natural attenuation of arsenic in groundwater) if criteria listed in Table C-4 are met, or (2) implementation of additional contingency action, if criteria listed in Table C-4 are not met.

Criteria for Wells CDM-107 and CDM-108

If verified arsenic concentrations in samples from CDM-107 or CDM-108 during evaluation of the contingency action exceed the criteria listed in Table C-3, S-W will provide written recommendations to DTSC to implement active groundwater extraction and treatment with disposal/reuse of treated water. The objective of the groundwater extraction contingency action, to address exceedance of the CDM-107/108 criteria, would be to prevent further migration of arsenic contaminated groundwater through one or both of the slurry wall breaches along the Union Pacific Railroad property, as necessary, to maintain protection of Temescal Creek channel. Supporting information for the contingency action

criteria for arsenic listed in Table C-3 for CDM-107 and CDM-108 is presented in the Remedial Action Plan (RAP) (CDM, 2010).

The submittal to DTSC for active groundwater extraction would also include criteria for evaluating the effectiveness of the extraction. Consistent with existing DTSC procedures, S-W would implement active groundwater extraction and evaluate its effectiveness. This evaluation would include consideration of (1) terminating active groundwater extraction and returning to the original remedy (i.e., natural attenuation of arsenic in groundwater) if criteria listed in Table C-4 are met, or (2) implementation of additional contingency action if criteria listed in Table C-4 are not met.

Implementation of Active Groundwater Extraction

The objective of the active groundwater extraction contingency action would be to control further migration of arsenic impacted groundwater on the former Rifkin property or through the slurry wall breaches. A contingency action that includes groundwater extraction would be implemented within the area of the higher permeability backfill on the S-W property, and would be consistent with evaluation presented in the Remedial Action Plan (CDM, 2010) and/or subsequent DTSC-approved modifications. The uniform nature of this higher permeability backfill would facilitate enhanced hydraulic communication with surrounding native materials, backfill in the remainder of the Site, and the interceptor trench.

Using the groundwater model for the Unit A aquifer (A-zone) developed for the FS (CDM, 2009), as updated during preparation of the RDIP, a groundwater extraction scenario has been evaluated for conditions anticipated to be present after implementation of the preferred remedy. Based on the groundwater model simulation results, a single groundwater extraction well within the higher permeability backfill on the S-W property would be sufficient to simultaneously meet the objectives of contingency actions for both the former Rifkin property and the slurry wall breaches. Under this selected groundwater extraction scenario, a pumping rate of approximately 3.1 gallons per minute (gpm) from this well would be sufficient to maintain a hydraulic capture zone that extends to the Rifkin Guard Wells and the downgradient slurry wall breach nearest to the source area. The model indicates that of the two downgradient slurry wall breaches along the Union Pacific Railroad property, the one associated with well CDM-108 is the more likely to first have potential increases in COC concentrations that would trigger a need for contingency action.

The groundwater model simulation results include a presentation of the steady-state potentiometric surface contours and particle tracking showing groundwater movement in the A-zone that would develop due to pumping from this single groundwater extraction well within the high permeability backfill on the S-W property. The results demonstrate that this contingency groundwater extraction action would adequately provide control of migration of COCs in groundwater.

a - Designated Rifkin Guard Well.

1 - Monitoring program is only for the first four years after remedy implementation.

2 - Depth to groundwater measured monthly for first year and then quarterly for next three years; should there be a change in the rate of infiltration that affects groundwater flow conditions, monthly monitoring would be reinitiated for at least one year.

3 - Field parameters include: temperature, pH, turbidity, dissolved oxygen, oxidation-reduction potential, and specific conductivity.

4 - Frequency of monitoring for arsenic for this well will be quarterly as arsenic concentration for this well increased above its historical maximum detection during remedy implementation.

5 - Frequency of monitoring for arsenic for this well will be semi-annually for the first two years; if after two years arsenic concentration is stable to decreasing, frequency of monitoring will be modified to annually after DTSC concurrence; otherwise, it will remain semi-annually.

Table C-2

Remedy Effectiveness Evaluation Criteria

Sherwin-Williams Emeryville Operation and Maintenance Plan

Groundwater Quality Effectiveness Criteria [1]	
Well	**Remedy Effectiveness Evaluation Criteria**
Former Rifkin Property	
CDM-101	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing four years after remedy implementation, and arsenic is less than 5,000 ug/L four years after remedy implementation
CDM-102	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing four years after remedy implementation, and arsenic is less than 5,000 ug/L four years after remedy implementation
RP-1[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
RP-2[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
RP-4[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing

Groundwater Movement Effectiveness Criteria
1. Long-term groundwater flow patterns are consistent with projected design groundwater model conditions.
2. Long-term arsenic in groundwater mass flux at the Rifkin/S-W property line between CDM-101/CDM-102 and PZ-101/CDM-104 is westward, from the former Rifkin property to the S-W property.
3. Absence of long-term groundwater mounding at the Site.
4. Depths to groundwater at all wells are more than 3 feet below ground surface.

Notes:

COC: chemical of concern

ug/L: microgram per liter

a - Designated Rifkin Guard Well.

1 - Wells not presented do not have groundwater quality remedy effectiveness evaluation criteria.

Table C-3

Criteria for Implementing Active Groundwater Extraction

Sherwin-Williams Emeryville Operation and Maintenance Plan

Well	Criteria for Implementing Active Groundwater Extraction [1]	*Maximum Arsenic Concentration Detected from Well thru February 2012* [2]
Former Rifkin Property (Guard) Wells		
RP-1[a]	Increasing arsenic concentration trend with concentration greater than higher of 150 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation	140
RP-2[a]	Increasing arsenic concentration trend with concentration greater than higher of 75 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation	42
RP-4[a]	Increasing arsenic concentration trend with concentration greater than higher of 75 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation	25
RP-5[a]	Increasing arsenic concentration trend with concentration greater than higher of 75 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation	38
LF-36[a]	Increasing arsenic concentration trend with concentration greater than higher of 75 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation	65
LF-41[a]	Increasing arsenic concentration trend with concentration greater than higher of 150 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation	97
Sherwin-Williams Property Wells		
CDM-107	Increasing arsenic concentration trend with concentration greater than 250 ug/L	Not applicable [3]
CDM-108	Increasing arsenic concentration trend with concentration greater than 500 ug/L	Not applicable [3]

Notes:

Attachment D

Soil Gas Evaluation Strategy

Attachment D

Soil Gas Evaluation

After completion of remediation implementation activities, S-W installed soil gas monitoring points at the Site to collect and analyze soil gas samples. This section provides the objective and methodology for sample collection. Table D-1 provides a summary of construction details of the installed soil gas monitoring points.

The monitoring points were installed at locations in proximity to previous soil gas sample locations at the Site, which were conducted in November and December 2006 and reported in CDM's January 30, 2007 report to DTSC. Attachment A, Drawing 3 of this Operation and Maintenance (O&M) Plan presents the locations for these monitoring points.

In order to have representative sample collection of steady-state conditions in the vadose zone after completion of backfill activities and evaluate potential seasonal variability, soil gas samples will be collected in June 2012 and December 2012.

Following the collection and analysis of soil gas samples from the December 2012 event, a data summary and evaluation report will be submitted to DTSC. The report will be submitted by the later of January 31, 2013 or within six weeks after receipt of all analytical reports from the laboratory. The report will contain summaries of the monitoring program, deviations, if any, from the strategy and/or methodology presented in this O&M Plan, and soil gas sample results. The report will evaluate if the results are above cleanup goals and, if needed, present recommendations for continued soil gas evaluation.

The results from the June 2012 event were provided to DTSC following this event, and without evaluation. The June 2012 results are included in Table D-2.

The O&M Plan will be amended, as needed, to include appropriate engineering controls that would be implemented as part of redevelopment if post-excavation sampling reveals that residual soil gas is present above indoor air protective levels. Engineering controls could include: increased building indoor air ventilation; sub-slab depressurization; and/or vapor barriers in combination with other controls.

Whether engineering controls are deemed necessary to address potential indoor vapor intrusion concerns, a long-term soil gas monitoring program may still be appropriate for continued evaluation.

D.1 Soil Gas Sample Collection and Analysis

Soil gas monitoring points were installed at 12 locations at the Site. These locations are in proximity to previous soil gas sample locations at the Site, see Attachment A, Drawing 3 of this O&M Plan.

D.2 Pre-Sampling Activities

Prior to installation of the soil gas monitoring points, installation permits were obtained from Alameda County Public Works Agency (ACPWA) and Underground Service Alert (USA) was contacted at least 72 hours prior to beginning fieldwork to determine the locations of any subsurface utilities. At potential

monitoring points outside of the excavation, S-W coordinated with S-W and Novartis personnel to assist in locating underground utilities.

D.3 Soil Gas Monitoring Point Installation

Methods to penetrate the subsurface for installation of soil gas monitoring points consisted of Concrete Coring (as necessary) and Direct Push. Overlying soil at portions of the Site may be paved asphalt and require coring prior to drilling.

The events for soil gas monitoring point installation were in the following order:

1. Used a concrete coring unit to penetrate the asphalt, where present, at the proposed locations.

2. Used a direct push rig to penetrate through soil with 1.5-inch outside diameter hardened steel rods to approximately 5 feet below ground surface (bgs), or the desired target depth depending on depth to groundwater. Retracted rods slightly to expose soil formation and set monitoring point. As the locations are to be within backfill from the remediation implementation or previous investigation areas, soil cores were not collected.

3. Attached a measured length of 1/8-inch outside diameter Nylaflow tubing to a soil gas sampling point. The point consisted of a six-inch stainless steel soil gas implant screen. The point was hung through the rods via the tubing and placed one foot above the bottom of the borehole. The point was surrounded with #2/12 sand (or equivalent) to two feet above the bottom of the borehole; with the point centered in the sand. As the rods were retracted, one foot of dry bentonite chips was placed above the sand, and then hydrated bentonite slurry placed to 0.5 foot of the surface. The bentonite sealed the point from the ground surface.

4. The monitoring point was completed with sand to the surface and a flush mounted vault.

The monitoring points were installed by a licensed driller: TEG, Inc. The completed monitoring points were allowed to equilibrate for at least 24 hours prior to sampling.

As stated above, the depth of the monitoring point placements was 4 feet bgs or shallower. DTSC guidelines specify 5 feet bgs as an appropriate depth to collect soil gas samples in order to minimize effects from atmospheric conditions, including changes in barometric pressure, temperature, and/or breakthrough of ambient air from the surface. Due to the shallow groundwater table (encountered at 4 to 7 feet bgs), S-W installed monitoring points at 5 feet bgs or shallower in order to minimize moisture content in the soil gas samples. No deeper soil gas samples will be collected. At locations where shallower groundwater was encountered, S-W installed monitoring points as shallow as 3 feet bgs, as necessary. S-W did not install monitoring points at locations with groundwater at or shallower than 4 feet bgs. Table D-1 provides a summary of construction details of the installed soil gas monitoring points.

D.4 Soil Gas Sampling Methodology

The soil gas sampling methodology is in accordance with the Remedial Design Implementation Plan (RDIP) (CDM Smith, 2012) and is consistent with applicable portions of the following guidance documents:

Advisory – Soil Gas Investigations. California Environmental Protection Agency, Department of Toxic Substances Control, Los Angeles Regional Water Quality Control Board, and San Francisco Regional Water Quality Control Board. April 2012.

Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance). California Environmental Protection Agency, Department of Toxic Substances Control, October 2011.

A schematic of the sampling train is shown in Figure D-1. Swagelock® fittings or equivalent will be used for all connections. After assembly, the sampling train will be tested for leaks by performing a vacuum shut-in test. The downhole valve will be closed and a test vacuum of at least 100 inches of water column (in-H2O) will be placed on the sampling train for at least one minute with a mechanical or hand pump, dedicated purge vacuum container, or equivalent. The test will be monitored using a vacuum gauge connected to the train. After the shut-in test, three volumes of air will be purged using a 200 milliliter per minute (mL/min) flow regulator, in order to minimize partitioning or short circuiting of soil gas flow paths, and monitored with a vacuum gauge connected to the train.

Helium gas will be used as a leak check compound to ensure that the bentonite seal is intact. After the shut-in test, a shroud will be placed over the monitoring point and shut-off valve. The atmosphere inside the shroud will be filled with helium. The shroud will have weather stripping along its base in order to maintain a constant leak check concentration in the atmosphere around the sampling location. The helium concentration within the shroud will be monitored using a portable helium detector.

The leak check analysis will be performed during the three volume purge test. After purging 1.5 volumes, the purge will be stopped, and a clean 50 cc disposable, syringe will be used to draw sample from a sample port in the line, see Figure D-1. The syringe sample will be pushed into the helium detector to test for helium. The presence of helium in the sample would be indicative of leak in the seal. If not detected, the purge will continue again to complete the remaining purge. After completing the three volume purge, one more sample will be drawn with a syringe and pushed into the helium detector to check for leak.

After completion of the two leak checks and three volume purge, soil gas will be collected in a 1-liter Summa canister using a flow regulator of less than 150 mL/min, in order to minimize partitioning or short circuiting of soil gas flow paths. Each Summa canister will consist of a stainless steel canister that will be under absolute vacuum (29 in. Hg). All canisters will be provided by and samples will be submitted to a certified air quality laboratory. All sample canisters will be purged and certified by the laboratory to be free of VOCs at the specified detection limits.

If the shut-in test cannot maintain a vacuum and/or helium is detected during purging, the seals will be checked and corrected if necessary and the test(s) repeated. If the problem(s) cannot be corrected, the monitoring point will be abandoned without sample collection and sealed, and a new point installed at a new location.

D.5 Sample Analysis

Soil gas samples will be analyzed, within 14 days of collection, at an analytical laboratory for VOCs by EPA Method TO-15. The samples will also be analyzed for helium by ASTM D-1946 (modified). Additionally, samples will be analyzed for oxygen, carbon dioxide, and methane by ASTM D-1946 (modified). Samples will be handled under standard chain of custody (COC) protocol at all times.

D.6 Quality Assurance and Quality Control

The Quality Assurance/Quality Control (QA/QC) plan for the soil gas evaluation was included with the RDIP in its Appendix C (CDM, Smith 2012). The plan provides methodology to manage overall quality control of sample collection, collection of original data recorded in field notebooks, sample identification tags, chain-of-custody records, data quality, equipment calibrations, and quality control tests. The plan also provides details on the project organization structure and identifies the duties and responsibilities of key personnel.

D.6.1 Field Samples

Field quality control/quality assurance (QA/QC) samples will be collected and analyzed to establish confidence in the sample collecting procedures. One duplicate sample will be collected over the each soil gas sampling event. This sample will be subject to the same sample analysis as the original sample. In addition a trip blank sample will be collected to ensure the integrity of sample canisters during shipping and handling. A trip blank sample will be a 1-liter Summa canister that will travel from the laboratory to the Site, will remain at the Site during each sampling event, and travel back to the laboratory for analysis. The trip blank canister will not be exposed to atmosphere. Equipment blanks will not be collected.

If field samples are found to have been impacted with helium after sample analysis, such samples will be considered to be invalid and require re-sampling at minimum, and may also require re-installation of the point.

D.6.2 Decontamination Procedures

All down-hole equipment will be decontaminated before and after each use. Decontamination will be accomplished by steam cleaning or washing in a solution of Alconox or equivalent non-phosphate detergent, followed by a double rinsing with clean water. Decontamination water will be containerized in 55-gallon drums, labeled, and retained at the Site until characterized for proper disposal.

D.7 Sample Labeling

Samples will be labeled with a unique identification name, date, time, location, and sampler's initials. The identification name will consist of the location name and sample date: Location Name – Sample Type – Sample Date.

D.8 Characterization and Disposal of Investigation Derived Waste

Soil cuttings and waste water will be containerized in separate 55-gallon drums, labeled, and held at a paved portion of the Site until characterized for proper disposal. Within 90 days from the generation of the waste, S-W will arrange for pickup and disposal.

D.9 Monitoring Point Sealing

After the completion of all soil gas sampling events, the monitoring points will be abandoned by pulling out the implant tubing. Since the boreholes are completed above the water table and contain bentonite seals, installation of additional subsurface seals is not anticipated. In accordance with ACPWA abandonment requirements, the vaults will be removed after abandonment and each borehole will be sealed at the surface with a mixture of Portland cement and bentonite slurry. The slurry will be

troweled flush with the surface, and as needed for selected locations, coated with a blackening material for blending with the asphalt.

Notes:

Samples collected on June 6 and 7, 2012.

Action Levels based on the following:

Lower and Upper Explosion Limit (LEL/UEL) for methane at 25 degrees Celsius.

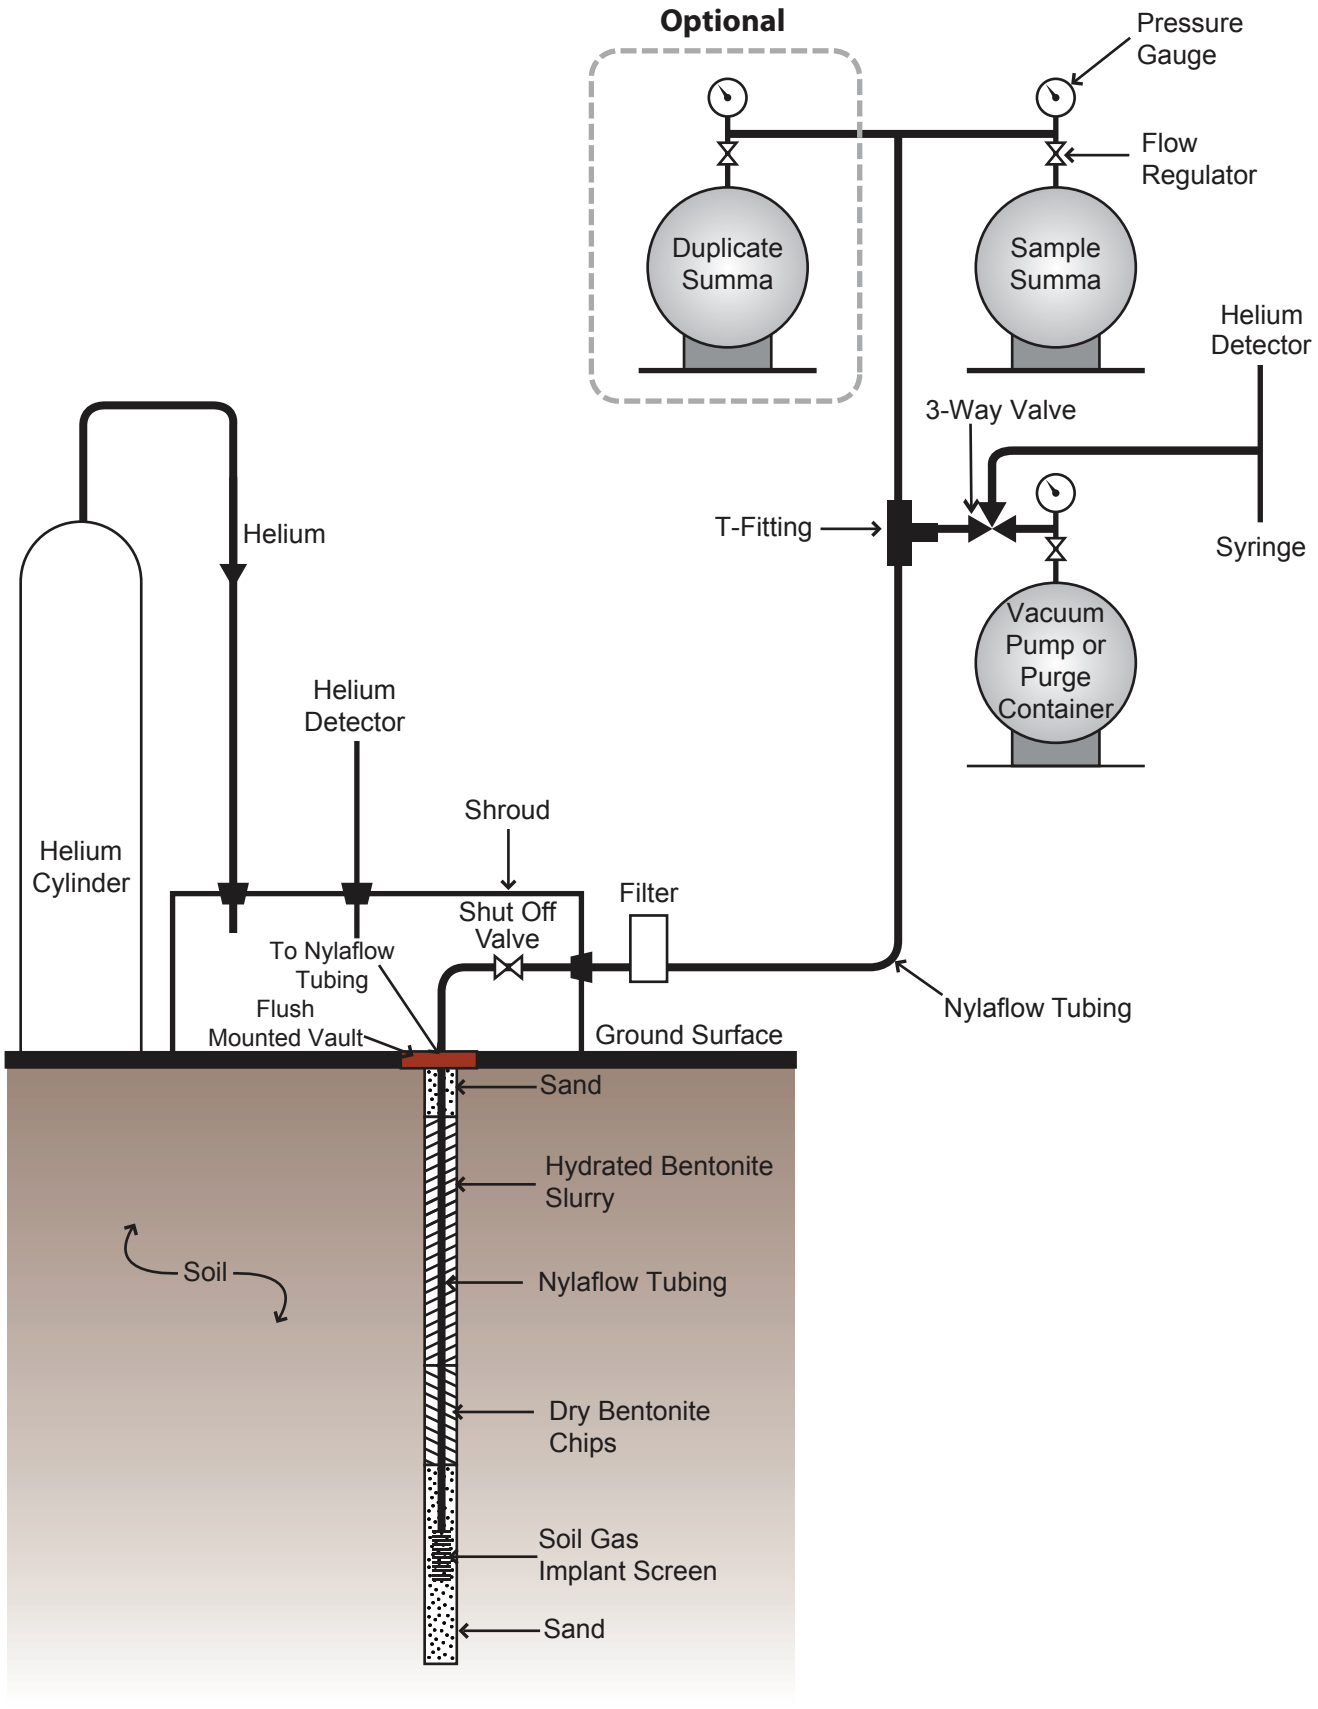
Acceptable presence of helium (leak-test gas) without compromising sample integrity and representiveness of soil gas, per Cal/EPA Advisory - Active Soil Gas Investigation (April 2012).

California Human Health Screening Level (CHHSL) for VOCs in soil gas under residential use, where applicable, per Cal/EPA guidance document (January 2005, revised November 2009).

ppm = parts per million and v/v = volume over volume ratio

ug/m3 = micrograms per cubic meter

NR = not reported by laboratory



Bold indicates detection above method detection limit (MDL).

Detections below laboratory reporting limit (RL) presented with J flag preceding result.

Yellow highlight indicates detection above action level.

Grey highlight indicates reporting limit above action level for VOCs or methane detected above UEL.

Green highlight indicates detection above CHHSL under industrial/commercial use (0.039 ppm v/v, 122 ug/m3 for benzene and 0.32 ppm v/v, 1400 ug/m3 for ethylbenzene).

SITE REMEDIATION
EMERYVILLE, CALIFORNIA

SOIL GAS MONITORING POINTS

PROJECT NO. 13452-81494
FILE NAME: sw as-built1a.dwg
SHEET NO.

HISTORY: *Summarize conditions that relate to hazard. Include citizen complaints, spills, previous investigations or agency actions, known injuries, etc.*

Sherwin-Williams began operations at the Site in 1919. Coating products were manufactured since operations began, but also included the production of lead-arsenate pesticides from the 1920s until 1948. Sherwin-Williams produced oil-based paints until 1987 and has since only produced water-based coating materials until 2009 when the facility was decommissioned. A slurry wall was installed around the source area of lead-arsenate contamination on the Sherwin-Williams property in 1980s. Groundwater extraction wells were installed within the slurry wall to prevent contaminated groundwater from migrating downgradient. Groundwater is treated at the on-site treatment facility and then discharged to Temescal Creek. Contamination from the upgradient former Shell Development property, underground storage tanks from the downgradient former Southern Pacific Railroad also contribute to groundwater and soil contamination at the Site. In 2011/2012, the agency approved remedial action was implemented at the site.

WASTE TYPES: (X) Liquid (X) Solid ( ) Sludge ( ) Gas ( ) Unknown ( ) Other, specify:

WASTE CHARACTERISTICS: *Check as many as applicable.*

( ) Corrosive () Flammable ( ) Radioactive

(X) Toxic **(X) Volatile** ( ) Reactive
( ) Inert Gas ( ) Unknown
( ) Other: _____

WORK ZONES:

The entire Site will be considered a work area and all PPE will be required with the fenced area. Specific work zones will be based on location of boring. When drilling, the exclusion zone (CRZ) is 1.5X the mast height of the drill rig. The contamination reduction zone is along the perimeter of the exclusion zone at the inside edge of the fenced work area. All protective equipment will be removed in the CRZ.

HAZARDS OF CONCERN: *Check as many as applicable.*

(X) Heat Stress CDM Guideline **(X) Noise** CDM Guideline
( ) Cold Stress CDM Guideline **(X) Inorganic Chemicals**
(X) Explosive/Flammable ( ) Organic Chemicals
( ) Oxygen Deficient ( ) Motorized Traffic
( ) Radiological **(X) Heavy Machinery**
(X) Biological ticks **(X) Slips & Falls** CDM Guideline

FACILITY'S PAST AND PRESENT DISPOSAL METHODS AND PRACTICES:

Soil produced during installation of wells will be containerized in 55-gallon drums. Soil will be characterized and disposed offsite.

This plan incorporates CDM's procedure for: *(Click on the relevant topics to download the hazard guideline. Delete irrelevant topics.)*

Housekeeping | Traffic and Work Zone Safety | Tools and Power Equipment
Working Around Heavy Equipment | Hazardous Waste Site Controls
Hazardous Waste Site Decontamination | Working Safely Around Drill Rigs

HEALTH AND SAFETY PLAN FORM	*This document is for the exclusive*	**CDM Smith**	
CDM Smith Health and Safety Program	*use of CDM Smith and its subcontractors*	**PROJECT DOCUMENT #:**	0

DESCRIPTION AND FEATURES: *Include principal operations and unusual features (containers, buildings, dikes, power lines, hillslopes, rivers, etc.)*

The site is occupied by two building associated with past operations of manufacturing paints, pigments, and pesticides. Subsequent to demolition activities that concluded in late November 2007 and cleanup activities that concluded in April 2012, the property is now covered by asphalt/concrete paved areas and gravel cover areas. Paved area are mainly foundations for several demolished buildings. The former Rifkin property is located along the western side of Horton Street, adjacent to the north and east of portions of the S-W property. The portion of the former Rifkin property included as part of the Site is currently covered by asphalt and serves as a parking lot.

SURROUNDING POPULATION: (X) Residential ( ) Industrial (X) Commercial ( ) Rural ( ) Urban OTHER:

EMERGENCY CONTACTS

Water Supply	N/A
Site Telephone Autodialer	510-420-7200
EPA Release Report #:	800 / 424 - 8802
CDM 24-Hour Emergency #:	CED 732 / 539 - 8128
Facility Management	
Other (specify) CAL-OSHA	N/A
CHEMTREC Emergency #:	800 / 424 - 9300

SAFETY NARRATIVE: *Summarize below*

CDM Smith shall ensure utility locates are performed prior to intrusive activities. Drilling and sampling personnel shall also be closely monitored for cleanliness duruing activities. If soil or water is observed on work clothing, the SSO will direct the workers to don Tyvek or similar disposable protective clothing.

Emergency Response Plan (ERP)

Prior to start of task activities, this plan will be discussed and signed by each person working at the Site. Site information, associated hazards, intended work and emergency procedures will be presented.

Two people will be present onsite during task activities. In the event of personnel injury, the uninjured person will direct emergency activities and implementation of the ERP.

In an event of a life threatening injury where there is insufficient time to wait for an ambulance, the field vehicle will be used to transport the injured personnel to the Kaiser Foundation Hospital (280 West Macarthur Boulevard, Oakland, CA).

If additional emergency personnel must be summoned to the Site the southeast corner of the site (entrance to building) will be used as the contact area.

A first aid kit will be available onsite for minor injuries, (i.e., scrapes, cuts, etc.) Call 911 for other emergencies.

Reporting of incidents to pertinent local, state, and federal agencies will be performed by appropriate CDM Smith representatives after report by field personnel. Review and follow up will be directed by said CDM Smith representatives.

No additional emergency or PPE will be kept at the Site for emergencies nor will emergency personnel require PPE during emergency response.

Emergency services will be contacted by cellular telephone.

Local Emergency Contacts

Pre-activity meetings with local officials and/or other local emergency and public safety agencies (e.g., fire, police, and local health officials) is not necessary. Coordination with these agencies will be carried out during emergencies only.

Contacting the local medical facility prior to commencement of work will not be necessary for remedial action activities. Map to hospital is attached. Assembly areas are not required as all personnel onsite will be together at all times.

Emergency decontamination of injured workers will not vary from normal decontamination procedures. Nitrile gloves will be removed. Hands and face may be washed once the injured worker has reached the emergency facility.

HEALTH AND SAFETY PLAN APPROVALS (H&S Mgr must sign each plan)

Distance to Hospital 2.1 miles (10 minutes)

16.12 Tools and Power Equipment

16.12.1 Hand Tools

CDM Smith employees who have a need to use basic hand tools should use the following work practices:

- All tools used on CDM Smith projects, regardless of ownership, shall be of an approved type and maintained in good condition. Tools are subject to inspection at any time. The project manager has the authority and responsibility to condemn unserviceable tools, regardless of ownership.
- Tag defective tools to prevent their use or removal from the job site.
- Use the proper tool for the job performed.
- Do not use hammers with metal handles, screwdrivers, knives with metal continuing through the handle, and metallic measuring tapes on or near energized electrical circuits or equipment.
- Do not throw tools from place to place or from person to person. Tools that must be raised or lowered from one elevation to another shall be placed in tool buckets or firmly attached to hand lines.
- Do not place tools unsecured on elevated places.
- Dress, repair, or replace all impact tools such as chisels, punches, drift pins, etc., that become mushroomed or cracked before further use.
- Use suitable holders or tongs, not the hands, to hold chisels, drills, punches, ground rods, or pipes that are struck by another employee.
- Do not use shims to make a wrench fit.
- Do not use wrenches with sprung or damaged jaws.
- Do not use pipe or other means to extend a wrench handle for added leverage unless the wrench was designed for such use.
- Use tools only for the purposes for which they have been designed.
- Store and handle tools with sharp edges so that they will not cause injury or damage. They shall not be carried in pockets.
- Use eye protection when using or working around impact type tools (e.g., hammer, chisel, ax, hatchet, etc.).
- Replace wooden handles that are loose, cracked, or splintered. The handle shall not be taped, glued, or lashed with wire.

- Keep all cutting tools such as saws, wood chisels, knives, or axes in suitable guards or in special compartments.

- When using such tools as screwdrivers and wrenches, avoid using your wrists in a bent, flexed, extended, or twisted position for long periods of time. Employees should maintain their wrists in a neutral or straight position.

- Do not leave tools lying around where they may cause a person to trip or stumble.

- When working on or above open grating, use a canvas or other suitable covering to cover the grating to prevent tools or parts from dropping to a lower level where others are present, or barricade or guard the danger area.

- Do not depend on the insulation on hand tools to protect users from shock.

16.12.2 Electric Tools

CDM Smith employees who have a need to use electric power tools should use the following work practices:

- The non-current carrying metal parts of portable electric tools such as drills, saws, and grinders shall be effectively grounded when connected to a power source unless the tool is an approved double-insulated type or the tool is connected to the power supply by means of an isolating transformer or other isolated power supply, such as a 24-volt DC system.

- All power tools shall be examined before use to ensure general serviceability and the presence of all applicable safety devices. The electric cord and components shall be given a thorough examination for cracks, exposed wires, or other defects.

- Power tools shall be used only within their capability and shall be operated in accordance with the manufacturers' instructions.

- The use of eye protection is required when using or working around power tools.

- Operators should take care to use appropriate hand positions on cutting tools such as saws, drills, or grinders to avoid hand injury.

- All tools shall be kept in good repair and disconnected from the power source while repairs are being made.

- Electrical tools shall not be used where there is a hazard of flammable vapors, gases, or dusts until that hazard is firmly under control.

- GFCI should be used with all electric power tools.

- All guards and safety interlocks with which the tools were purchased shall be in place and in working order.

- Any tool that is identified as defective should be tagged "not for use," and set aside for repair and/or discarded.
- Do not wear loose or frayed clothing while operating power tools and equipment. Hair should not stick out from hard hats.
- Do not use electrical cords to transport, suspend, hoist, or lower tools.
- Do not allow power cords to lie in water.
- Disconnect rotating tools from the power source before adjusting, servicing, or cleaning them. Follow the lockout procedure described in Section 16.5.
- Do not modify tools.

16.12.3 Pneumatic Tools

CDM Smith employees that use pneumatic power tools should use the following work practices:

- Compressed air and compressed air tools shall be used with caution.
- Pneumatic tools shall never be pointed at another person.
- Pneumatic hose connections should be secured by some positive means to prevent them from becoming accidentally disconnected. Chicago fittings have wire holes to allow such security.
- Pneumatic power tools shall be secured to the hose by some positive means to prevent the tool from becoming accidentally disconnected.
- Safety clips or retainers shall be securely installed and maintained on pneumatic impact tools to prevent attachments from being accidentally expelled.
- Compressed air shall not be used for cleaning purposes except when reduced to less than 30 psi and then only with effective chip guarding and PPE.
- Compressed air shall not be used to blow dust or dirt from clothing (or skin).
- The manufacturer's safe operating pressure for hoses, pipes, valves, filters, and other fittings shall not be exceeded.
- The use of hoses for hoisting or lowering tools shall not be permitted.
- All compressed air hoses exceeding 30 psi shall have a safety device at the source of supply or branch line to reduce pressure in case of hose failure or disengagement of a connection.

- Before making adjustments or changing air tools, the air shall be shut off at the air supply valve ahead of the hose. The hose shall be bled at the tool before breaking the connection. Disconnection at the quick-change connectors is one way to meet this goal.
- Eye protection is required when using or working around pneumatic tools.
- Use hearing protection if noise exposure is a concern (i.e., if it is too loud to conduct a normal conversation).
- Pneumatic tools shall be operated only by persons trained in their use.
- A pneumatic tool used where it may contact exposed live electrical parts shall have a nonconductive hose and an accumulator to collect moisture.
- Employees shall not use any part of their bodies to locate or attempt to stop an air leak.
- All guards and safety interlocks must be in place and functional.

16.12.4 Engine-Powered Tools

CDM Smith employees that use engine-powered tools should use the following work practices:

- Stop the engine and allow it to cool before refueling, servicing, or maintenance.
- Use care in refueling. Clean up any small spills of fuel or oil immediately.
- The use of eye protection is required when using or working around engine-powered tools.
- Use hearing protection if noise exposure is a concern (i.e., if it is too loud to conduct a normal conversation).
- If possible, disconnect the spark plug before performing an adjustment, maintenance, or service.
- Use tools in well ventilated areas to eliminate any accumulation of fumes.
- Do not use tools in a flammable or explosive atmosphere.
- Equip engines with spark-arresting mufflers.
- Avoid contact with hot engine components.
- All guards and safety interlocks should be in place and functional.

16.15 Working Around Heavy Equipment

Good work practices while working around heavy equipment include:

- Assume the operator cannot see you. The operator's vision may be blocked by blind spots. He or she is frequently concentrating on their work and equipment and may not notice a site visitor.
- If you must approach the operator, be sure you have made eye contact with the operator and they know you will be approaching them before approaching the equipment. Verbal contact, direct or by radio, is even better. Do not approach if the equipment is moving or in operation.
- Stay clear of pinch points and swing areas of equipment. At CDM Smith projects, these areas should be taped or barricaded off; however, when equipment moves frequently, you cannot count on other organizations to mark these zones.
- Do not walk near a moving piece of equipment. It could turn or rotate any minute. Modern construction equipment moves fast and in any direction.
- On a noisy site, you may not notice the equipment's back-up alarm. Keep aware of what is happening around you.
- Never walk under a load on a crane or hoist. Indeed, avoid the area under the hook or bucket.
- Do not cut across the path of equipment backing up.
- Wear your hardhat and safety glasses. The safety glasses protect your eyes from dust and debris and the hardhat provides protection for your head and makes you more visible on the site.
- On sites where there is frequent vehicle or construction equipment movement, wear high-visibility clothing.
- Maintain a clearance of at least 10 feet between any part of the machine or its load and any electrical line or apparatus carrying up to 50,000 volts. One foot of additional clearance is required for every additional 30,000 volts.

16.18 Safety Working Around Drill Rigs

The use of mechanical drill rigs to collect soil samples and install monitoring wells presents significant hazards to operators and helpers, as well as technicians and engineers who may work in proximity to such rigs. CDM Smith employees that manage or oversee drilling operations should be aware of the basic hazards of drilling equipment and operations and have an awareness of safe drilling work practices. The guidelines and work practices described below should be implemented on all projects where mechanical drill rigs are used.

16.18.1 Preparation

- Contract documentation with drillers contracted with CDM Smith should include CDM Smith's standard contract between "Engineer & Subcontractor for Drilling Services," and "Health and Safety Protocol for Subcontractors" available on the Office of General Council's page of contract forms at http://cdmweb/legalforms/inc.htm.

- Before drilling or other subsurface operations, a survey should be conducted to identify any overhead or underground utilities, unexploded ordnance, tanks, pipes, or other underground structures. The local agency or organization for utility location should be contacted to identify underground utilities. In some cases, ground penetrating radar or magnetometer studies may be needed to identify the location of underground obstructions.

- The work area for the drill rig and crew should be cleared of sticks, logs, brush, and trash. Inspect the area for any potential tripping hazards and remove them. If they cannot be removed, they should be identified with caution tape or cones.

- Before rig setup, the planned arrangement of equipment should be such that it does not present a dangerous condition. Take into account slopes of hills, mud, standing water, overhead power lines, etc.

- OSHA regulations require that any part of the rig must be at least 10 feet away from power lines under 50kV or less. For higher voltage lines, 1 foot of additional clearance is required for every additional 30,000 volts.

- If working in an area of moving vehicular traffic, appropriate traffic control systems should be in place. Contact local police or traffic control officer, before placing any traffic control equipment (Section 16.22).

- Define an exclusion zone around the drill rig that is at least 1.5 times the height of the mast. Only personnel necessary for the immediate task being performed should be inside the exclusion zone.

16.18.2 Drill Rig Inspection

- After the rig is set up, but before operation, the work area should be inspected for eye, bump, and tripping hazards.
- The driller should inspect the rig daily before operation of the rig. The inspection should include the following:
    - Condition of the vehicle. Brakes should work and tires should have adequate tread. It should have a back-up alarm. If it is driven over the road, it should have all necessary brake lights, headlights, horn, license plates, etc.
    - All welds should be solid, with no sign of visible cracks.
    - All gauges should be functional and legible.
    - All machine guards should be in place.
    - Emergency kill switches should be functional. All site personnel should be aware of the location and function of the kill switches. Have the driller review these with site personnel.
    - Cable and wire rope should be inspected for fraying, decay, "bird caging," broken strands, kinking, or flattening.
    - All hoses should be secure and in good shape. They should not be loose, bulging, or leaking.
    - High-pressure fittings should be secure and have whip checks (a pin or wire to prevent the hose whipping in the event of a failure of the connection).
    - High-pressure relief valves should be in working order.
    - Wire rope loops should be secure with at least two clamps.
    - The rig should have a fire extinguisher and first aid kit.
    - All tools should be clean and in good working condition. Hooks, eyes, pins, etc. should not be corroded or bent. Rod clamps should be in good condition.
    - If a cathead is used, it should be clean and free of burrs. The cathead rope should be in good condition and not be frayed or have excessive wear.
    - Back-up alarms should be functional.
    - Vehicles should have all lug nuts and they should all be tight.

16.18.3 Work Practices

- All personnel working around drilling operations should wear appropriate PPE including a hard hat, safety glasses, and hard-toed work boots.
- Drill crews should wear work gloves.
- On hazardous waste sites, additional PPE such as respirators, protective clothing, gloves, etc. may also be required.
- In areas where there is vehicular traffic, personnel should also wear high-visibility vests or clothing.
- Maintain an organized work area free from tripping hazards.
- Drill rods or other equipment should not be stored leaning up against equipment.
- Drill holes should be completed or secured before leaving the site for the day. Drill holes should not be left open at an unattended site.
- Boring locations should be placed to minimize the possibility of contacting underground utilities or structures. Clearance should be obtained from the site project manager before drilling begins.
- Do not move the rig with the mast in the upright position.
- Use a spotter when moving the rig from one location to another on the site.
- When sampling activities require working in proximity with heavy equipment or drill rigs, sampling personnel will stand clear of the equipment until sampling is required. They will notify the operator they are going to take a sample and must receive acknowledgment from the operator.
- Do not wear loose clothing such as hooded sweatshirts, parkas, or clothing with hanging drawstrings around drill rigs.
- Monitor weather conditions. Drilling operations should be terminated and the area near the drill rig evacuated during high winds and or storms with the potential for lightning strikes. The lead driller should be consulted to help assess if weather conditions are safe for drilling.
- Drill crew personnel should wear a personal fall arrest harness, connected to a secure tie-off point, when climbing the mast or working where fall exposures exceed 6 feet.
- Hearing protection should be worn during operations that produce significant noise exposures. (If you cannot hold a conversation using a normal voice with someone within 3 feet of you because of background noise, the use of personal hearing protection is recommended.)

16.21 Decontamination at Hazardous Waste Sites

Proper decontamination helps protect employees and prevents the contamination of uncontaminated areas. Decontamination protects all site personnel by minimizing the transfer of harmful materials into clean areas. It helps prevent mixing of incompatible chemicals and protects the community by preventing uncontrolled transportation of contaminants from the site.

16.21.1 Prevention of Contamination

To prevent contamination, crew members should:

- Follow procedures for proper dressing before entry into the exclusion zone. Proper dressing will minimize the potential for contaminants to bypass the PPE and escape decontamination.
- Protect monitoring and sampling instruments by bagging. Make openings in the bags for sample ports and sensors that must contact site materials, or cover equipment and tools with a strippable coating, which can be removed during decontamination.
- Encase any source of contaminants on the site with barriers (e.g., plastic sheeting or over packs).
- Stress work practices that minimize contact with hazardous substances. Use remote sampling, handling, and container-opening techniques.

16.21.2 Decontamination Equipment Selection

In selecting decontamination equipment, consider whether the equipment must be decontaminated for reuse or can be easily disposed. Recommended equipment for decontamination includes:

- Storage tanks or appropriate treatment systems
- Drains or pumps
- Long-handled brushes
- Wash solutions appropriate for the contaminants present
- Rinse solutions appropriate for the contaminants present
- Pressurized sprayers for washing and rinsing
- Curtains, enclosures, or spray booths
- Long-handled rods and shovels
- Containers to hold contaminants and contaminated soils
- Wash and rinse buckets
- Brooms
- Containers for the storage and disposal of contaminated material

16.21.3 Decontamination Design

Decontamination facilities should be located in the CRZ, i.e., the area between the exclusion zone (the contaminated area) and the support zone (the clean area), and described in the site HSP.

- Site-specific factors that affect the decontamination facility design must be considered. Typical factors include:
  - The chemical, physical, and toxicological properties of the wastes
  - The pathogenicity of infectious wastes
  - The amount, location, and containment of contaminants
  - The potential for and location of exposure based on assigned worker duties, activities, and functions
  - The potential for wastes to permeate, degrade, or penetrate materials used for personal protective clothing and equipment, vehicles, tools, buildings, and structures
  - The proximity of incompatible wastes
  - The movement of personnel and/or equipment among different zones
  - The emergencies that may arise
  - The methods available for protecting workers during decontamination
  - The impact of the decontamination process and compounds on worker H&S
- Decontamination Line
  - Decontamination should be an organized process by which levels of contamination are reduced.
  - The decontamination process consists of a series of steps performed in a specific sequence. For example, outer, more heavily contaminated items are decontaminated first, followed by the decontamination and removal of inner, less contaminated items.
  - Each step should be performed at separate stations to prevent cross contamination.
  - Decontamination stations should allow enough separation to prevent cross contamination and should be arranged in order of decreasing contamination.
  - Separate decontamination areas should be provided to isolate workers from different contamination zones containing incompatible wastes or decontamination processes.
  - Entry and exit points should be conspicuously marked. Preferably the entry to the CRZ from the exclusion zone should be separate from the entry to the exclusion zone from the CRZ.
  - Dress-out stations for entry to the CRZ should be separate from redressing areas for exit from the CRZ.
  - Personnel who wish to enter clean areas of the decontamination facility, such as locker rooms, must be appropriately decontaminated first.
  - Examples of decontamination lines and procedures for personnel wearing various levels of protection are provided in Exhibits 16A and B.

16.21.4 PPE for Decontamination Workers

A rule of thumb is that decontamination workers wear a level of protection one level below the level of protection worn in the exclusion zone. However, consideration should be given to the following when determining the level of protection for a given project.

- The nature of site contamination
- Degree of contamination expected on workers leaving the exclusion zone
- The results of wipe tests and onsite air monitoring

Some site-specific cases may require that decontamination personnel wear the same level of PPE as workers in the exclusion zone. Cases include:

- Workers using a steam jet may need a different type of respiratory protection than other decontamination personnel because of the high moisture content of the steam jets.

- Cleaning solutions used and wastes removed during decontamination may generate harmful vapors, requiring a different type of respiratory or clothing protection.

16.21.5 Decontamination Methods

All personnel, clothing, equipment, and samples leaving the contaminated area of a site should be decontaminated to remove any harmful chemicals, radioactive material, or infectious organisms that may have adhered to them. The extent of decontamination will vary depending on the nature of site activity, site contamination, and other factors.

- Decontamination methods available include:

    - Physical removal
    - Chemical detoxification or disinfections/sterilization
    - A combination of both physical and chemical methods

- The selected decontamination method should be reviewed for any safety and health hazards. If the selected method poses a direct health hazard, measures shall be taken to protect both the decontamination personnel and the workers to be decontaminated.

- Physical Removal

    - Physical methods using high pressure and/or heat should be used with caution.
    - Loose contaminants can be removed by using a soap and water rinse with a soft bristle brush to remove dust and vapors that cling to equipment and workers, or that are trapped in small openings, such as clothing or fabric weaving.

- Adhering contaminants can be removed by:

    - Scraping, brushing, and wiping.
    - Solidifying.
    - Freezing (using dry ice or ice water).
    - Adsorption or absorption (e.g., kitty litter or powdered lime).
    - Melting.

- Volatile liquid contaminants can be removed from PPE or equipment by evaporation followed by a water rinse. Evaporation may be expedited by the use of steam jets.

- Chemical Removal

  - Decontamination using chemicals should only be done if recommended by an industrial hygienist or other qualified professional.
  - Any chemical used in the decontamination process must be chemically compatible with the equipment or clothing being decontaminated.
  - Halogenated solvents should only be used for decontamination in extreme cases where other cleaning agents will not remove the contaminant.

- Chemical removal types include the following:

  - Surface contaminants can be dissolved in a solvent.
  - Solidification of liquid or gel contaminants can enhance their physical removal. Typical solidification processes are moisture removal using adsorbents such as grounded clay or powdered lime; and chemical reactions using polymerization chemicals and/or chemical reagents.

16.21.6 Personnel Decontamination

Different levels of personnel protection, as discussed in the PPE guidelines, may be used at any given site. The following is a description of the decontamination process for each level of protection.

- **Level D**

  - An area should be designated for the gross removal of dirt and mud from gloves and boot covers. Paper towels and buckets of rinse water can be made available for this purpose.
  - Typical decontamination steps for Level D operations are provided in Exhibit 16-B.
  - Soap and water should be used to wash hands and face before leaving the site.
  - Laundering of personal clothing should be completed as soon as possible once offsite.

- **Level C and B**

  - A decontamination line should be established.
  - Site-specific procedures should be outlined in the site HSP. The recommended procedure for this layout is listed in Exhibit 16-C.

- **Level A** - It is not anticipated CDM Smith will directly participate in Level A operations. If required, site-specific procedures will be developed in coordination with the division HSM.

16.21.7 Sampling and Monitoring Equipment Decontamination

Sampling equipment often becomes grossly contaminated. Often trowels or drum thieves (coliwassas) are dedicated to a particular site. These should be left in the exclusion zone and disposed of as contaminated waste at the end of site work. Sampling equipment such as split spoons or other equipment that is used to collect several samples must be cleaned and decontaminated between samples to prevent cross contamination. These items should be cleaned and decontaminated in accordance with the project operations or sampling

plan. Dirt and wash solutions from sampling equipment decontamination should be collected and disposed of as investigation-derived waste.

Once grossly contaminated, testing and monitoring instrumentation can be difficult to decontaminate without causing damage to the instrument. Care should be taken in the field to prevent gross contamination of field instruments by avoiding direct contact between the instrument and contaminated soils, water, or surfaces. In some cases it may be necessary to place instruments in plastic bags, leaving small openings for sampling ports, detectors, and exhaust ports. The plastic bags can then be removed as the instrument comes out of the exclusion zone. The outside of instruments can be wiped down with paper towels or brushed off with clean soft brushes.

16.21.8 Heavy Equipment Decontamination

Drill rigs, trucks, backhoes, and other heavy equipment can be difficult to decontaminate. The method generally used is to wash them with water under pressure and scrub accessible areas with soap and warm water. Hot water and steam systems can be effective but may increase air concentrations of contaminants, exposing decontamination workers. Particular care should be taken where equipment comes into direct contact with contaminated soils such as tires, buckets, or treads. In severe cases, tires may need to be replaced or parts sand blasted clean or disposed of. Equipment should be visually inspected to be sure it is free of any visible signs of contamination. In some cases, wipe tests or other methods may be needed to confirm equipment has been adequately decontaminated before leaving the site.

16.21.9 Decontamination Solutions, Disposable PPE, and Site Wastes

Potentially contaminated equipment, disposable PPE, respirator cartridges, disposable sampling equipment, brushes, buckets, waste decontamination solutions, etc. should be secured in drums and labeled. Disposal methods for these materials may depend on client requirements and/or results of site investigation data. The confirmed presence of hazardous materials on the site may require disposal of investigation-derived wastes as hazardous wastes.

Care should be taken during work and decontamination activities to minimize waste materials generated.

Exhibit 16-B
Minimum Measures For Level D Decontamination

Station 1 - Equipment Drop	Deposit equipment used on plastic drop cloths. Segregation at the drop reduces the probability of cross contamination. During hot weather, a cool down station may be set up in this area.
Station 2 - Outer Garment, Boots, and Gloves Wash and Rinse	Scrub outer boots, outer gloves, and suit with decontamination solution or detergent/water. Rinse off using copious amounts of water.
Station 3 - Hard Hat, Outer Boot, and Glove Removal	Remove hard hat, outer boots, and gloves.
Station 4 - Boots, Gloves, and Outer Garment Removal	Remove boots, suit, and inner gloves and deposit in separate containers lined with plastic.
Station 5 - Field Wash	Wash hands and face.

Exhibit 16-C
Minimum Measures For Level B, And C Decontamination

Station 1 - Equipment Drop	Deposit equipment used on plastic drop cloths. Segregation at the drop reduces the probability of cross contamination. During hot weather, a cool down station may be set up in this area.
Station 2 - Outer Garment, Hard Hat, Boots, and Gloves Wash and Rinse	Scrub outer boots, hard hat, outer gloves, and suit with decontamination solution or detergent/water. Rinse off using copious amounts of water.
Station 3 - Tank/Air Canister Change	If a worker leaves the exclusion zone to change an air tank, air canister, or mask, this is the last step in the decontamination procedure. Worker's air tank is exchanged, new outer gloves and boots donned, and joints tapped. Worker returns to duty.
Station 4 - Outer Boots, and Glove Removal	Remove outer boots and gloves. Deposit in container with plastic liner.
Station 5 - SCBA/Respirator Removal	SCBA backpack and facepiece/respirator is removed (avoid touching face with fingers). SCBA or respirator is deposited on plastic sheets.
Station 6 - Inner Gloves and Outer Garment Removal	Remove suit and inner gloves and deposit in separate containers lined with plastic.
Station 7 - Field Wash	Shower if highly toxic, skin-corrosive, or skin-absorbable materials are known or suspected to be present. Wash hands and face.

16.22 Traffic and Work Zone Safety

These guidelines apply whenever CDM Smith employees or subcontractors work in areas exposed to vehicular traffic on public streets or highways.

- Where vehicular traffic hazards exist because of work at locations near public streets or roads, a system of traffic and work zone controls should be developed to mitigate the hazard. The system should meet the requirements of Part 6 of the Manual of Uniform Traffic Control Devices (MUTCD) published by the Federal Highway Administration, or the applicable state version of the MUTCD.

- In general, when the MUTCD allows the use of traffic safety direction devices, such as cones, CDM Smith will supplement those direction devices with a physical barrier, such as a truck.

- All traffic control systems on public roads must be coordinated with local traffic control officials as required by applicable law.

- Periodically evaluate effectiveness of temporary traffic control setups by walking or riding the job area looking for evidence of poor controls and near misses such as swerving traffic, motorists braking quickly, skid marks, blind spots, etc.

- Give motorists plenty of advanced warning of upcoming work zones.

- All employees working within designated work zones or near vehicular traffic should wear high-visibility clothing such as orange, yellow, or yellow-green shirts, jackets, or vests. During wet or inclement weather, similarly colored rainwear should be worn.

- During night work, between the hours of sunset and sunrise, high-visibility clothing should incorporate reflective striping or fabric and be visible at a distance of 1,000 feet. This clothing should meet ANSI standard #107 for High Visibility Safety Apparel.

- All employees working near traffic and vehicles must maintain situational awareness at all times. Stay mindful that warning signs and cones inform drivers to take action but that some drivers may not pay attention, and vehicles may still enter the work zone.

16.2 Housekeeping

These guidelines are for the establishment and administration of a clean and orderly work environment at field project sites. A continuous housekeeping program strongly tends to prevent accidents. A clean and orderly work environment can be achieved and maintained through ongoing housekeeping efforts undertaken by personnel at all levels. Project managers shall initiate participation in housekeeping activities and good work habits, not only at the end of a work assignment, but throughout the evolution of the project.

- To achieve these benefits, the team shall plan the location of equipment and storage facilities to allow the easy flow of personnel, equipment, materials, fire hazards, and to prevent the obstruction of evacuation, fire fighting, or rescue activities.

- Store materials in a manner that facilitates access of material handling equipment and personnel handling limitations. Lack of sufficient workspace and storage capacity leads to the potential for accidents and decreases efficiency.

- Avoid storage of flammable liquids, such as paints and thinners unless they are required for specific project needs. If needed, such storage shall be within a metal storage cabinet that has been labeled and approved for the storage of flammable liquids.

- Continuously maintain work areas in a neat and orderly manner.

- Containers should be provided for the collection of waste, trash, and other non-hazardous refuse. Investigation-derived waste and other waste materials that are potentially hazardous should be stored and labeled in accordance with project specific procedures that meet regulatory and client requirements.

- Deploy leads, hoses, and extension cords so they do not present tripping hazards, and are not subject to contact with moisture or physical stress. Where possible they should be hung overhead with non-conductive material and kept away from walkways, doors, stairs, and ladders.

- Protect protruding rebar and anchor bolts and conspicuously mark them.

- Clean small spills that create slip hazards and or flammability hazards immediately and not leave them unattended.

- Keep walkways, aisles, stairways, and passageways in a clear and unobstructed condition.

- Prohibit eating and drinking in work areas where there is potential exposure to toxic or hazardous materials. Smoking is limited to designated smoking areas where there is no such exposure.

16.20 Hazardous Waste Site Controls

Work sites designated as Hazardous Waste Sites must control access to the work area to only authorized personnel and conform to general work practices expected at hazardous waste site operations as required by the OSHA Standard for Hazardous Waste Operations, 29 CFR 1910.120. The following concepts should be reflected in the health and safety plan for the project.

16.20.1 Access Control

Controlled access to hazardous waste site work areas is required to protect personnel working on the site as well as to limit the potential for transporting contaminants off site. Depending on the size of the work site, hazards and contaminants present, and complexity of the work, access control may range from verbally cautioning non-authorized personnel to stay away from the work area, to a program including site security, signs, or formal sign in and sign out procedures. Details of site-specific access control procedures should be included in the site-specific health and safety plan. Some general work practices for access control are noted below:

For small-scale site investigations that are short-term projects (i.e. days not weeks or months), identify a work area to the work crew and keep persons not associated with the job site out of the work area. If the site is in an area where non-authorized persons are likely to be encountered, traffic cones, caution tape, and signs identifying the area as a controlled access area may be used.

For more extensive projects where work may be done for weeks or longer, the team the should deploy more extensive access controls. They should:

- Set up physical barriers and hire security personnel to prevent non-authorized persons from entering the work site.
- Keep the number of personnel and equipment on site to the minimum required to do the project effectively and safely.
- Establish work zones within the site,(see the next section- work zones).
- Establish controlled access points to be used by authorized personnel.
- Track the entry and exit of personnel through a check-in, checkout system.
- Establish a formal decontamination corridor from exclusion zones.

16.20.2 Work Zones

Field project managers, working under health and safety plans for hazardous waste operations are required to establish work zones to prevent or reduce the spread of site contaminants to non-contaminated areas on or off site. Movement between zones should be restricted to those that need access to a specific area, and entry and exit between zones should be through designated access control points. A description of the three work-zone system for hazardous wastes is provided below.

Exclusion Zone – The exclusion zone should include any area where contamination is known or suspected. Areas of air, water, or soil that are contaminated with hazardous

materials (biohazards, radioactive materials, chemicals) should be included in the exclusion zone. The zone should be well known to site workers. On smaller projects, this can be a verbal identification to site workers, such as "A 20-foot radius around the drill rig". On larger projects, or in areas that may be encountered by observers or the general public, the zone may need to be defined with caution tape, traffic cones or in some instances, fencing and barriers. The need will be site specific and the specific method should be identified in the site-specific health and safety plan. Some work practices that should be followed in the exclusion zone include:

- Employees in the exclusion zone must wear the PPE designated in the site health and safety plan for tasks executed within the zone.
- No eating, drinking, chewing gum or tobacco, smoking, application of cosmetics, including application of lip balm, sunscreen, or insect repellant is allowed in the exclusion zone.
- Sitting or kneeling in areas of high concentrations of contaminants should be avoided.
- If any PPE becomes defective, the employee should leave the work area via the designated egress area, decontaminate as needed, and replace the defective PPE before returning to work in the exclusion zone.
- Prescription drugs should not be used within the exclusion zone unless approved by CDM's medical consultant. The use of illegal drugs or consumption of alcohol is prohibited.
- When leaving the exclusion zone, employees should exit via the designated access/egress point(s) and follow decontamination procedures described in the site health and safety plan.

Contaminant Reduction Zone (CRZ)– A CRZ is established to provide a transition between the exclusion zone and the support zone. The CRZ is set up at the access control points of the exclusion zone and will vary in size depending on the complexity of activities that need to occur within the zone. For small site investigations, the CRZ may simply be a designated area near containers set up to collect used disposable PPE and some soap and water. For larger projects, the CRZ may include specific decontamination points and be staffed by personnel specifically designated to participate in the decontamination of personnel and equipment exiting the exclusion zone. Depending on the site contaminants, level of contamination, and decontamination procedures, personnel in the CRZ may be required to wear protective clothing, gloves, or respirators. The specific requirements will be outlined in the site health and safety plan. The CRZ should be placed in an area that is not contaminated at the boundary of the exclusion zone.

Support Zone – The support zone is established near the entrance to the site and is far enough from the exclusion zone and CRZ that specialized protective clothing or respirators are not used. The use of normal field PPE such as hard hats, safety glasses, and safety work boots is expected except for areas such as office trailers, break and lunch areas, or other areas designated as having no known or anticipated hazards. Operational support activities and equipment storage and maintenance areas are located

in the support zone. No equipment or personnel should go from the exclusion zone to the support zone without passing through the CRZ and being decontaminated in accordance with the site health and safety plan.

Mobile Work Zone – For those projects that involve brief periods of work in multiple locations, a specific area may be designated as the exclusion zone for the duration of the work performed in that area. The exclusion zone can be terminated (provided there are no ongoing hazards or potential exposures to contaminants) and moved to the next area of work. For example, during soil borings or well installation, the exclusion zone can be defined as, "1.5 times the mast height" of the drill rig. Once the boring has been closed, or well installed and secured, and all drill cuttings have been secured, the area can be opened up and a new exclusion zone established around the next boring location.

16.20.3 Considerations When Establishing Work Zones

Work zones should be large enough to perform tasks within the zone safely, with no exposure to hazards to personnel outside the zone, but they should also be small enough to be able to secure and control access. Some considerations in establishing work zones include:

- Physical and topographical features of the site.
- Dimensions of the contaminated area.
- Weather.
- Physical, chemical, and toxicological characteristics of contaminants and chemicals used in the zone.
- Potential for exposure to site contaminants.
- Known and estimated concentrations of contaminants.
- Air dispersion of contaminants.
- Fire and explosion potential.
- Planned operations and space needed to perform the work safely.
- Surrounding areas.
- Decontamination procedures.
- History of job site.

16.20.4 General Hazardous Waste Site Work Practices

- **Buddy System -** Work should be scheduled so that no person works unobserved within the exclusion zone at any time. Each worker within the exclusion zone should maintain visual contact with at least one other worker on the site. All site personnel should remain aware of each other and monitor each other's condition.

- **Eating, drinking, chewing gum or tobacco, and smoking** - are prohibited within the contaminant reduction and exclusion zones. (Exception for heat stress: Squirt bottles of water, Gatorade, or other fluids may be consumed via squirt bottles in the

contaminant reduction zone with the approval of the health and safety manager. Open bottles, cups, etc. should not be permitted.)

- Sitting or kneeling should be avoided in areas of known or suspected areas of contamination.
- Hands and face should be thoroughly washed when leaving the work area.
- Defective PPE should be repaired or replaced immediately.

Sections 5,6, 7, 9, and 11 of this manual are particularly in applicable to health and safety at hazardous waste sites.

General-Vehicle -motor vehicle operation (all types on roadways)

Hazard Types (unmitigated ranking H-High, M-Medium, L-Low):

Biological	-	Chemical	-	Driving	M	Electrical	-
Environmental	-	Gravity	-	Mechanical	-	Motion	-
Personal Safety	-	Pressure	-	Radiation	-	Sound	-

Overall Unmitigated Risk: Medium Mitigated Risk: Low if utilizing:
Primary Controls: TRACK Smith System (on line) Inspections

Secondary Controls: JSAs Admin. Controls

Hazardous Activity #2

Groundwater monitoring - water level measurements & collection of groundwater samples

Hazard Types (unmitigated ranking H-High, M-Medium, L-Low):

Biological	-	Chemical	-	Driving	L	Electrical	L
Environmental	L	Gravity	-	Mechanical	-	Motion	L
Personal Safety	L	Pressure	-	Radiation	-	Sound	L

Overall Unmitigated Risk: Low Mitigated Risk: Low if utilizing:
Primary Controls: TRACK Smith System (on line)
Secondary Controls: JSAs Admin. Controls

Hazardous Activity #3

Field-Ambient environment - exposure heat, cold, sun, weather, etc

Hazard Types (unmitigated ranking H-High, M-Medium, L-Low):

Biological	-	Chemical	-	Driving	M	Electrical	L
Environmental	L	Gravity	H	Mechanical	-	Motion	L
Personal Safety	M	Pressure	-	Radiation	-	Sound	-

Overall Unmitigated Risk: Medium Mitigated Risk: Medium if utilizing:
Primary Controls: TRACK PPE (see HASP "PPE" section) Field H&S Handbook

Secondary Controls: H&S Standards Engineering Controls Admin. Controls Specialized Equipment

Hazardous Activity #4

Field-Railroad - work in the vicinity of moving trains (non-rail yard inspection and field activities)

Hazard Types (unmitigated ranking H-High, M-Medium, L-Low):

Biological	-	Chemical	-	Driving	M	Electrical	-
Environmental	-	Gravity	M	Mechanical	H	Motion	H
Personal Safety	H	Pressure	-	Radiation	-	Sound	L

Overall Unmitigated Risk: High Mitigated Risk: Medium if utilizing:
Primary Controls: TRACK Client Training/Briefing On Track Safety Training Specialized Checklist/Forms eRailsafe PPE (see HASP "PPE" section)

Secondary Controls: JSAs HASP Job Briefing/Site Awareness Cont/Emerg. Planning Engineering Controls Admin. Controls PPE (see HASP "PPE" section) Specialized Equipment Inspections H&S Standards

Risk Assessment Matrix		Likelihood Ratings** (likelihood that incident would occur)			
Consequences Ratings*		A	B	C	D
People	Property	0 Almost impossible	1 Possible but unlikely	2 Likely to happen	3 Almost certain to happen
1 - Slight or no health	Slight or no damage	0 - Low	1 - Low	2 - Low	3 - Low
2 - Minor health effect	Minor damage	0 - Low	2 - Low	4 - Medium	6 - Medium
3 - Major health effect	Local damage	0 - Low	3 - Low	6 - Medium	9 - High
4 - Fatalities	Major damage	0 - Low.	4 - Medium.	8 - High	12 - High

Task 2: Groundwater Monitoring (water level measurement and collecting groundwater samples)

Hazardous Activity #1

Chemical -Carcinogens - exposure to these materials

Hazard Types (unmitigated ranking H-High, M-Medium, L-Low):

Biological	-	Chemical	L	Driving	-	Electrical	-
Environmental	-	Gravity	-	Mechanical	-	Motion	-
Personal Safety	-	Pressure	-	Radiation	-	Sound	-

Overall Unmitigated Risk: Low Mitigated Risk: Low if utilizing:

Primary Controls: TRACK HASP Engineering Controls PPE (see HASP "PPE" section)

Secondary Controls: Job Briefing/Site Awareness Hazcom Training MSDS (see also HASP Hazcom section) Client Training/Briefing Specialized Equipment

Hazardous Activity #2

Field-Measurement - water levels and well sounding

Hazard Types (unmitigated ranking H-High, M-Medium, L-Low):

Biological	-	Chemical	L	Driving	-	Electrical	-
Environmental	-	Gravity	L	Mechanical	-	Motion	M
Personal Safety	-	Pressure	-	Radiation	-	Sound	-

Overall Unmitigated Risk: Low Mitigated Risk: Low if utilizing:

Primary Controls: TRACK JSAs PPE (see HASP "PPE" section)

Secondary Controls: Job Briefing/Site Awareness

Hazardous Activity #3

Field-Sampling - monitoring well sampling - manual (bailer, check valve)

Hazard Types (unmitigated ranking H-High, M-Medium, L-Low):

Biological	-	Chemical	L	Driving	-	Electrical	-
Environmental	-	Gravity	L	Mechanical	-	Motion	M
Personal Safety	-	Pressure	-	Radiation	-	Sound	-

Overall Unmitigated Risk: Low Mitigated Risk: Low if utilizing:

Primary Controls: TRACK JSAs Engineering Controls Job Rotation PPE (see HASP "PPE" section)

Secondary Controls: Job Briefing/Site Awareness Admin. Controls

Hazardous Activity #4

Field-Sampling - sample cooler preparation

Hazard Types (unmitigated ranking H-High, M-Medium, L-Low):

Biological	-	Chemical	M	Driving	-	Electrical	-
Environmental	-	Gravity	M	Mechanical	L	Motion	L
Personal Safety	M	Pressure	-	Radiation	-	Sound	-

Overall Unmitigated Risk: Medium Mitigated Risk: Low if utilizing:

Primary Controls: TRACK JSAs Engineering Controls PPE (see HASP "PPE" section) See HASP "Monitoring" section

Secondary Controls: Job Briefing/Site Awareness Admin. Controls Work Plan

Hazard Communication (HazCom)/Global Harmonization System (GHS)

☐ HAZCOM/GHS for this project is managed by the client or general contractor

*List the chemicals anticipated to be used by **ARCADIS** on this project per HazCom/GHS requirements.*
(Modify quantities as needed)

	Acids/Bases	Qty
☐	Not applicable	
☑	Hydrochloric acid	<500 ml
☑	Nitric acid	<500 ml
☐	Sulfuric acid	<500 ml
☐	Sodium hydroxide	<500 ml
☐	Zinc acetate	<500 ml
☐	Ascorbic acid	<500 ml
☐	Acetic acid	<500 ml
☐	Other:	
	_____

Material safety data sheets (MSDSs)/Safety Data Sheets (SDSs) must be available to field staff.
Indicate below how MSDS information will be provided:

☐ Not applicable
☐ Printed copy in company vehicle
☐ Printed copy in the project trailer/office
☑ Printed copy attached
☐ Electronic copy on field computer

☐ Contractor MSDSs/SDSs are not applicable
☐ Contractor MSDSs/SDSs are attached
☐ Contractor MSDSs/SDSs will be on site and located: _____

☐ Bulk quantities of the following materials will be stored: _____

Contact the project H&S contact for information in determining code and regulatory requirements associated with bulk storage of materials.

Monitoring

☑ Chemical air monitoring is not required for this project.

For projects requiring air monitoring, list the relevant constituents representing a hazard to site workers.

Constituent	Max. Conc.	Units	TWA	Units	STEL	Units	IDLH	Units	LEL/UEL (%)	VD Air=1	VP (mm Hg)	IP (eV)
None			9999	-	0	-	0	-	0	0	0	0
None			9999	-	0	-	0	-	0	0	0	0
None			9999	-	0	-	0	-	0	0	0	0
None			9999	-	0	-	0	-	0	0	0	0
None			9999	-	0	-	0	-	0	0	0	0
None			9999	-	0	-	0	-	0	0	0	0

Notes: TWAs are ACGIH 8 hr-TLVs unless noted.

p-ppm m-mg/m3
s- skin c-ceiling
r- resipirable i-inhalable

c2- ceiling (2 hr) se-sensitizer
"9999" - NA O-OSHA PEL
N-NIOSH 10 hr REL

"#N/A" -Constituent is not in database, manually enter information

Monitoring Equipment and General Protocols

Air monitoring is required for any task or activity where employees have potential exposure to vapors or particulates above the TWA. Action levels below are appropriate for most situations. Contact the project H&S contact for all stop work situations. Select monitoring frequency and instruments to be used.

Monitoring Frequency:

Indicator Tube/Chip Frequency: Indicator tube/chip monitoring not required

	Instrument	Action Levels			Actions
☐	Photoionization Detector Lamp (eV):		<	0.000	Continue work
		0.000	-	0.0	Sustained >5 min. continuous monitor, review eng. controls and PPE, proceed with caution
			>	0.0	Sustained >5 min. stop work, contact SSO
☐	Flame Ionization Detector (FID)		<	0.0	Continue work
		0.0	-	0.0	Sustained >5 min. continuous monitor, review eng. controls and PPE, use caution
			>	0.0	Sustained >5 min. stop work, contact SSO
☐	LEL/O2 Meter	0-5% LEL			Continue work
		>5-10% LEL			Continuous monitor, review eng. controls, proceed with caution
		>10% LEL			Stop work, evacuate, contact SSO
		19.5%-23.5% O2			Normal, continue work
		<19.5% O2			O2 deficient, stop work, evacuate, cont. SSO
		>23.5% O2			O2 enriched, stop work, evacuate, contact SSO
☐	Indicator: ☐tube ☐hip	≤PEL/TLV			Continue work
		>PEL/TLV			Stop work, review eng. controls and PPE, contact SSO
	Compound(s):				
☐	Particulate Monitor (mists, aerosols, dusts in mg/m^3)		<	2.5	Continue work
		2.5	-	5.00	Use engineering controls, monitor continuously
			>	5.00	Stop work, review controls, contact SSO
☐	Other:	Specify:			Specify:

Personal Protective Equipment (PPE)

See JSA for the task being performed for PPE requirements *. If the work is not conducted under a JSA, refer to the governing document for PPE requirements. At a minimum, the following checked PPE is required for* <u>*all tasks during field work*</u> *not covered by a JSA on this project:*

Level D or Level D Modified:

							Specify Type:
☑	Hard hat	☐	Snake chaps/guards	☐	Coveralls:		
☑	Safety glasses	☐	Briar chaps	☐	Apron:		
☐	Safety goggles	☐	Chainsaw chaps	☐	Chem. resistant gloves:		
☐	Face shield	☐	Sturdy boot	☑	Gloves other:		nitrile
☐	Hearing protection	☑	Steel toe boot	☐	Chemical boot:		
☐	Rain suit	☐	Metatarsal boot	☐	Boot other:		
☐	Other:			☑	Traffic vest:		
				☐	Life vest:		

Task specific PPE:

Comments:

Medical Surveillance (*check all that apply*)

☐ Medical Surveillance is not required for this project.
☑ HAZWOPER medical surveillance applies to all ARCADIS site workers on the project.
☐ HAZWOPER medical surveillance applies to all subcontractors on the project.
☐ HAZWOPER medical surveillance applies to all site workers on the project except:

☐ Other medical surveillance required (describe type and who is required to participate):

☐ Client drug and/or alcohol testing required.

Hazardous Materials Shipping and Transportation (*check all that apply*)

☐ Not applicable, no materials requiring a Shipping Determination will be transported or shipped
☐ A Shipping Determination has been reviewed and provided to field staff
☐ A Shipping Determination is attached
☑ All HazMat will be transported under Materials of Trade by ARCADIS
☐ Other (specify):

Roadway Work Zone Safety (*check all that apply*)

☐ Not applicable for this project
☐ All or portions of the work conducted under a TCP
☐ All or portions of the work conducted under a STAR Plan
☐ TCP or STAR Plan provided to field staff
☑ TCP or STAR Plan attached
☐ Other (specify):

ARCADIS Commercial Motor Vehicles (CMVs)

This section is applicable to ARCADIS operated vehicles only

☑ This project will **not** utilize CMV drivers
☐ This project will utilize CMV drivers

Site Control (*check all that apply*)

- [x] Not applicable for this project.
- [ ] Site control protocols are addressed in JSA or other supporting document (attach)
- [ ] Maintain an exclusion zone of _____ ft. around the active work area
- [ ] Site control is integrated into the STAR Plan or TCP for the project
- [ ] Level C site control - refer to Level C Supplement attached
- [ ] Other (specify):

Decontamination (*check all that apply*)

- [ ] Not applicable for this project.
- [ ] Decontamination protocols are addressed in JSA or other governing document (attach)
- [x] Level D work- wash hands and face prior to consuming food, drink or tobacco.
- [ ] Level D Modified work- remove coveralls and contain, wash hands and face prior to consuming food, drink or tobacco. Ensure footwear is clean of site contaminants
- [ ] Level C work - refer to the Level C supplement attached.
- [ ] Other (specify):

Sanitation *(check all that apply)*

- [x] Mobile operation with access to off-site restrooms and potable water
- [ ] Restroom facilities on site provided by client or other contractor
- [ ] Project to provide portable toilets (1 per 20 workers)
- [ ] Potable water available on site
- [ ] Project to provide potable water (assume 1 gal./person/day)
- [ ] Project requires running water (hot and cold, or tepid) with soap and paper towels

Safety Briefings (*check all that apply*)

- [x] Safety briefing required daily
- [ ] Safety briefing required twice a day
- [ ] Safety briefings required at the following frequency: _____
- [x] Subcontractors to participate in ARCADIS safety briefings
- [x] ARCADIS to participate in client/contractor safety briefings
- [ ] Other (specify):

Safety Equipment and Supplies

***Safety equipment/supply requirements are addressed in the JSA for the task being performed**. If work is not performed under a JSA, the following safety equipment is required to be present on site in good condition (Check all that apply):*

- [x] First aid kit
- [ ] Bloodborne pathogens kit
- [x] Fire extinguisher
- [ ] Eyewash (ANSI compliant)
- [x] Eyewash (bottle)
- [x] Drinking water
- [ ] Other: _____
- [x] Insect repellent
- [x] Sunscreen
- [ ] Air horn
- [x] Traffic cones
- [ ] 2-way radios
- [ ] Heat stress monitor

H&S Program (*check all that apply*)

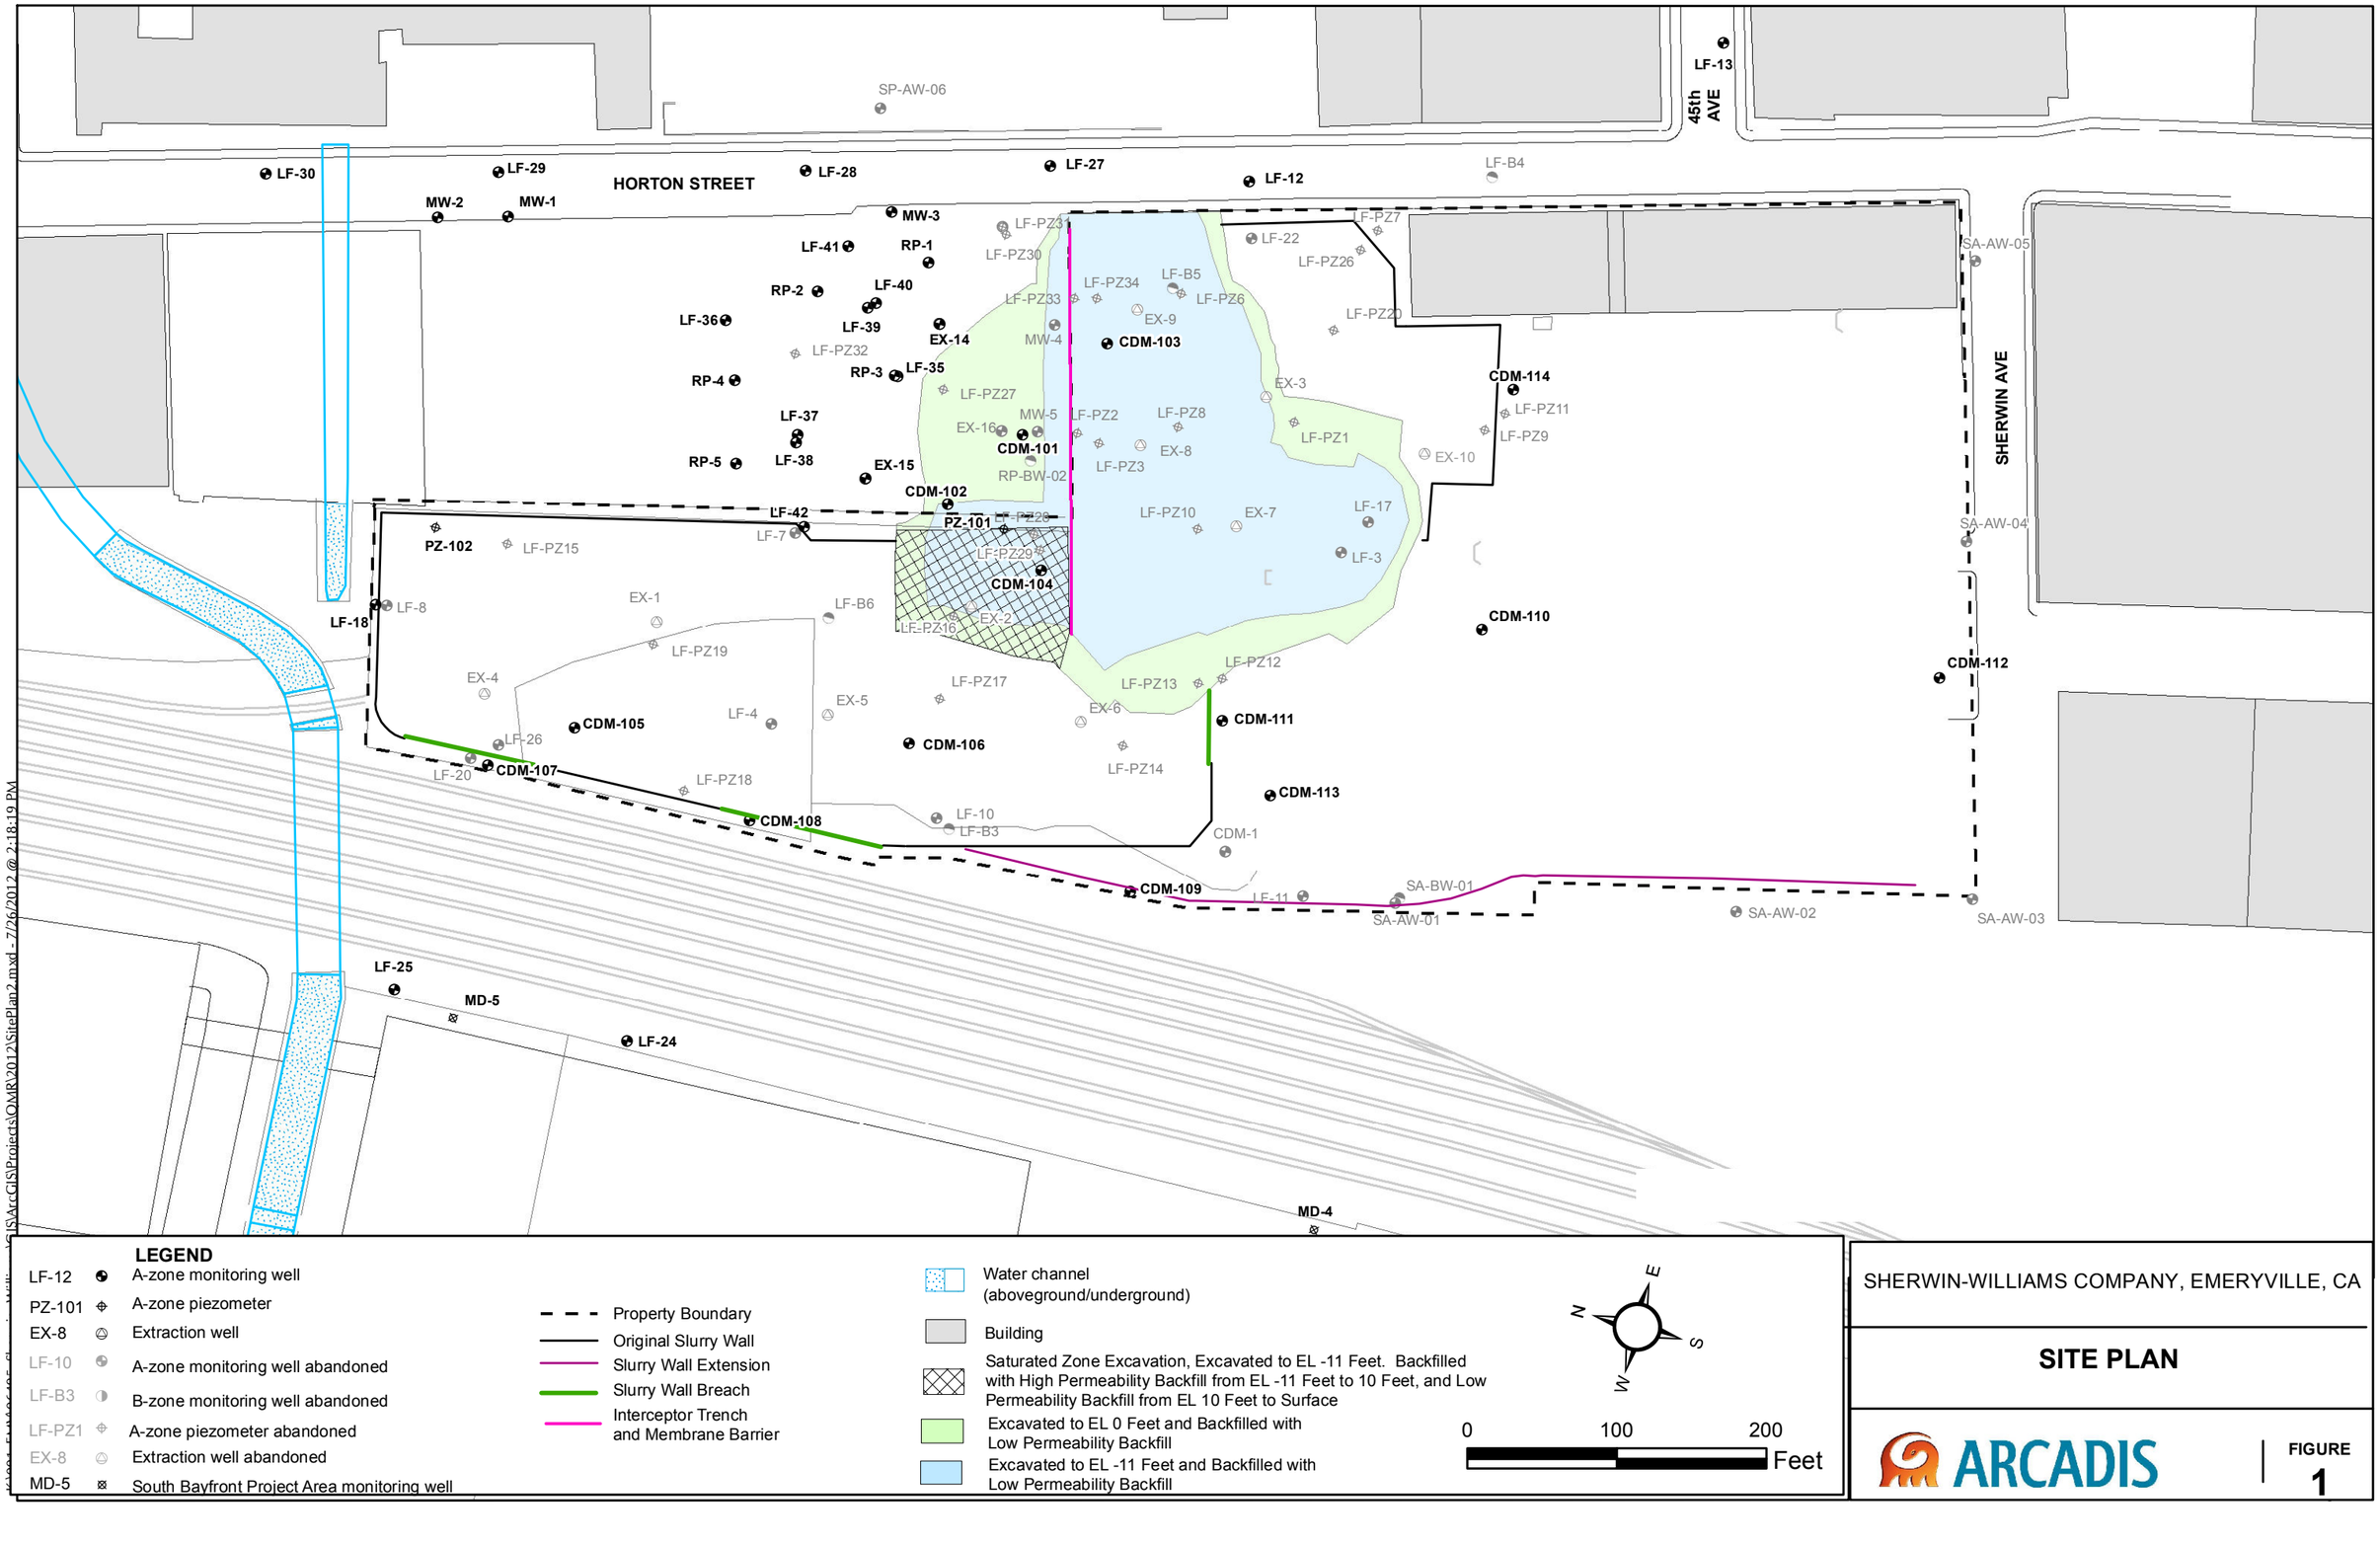
- ☐ H&S metrics are provided on the account level, refer to account guidance
- ☑ TIP required at the following frequency on this project:
  Select One: _____ mhrs _____ time(s) _____ Define: 1 per quarter
- ☐ H&S Field Assessment required at the following frequency on this project:
  Select One: _____ mhrs _____ time(s) _____ Define: _____
- ☐ Other (specify):

List tasks anticipated for TIP activity:

TIP will be performed during groundwater
Groundwater monitoring activities

Signatures

I have read, understand and agree to abide by the requirements presented in this health and safety plan. I understand that I have the absolute right to stop work if I recognize an unsafe condition affecting my work until corrected.



Printed Name	Signature	Date

Add additional sheets if necessary

- ☐ Subcontractor Acknowledgement Form attached

You have an absolute right to STOP WORK if unsafe conditions exist!

ARCADIS

HASP Addendum Page

This form should be completed for new tasks associated with the project. The project manager and/or task manager should revise the Project Hazard Analysis Worksheet with the new task information and attach to this addendum sheet. JLAs should be developed for any new tasks and attached as well.

Review the addendum with all site staff, including subcontractors, during the daily tailgate briefing, and complete the tailgate briefing form as required. Attach a copy of the addendum to all copies of the HASP including the site copy, and log in the Addendum Log Table A-1 on the next page.

Addendum Number: 2012 Revision 1 Project Number: EM002616

Date of Changed Conditions: 11/19/12 Date of Addendum: 11/19/12

Description of Change that Results in Modifications to HASP:

Update to new ARCADIS template. Groundwater extraction and treatment system no longer in operation

Signed: _____ Project Manager

Signed: _____ Site Safety Officer

Signed: _____ H&S Plan Writer

Signed: _____ H&S Plan Reviewer

Project Health & Safety Pre-Planning Form

This form will assist a project or task manager in the proper, proactive planning for H&S on a project or job task level. It can be used during the proposal stage of a project and during the pre-planning after project award. This does not take the place of a project HASP but can be used to help determine the contents of the project HASP.

Project Name:		Project Number:	Project Location:
Sherwin Williams Periodic Groundwater monitoring		EM002616	Emeryville, CA
Date:	**Duration:**	**Completed by:**	**Assisted by** (consult others when completing this form)**:**

Think through the Tasks — TRACKing Project Planning

List the major jobs or activities for the project:

1 Water level measurements
2 collection of groundwater samples
3
4
5
6

Think through the Tasks — Other Hazardous Activities

☐ Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations

If there are none, write "None" here:

If yes, describe them here:

How could they be controlled?

Prework Authorization - check activities to be conducted that may require permit issuance or completion of a checklist or similar before work begins:

		Doc #			Doc #			Doc #
X	Not applicable		☐	Working at Height		☐	Confined Space	
☐	Energy Isolation (LOTO)		☐	Excavation/Trenching		☐	Hot Work	
☐	Mechanical Lifting Ops		☐	Overhead & Buried Utilities		☐	Other (may be client required)	

Consider the following (to help with appropriately and adequately resourcing the project)

☐ What level of HASP will be needed?	☐ Any unique H&S issues?	☐ Understand client requirements?
☐ Have subcontractors been qualified?	☐ Level of H&S support needed?	☐ Will we use subcontractors?
☐ Lessons learned from other jobs?	☐ Training Requirements?	☐ Audits and assessments budgeted?
		☐ Travel-related Issues / International?

Comments:

Recognize the hazards

Assess the Risks

Low, **M**edium, **H**igh - Use the drop down menu in the box to identify & rank risks applicable to the project. Examples are provided.

L Gravity (i.e., ladder, scaffold, trips)	M Motion (i.e., traffic, moving water) medium	L Mechanical (i.e., augers, motors)
L Electrical (i.e., utilities, lightning)	L Pressure (i.e., gas cylinders, wells)	L Environment (i.e., heat, cold, ice)
L Chemical (i.e., fuel, acid, paint)	L Biological (i.e., ticks, poison ivy)	L Radiation (i.e., alpha, sun, laser)
L Sound (i.e., machinery, generators)	L Personal (i.e. alone, night, not fit)	M Driving (i.e. car, ATV, boat, dozer)

Continue TRACK Process on Page 2

Control the hazards

Check all and discuss those methods to control the hazards to be considered for the project: Review the Hazard Assessment and previous work similar to this project. Discuss any additional control processes that should be considered.

[ ] Elimination	[ ] Substitution	[ ] Isolation
[ ] Engineering controls	[ ] Worker Rotation	[X] Exposure Monitoring
[ ] General PPE Usage	[ ] Hearing Conservation	[ ] Respiratory Protection
[X] Personal Hygiene	[X] Exposure Guidelines	[X] Decon Procedures
[ ] Emergency Action Plan (EAP)	[X] Fall Protection	[ ] Work Zones/Site Control
[ ] JLA to be developed/used ***(specify)***	[ ] LPOs	[X] Traffic Control
[ ] Training (see below)	[ ] Utility Clearance	[ ] Site Monitors
[X] Medical Surveillance (see below)	[ ] Work/Rest Regimes	[ ] Other ***(specify)***

Control the hazards — Training Requirements and Needs

Check what training is required for completion of the project. Consider the hazards to be encountered and whether ARCADIS staff or subcontractor staff will do the work. The H&S Training matrix found on the Training Center site will assist in this.

[X] Smith Hands-On	[ ] Full LPS	[ ] Client-Specific
[X] 40 Hour HazWoper	[ ] 24 Hour HazWoper	[ ] HazWoper Site Supervisor
[ ] 10 Hour OSHA Construction	[ ] 30 Hour OSHA Construction	[ ] Respiratory Protection
[X] PPE	[ ] Hazard Communication	[ ] RCRA
[X] First Aid/CPR	[ ] DOT/IATA Haz Mat	[ ] MSHA
[X] FRA / Railroad / eRailsafe	[ ] Bloodborne Pathogen	[ ] Confined Space (Awareness or Entry)
[ ] Lockout/Tagout (Hazardous Energy)	[ ] Utility Clearance	[ ] Electrical / Arc Flash
[X] Fire Extinguisher	[ ] Heat and Cold Stress	[ ] Fall Protection
[ ] Noise / Hear Conservation	[ ] Forklifts	[ ] Asbestos
[ ] H2S	[ ] Boating and/or Water Safety	[ ] Lead
[ ] Cadmium or other toxic metals	[X] Benzene	[ ] SPCC
[ ] Process Safety Management	[ ] Radiation Safety	[ ] Troxler / Nuclear Density Gauges
[ ] Other (Specify)	[ ] Other (Specify)	[ ] Other (Specify)

Control the hazards — Medical Surveillance Requiremants and Needs

Check what medical surveillance is required for completion of the project. Consider the hazards to be encountered and whether ARCADIS staff or subcontractor staff will do the work. The H&S group and WorkCare can assist in this determination.

[X] HazWoper Medical Exam	[ ] Respirator-related exam if not	[ ] Client-Specific
[ ] Drug and Alcohol (client-required)	[ ] Hearing test	[ ] Vaccinations to travel
[ ] Hepatitis B if providing 1st Aid/CPR	[ ] Other (Specify)	[ ] Other (Specify)

Control the hazards — Additional Comments about controlling the hazards on this project

Post Project Activities Review - Review at end of project (Check those applicable and explain:)

- [ ] Lessons learned / best practices learned: _____
- [ ] Incidents that occurred : _____
- [ ] Stop Work interventions? _____
- [ ] Corrective/Preventive Actions needed for future work: _____
- [ ] Any other H&S issues: _____

Keep H&S 1st in all things — Remember to Share any Lessons Learned through H&S Moments or Safety Shares

ARCADIS

Document Control Number:TGM - _____

TGM + *project number plus date as follows: xxxxxxxx.xxxx.xxxxx - dd/mm/year*

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name:			**Project Location:**
Date:	**Time:**	**Conducted by:**	**Signature/Title:**
Client:		**Client Contact:**	**Subcontractor companies:**

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 _____ 3 _____ 5 _____

2 _____ 4 _____ 6 _____

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations ☐ If there are none, write "None" here: _____

If yes, describe them here: _____

How will they be controlled? _____

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☐ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☐ Excavation/Trenching		☐ Hot Work	
☐ Mechanical Lifting Ops		☐ Overhead & Buried Utilities		☐ Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

☐ Incidents from day before to review?	☐ Lessons learned from the day before?	☐ Any Stop Work Interventions yesterday?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ If deviations, notify PM & client
☐ JLAs or procedures are available?	☐ Field teams to "dirty" JLAs, as needed?	☐ All equipment checked & OK?
☐ Staff has appropriate PPE?	☐ Staff knows Emergency Plan (EAP)?	☐ Staff knows gathering points?

Comments: _____

Recognize the hazards (check all those that are discussed) (Examples are provided) and **Assess** the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

☐ Gravity (i.e., ladder, scaffold, trips) (L M H)	☐ Motion (i.e., traffic, moving water) (L M H)	☐ Mechanical (i.e., augers, motors) (L M H)
☐ Electrical (i.e., utilities, lightning) (L M H)	☐ Pressure (i.e., gas cylinders, wells) (L M H)	☐ Environment (i.e., heat, cold, ice) (L M H)
☐ Chemical (i.e., fuel, acid, paint) (L M H)	☐ Biological (i.e., ticks, poison ivy) (L M H)	☐ Radiation (i.e., alpha, sun, laser) (L M H)
☐ Sound (i.e., machinery, generators) (L M H)	☐ Personal (i.e. alone, night, not fit) (L M H)	☐ Driving (i.e. car, ATV, boat, dozer) (L M H)

Continue TRACK Process on Page 2

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JLAs, and other control processes. Discuss and document any additional control processes.

☒	**STOP WORK AUTHORITY** (Must be addressed in every Tailgate meeting - (*See statements below*)

Signature and Certification Section - Site Staff and Visitors

Name/Company/Signature	Initial & Sign in Time	Initial & Sign out Time	I have read and understand the

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.800.455.6155 and then notify the field supervisor who will, in turn, notify Corp H&S at 1.720.344.3844.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify Corp H&S at 1.720.344.3844 and then Corp Legal at 1.720.344.3756.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify Corp Legal at 1.678.373.9556 and Corp H&S at

Visitor Name/Co - not involved in work

In	Out
In	Out
In	Out

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

HAZARDOUS MATERIALS SHIPPING/TRANSPORTATION DETERMINATION FORM

Materials of Trade Template for use with the Standard HASP 8/10/2012

Date:	11/19/2012
Project Name:	Sherwin Williams
Project Number:	EM002616
Supplemental Information:	MSDS

Description of the Material to be Transported or Shipped:

Checked materials in the *HAZCOM* worksheet, *Monitoring* worksheet, *Safety Supplies and Equipment* section and *Level C Supplement* (if applicable) of the standard HASP for this project will be transported under the Materials of Trade Exception (49 CFR 143.6) in ARCADIS owned, leased or rented vehicles or vendor vehicles.

Special Instructions:

1) All containers will be maintained in an upright condition with lids or other openings secure. Containers will be protected against movement during transport and have adequate cushioning for protection
2) Cylinders will have valves removed during transport.
3) Batteries regardless of type or size, will have terminal protected and each battery will be protected from crushing, pressure or other condition that may affect the integrity of the battery.
4) Fire extinguishers will be mounted and secure in company owned or leased vehicles.

Limitations

1) No more than 440 pounds (combined gross weight) of materials subject to this shipping determination are permitted on a transport vehicle and individual container limits are specified in DOT Facts-108a and must not be exceeded. Gasoline, if transported, will be in metal safety cans no larger than 8 gallon capacity.
2) No more than 400 gallons of dilute Class 9 materials (<2% concentration) may be transported on a vehicle.
3) Materials that are radioactive or explosive are not eligible for MOT Exception and separate shipping determinations will be required for those materials.

References and Rationale for the Determination:

49 CFR 173.6 DOT Facts-108a
These materials are used in support of ARCADIS work.

Determination performed by: Erica Whiting

Determination QA/QC performed by: Ron Goloubow

Site Traffic Awareness and Response (STAR) Plan
Revision 1, 1/3/2011

1.0 General

Project Name:	Sherwin Williams Emeryville
Project Number:	EM002616
STAR Plan Developer Name:	Erica Whiting
Reviewed By:	Ron Goloubow
Duration of Work (hours or days):	8 hr days
Time Restrictions (describe below):	Daylight

Comments:

Day Light Savings time is in effect; Sunset is around 4:30 PM. Please plan accordingly.

2.0 Work Description

Modify the following statement as appropriate:
Site is a former paint factory and adjacent parking lot for local business. Groundwater monitoring including water level gauging and collection of groundwater samples will occur within site boundary, and adjacent Rifkin Parking lot where individuals may encounter moving cars in parking lot. Additionally, a few monitoring wells are on public streets.

☐ Work is planned on off site properties but not in the public right-of-way.

To facilitate identification of traffic controls to use, check all that apply to this project:

Short Duration Work (<1 hour)

- ☑ Water-level gauging and well sounding
- ☐ Surface soil sampling using manual methods
- ☐ Intermediate depth soil sampling using DPT
- ☑ Shallow monitor well purging and sampling
- ☐ Product recovery using manual methods
- ☐ Surveying
- ☐ Other (specify):

Intermediate Duration Work (1-8 hours)

- ☐ Intermediate/deep or > 2 in. diameter well sampling
- ☐ Slug testing and similar tests
- ☐ Deep handauger sampling (>20 ft depth)
- ☐ Manual soil sampling through concrete/asphalt
- ☐ Deep soil sampling using DPT (>40 ft depth)
- ☐ Soil sampling using other automated drilling method
- ☐ Other (specify):

Long Duration Work (>8 hours)

- ☐ Deep monitor well installation (>50 ft depth)
- ☐ Monitor wells with surface casing installation
- ☐ Intermediate depth monitor wells ≥ 4 in. diam.
- ☐ Long term product recovery using equipment
- ☐ Long term pump testing
- ☐ Other (specify):

Comments:

☐ The above documents are appropriate without significant modification and are available to field staff in the

Field Guide for Roadway Work Zone Safety.

4.0 Required Traffic Control Devices and Phasing

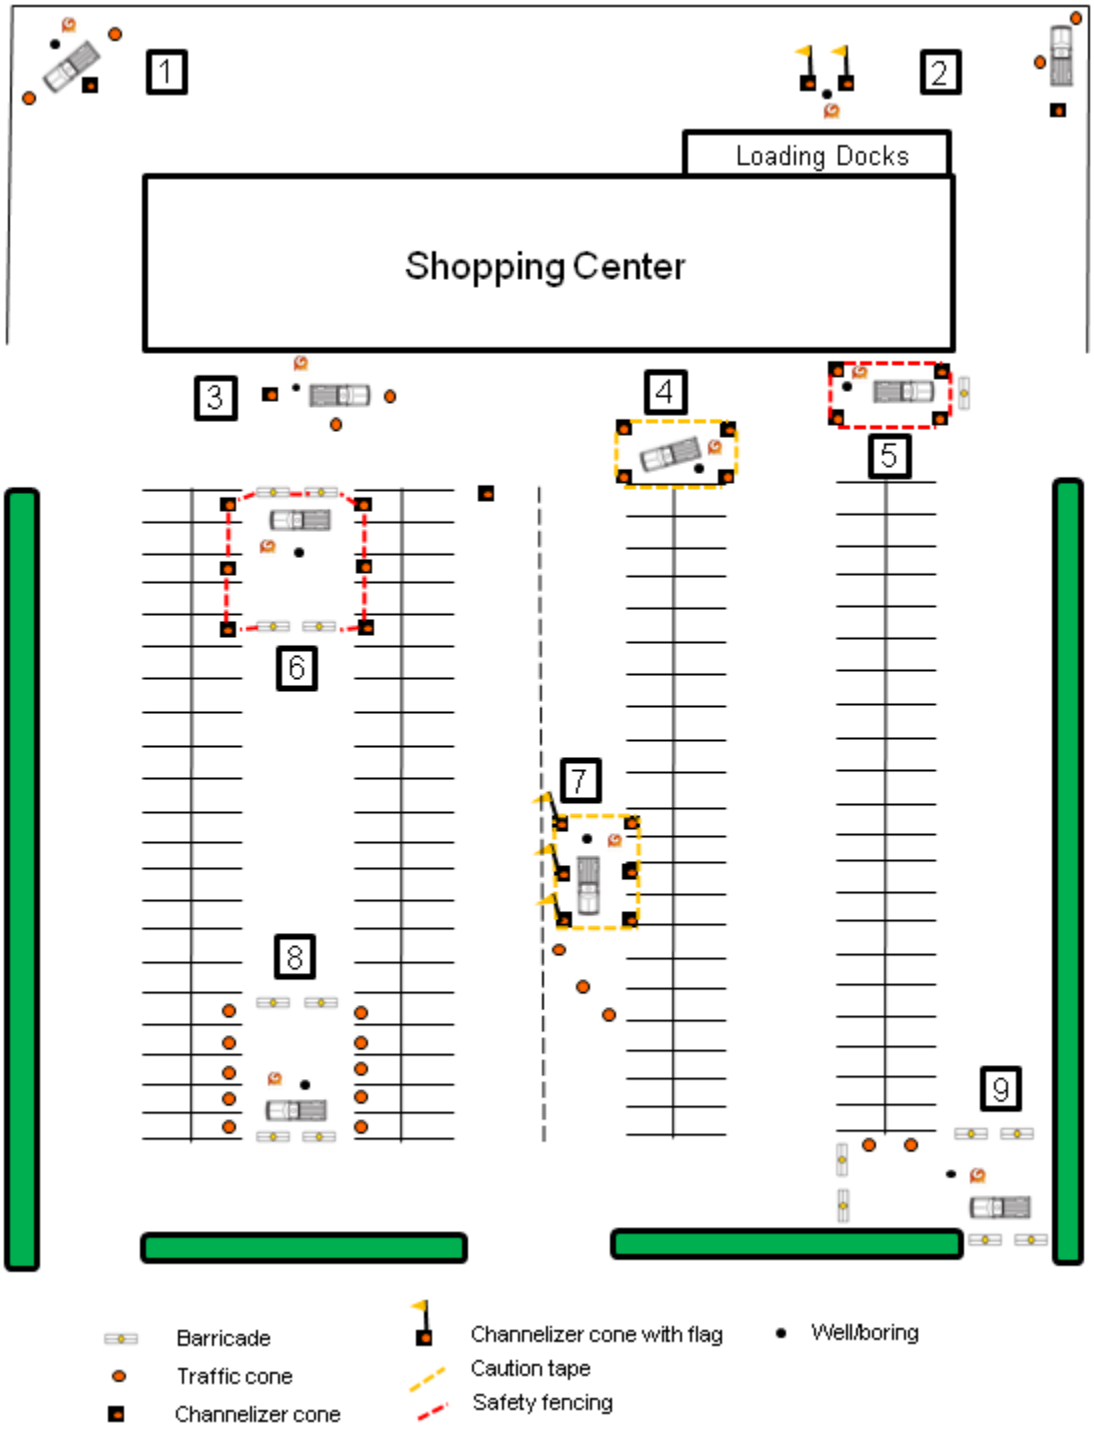
Tasks on this project may be implemented both individually or concurrently. Selection and number of traffic control devices required will be dependent on the scope of work. In all cases, a minimum of 4 x42 inch channelizer cones with flags will be available on site for any field work. Based on recommendations in DOT Fact Sheet applicable to the work being performed, indicate any additional traffic control devices for the current project below.

Traffic control device help: DOT Facts-302d

Check all that apply:	Number:
☐ Channelizer cone (42 inch height, 10 lb base)	
☐ Channelizer cone (42 inch height, 30 lb base)	
☑ Traffic cones (≥ 18 inches tall)	6
☐ Barricade ☐ Type I ☐ Type II	
☐ Flags for cones	
☐ Lights (for night work)	
☐ Plastic fencing (rolls)	
☐ Caution tape (rolls)	
☐ Other (specify): _____	

Phasing:
1) Position truck as shield, if practical
2) Deploy traffic control devices
3) Affix flags, caution tape or fencing as prescribed in fact sheet
4) Unload project equipment
5) Commence work
6) SSO to maintain controls
7) Remove controls in opposite order

☐ Additional client requirements are attached



If vehicle equipped with high intensity strobe or rotating lights, the lights should be utilized during work. If the vehicle is not equipped with supplemental lighting devices, use vehicle flashers (be aware of battery drain when using any of the lighting devices).
Personal protective equipment required for this work is listed in the applicable project Job Loss Analysis (JLA) or project specific HASP. A Class II (minimum) high visibility vest is required.

DOT Facts-302e
Recommended Best Practices for Multiple Business and Large Facility Parking Areas

The following configurations should be considered for traffic protection in retail parking areas for multiple businesses (strip malls, etc) and large facility parking lots.

Revision 1, 1/15/10

General Guidelines for Safety:

- **Use the vehicle as a shield when possible. Orient the rear of the ARCADIS vehicle away from site entrances and areas of increased backing or movement of other vehicles, when practical. Traffic cones used in scenarios above in conjunction with the parked vehicle should be consistent with the ARCADIS Cone and Spotter Program (see ARC HSGE-024 for more information)**
- **All channelizer cones shall be at least 42 inches in height**
- **Always work facing the area with greatest traffic movement and least protection**
- **Always assume vehicles will move in either direction (frontwards or backwards)**
- **Always use TRACK to predict traffic movement and stage vehicle and Control Zones in manner that offers protection without impairing site entrance or blocking access to loading docks when possible. STAR Plan requirements should be reviewed against HASP exclusion zone requirements for consistency.**
- **If there is a perceived drivable space or if there is an unused parking space, you must assume that someone will attempt to access or drive to/through the location. Plan, deploy and work accordingly. Block off parking spaces with cones during off hours to ensure no vehicles will occupy the planned work zone.**
- **Class II high visibility vest (minimum) to be worn at all times (refer to HASP or JLA for additional requirements, if any).**
- **Discuss with site operator or manager times of lower traffic volume and attempt to schedule work activity during traffic lulls. When working near dumpsters and loading docks find out when the dumpsters are emptied and avoid loading docks during planned delivery times.**
- **Warning lights shall be used for night work on both the channelizer drums and barricades, if used. Cones used during night work for taper purposes must have retroflective tape.**
- **Areas in green above may appear to be site property but may actually be within the roadway right-or way. Work performed in the right-of-way has additional requirements. See ARC DOT-301 for more information.**

Scenario Descriptions:

1) **Locations to the rear of strip malls and similar operations generally have low traffic volume and low pedestrian activities. Use the truck as a shield to the extent possible and deploy channelizer cone in direction of expected traffic exposure. This scenario may be used for short duration (< 1 hour) and intermediate duration (1-8 hours) daylight work activities. Since deliveries by larger vehicles are generally performed during night hours, long duration (>8 hours) and night time work should employ recommendations described in scenario #5 below, even in these low traffic areas.**
2) **Locations near loading docks involve large vehicle backing with limited visibility. Tight space and work zone proximity to other active operations may preclude the use of the vehicle as a shield in these areas. Work in these areas should use channelizer cones with flags to increase work zone awareness even if the vehicle is being used as a shield. When backing activities are occurring, work should be suspended and employees should leave the area until the backing operations are complete (leaving the traffic control devices in place).**
3) **Short duration work (<1 hour) in high traffic and pedestrian areas should use the vehicle as a shield with the front of the vehicle facing oncoming traffic. A channelizer cone should be deployed in the vicinity of the work zone near the ARCADIS employee's work area**
4) **Intermediate duration work (1-8 hours) in high traffic and pedestrian areas should use the vehicle as a shield with the front of the vehicle facing oncoming traffic. The work zone**

should be defined with channelizer cones (10 pound base weight recommended) and caution tape. Leave sufficient space to allow access to all areas of the vehicle.

5) **Long duration work (> 8 hours) and night work in high traffic and pedestrian areas should use the vehicle as a shield with the front of the vehicle facing oncoming traffic. Utilize standard orange plastic safety fencing and channelizing cones (30 pound base weight recommended) to delineate the work zone. Use of lighted barricades (Type I or II preferred) on the end facing oncoming traffic is recommended, if work is performed near site entrances.**
6) **Complete lane closure in areas of higher traffic and pedestrian flow should utilize barricades (Type I or II preferred) in sufficient number to clearly indicate the lanes are closed. Signs may be used in conjunction with the barricades to further communicate the closure. Channelizer cones should be used in conjunction with caution tape (intermediate duration) and safety fencing (long duration) closure. Place the vehicle as a shield in the area of highest exposure to traffic (at the lane entrance end as shown in the example above) and create adequate buffer zone on the end with lower traffic exposure.**
7) **Large parking areas may have a central thoroughfare leading to a red light at the city street. These areas may have increased traffic control, have wider lanes and traffic may drive in these areas at higher speeds. Work zones in these areas should use the vehicle as a shield with the front of the vehicle facing oncoming traffic. Channelizer cones should be used in conjunction with caution tape (intermediate duration) and safety fencing (long duration) lane closure. If parking spaces across the lanes are useable, use flags with the channelizer cones to increase awareness of the work zone to backing drivers. A taper, using standard traffic cones, may be used to help control traffic control through the area. If these locations have high volumes of traffic, consider using flaggers.**
8) **Work zones away from the active business area of the site and having low traffic and pedestrian flow may be configured using lesser requirements. Use barricades (Type I or II preferred) to close lanes and orient vehicle as a shield in the area of highest traffic exposure. Create a buffer between the work area and the area of lesser traffic exposure. Standard traffic cones may be used to delineate the work zone. Use of this scenario requires an understanding of traffic flow and patterns throughout the planned duration of the work activity. If conditions change, use of controls as described in scenario #6 should be used.**
9) **Complete lane closure involving an entrance should rely on barricades as the primary method of traffic control. Type I, II or III barricades should be used at the site entrance (Type III if the entrance has high traffic volume) for both intermediate and long duration work. Type I or II barricades are recommended for lane closures. Use the vehicle as a shield in the area of highest traffic exposure (usually the entrance). If vehicle or pedestrian traffic is persistent or heavy, controls using caution tape or safety fencing should be employed in conjunction with additional barricades or channelizer cones.**

How will the above documents be communicated to field staff?

- ☑ The above documents or modified documents are attached to this TCP, and/or
- ☐ The above documents are appropriate without significant modification and are available to field staff in the Field Guide for Roadway Work Zone Safety. (Read printing instructions)

4.0 Required Traffic Control Devices and Phasing

Modify statements as appropriate:

STAR Tasks:

Tasks on this project may be implemented both individually or concurrently. Selection and number of traffic control devices required will be dependent on the scope of work. In all cases, a minimum of 4 x 42 inch channelizer cones with flags will be available on site for any field work. Based on recommendations in DOT

Fact Sheet(s) applicable to the work being performed, indicate any additional traffic control devices for the current project below.

Roadway Tasks:

Regardless of TCP responsibility for this project, all ARCADIS vehicles in a RWZ will, at a minimum, have a functioning high intensity strobe or rotating orange light. All ARCADIS employees in the RWZ will wear, at a minimum, a retroflective high visibility vest meeting Class II or III requirements and other PPE required by JLA or HASP. ARCADIS employees will not enter a 3rd party RWZ if observed to be deficient or inconsistent with the ARCADIS RWZ Safety Program.

ARCADIS RWZ requirements stipulated in this TCP from above selected DOT Fact Sheet(s) or through attached document require the following traffic control devices to be present on site during work in the roadway or right-of-way:

Need sign help?	DOT Facts-301d	Need help determining cone needs:
Need channelizing device help?	DOT Facts-301e	ARCADIS Cone Calculator
Need Flagger help?	DOT Facts-301f

You have the absolute right to stop work if unsafe conditions exist!

DOT Facts-301o
Lane Closure on Two-Lane Road with Low Traffic Volumes

The following configuration may be used for lane closure on two-lane roads with low traffic volumes:

Road Type	"A" (m/ft)	"B" (m/ft)	"C" (m/ft)
Urban (Low Speed)	30/100	30/100	30/100
Urban (High Speed)	100/350	100/350	100/350
Rural	150/500	150/500	150/500

Guidance:

G1. This RWZ application may be used as an alternate to the RWZ application shown in DOT Facts-301n (using flaggers) when the following conditions exist:

a. Vehicular traffic volume is such that sufficient gaps exist for vehicular traffic that must yield.

b. Road users from both directions are able to see approaching vehicular traffic through and beyond the work site and have sufficient visibility of approaching vehicles.

G2. The Type B flashing warning lights may be placed on the ROAD WORK AHEAD and the ONE LANE ROAD AHEAD signs whenever a night lane closure is necessary.

Job Steps

Job Step No.	Job Step Description		Potential Hazard	Critical Action	H&S Reference
1	Performing Pre-trip inspections	1	Cuts scrapes to hands and fingers checking engine fluids	Use Track to plan inspection activity in the engine compartment. Wear protective gloves if reaching in poorly illuminated areas of the engine	
		2	Pinch crush hazards to hands and fingers checking engine fluids or closing doors.	Identify and keep hands fingers away from pinch hazards from doors and vehicle hood or tailgate (if present).	
		3	Awkward body positions checking tires, spare tire, undercarriage, or engine compartment	Maintain neutral body positions and avoid awkward reaches under the vehicle or in engine compartment	
		4	Failure to inspect vehicle emergency equipment may result in extensive vehicle damage or delay treatment in the event of injury	Conduct equipment inspections by visibly inspecting fire extinguisher and first aid kit for cleanliness, in date items/tags, readiness for use.	
2	Vehicle loading and unloading	1	Object placement obstructing rear, side or blind spot view.	Avoid placing objects in a manner that obstructs your view, brake equipment down to a smaller more manageable size to keep low profile in vehicle, If hanging clothes in vehicle, place in manner that does not obstruct blind spots.	
		2	Unsecure objects causing pedal, steering or gear shift obstruction or injury during vehicle operation	Secure all loads in vehicle (both in the bed of trucks and in passenger cabin) to prevent unanticipated movement or shifting that could injure driver, passenger or affect safe operation of vehicle	
		3	Obstruction of vehicle safety equipment caused by object placement in vehicle	Keep emergency equipment clear and unobstructed to ensure ready availability.	
3	Vehicle operation	1	Failure to use Smith System “5-Keys” increases risk of accident	Use Smith System “5-Keys”. Maintain space cushion around vehicle, maintain 4 second rule and add (second for each additional hazard (wet loads, snow, etc) Brake gradual, keep eyes moving, check mirrors every 6-8 seconds, use turn signals, focus on relevant objects. Use early lane positioning when approaching turns.	

		2	Injury or death from failure to wear seatbelt	Always wear seatbelts even if driving short distances off of a public roadway.	
		3	Cell phone use increase risk of accident and injury	Avoid using cell phones in any capacity when operation a vehicle, check client for cell use on project sites and follow requirements. Follow all local laws	
		4	Use of radar detectors encourages speeding and resulting in increased risk for accident or injury	Use of radar detectors and similar devices is prohibited	
4	Routine maintenance	1	Pinch crush hazards to hands and fingers replacing engine fluids or closing doors/hood.	Inspect and identify pinch and crush hazards and keep hands/fingers clear when closing hood, tailgates, or doors.	
		2	Burn hazards to hand from checking/replacing fluids in engine compartment	When practical allow engine to cool prior to servicing or adding fluids. Use protective gloves.	
		3	Vehicle damage from improper fuse replacement	Never replace a fuse with higher amperage than the one being replaced. Only replace fuses of the being replaced

Job Steps

Job Step No.	Job Step Description		Potential Hazard	Critical Action	H&S Reference
1	Inspect Drums for signs of Bulging, Leaking, Crystals, Temperature, and Odor	1	Exposure to chemicals stored in drum or container.	Read drum labels for information about contents. Review all relevant MSDSs about chemical contents. If labels are not attached, call PM or Local H&S Representative.	None
		2	Contents of the drum can cause fire/explosion hazard.	Use air monitoring meters to screen drums. % LEL and VOCs (PPM). If either of the values are above the action levels described in the HASP or MSDS then Stop Work, move away from the area, and reassess the situation. Call PM and H&S staff for support.	
2	Remove lids or bungs from Drums	1	Hand Injuries can occur from sharp edges, pinch points, and from use of hand tools.	Wear appropriate work gloves. When removing ring from drum, fingers can get pinched between ring and drum. Keep fingers clear of this space. Select proper tool for task. If large amount of drums will be encountered, use a speed or drum wrench.	Employee H&S Field book, Section III Subpart II, page 104. Also Section III Subpart L, page 38.
		2	Rapid depressurization from empty or partially full drums can cause flying parts or volatile COCs releasing on staff.	Do not handle or open bulging drums (contact Corp H&S for assistance). Bleed any built up pressure by carefully loosening bung prior to removing ring. Keep face and arms away from bung opening when loosening. Slightly lift lid, insert end of air monitoring device to monitor air inside drum.	
		3	Use of mechanical tools to remove bolts from drum lids causes excessive noise.	Wear hearing protection.	
		4	Splashing can occur if filling drum, or collecting samples.	Wear eye and face protection. Pour liquids into drum slowly to minimize splashing.	
		5	When working with COCs that have fire/explosive properties, sparking or heat could cause fire/explosion.	Use brass or non Spark Hand Tools if such a hazard exists or is suspected.	
3	Sample Contents from Drums	1	Exposure to COCs can occur by contacting impacted contents.	Select proper dermal protection for task, at a minimum nitrile gloves should be worn. Wear appropriate eye face and body protection as outlined in the HASP.	

		2	Staff can be exposed to chemical vapors/fumes when sampling.	Conduct air monitoring as outlined in the HASP, and if required, select appropriate respiratory protection for the task.	
		3	Sharp edges and broken sample containers can cause lacerations.	Discard any broken sample ware or glass properly. Do not over tighten sample containers.	
		4	Chemical burns or skin irritation can occur from contact with sample preservatives.	Wear chemical protective gloves when collecting samples, or when handling damaged sample containers.	
4	Replace drum lids	1	Hand Injuries can occur from sharp edges, pinch points, and from use of hand tools.	see step 2 above	
5	Moving and Storing Drums	1	Drum storage areas can be accessed by the general public, or may not be secure.	Calculate how many drums will be stored in new location. Ensure that drums are not easily accessed by the general public. Do not store such that drums impede pedestrian or vehicular traffic.	
		2	Muscle strain can occur when lifting/pulling/pushing drums.	Drums that are full can weigh as much as 800 lbs. Use a lift assist device whenever possible, and use a team lift approach. When moving soil drum generated by drilling, have drillers use their equipment to move the drums. Using dolly, slightly lift drum away from dolly to install forks under drum. Slowly let drum come back down and rest on dolly. Using hook on top of dolly, ensure it latches on top of drum bung.	
		3	Body parts can be pinched between lift device, or drum and the ground.	Be aware of hand and foot placement during drum staging. Do not hurry through task.	
		4	When moving, the drum can tip or the dolly could become unstable from uneven ground surface.	Plan travel route with drum prior to moving. With drum secure on dolly, have one employee pull back on dolly, and other employee slowly push back on drum toward dolly. Have second worker act as spotter for traffic, pedestrians, and any trip hazards along the way.	

PPE — Personal Protective Equipment

Type	Personal Protective Equipment	Description	Required
Eye Protection	safety goggles		Required
Hand Protection	chemical resistant gloves (specify type)	Nitrile	Required
	work gloves (specify type)		Required

Job Steps

Job Step No.	Job Step Description		Potential Hazard	Critical Action	H&S Reference
1	Verify all permits, forms, and trainings have been completed.	1	Administrative function - no hazards anticipated. Action is to ensure health and safety/regulatory compliance	Employees must have the following required training: OSHA 40-Hour HAZWOPER and refresher; First aid/CPR; medical clearance; DOT Hazardous Materials Shipping Training	
2	Mobilization to the Site	1	Collision, injury or death to occupants or other parties; Property damage	1. Secure all equipment in the vehicle prior to driving. 2. Obey all traffic laws and abide by posted speed limits. 3. Be aware of your surroundings and maintain a distance of 4 seconds behind the vehicle ahead. Add distance for adverse weather conditions. 4. Verify that all employees have accurate and understandable directions to the site. Use preprinted map or GPS. 5. Avoid driving when tired. Use cell phones for emergency contact. Do not use cell phones while driving. 6. Complete vehicle inspection checklist.	
		2	Weather Hazards/Road Conditions	Check local and destination forecasts and Road conditions for dates of travel	
3	Loading and unloading materials and equipment	1	Slips, trips, and falls; Lifting hazards and back strain.	Staff should use proper lifting techniques and to request assistance when lifting heavy equipment. Use dolly to transport equipment, if needed.	
		2	Pinch points/lacerations during equipment loading	Identify/avoid pinch points and sharp edges. Wear leather gloves to protect hands/fingers	
		3	Working near vehicles	Be mindful of traffic at all times. Use cones, barricades and signs as appropriate. Wear reflective traffic vests at all times.	
4	Working outdoors	1	Temperature-related illnesses (heat stress); Weather hazards.	Ensure all field staff drinks plenty of fluids; take breaks as needed to avoid overheating, frostbite, etc., dress appropriately for weather conditions. Check local weather forecasts daily, use sunscreen as appropriate, monitor changes in weather, shutdown operations if extreme weather conditions occur; postpone work if lightning is observed or expected.	

		2	Biological hazards (insects and plants)	1. Inspect area for hazardous plants and insects. 2. Apply insect repellent containing DEET during insect season. 3. Check for ticks throughout the day.	
5	Demobilization	1	Slips, trips, and falls; Loss of equipments/supplies from moving vehicle; lifting hazards	Keep all walkways clear of equipment and materials. Follow safe driving procedures (following distances, speed, headlights, safety belts, etc.). Do not use cell phone when driving. Properly secure all equipments and supplies before operating vehicle. Use proper lifting technique.	

PPE — Personal Protective Equipment

Type	Personal Protective Equipment	Description	Required
Dermal Protection	long sleeve shirt/pants		Required
Eye Protection	safety glasses		Required
Foot Protection	Other	Traffic Safety Vest	Required
	steel-toe boots		Required
Hand Protection	work gloves (specify type)		Required

Supplies

Job Steps

Job Step No.	Job Step Description		Potential Hazard	Critical Action	H&S Reference
1	Place samples in cooler for shipment.	1	Contact with broken glass or groundwater if bottles break.	• Place sample containers in bubble wrap or bags provided by laboratory. • Line bottom of cooler with bubble wrap to prevent breakage. • Ensure that sample containers are packed securely in cooler, but do not use excess pressure to force sample containers to fit inside cooler if adequate space is not available. • Wear leather gloves over nitrile gloves to protect hands from glass and/or groundwater if bottles break.	
2	Add ice to sample coolers.	1	Exertion from handling bags of ice.	• Do not lift more than 50 pounds of ice. • Use knees to lift when picking bags of ice off of the ground. • Avoid over-reaching or overextenting your back when placing ice bags into cooler or onto vehicle.	
		2	Contact with ice	• Do not place hands directly on ice bags for extended periods of time. Take breaks as needed to prevent hands from becoming too cold. • Wear leather gloves to provide protection from direct contact with cold ice.	
		3	Slips, trips, fall hazards from packing materials.	• Keep a 10-foot radius clear of packing materials (ice, tape, coolers, etc.). • Keep work area dry - pour excess water/ice onto the ground away from the immediate work area.	
3	Seal cooler with packing tape and custody seal.	1	Contact with cutting devices.	• Use scissors to cut tape. • Wear cut-resistant gloves to protect hands when using cutting devices.	

		2	Exertion/muscle strain from lifting coolers	• Use proper lifting techniques - lift with legs, not back. • Avoid excess twists and turns while moving cooler from one place to another and while placing tape around the cooler. • If cooler weighs more than 50 pounts, use 2-person lift.	
4	Place coolers in vehicle for shipment.	1	• Exertion/muscle strain from lifting coolers.	• Use proper lifting techniques - lift with legs, not back. • Avoid excess twists and turns while moving cooler from one place. • If cooler weighs more than 50 pounts, use 2-person lift.	
		2	Contact with other coolers.	• Avoid getting fingers caught between coolers when moving them. • Wear leather gloves while handling coolers to provide extra hand protection from potential pinch points.

Job Steps

Job Step No.	Job Step Description		Potential Hazard	Critical Action	H&S Reference
1	Stage at pre-determined sampling location and set up work zone and sampling equipment	1	personnel could be hit by vehicluar traffic.	Set-up cones and establish work area. Position vehicle so that field crew is protected from site traffic. Unload as close to work area as safely possible.	
		2	Sampling equipment, tools and monitoring well covers can cause tripping hazard	Keep equipment picked up and use TRACK to assess and changes	
2	Open wells to equilibrate and gauge wells	1	When squatting down, personnel can be difficult to see by vehicular traffic.	Wear Class II traffic vest if wells are located proximal to vehicular traffic. Use tall cones and the buddy system if practicable.	
		2	Poisionous insects in well vaults i.e. black widdows and walking sticks can bite or spray acid.	Wear elbow length nitrile gloves when opening well vaults where insects are present.Wear proper PPE including safety glasses.	
		3	pinchpoints on well vault can pinch or lacerate fingers.	Use correct tools to open well vault/cap. Wear leather gloves when removing well vault lids, and chemical protective gloves while guaging. Wear proper PPE including safety boots, knee pads and safety glasses.	
		4	Lifting sampling equipment can cause muscle strain	Unload as close to work area as safely possible; use proper lifting and reaching techniques and body positioning; don't carry more than you can handle, and get help moving heavy or awkward objects.	
		5	Pressure can build up inside well causing cap to release under pressure	Keep head away from well cap when removing. If pressure relief valves are on well use prior to opening well	
3	Begin Purging Well and Collecting Parameter Measurements	1	Electrical shock can occur when connecting/disconnecting pump from the battery.	Make sure equipment is turned off when connecting/disconnecting. Wear leather gloves. Use GFCIs when using powered tools and pumps. Do not use in the rain or run electrical cords through wet areas.	
		2	purge water can spill or leak from equipment	Stop purging activities immediately, stop leakage and block any drainage grate with sorbent pads. Call PM to notify them of any reportable spill.	

		3	Water spilling on the ground can cause muddy/slippery conditions	Be careful walking in work area when using plastic around well to protect from spillage	
		4	lacerations can occur when cutting materials such as plastic tubing	When cutting tubing, use tubing cutter. No open fixed blades should ever be used. When possible wear work gloves, leather type.	
		5	purge water can splash into eyes	Pour water slowly into buckets/drums to minimize splashing. Wear safety glasses	
4	Collect GW or Free Product Sample	1	Working with bailer rope can cause rope burns on hands.	Slowly raise and lower the rope or string for the bailer. Wear appropriate gloves for the task.	
		2	sample containers could break or leak preservative	Discard any broken sampleware or glass properly. Do not overtighten sample containers. Wear chemical protective gloves	
5	Recovery of Free Product from well	1	exposure to free product	Additional chemical protection may be necessary based on the type of product. Additionally, safety goggles, a faceshield, or respiratory protection may be required. Verify in the HASP.	
6	Staging of Well Purge water and/or Free Product	1	Muscle strains can occur when moving purge water or drums	If using buckets, do not fill buckets up to the top. Always keep lid on buckets when traveling or moving them to another location. Only half fill buckets so when dumping the buckets weigh less. See drum handling JLA for movement of drums.	Drum handling JLA

Perchloroethylene
MSDS 313
TET2750

Section 1 - Chemical Product and Company Identification 54.1

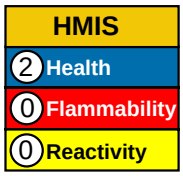
Material Name: Perchloroethylene **CAS Number:** 127-18-4
Chemical Formula: C_2Cl_4
Structural Chemical Formula: $Cl_2C=CCl_2$
Synonyms: ANKILOSTIN; ANTISAL 1; ANTISOL 1; CARBON BICHLORIDE; CARBON DICHLORIDE; CZTEROCHLOROETYLEN; DIDAKENE; DILATIN PT; DOW-PER; ENT 1,860; EPA PESTICIDE CHEMICAL CODE 078501; ETHENE,TETRACHLORO-; ETHYLENE TETRACHLORIDE; ETHYLENE,TETRACHLORO-; FEDAL-UN; NEMA; PCE; PER; PERAWIN; PERC; PERCHLOORETHYLEEN,PER; PERCHLOR; PERCHLORAETHYLEN,PER; PERCHLORETHYLENE; PERCHLORETHYLENE,PER; PERCHLOROETHYLENE; PERCLENE; PERCLENE D; PERCLOROETILENE; PERCOSOLV; PERCOSOLVE; PERK; PERKLONE; PERSEC; TETLEN; TETRACAP; TETRACHLOORETHEEN; TETRACHLORAETHEN; TETRACHLORETHYLENE; TETRACHLOROETHENE; 1,1,2,2-TETRACHLOROETHYLENE; TETRACHLOROETHYLENE; TETRACLOROETENE; TETRAGUER; TETRALENO; TETRALEX; TETRAVEC; TETROGUER; TETROPIL
General Use: Used as a drycleaning solvent, a vapor-degreasing solvent; a drying agent for metals and certain other solids. Used also as a heat transfer medium and in the manufacture of fluorocarbons.

Section 2 - Composition / Information on Ingredients

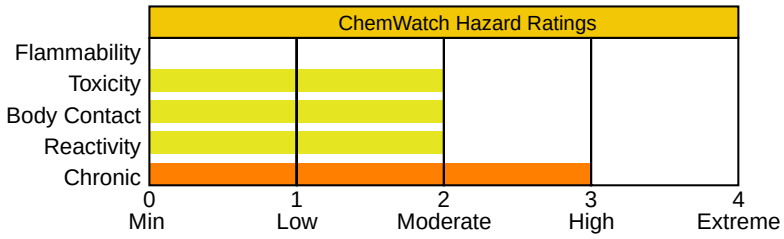
Name	CAS	%
perchloroethylene	127-18-4	100

OSHA PEL
TWA: 100 ppm; STEL: 200 ppm; from Table Z-2. Other Values: 300 mg/m^3; 5 min peak 3hr ppm.

OSHA PEL Vacated 1989 Limits
TWA: 25 ppm; 170 mg/m^3.

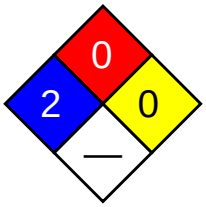


ACGIH TLV
TWA: 25 ppm; 170 mg/m^3; STEL: 100 ppm; 6850 mg/m^3.



NIOSH REL
No data found.

IDLH Level
150 ppm.



DFG (Germany) MAK
TWA: 50 ppm; 345 mg/m^3.

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word
Caution

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Colorless liquid; ether-like odor. Irritating to eyes/skin/respiratory tract. Also causes: headache, dizziness, CNS depression, incoordination, slurred speech. Chronic: liver/kidney damage; possible cancer hazard based on animal studies.

Copyright © 2000 by Genium Publishing Corporation. Any commercial use or reproduction without the publisher's permission is prohibited. Potential Health Effects

Primary Entry Routes: inhalation, skin contact, eye contact
Target Organs: liver, kidneys, eyes, upper respiratory system, skin, central nervous system (CNS)
Acute Effects

Inhalation: Acute intoxication by halogenated aliphatic hydrocarbons appears to take place over two stages. Signs of a reversible narcosis are evident in the first stage and in the second stage signs of injury to organs may become evident.
A single organ alone is (almost) never involved.
The vapor is highly discomforting to the upper respiratory tract and lungs.
Inhalation hazard is increased at higher temperatures.
Anesthetic and narcotic effects (with dulling of senses and odor fatigue) are a consequence of exposure to chlorinated solvents.
Individual response varies widely; odor may not be considered objectionable at levels which quickly induce central nervous system effects.
High vapor concentrations may give a feeling of euphoria. This may result in reduced responses, followed by rapid onset of unconsciousness, possible respiratory arrest and death.
Accidental high level exposure has produced lightheadedness, unconsciousness and liver and kidney damage in workers. In at least two cases such exposures were fatal. Subjects exposed to 106 ppm in laboratory studies experienced slight eye irritation; dizziness and sleepiness were reported at 216 ppm; at exposures of 280 ppm or 600 ppm for 10 minutes there was a loss of motor coordination. In another study subjects exposed for 7 hours at 101 ppm complained of eye irritation and subjective symptoms such headache, drowsiness and sleepiness.

Eye: The liquid may produce eye discomfort and is capable of causing temporary impairment of vision and/or transient eye inflammation, ulceration Eye contact may cause lachrymation (tears) and burning sensation.
The vapor is highly discomforting to the eyes.
The material may be irritating to the eye, with prolonged contact causing inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.

Skin: The liquid is highly discomforting to the skin if exposure is prolonged and may cause drying of the skin, which may lead to dermatitis.
Toxic effects may result from skin absorption.
Absorption by skin may readily exceed vapor inhalation exposure.
Symptoms for skin absorption are the same as for inhalation.
Bare unprotected skin should not be exposed to this material.
The material may accentuate any pre-existing skin condition.
The material may produce severe skin irritation after prolonged or repeated exposure, and may produce a contact dermatitis (nonallergic).
This form of dermatitis is often characterized by skin redness (erythema) and swelling (edema) which may progress to vesiculation, scaling and thickening of the epidermis.
Histologically there may be intercellular edema of the spongy layer (spongiosis) and intracellular edema of the epidermis.
Prolonged contact is unlikely, given the severity of response, but repeated exposures may produce severe ulceration.
Industrial experience shows localized skin irritation. Prolonged dermal contact can cause chemical burns and blistering.

Ingestion: Considered an unlikely route of entry in commercial/industrial environments.
The liquid is highly discomforting and toxic if swallowed and may be fatal if swallowed in large quantity.
Ingestion may result in nausea, abdominal irritation, pain and vomiting.
When used in the treatment of hookworm (4.5 to 6.5 gm orally) the only adverse effect is inebriation. Transient hepatotoxicity in patients given single oral doses of up to 5 mL have been recorded.

Carcinogenicity: NTP - Class 2B, Reasonably anticipated to be a carcinogen, sufficient evidence of carcinogenicity from studies in experimental animals; IARC - Group 2B, Possibly carcinogenic to humans; OSHA - Not listed; NIOSH - Listed as carcinogen; ACGIH - Class A3, Animal carcinogen; EPA - Not listed; MAK - Class B, Justifiably suspected of having carcinogenic potential.

Chronic Effects: Prolonged or continuous skin contact with the liquid may cause defatting with drying, cracking, irritation and dermatitis following.
Workers inhaling 232 to 385 ppm for 8 hours/day, 5 days/week for 2 to 6 years have shown abnormal hepatic function, including cirrhosis, with lightheadedness, headache, malaise and dizziness.

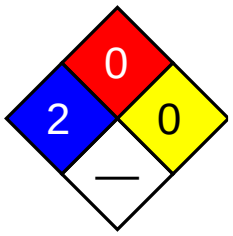
Section 4 - First Aid Measures

Inhalation: Remove to fresh air.
Lay patient down. Keep warm and rested.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor.

Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water.
Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.
Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Copyright © 2000 Genium Publishing Corporation. Any commercial use or reproduction without the publisher's permission is prohibited.

Skin Contact: Immediately remove all contaminated clothing, including footwear (after rinsing with water).
Wash affected areas thoroughly with water (and soap if available).
Seek medical attention in event of irritation.
Ingestion: Contact a Poison Control Center.
Do NOT induce vomiting. Give a glass of water.
Avoid giving milk or oils.
Avoid giving alcohol.
After first aid, get appropriate in-plant, paramedic, or community medical support.
Note to Physicians: Treat symptomatically.
Do not administer sympathomimetic drugs as they may cause ventricular arrhythmias.
For acute or short-term repeated exposures to perchloroethylene:
Tetrachloroethylene/perchlorethylene is well absorbed through the lungs with peak levels more important than duration in determining blood concentration.
Lungs excrete most of the absorbed tetrachloroethylene in an unchanged state; about 3% is converted by the liver to form trichloracetic acid and subsequently excreted by the kidney. Exhaled material has a biological half-life of 65 hours.
INHALATION:
The treatment of acute inhalation exposures is supportive with initial attention directed to evaluation/support of ventilation and circulation.
As with all hydrocarbons care must be taken to reduce the risk of aspiration by proper positioning and medical observation.
INGESTION:
1.The ingestion level at which emesis should be induced is difficult to predict in the absence of extensive human studies.
2.The role of charcoal and cathartics remains uncertain.



BIOLOGICAL EXPOSURE INDEX - BEI
These represent the determinants observed in specimens collected from a healthy worker who has been exposed at the Exposure Standard (ES or TLV):

Determinant	Index	Sampling Time	Comments
Perchloroethylene in end-exhaled air	10 ppm	Prior to last shift of work-week	
Perchloroethylene in Blood	1 mg/L	Prior to last shift of work-week	
Trichloroacetic acid in urine	7 mg/L	End of work-week	NS,SQ

NS: Non-specific determinant; also seen after exposure to other materials
SQ: Semi-quantitative determinant - Interpretation may be ambiguous; should be used as a screening test or confirmatory test.

Section 5 - Fire-Fighting Measures

Flash Point: Nonflammable
Autoignition Temperature: 490 °C
LEL: 1.8% v/v
UEL: 11.5% v/v at 740 mm Hg 160 °C
Extinguishing Media: Use extinguishing media suitable for surrounding area.
General Fire Hazards/Hazardous Combustion Products: Nonflammable liquid. However vapor will burn when in contact with high temperature flame. Ignition ceases on removal of flame.
May form a flammable/explosive mixture in an oxygen enriched atmosphere. Heating may cause expansion/vaporization with violent rupture of containers. Decomposes on heating and produces corrosive fumes of hydrochloric acid, carbon monoxide and small amounts of toxic phosgene.

Fire Diamond

Fire Incompatibility: Avoid mixing with strong alkalis or powdered metals, particularly zinc as ignition may result.
Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
Wear breathing apparatus plus protective gloves for fire only. Prevent, by any means available, spillage from entering drains or waterways.
Use fire fighting procedures suitable for surrounding area.
Do not approach containers suspected to be hot.

Copyright © 2000 Genium Publishing Corporation. Any commercial use or reproduction without the publisher's permission is prohibited.

Cool fire-exposed containers with water spray from a protected location.
If safe to do so, remove containers from path of fire.
Equipment should be thoroughly decontaminated after use.

Section 6 - Accidental Release Measures

Small Spills: Clean up all spills immediately.
Wear protective neoprene gloves and chemical goggles.
If risk of overexposure exists, wear NIOSH-approved respirator.
Wipe up and absorb small quantities with vermiculite or other absorbent material.
DO NOT discharge into sewer or waterways.
Place spilled material in clean, dry, sealable, labeled container.
Large Spills: Minor hazard. Clear area of personnel and move upwind.
Contact fire department and tell them location and nature of hazard.
Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways.
No smoking, bare lights or ignition sources. Increase ventilation.
Stop leak if safe to do so. Contain spill with sand, earth or vermiculite.
Collect recoverable product into labeled containers for recycling.
Absorb remaining product with sand, earth or vermiculite.
Collect solid residues and seal in labeled drums for disposal.
Wash area and prevent runoff into drains.
If contamination of drains or waterways occurs, advise emergency services.
Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid generating and breathing mist. Avoid all personal contact, including inhalation.
Wear protective clothing when risk of exposure occurs.
Use in a well-ventilated area. Prevent concentration in hollows and sumps.
DO NOT enter confined spaces until atmosphere has been checked.
DO NOT allow material to contact humans, exposed food or food utensils.
Avoid contact with incompatible materials.
When handling, DO NOT eat, drink or smoke.
Keep containers securely sealed when not in use. Avoid physical damage to containers. Always wash hands with soap and water after handling. Work clothes should be laundered separately.
Launder contaminated clothing before reuse.
Use good occupational work practices. Observe manufacturer's storing and handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions are maintained.
Recommended Storage Methods: Check that containers are clearly labeled. Glass container.
Heavy gauge metal packages/heavy gauge metal drums.
Avoid storage with zinc, galvanized or diecast metal (including bungs).
DO NOT use aluminum or galvanized containers.
Packaging as recommended by manufacturer.
Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: CARE: Use of a quantity of this material in confined space or poorly ventilated area, where rapid build-up of concentrated atmosphere may occur, could require increased ventilation and/or protective gear. Use in a well-ventilated area.
Local exhaust ventilation may be required for safe working, i.e., to keep exposures below required standards; otherwise, PPE is required.
If inhalation risk exists, wear NIOSH-approved organic-vapor respirator or air supplied breathing apparatus.
Personal Protective Clothing/Equipment
Eyes: Chemical goggles. Full face shield.
Hands/Feet: Neoprene gloves; Viton gloves.
PVA gloves.
PVC gloves.
Protective footwear.
Respiratory Protection:
Exposure Range >100 to <150 ppm: Supplied Air, Constant Flow/Pressure Demand, Half Mask
Exposure Range 150 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Note: poor warning properties
Other: Overalls. Eyewash unit. Ensure there is ready access to an emergency shower.

Copyright © 2000 Genium Publishing Corporation. Any commercial use or reproduction without the publisher's permission is prohibited.

Glove Selection Index:

PE/EVAL/PE	A
VITON/CHLOROBUTYL	A
VITON/NITRILE	A
VITON	A
PVA	A
CPE	A
NITRILE	B
TEFLON	B
NITRILE+PVC	C
SARANEX-23 2-PLY	C
SARANEX-23	C
PVC	C
BUTYL	C
NEOPRENE	C

A: Best selection
B: Satisfactory; may degrade after 4 hours continuous immersion
C: Poor to dangerous choice for other than short-term immersion

Section 9 - Physical and Chemical Properties

Appearance/General Info: Colorless liquid, with a chloroform-like odor. Extremely stable, resists hydrolysis. Miscible with alcohol, ether and oils.

Physical State: Liquid
Vapor Pressure (kPa): 2.11 at 22 °C
Vapor Density (Air=1): 5.83
Formula Weight: 165.82
Specific Gravity (H_2O=1, at 4 °C): 1.63 at 15 °C
Water Solubility: 0.02% by weight
Evaporation Rate: 0.09 Ether=1

pH: Not applicable
pH (1% Solution): Not applicable.
Boiling Point Range: 121 °C (250 °F) at 760 mm Hg
Freezing/Melting Point Range: -19 °C (-2.2 °F)
Volatile Component (% Vol): 100

Section 10 - Stability and Reactivity

Stability/Polymerization: Product is considered stable and hazardous polymerization will not occur.
Storage Incompatibilities: Avoid reaction with oxidizing agents. Segregate from strong alkalis.
Haloalkenes are highly reactive. Some of the more lightly substituted lower members are highly flammable; many members of the group are peroxidizable and polymerizable.
The presenceof 0.5% trichloroethylene as an impurity caused generation of dichloroacetylene during unheated drying over solid sodium hydroxide.
Subsequent fractional distillation produced an explosion.

Section 11 - Toxicological Information

Unless otherwise specified data extracted from RTECS - Registry of Toxic Effects of Chemical Substances

TOXICITY
Oral (rat) LD_{50}: 2629 mg/kg
Inhalation (man) LD_{Lo}: 2857 mg/kg
Inhalation (human) TC_{Lo}: 96 ppm/7 hrs
Inhalation (man) TC_{Lo}: 280 ppm/2 hrs
Inhalation (man) TC_{Lo}: 600 ppm/10 min
Inhalation (rat) LC_{Lo}: 34200 mg/m^3/8 hr

IRRITATION
Skin (rabbit): 810 mg/24h -SEVERE
Eye (rabbit): 162 mg -mild

See NIOSH, *RTECS* KX 3850000, for additional data.

Section 12 - Ecological Information

Environmental Fate: If it is released to soil, it will be subject to evaporation into the atmosphere and to leaching to the groundwater. Biodegradation may be an important process in anaerobic soils based on laboratory tests with methanogenic columns. Slow biodegradation may occur in groundwater where acclimated populations of microorganisms exist. If released to water, it will be subject to rapid volatilization with estimated half-lives ranging from <1 day to several weeks. It will not be expected to significantly biodegrade, bioconcentrate in aquatic organisms or significantly adsorb to sediment. It will not be expected to significantly hydrolyze in soil or water under normal environmental conditions. If released to the atmosphere, it will exist mainly in the gas-phase and it will be subject to photooxidation with estimates of degradation time scales ranging from an approximate half-life of 2 months to complete degradation in an hour. Some in the atmosphere may be subject to washout in rain based on the solubility in water.

Ecotoxicity: LC_{50} Tanytarsus dissimilis (midge) 30, 840 ug/l/48 hr, static bioassay; LC_{50} Poecilia reticulata (guppy) 18 ppm/7 days /Conditions of bioassay not specified; LC_{50} Daphnia magna (water flea) 18 mg/l/48 hr, static bioassay, at 22 °C; LC_{50} Salmo gairdneri (rainbow trout) 5 mg/l/96 hr, static bioassay at 12 °C
Henry's Law Constant: 2.87 $x10^{-2}$
BCF: fathead minnow 38.9
Biochemical Oxygen Demand (BOD): none
Octanol/Water Partition Coefficient: log K_{ow} = 3.40
Soil Sorption Partition Coefficient: K_{oc} = 209

Section 13 - Disposal Considerations

Disposal: Reclaim solvent at an approved site.
Allow absorbed spillage to evaporate in an open top container, away from habitation.
Incinerate residue at an approved site.
Used containers should be left upside down with bungs out.
Return containers to drum reconditioner or recycler.

Section 14 - Transport Information

DOT Transportation Data (49 CFR 172.101):

Shipping Name: TETRACHLOROETHYLENE
Additional Shipping Information: PERCHLOROETHYLENE
Hazard Class: 6.1(b)
ID No.: 1897
Packing Group: III
Label: Harmful[6]

Section 15 - Regulatory Information

EPA Regulations:
RCRA 40 CFR: Listed U210 Toxic Waste
CERCLA 40 CFR 302.4: Listed per RCRA Section 3001; per CWA Section 307(a) 100 lb (45.35 kg)
SARA 40 CFR 372.65: Listed
SARA EHS 40 CFR 355: Not listed
TSCA: Listed

Section 16 - Other Information

Research Date: .....1999-11 **Review Date:** 2000-07

Trichloroethylene
MSDS 312
TRI2710

Section 1 - Chemical Product and Company Identification 54.1

Material Name: Trichloroethylene **CAS Number:** 79-01-6
Chemical Formula: C_2HCl_3
Structural Chemical Formula: $ClCH=CCl_2$
Synonyms: ACETYLENE TRICHLORIDE; ALGYLEN; ANAMENTH; BENZINOL; BLACOSOLV; BLANCOSOLV; CECOLENE; CHLORILEN; 1-CHLORO-2,2-DICHLOROETHYLENE; CHLORYLEA; CHLORYLEA,CHORYLEN,CIRCOSOLV,CRAWHASPOL,DOW-TRI,DUKERON,PER-A-CLOR,TRIAD,TRIAL,TRI-PLUS M,VITRAN; CHLORYLEN; CHORYLEN; CIRCOSOLV; CRAWHASPOL; DENSINFLUAT; 1,1-DICHLORO-2-CHLOROETHYLENE; DOW-TRI; DUKERON; EPA PESTICIDE CHEMICAL CODE 081202; ETHENE,TRICHLORO-; ETHINYL TRICHLORIDE; ETHYLENE TRICHLORIDE; ETHYLENE,TRICHLORO-; FLECK-FLIP; FLOCK FLIP; FLUATE; GEMALGENE; GERMALGENE; LANADIN; LETHURIN; NARCOGEN; NARKOGEN; NARKOSOID; NIALK; NSC 389; PERM-A-CHLOR; PERM-A-CLOR; PETZINOL; PHILEX; TCE; THRETHYLEN; THRETHYLENE; TRETHYLENE; TRI; TRIAD; TRIAL; TRIASOL; TRICHLOORETHEEN; TRICHLOORETHYLEEN,TRI; TRICHLORAETHEN; TRICHLORAETHYLEN,TRI; TRICHLORAN; TRICHLOREN; TRICHLORETHENE; TRICHLORETHYLENE; TRICHLORETHYLENE,TRI; TRICHLOROETHENE; 1,1,2-TRICHLOROETHYLENE; TRICHLOROETHYLENE; TRICHLOROETHYLENE; 1,2,2-TRICHLOROETHYLENE; TRI-CLENE; TRICLENE; TRICLORETENE; TRICLOROETILENE; TRIELENE; TRIELIN; TRIELINA; TRIELINE; TRIKLONE; TRILEN; TRILENE; TRILINE; TRIMAR; TRIOL; TRI-PLUS; TRI-PLUS M; VESTROL; VITRAN; WESTROSOL
General Use: Mainly used for vapor degreasing; solvent in textile and electronics industries; for adhesives, lubricants and consumer products (such as spot removers and rug cleaners).
Until recently, it was used to make hop extracts for beer, decaffeinated coffee and spice extracts.

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Clear, colorless liquid; sweet odor. Irritating to eyes/skin/respiratory tract. Inhalation: irregular heart beat, drunkenness. Chronic: heart, liver and kidney damage, dermatitis. Birth defects and cancer may occur based on animal studies. Flammable.

Potential Health Effects

Primary Entry Routes: inhalation, skin contact, eye contact, ingestion (rarely)

Target Organs: respiratory system, central nervous system (CNS), peripheral nervous system, cardiovascular system, liver, kidneys, skin

Acute Effects

Inhalation: The vapor is mildly discomforting to the upper respiratory tract.
Inhalation hazard is increased at higher temperatures.
Anesthetics and narcotic effects (with dulling of senses and odor fatigue) are a consequence of exposure to chlorinated solvents.
Individual response varies widely; odor may not be considered objectionable at levels which quickly induce central nervous system effects.
High vapor concentrations may give a feeling of euphoria. This may result in reduced responses, followed by rapid onset of unconsciousness, possible respiratory arrest and death.
Acute effects from inhalation of high concentrations of vapor are pulmonary irritation, including coughing, with nausea; central nervous system depression - characterized by headache and dizziness, increased reaction time, fatigue and loss of coordination.
If exposure to highly concentrated solvent atmosphere is prolonged this may lead to narcosis, unconsciousness, even coma and possible death.
Evidence of acute human toxicity comes mainly from the use of TCE as an anesthetic, Tachypnea and ventricular arrhythmias are experienced at inhaled concentrations exceeding 15000 ppm. Systemic toxicity is low following anesthesia. Occasional hepatotoxicity (liver dysfunction) has been reported; this is probably due to the breakdown of TCE to dichloroacetylene and phosgene by soda-lime present in some anesthetic devices. The effects of TCE appear to be enhanced in some individuals by simultaneous exposure to caffeine, ethanol and other drugs. "Degreasers Flush" describes a reddening of facial, neck, and back skin and is seen after intake of substantial quantities of ethanol by certain individuals after exposures to TCE.

Eye: The liquid is highly discomforting to the eyes and is capable of causing pain and severe conjunctivitis.
Corneal injury may develop, with possible permanent impairment of vision, if not promptly and adequately treated.
The vapor is discomforting to the eyes.
The material may produce moderate eye irritation leading to inflammation.
Repeated or prolonged exposure to irritants may produce conjunctivitis.

Skin: The liquid is discomforting to the skin and may cause drying of the skin, which may lead to dermatitis.
Toxic effects may result from skin absorption.
Bare unprotected skin should not be exposed to this material. The material may accentuate any pre-existing skin condition.
The material may produce severe skin irritation after prolonged or repeated exposure, and may produce a contact dermatitis (nonallergic).
This form of dermatitis is often characterized by skin redness (erythema) and swelling (edema) which may progress to vesiculation, scaling and thickening of the epidermis.
Histologically there may be intercellular edema of the spongy layer (spongiosis) and intracellular edema of the epidermis.
Repeated exposures may produce severe ulceration.
Localized application may produce pustular eruptions, pruritus and erythema. A permeability coefficient of 1.6×10^{-2} cm/hr has been calculated by the US EPA. Percutaneous absorption is unlikely to contribute significantly to total body burdens unless dermatitis is present.

Ingestion: The liquid is highly discomforting and toxic if swallowed.
Ingestion may result in nausea, abdominal irritation, pain and vomiting.
Considered an unlikely route of entry in commercial/industrial environments.

Carcinogenicity: NTP - Not listed; IARC - Group 3, Not classifiable as to carcinogenicity to humans; OSHA - Not listed; NIOSH - Listed as carcinogen; ACGIH - Class A5, Not suspected as a human carcinogen; EPA - Not listed; MAK - Class B, Justifiably suspected of having carcinogenic potential.

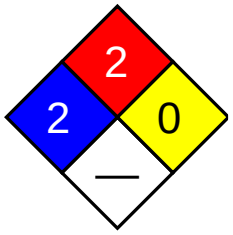
Chronic Effects: Sensitive humans may experience anesthetic effects from short exposures.
Chronic effects of exposure include fatigue, headache, irritability, vomiting, skin flush and intolerance to alcohol.
Liver, kidney, heart and neurological damage may also result from chronic overexposure.
Alcohol intake may increase the toxic effects of the material.
A variety of disturbances have been seen among workers exposed at concentrations ranging from 1 to 335 ppm. These disturbances increased with the length of exposure (to 5 years or more) and where more prominent when exposures exceeded 40 ppm. Increased complaints of alcohol intolerance, tremors, giddiness and anxiety were amongst symptoms recorded. Variation in effects in different occupational settings may be due to different physical workloads.

Copyright © 2000 Genium Publishing Corporation. Any commercial use or reproduction without the publisher's permission is prohibited.

There appeared to be no increase in the expected rates of congenital defects in children born to women exposed to TCE over a 13 year period.
Epidemiological studies consistently fail to show a link between cancers and TCE exposure. This is significant because of the tens of thousands of exposed workers monitored.

Section 4 - First Aid Measures

Inhalation: Remove to fresh air.
Lay patient down. Keep warm and rested.
If available, administer medical oxygen by trained personnel.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor, without delay.
Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water.
Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.
Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.
Skin Contact: Immediately remove all contaminated clothing, including footwear (after rinsing with water).
Wash affected areas thoroughly with water (and soap if available).
Seek medical attention in event of irritation.
Ingestion: Contact a Poison Control Center.
Do NOT induce vomiting. Give a glass of water.
Avoid giving milk or oils.
Avoid giving alcohol.
After first aid, get appropriate in-plant, paramedic, or community medical support.
Note to Physicians: Treat symptomatically.
Do not administer sympathomimetic drugs as they may cause ventricular arrhythmias.
Following acute or short-term continued exposures to trichloroethylene:
1.Trichloroethylene concentration in expired air correlates with exposure. 8 hours exposure to 100 ppm produces levels of 25 ppm immediately and 1 ppm 16 hours after exposures.
2.Most mild exposure respond to removal from the source and supportive care.
Serious toxicity most often results from hypoxemia or cardiac dysrhythmias so that oxygen, intubation, intravenous lines and cardiac monitoring should be started initially as the clinical situation dictates.
3.Ipecac syrup should be give to alert patients who ingest more than a minor amount and present within 2 hours.
4.The efficacy of activated charcoal and cathartics is unclear.
5.The metabolites, trichloracetic acid, trichlorethanol and to a lesser degree, chloral hydrate, may be detected in the urine up to 16 days postexposure.



BIOLOGICAL EXPOSURE INDEX - BEI
These represent the determinants observed in specimens collected from a healthy worker exposed at the Exposure Standard (ES or TLV):

Determinant	Index	Sampling Time	Comments
Trichloroacetic acid in urine	10 mg/gm creatinine	End of work-week	NS
Trichloroacetic acid AND Trichloroethanol in urine	300 mg/mg creatinine	End of shift at end of work-week	NS
Free Trichloroethanol in blood	4 mg/L	End of shift at end of work-week	NS
Trichloroethylene in end-exhaled air			SQ
Trichloroethylene in blood			SQ

NS: Non-specific determinant; also seen after exposure to other materials
SQ: Semi-quantitative determinant - Interpretation may be ambiguous; should be used as a screening test or confirmatory test.

Section 5 - Fire-Fighting Measures

Fire Diamond

Flash Point: 32.222 °C Closed Cup
Autoignition Temperature: 420 °C
LEL: 8% v/v
UEL: 10.5% v/v
Extinguishing Media: Water spray or fog; foam, dry chemical powder, or BCF (where regulations permit).
Carbon dioxide.
General Fire Hazards/Hazardous Combustion Products: Vapor will burn when in contact with high temperature flame.
May form a flammable/explosive mixture in an oxygen enriched atmosphere. Heating may cause expansion/vaporization with violent rupture of containers. Decomposes on heating and produces corrosive fumes of hydrochloric acid, carbon monoxide and small amounts of toxic phosgene.
Fire Incompatibility: Avoid reaction with strong oxidizing agents (particularly oxygen in gas or liquid form and nitrogen dioxide), strong bases, sodium and sodium-potassium alloys. Powdered metals; magnesium, zinc and aluminum.
Contact with water may result in the slow formation of hydrochloric acid.
Attacks natural rubber.
Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways.
Use water delivered as a fine spray to control fire and cool adjacent area.
Avoid spraying water onto liquid pools.
Do not approach containers suspected to be hot.
Cool fire-exposed containers with water spray from a protected location.
If safe to do so, remove containers from path of fire.

Section 6 - Accidental Release Measures

Small Spills: Remove all ignition sources. Clean up all spills immediately.
Avoid breathing vapors and contact with skin and eyes.
Control personal contact by using protective equipment.
Contain and absorb spill with sand, earth, inert material or vermiculite.
Wipe up. Place in a suitable labeled container for waste disposal.
Large Spills: Clear area of personnel and move upwind.
Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways.
Increase ventilation.
No smoking or bare lights within area.
Stop leak if safe to do so.
Contain and absorb spill with sand, earth, inert material or vermiculite.
Collect and seal in labeled drums for disposal.
If contamination of drains or waterways occurs, advise emergency services.
After clean-up operations, decontaminate and launder all protective clothing and equipment before storing and reusing.
Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid all personal contact, including inhalation.
Wear protective clothing when risk of overexposure occurs.
Use in a well-ventilated area. Prevent concentration in hollows and sumps.
DO NOT enter confined spaces until atmosphere has been checked.
DO NOT allow material to contact humans, exposed food or food utensils.
Avoid smoking, bare lights or ignition sources. When handling, DO NOT eat, drink or smoke. Avoid contact with incompatible materials.
Keep containers securely sealed when not in used. Avoid physical damage to containers. Always wash hands with soap and water after handling. Working clothes should be laundered separately.
Launder contaminated clothing before reuse.
Observe manufacturer's storing/handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions are maintained.
Recommended Storage Methods: Inhibited grades may be stored in metal drums.
DO NOT use aluminum or galvanized containers. Check that containers are clearly labeled and free from leaks.
Packaging as recommended by manufacturer.

Copyright © 2000 Genium Publishing Corporation. Any commercial use or reproduction without the publisher's permission is prohibited.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Local exhaust ventilation usually required.
If risk of overexposure exists, wear NIOSH-approved respirator.
Correct fit is essential to obtain adequate protection. NIOSH-approved self contained breathing apparatus (SCBA) may be required in some situations.
Provide adequate ventilation in warehouse or closed storage area.

Personal Protective Clothing/Equipment

Eyes: Safety glasses with side shields; chemical goggles. Full face shield.
Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: PVA gloves. Polyethylene gloves.
Viton gloves.
PVC boots.

Respiratory Protection:
Exposure Range >100 to <1000 ppm: Supplied Air, Constant Flow/Pressure Demand, Half Mask
Exposure Range 1000 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Note: odor threshold unknown

Other: Overalls. Eyewash unit. Barrier cream. Skin cleansing cream.

Glove Selection Index:

PE/EVAL/PE	A
PVA	A
TEFLON	A
VITON	B
VITON/NEOPRENE	C
VITON/NITRILE	C
HYPALON	C
NEOPRENE	C
PVC	C
NITRILE	C

A: Best selection
B: Satisfactory; may degrade after 4 hours continuous immersion
C: Poor to dangerous choice for other than short-term immersion

Section 9 - Physical and Chemical Properties

Appearance/General Info: Colorless liquid with a sweetish, chloroform-like odor, miscible with most organic solvents.

Physical State: Liquid
Vapor Pressure (kPa): 7.87 at 20 °C
Vapor Density (Air=1): 4.54
Formula Weight: 131.38
Specific Gravity (H_2O=1, at 4 °C): 1.47 at 15 °C
Water Solubility: < 1 mg/mL at 21 °C
pH: Not applicable
pH (1% Solution): Not applicable.
Boiling Point Range: 87 °C (189 °F)
Freezing/Melting Point Range: -73 °C (-99.4 °F)
Volatile Component (% Vol): 100

Section 10 - Stability and Reactivity

Stability/Polymerization: Decomposes in the presence of moisture to produce corrosive acid.
Product is considered stable under normal handling conditions. Hazardous polymerization will not occur.

Storage Incompatibilities: Avoid storage with strong oxidizers (particularly oxygen in gas or liquid form and nitrogen dioxide), strong bases, acetone, sodium/sodium-potassium alloys, magnesium, zinc and aluminum.
Avoid contact with water as the slow formation of hydrochloric acid results.
Attacks natural rubber.
Haloalkenes are highly reactive. Some of the more lightly substituted lower members are highly flammable; many members of the group are peroxidizable and polymerizable.

Copyright © 2000 Genium Publishing Corporation. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 11 - Toxicological Information

Unless otherwise specified data extracted from RTECS - Registry of Toxic Effects of Chemical Substances

TOXICITY
Oral (human) LD_{Lo}: 7000 mg/kg
Oral (man) TD_{Lo}: 2143 mg/kg
Oral (rat) LD_{50}: 5650 mg/kg
Inhalation (man) LC_{Lo}: 2900 ppm
Inhalation (human) TD_{Lo}: 812 mg/kg
Inhalation (human) TC_{Lo}: 6900 mg/m^3/10 m
Inhalation (man) TC_{Lo}: 2900 ppm
Inhalation (man) TC_{Lo}: 110 ppm/8h
Inhalation (man) TC_{Lo}: 160 ppm/83 m

IRRITATION
Skin (rabbit): 500 mg/24h - SEVERE
Eye (rabbit): 20 mg/24h - SEVERE

See NIOSH, *RTECS* KX 4550000, for additional data.

Section 12 - Ecological Information

Environmental Fate: No data found.

Ecotoxicity: LC_{50} Sheepshead minnow 20 mg/l/96 hr. /Conditions of bioassay not specified; LC_{50} Mexican axolotl (3-4 wk after hatching) 48 mg/l/48 hr /Conditions of bioassay not specified; LC_{50} Clawed toad (3-4 wk after hatching) 45 mg/l/48 hr /Conditions of bioassay not specified; LC_{50} Pimephales promelas (fathead minnow) 40.7 mg/l/96 hr (95% confidence limits 31.4-71.8 mg/l) /Flow-through test; EC_{10} Pimephales promelas (fathead minnow) 15.2 mg/l/24 hr; 16.9 mg/l/48 hr; 15.5 mg/l/72 hr; 13.7 mg/l/96 hr; Toxic effect for all concentrations specified: loss of equilibrium. /Flow-through bioassay; Toxicity Threshold (Cell Multiplication Inhibition Test) Scenedesmus quadricauda(green algae) >1000 mg/l /Time not specified, conditions of bioassay not specified; Toxicity Threshold (Cell Multiplication Inhibition Test) Pseudomonas putida (bacteria) 65 mg/l ; LC_{50} Grass shrimp 2 mg/l/96 hr. /Conditions of bioassay not specified

Henry's Law Constant: 1 x10^{-2}

BCF: bluegill 17 to 39

Biochemical Oxygen Demand (BOD): 0%, 20 days

Octanol/Water Partition Coefficient: log K_{ow} = 2.29

Soil Sorption Partition Coefficient: K_{oc} = 2.0

Section 13 - Disposal Considerations

Disposal: Recycle wherever possible. Consult manufacturer for recycling options.
Follow applicable federal, state, and local regulations.
Reclaim solvent at an approved site.
Evaporate or incinerate residue at an approved site.
Recycle containers if possible, or dispose of in an authorized landfill.

Section 14 - Transport Information

DOT Transportation Data (49 CFR 172.101):

Shipping Name: TRICHLOROETHYLENE **Additional Shipping Information:**
Hazard Class: 6.1(b)
ID No.: 1710
Packing Group: III
Label: Harmful[6]

Section 15 - Regulatory Information

EPA Regulations:

RCRA 40 CFR: Listed U228 Toxic Waste
CERCLA 40 CFR 302.4: Listed per CWA Section 311(b)(4); per RCRA Section 3001; per CWA Section 307(a) 100 lb (45.35 kg)
SARA 40 CFR 372.65: Listed
SARA EHS 40 CFR 355: Not listed

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word

Danger!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Colorless liquid; sickly, sweet odor. Irritating to eyes/skin/respiratory tract. Other Acute Effects: weakness, headache, dizziness, confusion, insomnia. Chronic Effects: liver/kidney damage, may cause birth defects. Flammable.

Potential Health Effects

Target Organs: Skin, liver, kidneys, central nervous system.
Primary Entry Routes: Inhalation, skin contact/absorbtion.
Acute Effects
Inhalation: The vapor is highly discomforting to the upper respiratory tract. Inhalation hazard is increased at higher temperatures.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Acute effects from inhalation of high concentrations of vapor are pulmonary irritation, including coughing, with nausea; central nervous system depression - characterized by headache and dizziness, increased reaction time, fatigue and loss of coordination.
If exposure to highly concentrated solvent atmosphere is prolonged this may lead to narcosis, unconsciousness, even coma and possible death.
Central nervous system (CNS) depression may include nonspecific discomfort, symptoms of giddiness, headache, dizziness, nausea, anesthetic effects, slowed reaction time, slurred speech and may progress to unconsciousness.
Serious poisonings may result in respiratory depression and may be fatal.

Eye: The liquid produces a high level of eye discomfort and is capable of causing pain and severe conjunctivitis.
Corneal injury may develop, with possible permanent impairment of vision, if not promptly and adequately treated.
The vapor is discomforting to the eyes if exposure is prolonged.
The material may produce severe irritation to the eye causing pronounced inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.

Skin: The liquid may produce skin discomfort following prolonged contact.
Defatting and/or drying of the skin may lead to dermatitis and it is absorbed by skin.
Toxic effects may result from skin absorption.
Open cuts, abraded or irritated skin should not be exposed to this material.
The material may accentuate any pre-existing skin condition.
The material may cause skin irritation after prolonged or repeated exposure and may produce a contact dermatitis (nonallergic). This form of dermatitis is often characterized by skin redness (erythema) and swelling (edema) which may progress to vesiculation, scaling and thickening of the epidermis. Histologically there may be intercellular edema of the spongy layer (spongiosis) and intracellular edema of the epidermis.

Ingestion: Considered an unlikely route of entry in commercial/industrial environments.
The liquid may produce gastrointestinal discomfort and may be harmful if swallowed. Ingestion may result in nausea, pain and vomiting. Vomit entering the lungs by aspiration may cause potentially lethal chemical pneumonitis.

Carcinogenicity: NTP - Not listed; IARC - Group 3, Not classifiable as to carcinogenicity to humans; OSHA - Not listed; NIOSH - Not listed; ACGIH - Class A4, Not classifiable as a human carcinogen; EPA - Class D, Not classifiable as to human carcinogenicity; MAK - Not listed.

Chronic Effects: Chronic solvent inhalation exposures may result in nervous system impairment and liver and blood changes.
Chronic toluene habituation occurs following intentional abuse (glue-sniffing) or from occupational exposure. Ataxia, incoordination and tremors of the hands and feet (as a consequence of diffuse cerebral atrophy), headache, abnormal speech, transient memory loss, convulsions, coma, drowsiness, reduced color perception, frank blindness, nystagmus (rapid, involuntary eye-movements), decreased hearing leading to deafness and mild dementia have all been associated with chronic abuse.
Peripheral nerve damage, encephalopathy, giant axonopathy, electrolyte disturbances in the cerebrospinal fluid and abnormal computer tomographic (CT) scans are common amongst toluene addicts. Although toluene abuse has been linked with kidney disease, this does not commonly appear in cases of occupational toluene exposures. Cardiac and hematological toxicity are however associated with chronic toluene exposure. Cardiac arrhythmia, multifocal and premature ventricular contractions and supraventricular tachycardia are present in 20% of patients who abused toluene-containing paints.
Previous suggestions that chronic toluene inhalation produced human peripheral neuropathy have largely been discounted. However central nervous system (CNS) depression is well documented where blood toluene levels exceed 2.2 mg%. Toluene abusers can achieve transient circulating concentrations of 6.5 mg%. Amongst workers exposed for a median time of 29 years to toluene no subacute effects on neurasthenic complaints and pyschometric test results could be established.
The prenatal toxicity of very high toluene concentrations has been documented for several animal species and man. Malformations indicative of specific teratogenicity have not generally been found. The toxicity described in the literature takes the form of embryo death or delayed fetal growth and delayed skeletal system development. Permanent damage of children has been seen only when mothers had suffered from chronic intoxication as a result of "sniffing".

Section 4 - First Aid Measures

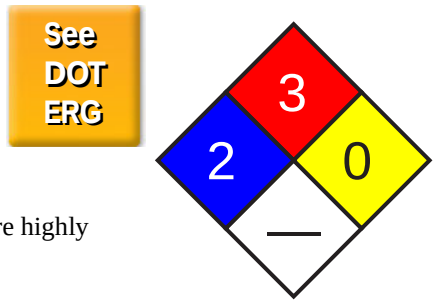
Inhalation: Remove to fresh air.
Lay patient down. Keep warm and rested.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor.

Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.
Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: Immediately remove all contaminated clothing, including footwear (after rinsing with water).
Wash affected areas thoroughly with water (and soap if available).
Seek medical attention in event of irritation.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Ingestion: Contact a Poison Control Center.
Do NOT induce vomiting. Give a glass of water.
After first aid, get appropriate in-plant, paramedic, or community medical support.



Note to Physicians: Following acute or short-term repeated exposures to toluene:
1. Toluene is absorbed across to alveolar barrier, the blood/air mixture being 11.2/15.6 (at 37 °C) The order of toluene, in expired breath, is of the order of 18 ppm following sustained exposure to 100 ppm.
The tissue/blood proportion is 1/3 except in adipose where the proportion is 8/10.
2.Metabolism by microsomal mono-oxygenation, results in the production of hippuric acid. This may be detected in the urine in amounts between 0.5 and 2.5 g/24hr which represents, on average 0.8 gm/gm of creatinine.
The biological half life of hippuric acid is in the order of 1-2 hours.
3.Primary threat to life from ingestion and/or inhalation is respiratory failure.
4.Patients should be quickly evaluated for signs of respiratory distress (e.g. cyanosis, tachypnea, intercostal retraction, obtundation) and given oxygen. Patients with inadequate tidal volumes or poor arterial blood gases (pO_2 <50 mm Hg or pCO_2 >50 mm Hg) should be intubated.
5.Arrhythmias complicate some hydrocarbon ingestion and/or inhalation and electrocardiographic evidence of myocardial injury has been reported; intravenous lines and cardiac monitors should be established in obviously symptomatic patients. The lungs excrete inhaled solvents, so that hyperventilation improves clearance.
6.A chest x-ray should be taken immediately after stabilization of breathing and circulation to document aspiration and detect the presence of pneumothorax.
7.Epinephrine (adrenalin) is not recommended for treatment of bronchospasm because of potential myocardial sensitization to catecholamines.
Inhaled cardioselective bronchodilators (e.g. Alupent, Salbutamol) are the preferred agents, with aminophylline a second choice.
8.Lavage is indicated in patients who require decontamination; ensure use of cuffed endotracheal tube in adult patients.
BIOLOGICAL EXPOSURE INDEX - BEI
These represent the determinants observed in specimens collected from a healthy worker exposed at the Exposure Standard (ES or TLV):

Determinant	Index	Sampling Time	Comments
Hippuric acid in urine	2.5 gm/gm creatinine	End of shift Last 4 hrs of shift	B,NS
Toluene in venous blood	1 mg/L	End of shift	SQ
Toluene in end-exhaled air		End of shift	SQ

NS: Non-specific determinant; also observed after exposure to other material
SQ: Semi-quantitative determinant - Interpretation may be ambiguous; should be used as a screening test or confirmatory test.
B: Background levels occur in specimens collected from subjects NOT exposed.

Section 5 - Fire-Fighting Measures

Flash Point: 4 °C Closed Cup
Autoignition Temperature: 480 °C
LEL: 1.2% v/v
UEL: 7.1% v/v
Extinguishing Media: Foam, dry chemical powder, BCF (where regulations permit), carbon dioxide.
Water spray or fog - Large fires only.
General Fire Hazards/Hazardous Combustion Products: Liquid and vapor are highly flammable.
Severe fire hazard when exposed to heat, flame and/or oxidizers.
Vapor forms an explosive mixture with air.
Severe explosion hazard, in the form of vapor, when exposed to flame or spark. Vapor may travel a considerable distance to source of ignition.
Heating may cause expansion/decomposition with violent rupture of containers.
On combustion, may emit toxic fumes of carbon monoxide (CO) and carbon dioxide (CO_2).

Fire Diamond

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Fire Incompatibility: Avoid contamination with strong oxidizing agents as ignition may result.
Nitric acid with toluene, produces nitrated compounds which are explosive.

Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
Fight fire from a safe distance, with adequate cover.
If safe, switch off electrical equipment until vapor fire hazard removed.
Use water delivered as a fine spray to control the fire and cool adjacent area. Avoid spraying water onto liquid pools.
Do not approach containers suspected to be hot.
Cool fire-exposed containers with water spray from a protective location.
If safe to do so, remove containers from path of fire.

Section 6 - Accidental Release Measures

Small Spills: Remove all ignition sources. Clean up all spills immediately.
Avoid breathing vapors and contact with skin and eyes.
Control personal contact by using protective equipment.
Contain and absorb small quantities with vermiculite or other absorbent material. Wipe up. Collect residues in a flammable waste container.

See DOT ERG

Large Spills: Clear area of personnel and move upwind.
Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
No smoking, bare lights or ignition sources. Increase ventilation.
Stop leak if safe to do so. Water spray or fog may be used to disperse/absorb vapor. Contain spill with sand, earth or vermiculite.
Use only spark-free shovels and explosion proof equipment.
Collect recoverable product into labeled containers for recycling.
Absorb remaining product with sand, earth or vermiculite.
Collect solid residues and seal in labeled drums for disposal.
Wash area and prevent runoff into drains.
If contamination of drains or waterways occurs, advise emergency services.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid all personal contact, including inhalation.
Wear protective clothing when risk of exposure occurs.
Use in a well-ventilated area. Prevent concentration in hollows and sumps.
DO NOT enter confined spaces until atmosphere has been checked.
Avoid smoking, bare lights, heat or ignition sources.
When handling, DO NOT eat, drink or smoke.
Vapor may ignite on pumping or pouring due to static electricity.
DO NOT use plastic buckets. Ground and secure metal containers when dispensing or pouring product. Use spark-free tools when handling.
Avoid contact with incompatible materials.
Keep containers securely sealed. Avoid physical damage to containers.
Always wash hands with soap and water after handling.
Work clothes should be laundered separately.
Use good occupational work practices. Observe manufacturer's storing and handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions.

Recommended Storage Methods: Metal can; Metal drum; Metal safety cans. Packing as supplied by manufacturer.
Plastic containers may only be used if approved for flammable liquid.
Check that containers are clearly labeled and free from leaks.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use in a well-ventilated area; local exhaust ventilation may be required for safe working, i. e. , to keep exposures below required standards; otherwise, PPE is required.
General exhaust is adequate under normal operating conditions.
Local exhaust ventilation may be required in special circumstances.
If risk of overexposure exists, wear NIOSH-approved respirator. Correct fit is essential to ensure adequate protection.
Provide adequate ventilation in warehouses and enclosed storage areas.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

In confined spaces where there is inadequate ventilation, wear full-face air supplied breathing apparatus.

Personal Protective Clothing/Equipment:

Eyes: Safety glasses with side shields; chemical goggles. Full face shield.
DO NOT wear contact lenses. Contact lenses pose a special hazard; soft contact lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Wear chemical protective gloves, eg. PVC. Wear safety footwear.

Respiratory Protection:

Exposure Range >200 to <500 ppm: Air Purifying, Negative Pressure, Half Mask
Exposure Range 500 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Cartridge Color: black

Other: Overalls. Barrier cream. Eyewash unit.

Glove Selection Index:

PE/EVAL/PE ..... Best selection
VITON/CHLOROBUTYL ..... Best selection
VITON ..... Best selection
PVA ..... Best selection
TEFLON ..... Satisfactory; may degrade after 4 hours continuous immersion
SARANEX-23 2-PLY..... Poor to dangerous choice for other than short-term immersion
CPE ..... Poor to dangerous choice for other than short-term immersion
VITON/NEOPRENE ..... Poor to dangerous choice for other than short-term immersion
SARANEX-23 ..... Poor to dangerous choice for other than short-term immersion
NEOPRENE/NATURAL..... Poor to dangerous choice for other than short-term immersion
NITRILE+PVC ..... Poor to dangerous choice for other than short-term immersion
NITRILE ..... Poor to dangerous choice for other than short-term immersion
BUTYL ..... Poor to dangerous choice for other than short-term immersion
PVC..... Poor to dangerous choice for other than short-term immersion
NEOPRENE..... Poor to dangerous choice for other than short-term immersion

Section 9 - Physical and Chemical Properties

Appearance/General Info: Clear highly flammable liquid with a strong aromatic odor; floats on water. Mixes with most organic solvents.

Physical State: Liquid
Odor Threshold: 2.14 ppm
Vapor Pressure (kPa): 2.93 at 20 °C
Vapor Density (Air=1): 3.2
Formula Weight: 92.14
Specific Gravity (H_2O=1, at 4 °C): 0.87 at 20 °C
Evaporation Rate: 2.4 (BuAc=1)

pH: Not applicable
pH (1% Solution): Not applicable.
Boiling Point: 111 °C (232 °F) at 760 mm Hg
Freezing/Melting Point: -95 °C (-139 °F)
Volatile Component (% Vol): 100
Water Solubility: < 1 mg/mL at 18 °C

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Product is considered stable. Hazardous polymerization will not occur.
Storage Incompatibilities: Segregate from strong oxidizers.

Section 11 - Toxicological Information

Toxicity

Oral (human) LD_{Lo}: 50 mg/kg
Oral (rat) LD_{50}: 636 mg/kg
Inhalation (human) TC_{Lo}: 100 ppm
Inhalation (man) TC_{Lo}: 200 ppm
Inhalation (rat) LC_{50}: > 26700 ppm/1h
Dermal (rabbit) LD_{50}: 12124 mg/kg
Reproductive effector in rats

Irritation

Skin (rabbit): 20 mg/24h-moderate
Skin (rabbit): 500 mg - moderate
Eye (rabbit): 0.87 mg - mild
Eye (rabbit): 2 mg/24h - SEVERE
Eye (rabbit): 100 mg/30sec - mild

See *RTECS* XS 5250000, for additional data.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 12 - Ecological Information

Environmental Fate: If released to soil, it will be lost by evaporation from near-surface soil and by leaching to the groundwater. Biodegradation occurs both in soil and groundwater, but it is apt to be slow especially at high concentrations, which may be toxic to microorganisms. The presence of acclimated microbial populations may allow rapid biodegradation. It will not significantly hydrolyze in soil or water under normal environmental conditions. If released into water, its concentration will decrease due to evaporation and biodegradation. This removal can be rapid or take several weeks, depending on temperature, mixing conditions, and acclimation of microorganisms. It will not significantly adsorb to sediment or bioconcentrate in aquatic organisms. If released to the atmosphere, it will degrade by reaction with photochemically produced hydroxyl radicals (half-life 3 hr to slightly over 1 day) or be washed out in rain. It will not be subject to direct photolysis.

Ecotoxicity: LC_{50} Aedes aegypti-4th instar (mosquito larvae) 22 mg/l /Conditions of bioassay not specified; LC_{50} Cyprinodon variegatus (sheepshead minnow) 277-485 mg/l 96 hr /Conditions of bioassay not specified; LC_{50} Calandra granaria (grain weevil) 210 mg/l /in air; LC_{50} Cancer magister (crab larvae stage I) 28 ppm/96 hr /Conditions of bioassay not specified; LC_{50} Crangon franciscorum (shrimp) 4.3 ppm 96 hr /Conditions of bioassay not specified; LC_{50} Artemia salina (brine shrimp) 33 mg/l 24 hr /Conditions of bioassay not specified; LC_{50} Morone saxatilis (striped bass) 7.3 mg/l 96 hr /Conditions of bioassay not specified; LC_{50} Pimephales promelas (fathead minnows) 55-72 mg/l (embryos), 25-36 mg/l (1-day posthatch protolarvae), and 26-31 mg/l (30-day-old minnows)/ 96 hour /Conditions of bioassay not specified

Henry's Law Constant: 0.0067

BCF: eels 13.2

Biochemical Oxygen Demand (BOD): 0%, 5 days

Octanol/Water Partition Coefficient: log K_{ow} = 2.69

Soil Sorption Partition Coefficient: K_{oc} = silty loam 37

Section 13 - Disposal Considerations

Disposal: Consult manufacturer for recycling options and recycle where possible.
Follow applicable federal, state, and local regulations.
Incinerate residue at an approved site.
Recycle containers where possible, or dispose of in an authorized landfill.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

Shipping Name and Description: Toluene
ID: UN1294
Hazard Class: 3 - Flammable and combustible liquid
Packing Group: II - Medium Danger
Symbols:
Label Codes: 3 - Flammable Liquid
Special Provisions: IB2, T4, TP1
Packaging: **Exceptions:** 150 **Non-bulk:** 202 **Bulk:** 242
Quantity Limitations: **Passenger aircraft/rail:** 5 L **Cargo aircraft only:** 60 L
Vessel Stowage: **Location:** B **Other:**

Section 15 - Regulatory Information

EPA Regulations:

RCRA 40 CFR: Listed U220 Toxic Waste
CERCLA 40 CFR 302.4: Listed per CWA Section 311(b)(4), per RCRA Section 3001, per CWA Section 307(a) 1000 lb (453.5 kg)
SARA 40 CFR 372.65: Listed
SARA EHS 40 CFR 355: Not listed
TSCA: Listed

Material Safety Data Sheet Collection
Genium group inc.
1171 RiverFront Center, Amsterdam, NY 12010
(518) 842-4111

Issue Date: 2006-06

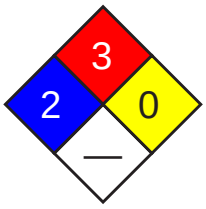
Section 1 - Chemical Product and Company Identification 61

Material Name: Xylene
CAS Number: 1330-20-7
Chemical Formula: C_8H_{10}
Structural Chemical Formula: $C_6H_4(CH_3)_2$
EINECS Number: 215-535-7
ACX Number: X1001166-8
Synonyms: BENZENE,DIMETHYL-; COMPONENT 1 (83%): XYLENES; COMPONENT 2 (17%): ETHYL BENZENE; DIMETHYLBENZENE; DIMETHYLBENZENES; EPA PESTICIDE CHEMICAL CODE 086802; KSYLEN; METHYL TOLUENE; METHYLTOLUENE; VIOLET 3; XILOLI; XYLENE; XYLENEN; XYLOL; XYLOLE
General Use: A strong solvent for general use in the manufacture of paints, varnishes, lacquers, thinners, inks, rubber, pesticides, herbicides and paint strippers.

Section 2 - Composition / Information on Ingredients

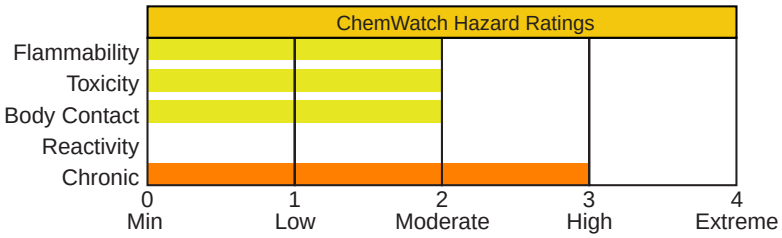
Name	CAS	%
xylene	1330-20-7	> 95

OSHA PEL
TWA: 100 ppm; 435 mg/m^3.

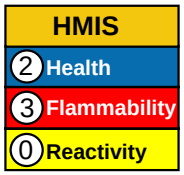


NIOSH REL
TWA: 100 ppm, 435 mg/m^3; STEL: 150 ppm, 655 mg/m^3.

DFG (Germany) MAK
TWA: 100 ppm; PEAK: 200 ppm; skin.



ACGIH TLV
TWA: 100 ppm; STEL: 150 ppm.



EU OEL
TWA: 50 ppm; STEL: 100 ppm.

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word
Warning!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Clear, sweet smelling liquid. Irritating to eyes/skin/respiratory tract. Other Acute Effects: dizziness, nausea, drowsiness. Chronic Effects: dermatitis, kidney/liver/peripheral nerve damage. May cause birth defects (animal data). Flammable.

Potential Health Effects

Target Organs: central nervous system (CNS), eyes, gastrointestinal (GI) tract, liver, kidneys, skin
Primary Entry Routes: inhalation, skin absorption (slight), eye contact, ingestion
Acute Effects
Inhalation: Xylene is a central nervous system depressant. The vapor is discomforting to the upper respiratory tract and may be harmful if inhaled.
Inhalation hazard is increased at higher temperatures.
Toxic effects are increased by consumption of alcohol.
Acute effects from inhalation of high concentrations of vapor are pulmonary irritation, including coughing, with nausea; central nervous system depression - characterized by headache and dizziness, increased reaction time, fatigue and loss of coordination.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

If exposure to highly concentrated solvent atmosphere is prolonged this may lead to narcosis, unconsciousness, even coma and possible death.
Headache, fatigue, lassitude, irritability and gastrointestinal disturbances (e.g., nausea, anorexia and flatulence) are the most common symptoms of xylene overexposure. Injury to the heart, liver, kidneys and nervous system has also been noted among workers. Transient memory loss, renal impairment, temporary confusion and some evidence of disturbance of liver function was reported in three workers overcome by gross exposure to xylene (10000 ppm). One worker died and autopsy revealed pulmonary congestion, edema, and focal alveolar hemorrhage.
Volunteers inhaling xylene at 100 ppm for 5 to 6 hours showed changes in manual coordination, reaction time and slight ataxia. Tolerance developed during the workweek but was lost over the weekend. Physical exercise may antagonize this effect. Xylene body burden in humans exposed to 100 or 200 ppm xylene in air depends on the amount of body fat with 4% to 8% of total absorbed xylene accumulating in human adipose tissues.

Eye: The liquid is highly discomforting to the eyes and is capable of causing a mild, temporary redness of the conjunctiva (similar to wind-burn), temporary impairment of vision and/or other transient eye damage/ulceration.
The vapor is highly discomforting to the eyes.
The material may produce severe irritation to the eye causing pronounced inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.
Corneal changes have been reported in furniture polishers exposed to xylene.

Skin: The liquid is highly discomforting to the skin and may cause drying of the skin, which may lead to dermatitis and it is absorbed by the skin.
Toxic effects may result from skin absorption.
Open cuts, abraded or irritated skin should not be exposed to this material.
The material may accentuate any pre-existing skin condition.
The material may cause skin irritation after prolonged or repeated exposure and may produce a contact dermatitis (nonallergic). This form of dermatitis is often characterized by skin redness (erythema) and swelling (edema) which may progress to vesiculation, scaling and thickening of the epidermis. Histologically there may be intercellular edema of the spongy layer (spongiosis) and intracellular edema of the epidermis.

Ingestion: Considered an unlikely route of entry in commercial/industrial environments.
The liquid may produce gastrointestinal discomfort and may be harmful if swallowed. Ingestion may result in nausea, pain and vomiting. Vomit entering the lungs by aspiration may cause potentially lethal chemical pneumonitis.

Carcinogenicity: NTP - Not listed; IARC - Group 3, Not classifiable as to carcinogenicity to humans; OSHA - Not listed; NIOSH - Not listed; ACGIH - Not listed; EPA - Class D, Not classifiable as to human carcinogenicity; MAK - Not listed.

Chronic Effects: Chronic solvent inhalation exposures may result in nervous system impairment and liver and blood changes.
Prolonged or continuous skin contact with the liquid may cause defatting with drying, cracking, irritation and dermatitis following.
Small excess risks of spontaneous abortion and congenital malformation was reported amongst women exposed to xylene in the first trimester of pregnancy. In all cases however the women had also been exposed to other substances.
Evaluation of workers chronically exposed to xylene has demonstrated a lack of genotoxicity. Exposure to xylene has been associated with increased risks of hemopoietic malignancies but, again simultaneous exposure to other substances (including benzene) complicate the picture. A long-term gavage study of mixed xylenes (containing 17% ethyl benzene) found no evidence of carcinogenic activity in rats and mice of either sex.
Exposure to the material for prolonged periods may cause physical defects in the developing embryo (teratogenesis).

Section 4 - First Aid Measures

Inhalation: Remove to fresh air.
Lay patient down. Keep warm and rested.
If available, administer medical oxygen by trained personnel.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor, without delay.

Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.
Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

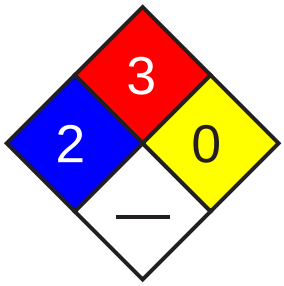
Skin Contact: Immediately remove all contaminated clothing, including footwear (after rinsing with water).
Wash affected areas thoroughly with water (and soap if available).
Seek medical attention in event of irritation.

Ingestion: Contact a Poison Control Center.
Do NOT induce vomiting. Give a glass of water.

After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: For acute or short-term repeated exposures to xylene:
1.Gastrointestinal absorption is significant with ingestions.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.



For ingestions exceeding 1-2 mL (xylene)/kg, intubation and lavage with cuffed endotracheal tube is recommended. The use of charcoal and cathartics is equivocal.
2.Pulmonary absorption is rapid with about 60-65% retained at rest.
3.Primary threat to life from ingestion and/or inhalation is respiratory failure.
4.Patients should be quickly evaluated for signs of respiratory distress (e.g. cyanosis, tachypnea, intercostal retraction, obtundation) and given oxygen. Patients with inadequate tidal volumes or poor arterial blood gases (pO_2 <50 mm Hg or pCO_2 >50 mm Hg) should be intubated.
5.Arrhythmias complicate some hydrocarbon ingestion and/or inhalation and electrocardiographic evidence of myocardial injury has been reported; intravenous lines and cardiac monitors should be established in obviously symptomatic patients. The lungs excrete inhaled solvents, so that hyperventilation improves clearance.
6.A chest x-ray should be taken immediately after stabilization of breathing and circulation to document aspiration and detect the presence of pneumothorax.
7.Epinephrine (adrenalin) is not recommended for treatment of bronchospasm because of potential myocardial sensitization to catecholamines.
Inhaled cardioselective bronchodilators (e.g. Alupent, Salbutamol) are the preferred agents, with aminophylline a second choice.
BIOLOGICAL EXPOSURE INDEX - BEI
These represent the determinants observed in specimens collected from a healthy worker exposed at the Exposure Standard (ES or TLV):

Determinant	Index	Sampling Time	Comments
Methylhippuric acids in urine	1.5 gm/gm creatinine	End of shift	
	2 mg/min	Last 4 hrs of shift.	

Section 5 - Fire-Fighting Measures

Flash Point: 25.6 °C
Autoignition Temperature: 241 °C
LEL: 1.0% v/v
UEL: 7.0% v/v
Extinguishing Media: Alcohol stable foam; dry chemical powder; carbon dioxide.
Water spray or fog - Large fires only.
General Fire Hazards/Hazardous Combustion Products: Liquid and vapor are flammable.
Moderate fire hazard when exposed to heat or flame.
Vapor forms an explosive mixture with air.
Moderate explosion hazard when exposed to heat or flame.
Vapor may travel a considerable distance to source of ignition.
Heating may cause expansion or decomposition leading to violent rupture of containers.
On combustion, may emit toxic fumes of carbon monoxide (CO).
Other combustion products include carbon dioxide (CO_2).
Fire Incompatibility: Avoid contamination with strong oxidizing agents as ignition may result.
Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways.
If safe, switch off electrical equipment until vapor fire hazard removed.
Use water delivered as a fine spray to control fire and cool adjacent area.
Avoid spraying water onto liquid pools.
Do not approach containers suspected to be hot.
Cool fire-exposed containers with water spray from a protected location.
If safe to do so, remove containers from path of fire.

See DOT ERG

Fire Diamond

Section 6 - Accidental Release Measures

Small Spills: Remove all ignition sources. Clean up all spills immediately.
Avoid breathing vapors and contact with skin and eyes.
Control personal contact by using protective equipment.
Contain and absorb small quantities with vermiculite or other absorbent material. Wipe up. Collect residues in a flammable waste container.
Large Spills: Clear area of personnel and move upwind.
Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways.
No smoking, bare lights or ignition sources. Increase ventilation.

See DOT ERG

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Stop leak if safe to do so. Water spray or fog may be used to disperse/absorb vapor. Contain spill with sand, earth or vermiculite.
Use only spark-free shovels and explosion proof equipment.
Collect recoverable product into labeled containers for recycling.
Absorb remaining product with sand, earth or vermiculite.
Collect solid residues and seal in labeled drums for disposal.
Wash area and prevent runoff into drains.
If contamination of drains or waterways occurs, advise emergency services.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid all personal contact, including inhalation.
Wear protective clothing when risk of overexposure occurs.
Use in a well-ventilated area. Prevent concentration in hollows and sumps.
DO NOT enter confined spaces until atmosphere has been checked.
Avoid smoking, bare lights or ignition sources.
Avoid generation of static electricity. DO NOT use plastic buckets.
Ground all lines and equipment. Use spark-free tools when handling.
Avoid contact with incompatible materials.
When handling, DO NOT eat, drink or smoke.
Keep containers securely sealed when not in use. Avoid physical damage to containers. Always wash hands with soap and water after handling.
Work clothes should be laundered separately.
Observe manufacturer's storing and handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions.

Recommended Storage Methods: Metal can; metal drum. Packing as recommended by manufacturer.
Check all containers are clearly labeled and free from leaks.
Plastic containers may only be used if approved for flammable liquids.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use in a well-ventilated area. Local exhaust ventilation may be required for safe working, i. e. , to keep exposures below required standards; otherwise, PPE is required.
CARE: Use of a quantity of this material in confined space or poorly ventilated area, where rapid build-up of concentrated atmosphere may occur, could require increased ventilation and/or protective gear.
General exhaust is adequate under normal operating conditions.
Local exhaust ventilation may be required in specific circumstances.
If risk of overexposure exists, wear NIOSH-approved respirator.
Correct fit is essential to obtain adequate protection.
Provide adequate ventilation in warehouse or closed storage areas.
In confined spaces where there is inadequate ventilation, wear full-face air supplied breathing apparatus.

Personal Protective Clothing/Equipment:

Eyes: Safety glasses with side shields; or as required, chemical goggles.
Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Barrier cream with polyethylene gloves; Butyl rubber gloves or Neoprene gloves or PVC gloves.
Safety footwear.
Do NOT use this product to clean the skin.

Other: Overalls. Impervious protective clothing.
Eyewash unit.
Ensure there is ready access to an emergency shower.

Glove Selection Index:

PE/EVAL/PE ..... Best selection
PVA ..... Best selection
VITON ..... Best selection
TEFLON ..... Best selection
PVDC/PE/PVDC ..... Poor to dangerous choice for other than short-term immersion

NITRILE..... Poor to dangerous choice for other than short-term immersion
NEOPRENE..... Poor to dangerous choice for other than short-term immersion
PVC..... Poor to dangerous choice for other than short-term immersion

Section 9 - Physical and Chemical Properties

Appearance/General Info: Clear colorless flammable liquid with a strong aromatic odor; floats on water. Mixes with most organic solvents.

Physical State: Liquid
Odor Threshold: 5.00 x10^{-5} ppm
Vapor Pressure (kPa): 0.5 at 15 °C
Vapor Density (Air=1): 3.66 at 15 °C
Formula Weight: 106.18
Specific Gravity (H_2O=1, at 4 °C): 0.87 at 15 °C
Evaporation Rate: 0.7 Bu Ac=1

pH: Not applicable
pH (1% Solution): Not applicable.
Boiling Point: 137 °C (279 °F) to 140 °C (284 °F)
Freezing/Melting Point: -47 °C (-53 °F)
Volatile Component (% Vol): 100
Water Solubility: Practically insoluble in water

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Product is considered stable. Hazardous polymerization will not occur.
Storage Incompatibilities: Avoid storage with oxidizers.

Section 11 - Toxicological Information

Toxicity
Oral (human) LD_{Lo}: 50 mg/kg
Oral (rat) LD_{50}: 4300 mg/kg
Inhalation (human) TC_{Lo}: 200 ppm
Inhalation (man) LC_{Lo}: 10000 ppm/6h
Inhalation (rat) LC_{50}: 5000 ppm/4h
Reproductive effector in rats

Irritation
Skin (rabbit):500 mg/24h moderate
Eye (human): 200 ppm irritant
Eye (rabbit): 87 mg mild
Eye (rabbit): 5 mg/24h SEVERE

See *RTECS* ZE 2100000, for additional data.

Section 12 - Ecological Information

Environmental Fate: Most of the xylenes are released into the atmosphere where they may photochemically degrade by reaction with hydroxyl radicals (half-life 1-18 hr). The dominant removal process in water is volatilization. Xylenes are moderately mobile in soil and may leach into groundwater where they are known to persist for several years, despite some evidence that they biodegrade in both soil and groundwater. Bioconcentration is not expected to be significant.
Ecotoxicity: LC_{50} Rainbow trout 13.5 mg/l/96 hr /Conditions of bioassay not specified; LD_{50} Goldfish 13 mg/l/24 hr /Conditions of bioassay not specified
Henry's Law Constant: 0.22
BCF: estimated at 2.14 to 2.20
Octanol/Water Partition Coefficient: log K_{ow} = 3.12 to 3.20
Soil Sorption Partition Coefficient: K_{OC} = 48 to 68

Section 13 - Disposal Considerations

Disposal: Consult manufacturer for recycling options and recycle where possible.
Follow applicable federal, state, and local regulations.
Incinerate residue at an approved site.
Recycle containers where possible, or dispose of in an authorized landfill.

Material Safety Data Sheet Collection
Genium group inc.
1171 RiverFront Center, Amsterdam, NY 12010
(518) 842-4111

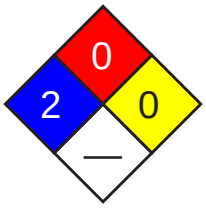
Issue Date: 2006-06

Section 1 - Chemical Product and Company Identification 61

Material Name: Arsenic **CAS Number:** 7440-38-2
Chemical Formula: As
Structural Chemical Formula: As_4
EINECS Number: 231-148-6
ACX Number: X1002785-7
Synonyms: ARSEN; ARSENIA; ARSENIC; ARSENIC-75; ARSENIC BLACK; ARSENICALS; COLLOIDAL ARSENIC; GRAY ARSENIC; GREY ARSENIC; METALLIC ARSENIC
General Use: In metallurgy for hardening copper, lead alloys. In the manufacture of certain types of glass.

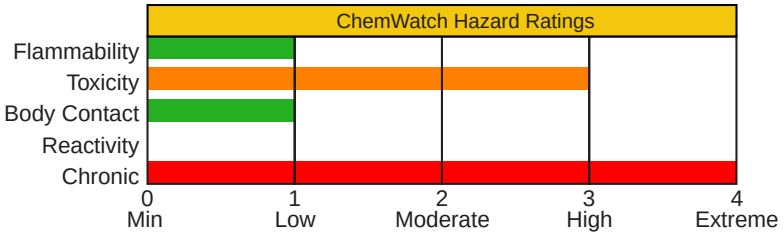
Section 2 - Composition / Information on Ingredients

Name	CAS	%
Arsenic		>98

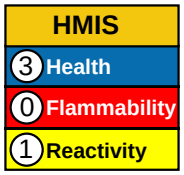


OSHA PEL
TWA: 0.01 mg/m^3.

NIOSH REL
Ceiling: 0.002 mg/m^3 (15-minute).



ACGIH TLV
TWA: 0.01 mg/m^3.



IDLH Level
5 mg/m^3 (as As).

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word

Warning!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Brittle, crystalline, silvery-black metal. Irritating to eyes/skin/respiratory tract. Chronic Effects: damage to blood-forming organs, nervous/cardiovascular systems effects. Cancer hazard. Powder is flammable.

Potential Health Effects

Target Organs: liver, kidneys, skin, lungs, lymphatic system
Primary Entry Routes: inhalation, ingestion of dust and fumes, skin absorption
Acute Effects

Inhalation: The dust is toxic and discomforting to the upper respiratory tract and lungs.
Acute inhalation exposure can cause cough, chest pain, shortness of breath, dizziness, headache, pulmonary edema and extreme general weakness.
Prolonged or repeated exposure can cause perforation of the nasal septum.
High exposures can cause poor appetite, nausea, vomiting and muscle cramps. Heart effects with abnormal EKG can also occur with very high exposures.

Eye: The dust may produce eye discomfort causing smarting, pain and redness.

Skin: The material is moderately discomforting to the skin and may be harmful.
Exposure may result in abnormal redness (caused by capillary congestion), burning, itching, swelling, skin eruptions and dermatitis.
Toxic effects may result from skin absorption.
Repeated skin contact can cause thickened skin and/or patchy areas of darkening and loss of pigment. Some persons develop white lines on the nails.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Ingestion: The solid/dust is discomforting to the gastrointestinal tract and is toxic and may be fatal if swallowed. Symptoms of acute poisoning by ingestion, which develop within 4 hours include epigastric pain, vomiting and watery diarrhea. Blood may appear in vomitus and stools. If amount ingested is sufficiently high, shock may develop, followed by death within 24 hours.
Considered an unlikely route of entry in commercial/industrial environments.

Carcinogenicity: NTP - Class 1, Known to be a carcinogen; IARC - Group 1, Carcinogenic to humans; OSHA - Listed as a carcinogen; NIOSH - Listed as carcinogen; ACGIH - Class A1, Confirmed human carcinogen; EPA - Class A, Human carcinogen; MAK - Class A1, Capable of inducing malignant tumors as shown by experience with humans.

Chronic Effects: Symptoms of chronic poisoning by inhalation include weight loss, nausea and diarrhea alternating with constipation, pigmentation and eruption of the skin, loss of hair, peripheral neuritis, blood disorders (anemia), striations on fingernails and toenails.
Long-term exposure can cause an ulcer or hole in the `bone' dividing the inner nose. Hoarseness and sore eyes also occur.
High or repeated exposure can cause nerve damage with `pins and needles', burning, numbness, and later weakness of arms and legs. Repeated exposure can also damage the liver, causing narrowing of the blood vessels, or interfere with the bone marrow's ability to make red blood cells.
Many cases of skin cancer have been reported among people exposed to arsenic through medical treatment with inorganic trivalent arsenic compounds. In some instances skin cancers have occurred in combination with other cancers, such as liver angiosarcoma, intestinal and urinary bladder carcinomas and meningioma. Epidemiological studies of cancer after medical treatment have shown an excess of skin cancers but no clear association with other cancers has been shown. An association between environmental exposure to arsenic through drinking water and skin cancer has been observed and confirmed. Epidemiological studies in areas where drinking water contained 0.35-1.14 mg/l arsenic elevated risks for cancers of the bladder, kidney, skin, liver, lung and colon in both men and women. Occupational exposure to inorganic arsenic, especially in mining and copper smelting, has consistently been associated with an increased risk of cancer. An almost tenfold increase in the incidence of lung cancer was found in workers most heavily exposed to arsenic and relatively clear dose-response relationships have been obtained with regard to cumulative exposure. Other smelter worker populations have been shown to have consistent increases in lung cancer incidence, as well as increases of about 20% in the incidence of gastrointestinal cancer and of 30% for renal cancer and hematolymphatic malignancies.

Section 4 - First Aid Measures

Inhalation: Remove to fresh air. Lay patient down. Keep warm and rested.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor.

See DOT ERG

Eye Contact: Immediately hold the eyes open and wash continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids. Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: Quickly but gently, wipe material off skin with a dry, clean cloth.
Immediately remove all contaminated clothing, including footwear.
Wash affected areas with water (and soap if available) for at least 15 minutes. Transport to hospital or doctor.

Ingestion: Contact a Poison Control Center.
If swallowed, and if more than 15 minutes from a hospital, induce vomiting, preferably using Ipecac Syrup APF.
Note: DO NOT INDUCE VOMITING in an unconscious person

After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: For acute or short term repeated exposures to arsenic, soluble compounds:
Treat as per arsenic poisoning.
1. Acute skin lesions such as contact dermatitis usually do not require other treatment than removal from exposure.
2. If more severe symptoms of the respiratory system, the skin or the gastrointestinal tract occur, British Anti-Lewisite (BAL, dimercaprol) may be given. Prompt administration in such cases is vital; to obtain maximum benefit such treatment should be administered within 4 hours of poisoning.
3. In addition, general treatment such as prevention of further absorption from the gastrointestinal tract are mandatory.
4. General supportive therapy such as maintenance of respiration and circulation, maintenance of water and electrolyte balance and control of nervous system effects, as well as elimination of absorbed poison through dialysis and exchange transfusion, may be used if feasible.
5. Dimercaprol is given by deep intramuscular injection as a 5% solution in peanut oil (or a 10% solution with benzyl-benzoate in vegetable oil). It is usually given in a dose of 3 mg/kg, 4-hourly, for the first two days, or twice daily for up to seven days.
6. BAL Therapy is effective for hematological manifestations of chronic arsenic poisoning but not for neurological symptoms. Watch for side effects (e.g. urticaria, burning sensation in the lips, mouth and throat, fever, conjunctivitis etc).
7. Some relief results from administration of diphenhydramine (Benadryl) (1.5 mg/kg intramuscularly or by mouth every 6 hour).

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

BIOLOGICAL EXPOSURE INDEX - BEI

These represent the determinants observed in specimens collected from a healthy worker exposed at the Exposure Standard (ES or TLV):

Determinant	Index	Sampling Time	Comments
Inorganic arsenic metabolites in urine	50 ug/g creatinine	End of workweek	B

B: Background levels occur in specimens collected from subjects NOT exposed

Consult specific documentation.

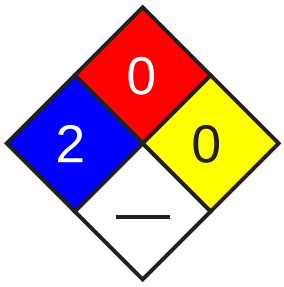
Section 5 - Fire-Fighting Measures

Flash Point: Noncombustible solid

Extinguishing Media: Use fire fighting procedures suitable for surrounding area.

General Fire Hazards/Hazardous Combustion Products: Solid which exhibits difficult combustion or is difficult to ignite.

Avoid generating dust, particularly clouds of dust in a confined or unventilated space.



Dust may form an explosive mixture with air, and any source of ignition, i.e. flame or spark, will cause fire or explosion.

Dry dust can be charged electrostatically by turbulence, pneumatic transport, pouring, in exhaust ducts and during transport. Build-up of electrostatic charge may be prevented by bonding and grounding.

Powder handling equipment such as dust collectors, dryers and mills may require additional protection measures such as explosion venting.

Decomposes on heating and produces toxic fumes of arsenic oxides (AsO_x).

See DOT ERG

Fire Diamond

Fire Incompatibility: Avoid contact with acids, oxidizing agents, halogens.

Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.

Wear breathing apparatus plus protective gloves for fire only. Prevent, by any means available, spillage from entering drains or waterways.

Use fire fighting procedures suitable for surrounding area.

Do not approach containers suspected to be hot.

Cool fire exposed containers with water spray from a protected location.

If safe to do so, remove containers from path of fire.

Equipment should be thoroughly decontaminated after use.

Section 6 - Accidental Release Measures

Small Spills: Clean up all spills immediately. Wear protective clothing, impervious gloves and safety glasses. Increase ventilation.

Use a vacuum or a wet method to reduce dust during clean-up. DO NOT dry sweep.

Place in suitable containers for disposal.

Wash area down with large quantity of water and prevent runoff into drains.

See DOT ERG

Large Spills: POLLUTANT -contain spillage. Clear area of personnel and move upwind.

Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways.

If contamination of drains or waterways occurs, advise emergency services.

Shut off all possible sources of ignition and increase ventilation.

Stop leak if safe to do so.

Contain spill with sand, earth or vermiculite.

Use dry clean up procedures and avoid generating dust.

Collect recoverable product into labeled containers for recycling. Collect residues and seal in labeled drums for disposal.

Wash area down with large quantity of water and prevent runoff into drains.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions are maintained.

Use good occupational work practice.

Avoid contact with skin and eyes.

Avoid generating and breathing dust.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Use in a well-ventilated area.
Wear protective clothing when risk of exposure occurs.
Avoid sources of heat. Avoid contact with incompatible materials. Avoid physical damage to containers.
Keep containers securely sealed when not in use.
When handling, DO NOT eat, drink or smoke.
Wash hands with soap and water after handling.
Work clothes should be laundered separately: NOT at home.

Recommended Storage Methods: Glass container. Plastic drum. Polyethylene or polypropylene container. Steel drum. Metal drum.
Check that containers are clearly labeled.

Storage Requirements: Observe manufacturer's storing and handling recommendations.
Store in a cool, dry place. Store in a well-ventilated area. Store away from sources of heat or ignition/bare lights. Avoid storage at temperatures higher than 60 °C. Store away from incompatible materials. Store away from foodstuff containers.
Protect containers against physical damage.
Keep containers securely sealed.
Check regularly for spills and leaks.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: General exhaust is adequate under normal operating conditions.
Local exhaust ventilation may be required.
Use ventilated helmet or air-line hood to provide clean air at the breathing zone.
If risk of overexposure exists, wear NIOSH approved respirator. Correct fit is essential to obtain adequate protection.

Personal Protective Clothing/Equipment:

Eyes: Safety glasses. Chemical goggles.
Full face shield.
Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Impervious, gauntlet length gloves; Rubber gloves. Neoprene gloves.
Rubber boots.

Respiratory Protection:
Exposure Range >0.01 to 0.1 mg/m^3: Air Purifying, Negative Pressure, Half Mask
Exposure Range >0.1 to 1 mg/m^3: Air Purifying, Negative Pressure, Full Face
Exposure Range >1 to <5 mg/m^3: Supplied Air, Constant Flow/Pressure Demand, Full Face
Exposure Range 5 to unlimited mg/m^3: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Cartridge Color: magenta (P100)

Other: Overalls. PVC apron. PVC protective suit may be required if exposure severe.
Eyewash unit. Ensure there is ready access to a safety shower.
* Preplacement and periodic medical examinations are essential for workers exposed to arsenic. Preplacement physical examinations should give particular attention to allergic and chronic skin lesions, eye disease, psoriasis, chronic eczematous dermatitis, hyperpigmentation of the skin, keratosis and warts, baseline weight, baseline blood and hemoglobin counts, baseline urinary arsenic determinations.
Annual physical examinations should give attention to general health, weight, skin condition, and any evidence of excessive exposure or absorption of arsenic.

Section 9 - Physical and Chemical Properties

Appearance/General Info: Grey, shiny, brittle, metallic-looking rhombohedral crystals. Can be heated to burn in air with a bluish flame, giving off an odor of garlic and dense white fumes of arsenic trioxide. Loses its luster on exposure to air. Converted by nitric acid or hot sulfuric acid into arsenous or arsenic acid.

Brinell hardness: 147
Mohs' scale: 3.5

Physical State: Divided solid
Vapor Pressure (kPa): Not applicable
Vapor Density (Air=1): Not applicable
Formula Weight: 74.92
Specific Gravity (H_2O=1, at 4 °C): 5.73
Evaporation Rate: Not applicable
pH: Not applicable
pH (1% Solution): Not applicable
Boiling Point: Sublimes
Freezing/Melting Point: 817 °C (1502.6 °F) at 28 atm
Volatile Component (% Vol): Not applicable
Water Solubility: Insoluble

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Contact with acids liberates toxic gases. Presence of heat source and ignition source.
Product is considered stable under normal handling conditions. Hazardous polymerization will not occur.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Storage Incompatibilities: Segregate from oxidizing agents, halogens.
Contact with acids produces toxic fumes.

Section 11 - Toxicological Information

Toxicity
Oral (man) TD_{Lo}: 7857 mg/kg/55 years
Oral (rat) LD_{50}: 763 mg/kg
Tumorigenic - Carcinogenic by RTECS criteria.

Irritation
Nil reported

See *RTECS* CG 0525000, for additional data.

Section 12 - Ecological Information

Environmental Fate: No data found.
Ecotoxicity: Food chain concentration potential: Bioaccumulated by fresh water and marine aquatic organisms
BCF: bioaccumulated by aquatic organisms
Biochemical Oxygen Demand (BOD): none

Section 13 - Disposal Considerations

Disposal: Follow all federal, state, and local regulations.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

Shipping Name and Description: Arsenic
ID: UN1558

1171 RiverFront Center, Amsterdam, NY 12010
(518) 842-4111

Issue Date: 2006-06

Section 1 - Chemical Product and Company Identification 61

Material Name: Benzene **CAS Number:** 71-43-2
Chemical Formula: C_6H_6
Structural Chemical Formula: C_6H_6
EINECS Number: 200-753-7
ACX Number: X1001488-9
Synonyms: Benzene; BENZENE; (6)ANNULENE; BENZEEN; BENZEN; BENZIN; BENZINE; BENZOL; BENZOL 90; BENZOLE; BENZOLENE; BENZOLO; BICARBURET OF HYDROGEN; CARBON OIL; COAL NAPHTHA; CYCLOHEXATRIENE; EPA PESTICIDE CHEMICAL CODE 008801; FENZEN; MINERAL NAPHTHA; MOTOR BENZOL; NITRATION BENZENE; PHENE; PHENYL HYDRIDE; POLYSTREAM; PYROBENZOL; PYROBENZOLE
General Use: Manufacture of chemicals including styrene, dyes, and many other organic chemicals. Has been used in artificial leather, linoleum, oil cloth, airplane dopes, lacquers; as solvent for waxes, resins, oils etc.
May also be a minor component of gasoline, petrol.
Exposure should be minimized by use in closed systems.
Handling procedures and control measures should be evaluated for exposure before commencement of use in plant operations.

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word

Danger!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Colorless liquid; sweet odor. Irritating to eyes/skin/respiratory tract. Toxic. Other Acute Effects: headache, dizziness, drowsiness. Absorbed through skin. Chronic Effects: dermatitis, leukemia, bone marrow damage. Carcinogen. Reproductive effects. Flammable.

Potential Health Effects

Target Organs: blood, central nervous system (CNS), bone marrow, eyes, upper respiratory system, skin
Primary Entry Routes: inhalation, skin contact
Acute Effects
Inhalation: The vapor is discomforting to the upper respiratory tract and lungs and may be harmful if inhaled.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

If exposure to highly concentrated solvent atmosphere is prolonged this may lead to narcosis, unconsciousness, even coma and possible death.
Acute effects from inhalation of high concentrations of vapor are pulmonary irritation, including coughing, with nausea; central nervous system depression - characterized by headache and dizziness, increased reaction time, fatigue and loss of coordination.
Inhalation hazard is increased at higher temperatures.
The symptoms of acute exposure to high vapor concentrations include confusion, dizziness, tightening of the leg muscles and pressure over the forehead followed by a period of excitement. If exposure continues the casualty quickly becomes stupefied and lapses into a coma with narcosis.
Effects of inhalation may include nausea, vomiting headache, dizziness, drowsiness, weakness, sometimes preceded by brief periods of exhilaration, or euphoria, irritability, malaise, confusion, ataxia, staggering, weak and rapid pulse, chest pain and tightness with breathlessness, pallor, cyanosis of the lips and fingertips and tinnitus. Severe exposures may produce blurred vision, shallow, rapid breathing, delirium, cardiac arrhythmias, unconsciousness, deep anesthesia, paralysis and coma characterized by motor restlessness, tremors and hyperreflexia (occasionally preceded by convulsions). Polyneuritis and persistent nausea, anorexia, muscular weakness, headache, drowsiness, insomnia and agitation may also occur. Two-three weeks after the exposure, nervous irritability, breathlessness and unsteady gait may still persist; cardiac distress and an unusual dicoloration of the skin may be evident for up to four weeks.
Hemotoxicity is not normally a feature of acute exposures although anemia, thrombocytopenia, petechial hemorrhage, and spontaneous internal bleeding have been reported. Fatal exposures may result from asphyxia, central nervous system depression, cardiac and respiratory failure and circulatory collapse; sudden ventricular fibrillation may also be fatal.
Death may be sudden or may be delayed for 24 hours. Central nervous system, respiratory or hemorrhagic complications may occur up to five days after the exposure and may be lethal; pathological findings include respiratory inflammation with edema, and lung hemorrhage, renal congestion, cerebral edema and extensive petechial hemorrhage in the brain, pleurae, pericardium, urinary tract, mucous membrane and skin.
Exposure to toxic levels has also produced chromosome damage.

Eye: The liquid is highly discomforting to the eyes, may be harmful following absorption and is capable of causing a mild, temporary redness of the conjunctiva (similar to wind-burn), temporary impairment of vision and/or other transient eye damage/ulceration.
The vapor is moderately discomforting to the eyes.
The material may produce severe irritation to the eye causing pronounced inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.

Skin: The liquid may produce skin discomfort following prolonged contact.
Defatting and/or drying of the skin may lead to dermatitis. Open cuts, abraded or irritated skin should not be exposed to this material.
Toxic effects may result from skin absorption.
The material may cause skin irritation after prolonged or repeated exposure and may produce a contact dermatitis (nonallergic). This form of dermatitis is often characterized by skin redness (erythema) and swelling (edema) which may progress to vesiculation, scaling and thickening of the epidermis. Histologically there may be intercellular edema of the spongy layer (spongiosis) and intracellular edema of the epidermis.

Ingestion: The liquid is discomforting to the gastrointestinal tract and may be harmful if swallowed.
Ingestion may result in nausea, pain, vomiting. Vomit entering the lungs by aspiration may cause potentially lethal chemical pneumonitis.

Carcinogenicity: NTP - Class 1, Known to be a carcinogen; IARC - Group 1, Carcinogenic to humans; OSHA - Listed as a carcinogen; NIOSH - Listed as carcinogen; ACGIH - Class A2, Suspected human carcinogen; EPA - Class A, Human carcinogen; MAK - Class A1, Capable of inducing malignant tumors as shown by experience with humans.

Chronic Effects: Liquid is an irritant and may cause burning and blistering of skin on prolonged exposure.
Chronic exposure may cause headache, fatigue, loss of appetite and lassitude with incipient blood effects including anemia and blood changes.
Benzene is a myelotoxicant known to suppress bone-marrow cell proliferation and to induce hematologic disorders in humans and animals.
Signs of benzene-induced aplastic anemia include suppression off leukocytes (leukopenia), red cells (anemia), platelets (thromocytopenia) or all three cell types (pancytopenia). Classic symptoms include weakness, purpura, and hemorrhage. The most significant toxic effect is insidious and often irreversible injury to the blood forming tissue. Leukemia may develop.

Section 4 - First Aid Measures

Inhalation: Remove to fresh air.
Lay patient down. Keep warm and rested.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor.

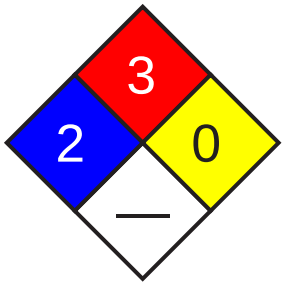
Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: Immediately remove all contaminated clothing, including footwear (after rinsing with water).
Wash affected areas thoroughly with water (and soap if available).
Seek medical attention in event of irritation.

Ingestion: Contact a Poison Control Center.
Do NOT induce vomiting. Give a glass of water.



After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: For acute or short-term repeated exposures to petroleum distillates or related hydrocarbons:
1.Primary threat to life from pure petroleum distillate ingestion and/or inhalation is respiratory failure.
2.Patients should be quickly evaluated for signs of respiratory distress (e.g. cyanosis, tachypnea, intercostal retraction, obtundation) and given oxygen. Patients with inadequate tidal volumes or poor arterial blood gases (pO_2 <50 mm Hg or pCO_2 >50 mm Hg) should be intubated.
3.Arrhythmias complicate some hydrocarbon ingestion and/or inhalation and electrocardiographic evidence of myocardial injury has been reported; intravenous lines and cardiac monitors should be established in obviously symptomatic patients. The lungs excrete inhaled solvents, so that hyperventilation improves clearance.
4.A chest x-ray should be taken immediately after stabilization of breathing and circulation to document aspiration and detect the presence of pneumothorax.
5.Epinephrine (adrenalin) is not recommended for treatment of bronchospasm because of potential myocardial sensitization to catecholamines.
Inhaled cardioselective bronchodilators (e.g. Alupent, Salbutamol) are the preferred agents, with aminophylline a second choice.
6.Lavage is indicated in patients who require decontamination; ensure use of cuffed endotracheal tube in adult patients.
Consider complete blood count. Evaluate history of exposure.

Section 5 - Fire-Fighting Measures

Flash Point: -11 °C Closed Cup
Autoignition Temperature: 562 °C
LEL: 1.3% v/v
UEL: 7.1% v/v
Extinguishing Media: Foam, dry chemical powder, BCF (where regulations permit), carbon dioxide.
Water spray or fog - Large fires only.

See DOT ERG

Fire Diamond

General Fire Hazards/Hazardous Combustion Products: Liquid and vapor are highly flammable.
Severe fire hazard when exposed to heat, flame and/or oxidizers.
Vapor forms an explosive mixture with air.
Severe explosion hazard, in the form of vapor, when exposed to flame or spark. Vapor may travel a considerable distance to source of ignition.
Heating may cause expansion/decomposition with violent rupture of containers.
On combustion, may emit toxic fumes of carbon monoxide (CO).

Fire Incompatibility: Avoid contamination with oxidizing agents i.e. nitrates, oxidizing acids, chlorine bleaches, pool chlorine etc. as ignition may result.

Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear full body protective clothing with breathing apparatus. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
Fight fire from a safe distance, with adequate cover.
If safe, switch off electrical equipment until vapor fire hazard removed.
Use water delivered as a fine spray to control fire and cool adjacent area.
Avoid spraying water onto liquid pools.
Do not approach containers suspected to be hot.
Cool fire-exposed containers with water spray from a protected location.
If safe to do so, remove containers from path of fire.
Equipment should be thoroughly decontaminated after use.

Section 6 - Accidental Release Measures

Small Spills: Remove all ignition sources. Clean up all spills immediately.
Avoid breathing vapors and contact with skin and eyes.
Control personal contact by using protective equipment.
Contain and absorb small quantities with vermiculite or other absorbent material. Wipe up. Collect residues in a flammable waste container.

See DOT ERG

Large Spills: Pollutant - contain spillage. Clear area of personnel and move upwind.
Contact fire department and tell them location and nature of hazard.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
No smoking, bare lights or ignition sources. Increase ventilation.
Stop leak if safe to do so. Water spray or fog may be used to disperse/absorb vapor. Contain spill with sand, earth or vermiculite.
Use only spark-free shovels and explosion proof equipment.
Collect recoverable product into labeled containers for recycling.
Absorb remaining product with sand, earth or vermiculite.
Collect solid residues and seal in labeled drums for disposal.
Wash area and prevent runoff into drains.
If contamination of drains or waterways occurs, advise emergency services.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid all personal contact, including inhalation.
Wear protective clothing when risk of exposure occurs.
Use in a well-ventilated area. Prevent concentration in hollows and sumps.
DO NOT enter confined spaces until atmosphere has been checked.
Avoid smoking, bare lights, heat or ignition sources.
When handling, DO NOT eat, drink or smoke.
Vapor may ignite on pumping or pouring due to static electricity.
DO NOT use plastic buckets. Ground and secure metal containers when dispensing or pouring product. Use spark-free tools when handling.
Avoid contact with incompatible materials.
Keep containers securely sealed. Avoid physical damage to containers.
Always wash hands with soap and water after handling.
Work clothes should be laundered separately.
Use good occupational work practices. Observe manufacturer's storing and handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions.

Recommended Storage Methods: Metal can; metal drum. Packing as recommended by manufacturer.
Check all containers are clearly labeled and free from leaks.

Storage Requirements: Store in original containers in approved flame-proof area.
No smoking, bare lights, heat or ignition sources.
DO NOT store in pits, depressions, basements or areas where vapors may be trapped. Keep containers securely sealed.
Store away from incompatible materials in a cool, dry well ventilated area.
Protect containers against physical damage and check regularly for leaks.
Observe manufacturer's storing and handling recommendations.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use in a well-ventilated area. Local exhaust ventilation usually required.
If risk of overexposure exists, wear NIOSH-approved respirator.
Correct fit is essential to obtain adequate protection. NIOSH-approved self contained breathing apparatus (SCBA) may be required in some situations.
Provide adequate ventilation in warehouse or closed storage area.

Personal Protective Clothing/Equipment:

Eyes: Chemical goggles. Full face shield.
Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Nitrile gloves; Neoprene gloves.
Safety footwear.
Do NOT use this product to clean the skin.

Respiratory Protection:
Exposure Range >1 to 10 ppm: Air Purifying, Negative Pressure, Half Mask
Exposure Range >10 to 100 ppm: Air Purifying, Negative Pressure, Full Face
Exposure Range >100 to 1000 ppm: Supplied Air, Constant Flow/Pressure Demand, Full Face
Exposure Range >1000 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Cartridge Color: black
Note: must change cartridge at beginning of each shift

Other: Overalls. Eyewash unit. Barrier cream. Skin cleansing cream.

Section 9 - Physical and Chemical Properties

Appearance/General Info: Clear, highly flammable liquid; floats on water. Characteristic aromatic odor. Highly volatile. Mixes with alcohol, chloroform, ether, carbon disulfide, carbon tetrachloride, glacial acetic acid, acetone and oils.

Physical State: Liquid
Odor Threshold: 4.68 ppm
Vapor Pressure (kPa): 9.95 at 20 °C
Vapor Density (Air=1): 2.77
Formula Weight: 78.12
Specific Gravity (H_2O=1, at 4 °C): 0.879 at 20 °C
Evaporation Rate: Fast

pH: Not applicable
pH (1% Solution): Not applicable.
Boiling Point: 80.1 °C (176 °F)
Freezing/Melting Point: 5.5 °C (41.9 °F)
Volatile Component (% Vol): 100
Water Solubility: 0.18 g/100 g of water at 25 °C

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Product is considered stable. Hazardous polymerization will not occur.
Storage Incompatibilities: Avoid reaction with oxidizing agents.

Section 11 - Toxicological Information

Toxicity
Oral (man) LD_{Lo}: 50 mg/kg
Oral (rat) LD_{50}: 930 mg/kg
Inhalation (rat) LC_{50}: 10000 ppm/7h
Inhalation (human) LC_{Lo}: 2000 ppm/5m
Inhalation (man) TC_{Lo}: 150 ppm/1y - I
Inhalation (human) TC_{Lo}: 100 ppm
Reproductive effector in rats

Irritation
Skin (rabbit): 20 mg/24 hr - mod
Eye (rabbit): 2 mg/24 hr - SEVERE

See *RTECS* CY 1400000, for additional data.

Section 12 - Ecological Information

Environmental Fate: If released to soil, it will be subject to rapid volatilization near the surface and that which does not evaporate will be highly to very highly mobile in the soil and may leach to groundwater. It may be subject to biodegradation based on reported biodegradation of 24% and 47% of the initial 20 ppm in a base-rich para-brownish soil in 1 and 10 weeks, respectively. It may be subject to biodegradation in shallow, aerobic groundwaters, but probably not under anaerobic conditions. If released to water, it will be subject to rapid volatilization; the half-life for evaporation in a wind-wave tank with a moderate wind speed of 7.09 m/sec was 5.23 hours; the estimated half-life for volatilization from a model river one meter deep flowing 1 m/sec with a wind velocity of 3 m/sec is estimated to be 2.7 hours at 20 °C. It will not be expected to significantly adsorb to sediment, bioconcentrate in aquatic organisms or hydrolyze. It may be subject to biodegradation based on a reported biodegradation half-life of 16 days in an aerobic river die-away test. In a marine ecosystem biodegradation occurred in 2 days after an acclimation period of 2 days and 2 weeks in the summer and spring, respectively, whereas no degradation occurred in winter. According to one experiment, it has a half-life of 17 days due to photodegradation which could contribute to removal in situations of cold water, poor nutrients, or other conditions less conductive to microbial degradation. If released to the atmosphere, it will exist predominantly in the vapor phase. Gas-phase will not be subject to direct photolysis but it will react with photochemically produced hydroxyl radicals with a half-life of 13.4 days calculated using an experimental rate constant for the reaction. The reaction time in polluted atmospheres which contain nitrogen oxides or sulfur dioxide is accelerated with the half-life being reported as 4-6 hours. Products of photooxidation include phenol, nitrophenols, nitrobenzene, formic acid, and peroxyacetyl nitrate. It is fairly soluble in water and is removed from the atmosphere in rain.

Ecotoxicity: LC_{50} Clawed toad (3-4 wk after hatching) 190 mg/l/48 hr /Conditions of bioassay not specified; LC_{50} Morone saxatilis (bass) 5.8 to 10.9 ppm/96 hr /Conditions of bioassay not specified; LC_{50} Poecilia reticulata (guppy) 63 ppm/14 days /Conditions of bioassay not specified; LC_{50} Salmo trutta (brown trout yearlings) 12 mg/l/1 hr (static bioassay); LD_{50} Lepomis macrochirus (bluegill sunfish) 20 mg/l/24 to 48 hr /Conditions of bioassay not specified; LC_{100} Tetrahymena pyriformis (ciliate) 12.8 mmole/l/24 hr /Conditions of bioassay not specified; LC_{50} Cancer magister (crab larvae) stage 1, 108 ppm/96 hr /Conditions of bioassay not specified; LC_{50} Crangon franciscorum (shrimp) 20 ppm/96 hr /Conditions of bioassay not specified

Henry's Law Constant: 5.3×10^{-3}

BCF: eels 3.5

Biochemical Oxygen Demand (BOD): 1.2 lb/lb, 10 days

Octanol/Water Partition Coefficient: log K_{ow} = 2.13

Soil Sorption Partition Coefficient: K_{oc} = woodburn silt loam 31 to 143

Section 13 - Disposal Considerations

Disposal: Consult manufacturer for recycling options and recycle where possible.
Follow applicable federal, state, and local regulations.
Incinerate residue at an approved site.
Recycle containers where possible, or dispose of in an authorized landfill.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

cis-Acetylene Dichloride
DIC4550

Issue Date: 2006-06

Section 1 - Chemical Product and Company Identification 61

Material Name: cis-Acetylene Dichloride **CAS Number:** 156-59-2
Chemical Formula: $C_2H_2Cl_2$
Structural Chemical Formula: CHCl=CHCl
EINECS Number: 205-859-7
ACX Number: X1007815-0
Synonyms: ACETALYNE DICHLORIDE; CIS-ACETYLENE DICHLORIDE; CIS-1,2-DICHLORETHYLENE; CIS-1,2-DICHLOROETHENE; (Z)-1,2-DICHLOROETHYLENE; 1,2-CIS-DICHLOROETHYLENE; CIS-1,2-DICHLOROETHYLENE; CIS-DICHLOROETHYLENE; ETHENE,1,2-DICHLORO-,(Z)-; ETHYLENE,1,2-DICHLORO-,(Z)-
General Use: solvent for waxes, resins, fats, phenol, camphor, acetyl cellulose, organic materials and heat-sensitive substances such as caffeine; in rubber manufacture, as a refrigerant, as an additive to dye and lacquer solutions, in retarding fermentation, in organic synthesis, in medicines, in dye extraction, in chlorination reactions and in the manufacture of artificial pearls; a constituent of perfumes and thermoplastics

Section 2 - Composition / Information on Ingredients

Fire Diamond

ANSI Signal Word
Warning!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Colorless liquid; sweetish odor. Irritating to eyes/skin/respiratory tract. Harmful. Other Acute Effects: narcotic effect. Flammable.

Potential Health Effects

Target Organs: eyes, skin, respiratory system, nervous system, liver, kidneys
Primary Entry Routes: inhalation of vapor, skin/eye contact

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Acute Effects

Inhalation: There is a single report of an industrial poisoning, a fatality caused by the inhalation of a vapor in a small enclosure. Acute intoxication by halogenated aliphatic hydrocarbons appears to take place over two stages. Signs of a reversible narcosis are evident in the first stage and in the second stage signs of injury to organs may become evident, a single organ alone is (almost) never involved. Depression of the central nervous system is the most outstanding effect of most halogenated aliphatic hydrocarbons. Inebriation and excitation, passing into narcosis, is a typical reaction. In severe acute exposures there is always a danger of death from respiratory failure or cardiac arrest due to a tendency to make the heart more susceptible to catecholamines (adrenalin). The most important effects of exposure are narcosis and irritation of the central nervous system. Liver responses may occur after repeated narcotic doses and involves fatty liver degeneration. Vapor exposure may produce central nervous system depression or in milder exposures, nausea, vomiting, weakness, tremor and epigastric cramps. Recovery is usually rapid.

Eye: The vapor when concentrated has pronounced eye irritation effect; this gives some warning of high vapor concentrations. If eye irritation occurs seek to reduce exposure with available control measures, or evacuate area. Exposure to the trans isomer at 2200 ppm caused burning of the eyes, vertigo, nausea. Reversible corneal clouding has been described in exposures to acetylene dichloride.

Skin: The liquid may produce skin discomfort following prolonged contact. Defatting and/ or drying of the skin may lead to dermatitis.

Ingestion: The liquid is discomforting to the gastrointestinal tract and toxic if swallowed. Considered an unlikely route of entry in commercial/industrial environments.

Carcinogenicity: NTP - Not listed; IARC - Not listed; OSHA - Not listed; NIOSH - Not listed; ACGIH - Not listed; EPA - Class D, Not classifiable as to human carcinogenicity; MAK - Not listed.

Chronic Effects: The material may accumulate in the human body and progressively cause tissue damage.

Section 4 - First Aid Measures

Inhalation: • If fumes or combustion products are inhaled, remove to fresh air.
• Lay patient down. Keep warm and rested.
• If breathing is shallow or has stopped, ensure clear airway and apply resuscitation, preferably with a demand valve resuscitator, bag-valve mask device, or pocket mask as trained. Perform CPR if necessary.
• Transport to hospital or doctor.

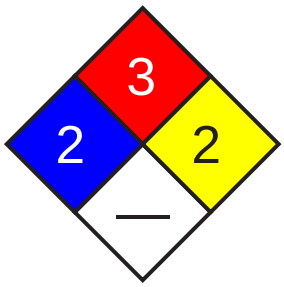
See DOT ERG

Eye Contact: • Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water.
• Ensure complete irrigation of the eye by keeping eyelids apart and away from eye and moving the eyelids by occasionally lifting the upper and lower lids.
• Transport to hospital or doctor without delay.
• Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: • Immediately remove all contaminated clothing, including footwear (after rinsing with water).
• Wash affected areas thoroughly with water (and soap if available).
• Seek medical attention in event of irritation.

Ingestion: Contact a Poison Control Center. Do NOT induce vomiting. Give a glass of water.

After first aid, get appropriate in-plant, paramedic, or community medical support.



Note to Physicians: Treatment should follow that practiced in carbon tetrachloride exposures:
• Acute exposures to carbon tetrachloride present, initially, with CNS depression followed by hepatic and renal dysfunction.
• Respiratory depression and cardiac dysrhythmias are an immediate threat to life.
• Since a major fraction of absorbed carbon tetrachloride is exhaled in first hour, good tidal volumes should be maintained in severely poisoned patients; hyperventilation may be an additional therapeutic modality.
• Ipecac syrup, lavage, activated charcoal or catharsis may all be used in the first 4 hours.
• Since reactive metabolites may cause hepatorenal toxicity, administration of N-acetyl-L-cysteine may reduce complications. Experience with this therapy is limited.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 5 - Fire-Fighting Measures

Flash Point: 2.2 to 3.9 °C Closed Cup
Autoignition Temperature: 460 °C
LEL: 9.7% v/v
UEL: 12.8% v/v
Extinguishing Media: Foam. Dry chemical powder. BCF (where regulations permit). Carbon dioxide. Water spray or fog - Large fires only.

See DOT ERG

Fire Diamond

General Fire Hazards/Hazardous Combustion Products: • Liquid and vapor are highly flammable.
• Severe fire hazard when exposed to heat, flame and/or oxidizers.
• Vapor forms an explosive mixture with air.
• Severe explosion hazard, in the form of vapor, when exposed to flame or spark.
• Vapor may travel a considerable distance to source of ignition.
• Heating may cause expansion/decomposition with violent rupture of containers.
• On combustion, may emit toxic fumes of carbon monoxide (CO). Other combustion products include hydrogen chloride and phosgene.
Fire Incompatibility: Avoid contamination with oxidizing agents i.e., nitrates, oxidizing acids, chlorine bleaches, pool chlorine etc. as ignition may result.
Fire-Fighting Instructions: • Contact fire department and tell them location and nature of hazard.
• May be violently or explosively reactive.
• Wear breathing apparatus plus protective gloves.
• Prevent, by any means available, spillage from entering drains or waterways.
• Consider evacuation (or protect in place).
• Fight fire from a safe distance, with adequate cover.
• If safe, switch off electrical equipment until vapor fire hazard removed.
• Use water delivered as a fine spray to control the fire and cool adjacent area.
• Avoid spraying water onto liquid pools.
• Do not approach containers suspected to be hot.
• Cool fire-exposed containers with water spray from a protected location.
• If safe to do so, remove containers from path of fire.

Section 6 - Accidental Release Measures

See DOT ERG

Small Spills: • Remove all ignition sources.
• Clean up all spills immediately.
• Avoid breathing vapors and contact with skin and eyes.
• Control personal contact by using protective equipment.
• Contain and absorb small quantities with vermiculite or other absorbent material.
• Wipe up.
• Collect residues in a flammable waste container.
Large Spills: • Clear area of personnel and move upwind.
• Contact fire department and tell them location and nature of hazard.
• May be violently or explosively reactive.
• Wear breathing apparatus plus protective gloves.
• Prevent, by any means available, spillage from entering drains or waterways.
• No smoking, bare lights or ignition sources.
• Increase ventilation.
• Stop leak if safe to do so.
• Water spray or fog may be used to disperse/absorb vapor.
• Contain spill with sand, earth or vermiculite.
• Use only spark-free shovels and explosion proof equipment.
• Collect recoverable product into labeled containers for recycling.
• Absorb remaining product with sand, earth or vermiculite.
• Collect solid residues and seal in labeled drums for disposal.
• Wash area and prevent runoff into drains.
• If contamination of drains or waterways occurs, advise emergency services.
Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: • Avoid all personal contact, including inhalation.
• Wear protective clothing when risk of exposure occurs.
• Use in a well-ventilated area.
• Prevent concentration in hollows and sumps.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

• DO NOT enter confined spaces until atmosphere has been checked.
• Avoid smoking, bare lights or ignition sources.
• Avoid contact with incompatible materials.
• When handling, DO NOT eat, drink or smoke.
• Keep containers securely sealed when not in use.
• Avoid physical damage to containers.
• Always wash hands with soap and water after handling.
• Work clothes should be laundered separately.
• Follow good occupational work practices.
• Observe manufacturer's storage and handling recommendations.
• Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions.

Recommended Storage Methods: Check that containers are clearly labeled. Packaging as recommended by manufacturer. DO NOT use aluminum or galvanized containers.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Local exhaust ventilation usually required. If risk of overexposure exists, wear NIOSH-approved respirator. Provide adequate ventilation in warehouse or closed storage area.

Personal Protective Clothing/Equipment:

Eyes: Safety glasses with side shields or, as required, chemical goggles. Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Butyl rubber gloves. Neoprene gloves.

Respiratory Protection: Respirator protection may be required. Consult your supervisor.

Other: • Overalls.
• Barrier cream.
• Eyewash unit.

Glove Selection Index:

VITON ..... Poor to dangerous choice for other than short-term immersion

Section 9 - Physical and Chemical Properties

Appearance/General Info: Colorless liquid with pleasant chloroform-like odor.

Physical State: colorless liquid
Odor Threshold: 0.085 ppm
Vapor Pressure (kPa): 200 mm Hg at 25 °C
Vapor Density (Air=1): 3.34
Formula Weight: 96.94
Specific Gravity (H_2O=1, at 4 °C): 1.2837 at 20 °C/4 °C
Boiling Point: 60.3 °C (141 °F) at 760 mm Hg
Freezing/Melting Point: -80.5 °C (-112.9 °F)
Water Solubility: 1 to 5 mg/mL at 16 °C

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Product is considered stable. Hazardous polymerization will not occur.

Storage Incompatibilities: Avoid reaction with oxidizing agents. Acetylene dichloride in contact with solid caustic alkalies or their concentrated solutions will form chloracetylene which ignites in air. Haloalkenes are highly reactive.

Section 11 - Toxicological Information

Toxicity

Inhalation (mouse) LC_{Lo}: 65000 mg/m^3/2 hr

Rat liver cell mutagen in vitro

Irritation

Nil reported

See *RTECS* KV9420000, for additional data.

Section 12 - Ecological Information

Environmental Fate: If released on soil, it should evaporate and/or leach into the groundwater where very slow biodegradation should occur. If released into water, it will be lost mainly through volatilization (half life 3 hr in a model river). Biodegradation, adsorption to sediment, and bioconcentration in aquatic organisms should not be significant. In the atmosphere it will be lost by reaction with photochemically produced hydroxyl radicals (half life 8 days) and scavenged by rain. Because it is relatively long lived in the atmosphere, considerable dispersal from source areas should occur.

Ecotoxicity: LC_{50} Lepomis machrochirus (bluegill) 135,000 ug/l/96 hr in a static unmeasured bioassay

Henry's Law Constant: estimated at 0.00337

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

BCF: calculated at 15
Octanol/Water Partition Coefficient: log K_{ow} = 1.86
Soil Sorption Partition Coefficient: K_{oc} = 49

Section 13 - Disposal Considerations

Disposal: • Consult manufacturer for recycling options and recycle where possible.
• Follow applicable local, state, and federal regulations.
• Incinerate residue at an approved site.
• Recycle containers if possible, or dispose of in an authorized landfill.

Section 14 - Transport Information

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word
Warning!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Colorless liquid; pungent odor. Irritating to eyes/skin/respiratory tract. Other Acute Effects: chest constriction, vertigo, narcosis, cramps, respiratory paralysis. Chronic Effects: fatigue, sleepiness, headache, blood disorders, lymphocytosis. Flammable.

Potential Health Effects

Target Organs: eyes, respiratory system, skin, central nervous system (CNS), blood
Primary Entry Routes: inhalation, skin contact, eye contact
Acute Effects
Inhalation: The vapor is discomforting to the upper respiratory tract.
Inhalation hazard is increased at higher temperatures.
Acute effects from inhalation of high concentrations of vapor are pulmonary irritation, including coughing, with nausea; central nervous system depression - characterized by headache and dizziness, increased reaction time, fatigue and loss of coordination.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

If exposure to highly concentrated solvent atmosphere is prolonged this may lead to narcosis, unconsciousness, even coma and possible death.
Inhalation of vapor may aggravate a pre-existing respiratory condition such as asthma, bronchitis, emphysema.
When humans were exposed to the 100 and 200 ppm for 8 hours about 45-65% is retained in the body. Only traces of unchanged ethyl benzene are excreted in expired air following termination of inhalation exposure.
Humans exposed to concentrations of 23-85 ppm excreted most of the retained dose in the urine (mainly as metabolites).
Guinea pigs that died from exposure had intense congestion of the lungs and generalized visceral hyperemia. Rats exposed for three days at 8700 mg/m^3 (2000 ppm) showed changes in the levels of dopamine and noradrenaline in various parts of the brain.

Eye: The liquid is highly discomforting to the eyes and is capable of causing a mild, temporary redness of the conjunctiva (similar to wind-burn), temporary impairment of vision and/or other transient eye damage/ulceration.
The vapor is discomforting to the eyes.
The material may produce severe irritation to the eye causing pronounced inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.
Two drops of the material in to the conjunctival sac produced only slight irritation of the conjunctival membrane but no corneal injury.

Skin: The liquid is discomforting to the skin if exposure is prolonged and is capable of causing skin reactions which may lead to dermatitis.
The material may cause skin irritation after prolonged or repeated exposure and may produce a contact dermatitis (nonallergic). This form of dermatitis is often characterized by skin redness (erythema) and swelling (edema) which may progress to vesiculation, scaling and thickening of the epidermis. Histologically there may be intercellular edema of the spongy layer (spongiosis) and intracellular edema of the epidermis.
The mean rate of absorption of liquid ethyl benzene applied to 17.3 cm2 area of the forearm of seven volunteers for 10-15 minutes was determined to be 38 mg/cm2/hr. Immersion of the whole hand in aqueous solutions of ethyl benzene (112-156 mg/l) for 1 hour yielded mean absorption rates of 118 and 215.7 ug/cm2/hr. The rate of absorption is thus greater than that of aniline, benzene, nitrobenzene, carbon disulfide and styrene.
Repeated application of the undiluted product to the abdominal area of rabbits (10-20 applications over 2-4 weeks) resulted in erythema, edema and superficial necrosis. The material did not appear to be absorbed through the skin in sufficient quantity to produce outward signs of toxicity.

Ingestion: Considered an unlikely route of entry in commercial/industrial environments.
The liquid may produce considerable gastrointestinal discomfort and may be harmful or toxic if swallowed. Ingestion may result in nausea, pain and vomiting. Vomit entering the lungs by aspiration may cause potentially lethal chemical pneumonitis.

Carcinogenicity: NTP - Not listed; IARC - Not listed; OSHA - Not listed; NIOSH - Not listed; ACGIH - Not listed; EPA - Class D, Not classifiable as to human carcinogenicity; MAK - Not listed.

Chronic Effects: Chronic solvent inhalation exposures may result in nervous system impairment and liver and blood changes.
Prolonged or continuous skin contact with the liquid may cause defatting with drying, cracking, irritation and dermatitis following.
Industrial workers exposed to a maximum level of ethyl benzene of 0.06 mg/l (14 ppm) reported headaches and irritability and tired quickly. Functional nervous system disturbances were found in some workers employed for over 7 years whilst other workers had enlarged livers.

Section 4 - First Aid Measures

See DOT ERG

Inhalation: Remove to fresh air.
Lay patient down. Keep warm and rested.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor.

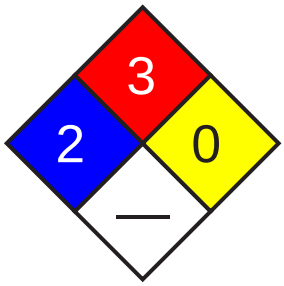
Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.
Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: Immediately remove all contaminated clothing, including footwear (after rinsing with water).
Wash affected areas thoroughly with water (and soap if available).
Seek medical attention in event of irritation.

Ingestion: Rinse mouth out with plenty of water. DO NOT induce vomiting.
Observe the patient carefully. Never give liquid to a person showing signs of being sleepy or with reduced awareness; i.e. becoming unconscious.
Give water (or milk) to rinse out mouth. Then provide liquid slowly and as much as casualty can comfortably drink.
Transport to hospital or doctor without delay.

After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: For acute or short-term repeated exposures to petroleum distillates or related hydrocarbons:



Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

1. Primary threat to life from pure petroleum distillate ingestion and/or inhalation is respiratory failure.
2.Patients should be quickly evaluated for signs of respiratory distress (e.g. cyanosis, tachypnea, intercostal retraction, obtundation) and given oxygen. Patients with inadequate tidal volumes or poor arterial blood gases (pO_2 <50 mm Hg or pCO_2 >50 mm Hg) should be intubated.
3.Arrhythmias complicate some hydrocarbon ingestion and/or inhalation and electrocardiographic evidence of myocardial injury has been reported; intravenous lines and cardiac monitors should be established in obviously symptomatic patients. The lungs excrete inhaled solvents, so that hyperventilation improves clearance
4.A chest x-ray should be taken immediately after stabilization of breathing and circulation to document aspiration and detect the presence of pneumothorax.
5.Epinephrine (adrenalin) is not recommended for treatment of bronchospasm because of potential myocardial sensitization to catecholamines.
Inhaled cardioselective bronchodilators (e.g. Alupent, Salbutamol) are the preferred agents, with aminophylline a second choice.
6.Lavage is indicated in patients who require decontamination; ensure use of cuffed endotracheal tube in adult patients.

Section 5 - Fire-Fighting Measures

Flash Point: 12.8 °C Closed Cup
Autoignition Temperature: 432 °C
LEL: 1.6% v/v
UEL: 7% v/v
Extinguishing Media: Foam, dry chemical powder, BCF (where regulations permit), carbon dioxide.
Water spray or fog - Large fires only.
General Fire Hazards/Hazardous Combustion Products: Liquid and vapor are flammable.
Moderate fire hazard when exposed to heat or flame.
Vapor forms an explosive mixture with air.
Moderate explosion hazard when exposed to heat or flame.
Vapor may travel a considerable distance to source of ignition.
Heating may cause expansion or decomposition leading to violent rupture of containers.
On combustion, may emit toxic fumes of carbon monoxide (CO).
May emit clouds of acrid smoke.

See DOT ERG

Fire Diamond

Fire Incompatibility: Avoid contamination with oxidizing agents i.e. nitrates, oxidizing acids, chlorine bleaches, pool chlorine etc. as ignition may result.
Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways.
If safe, switch off electrical equipment until vapor fire hazard removed.
Use water delivered as a fine spray to control fire and cool adjacent area.
Avoid spraying water onto liquid pools.
Do not approach containers suspected to be hot.
Cool fire-exposed containers with water spray from a protected location.
If safe to do so, remove containers from path of fire.

Section 6 - Accidental Release Measures

Small Spills: Remove all ignition sources. Clean up all spills immediately.
Avoid breathing vapors and contact with skin and eyes.
Control personal contact by using protective equipment.
Contain and absorb small quantities with vermiculite or other absorbent material. Wipe up. Collect residues in a flammable waste container.

See DOT ERG

Large Spills: Clear area of personnel and move upwind.
Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways.
No smoking, bare lights or ignition sources. Increase ventilation.
Stop leak if safe to do so. Water spray or fog may be used to disperse/absorb vapor. Contain spill with sand, earth or vermiculite.
Use only spark-free shovels and explosion proof equipment.
Collect recoverable product into labeled containers for recycling.
Absorb remaining product with sand, earth or vermiculite.
Collect solid residues and seal in labeled drums for disposal.
Wash area and prevent runoff into drains.
If contamination of drains or waterways occurs, advise emergency services.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid generating and breathing mist. Avoid all personal contact, including inhalation.
Wear protective clothing when risk of exposure occurs.
Use in a well-ventilated area. Prevent concentration in hollows and sumps.
DO NOT enter confined spaces until atmosphere has been checked.
Avoid smoking, bare lights, heat or ignition sources.
When handling, DO NOT eat, drink or smoke.
Vapor may ignite on pumping or pouring due to static electricity.
DO NOT use plastic buckets. Ground and secure metal containers when dispensing or pouring product. Use spark-free tools when handling.
Avoid contact with incompatible materials.
Keep containers securely sealed. Avoid physical damage to containers.
Always wash hands with soap and water after handling.
Work clothes should be laundered separately.
Use good occupational work practices. Observe manufacturer's storing and handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions.
Recommended Storage Methods: Metal can; metal drum. Packing as recommended by manufacturer.
Check all containers are clearly labeled and free from leaks.
Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: CARE: Use of a quantity of this material in confined space or poorly ventilated area, where rapid build-up of concentrated atmosphere may occur, could require increased ventilation and/or protective gear. Use in a well-ventilated area.
General exhaust is adequate under normal operating conditions.
If risk of overexposure exists, wear NIOSH-approved respirator.
Correct fit is essential to obtain adequate protection.
Provide adequate ventilation in warehouse or closed storage areas.
Personal Protective Clothing/Equipment:
Eyes: Safety glasses with side shields; or as required, chemical goggles.
Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.
Hands/Feet: Barrier cream with polyethylene gloves or Nitrile gloves.
Protective footwear.
Respiratory Protection:
Exposure Range >100 to <800 ppm: Air Purifying, Negative Pressure, Half Mask
Exposure Range 800 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Cartridge Color: black
Other: Overalls. Eyewash unit.
Glove Selection Index:
VITON ..... Best selection
TEFLON ..... Best selection

Section 9 - Physical and Chemical Properties

Appearance/General Info: Clear highly flammable liquid; floats on water. Aromatic solvent odor. Soluble in alcohol, benzene, carbon tetrachloride and ether.

Physical State: Liquid
Odor Threshold: 8.7 to 870.0 mg/m^3
Vapor Pressure (kPa): 1.333 at 25.9 °C
Vapor Density (Air=1): 3.66
Formula Weight: 106.17
Specific Gravity (H_2O=1, at 4 °C): 0.8670 at 20 °C
Evaporation Rate: Fast

pH: Not applicable
pH (1% Solution): Not applicable.
Boiling Point: 136.2 °C (277 °F) at 760 mm Hg
Freezing/Melting Point: -95 °C (-139 °F)
Volatile Component (% Vol): 100
Water Solubility: 0.01% by weight

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Hazardous polymerization will not occur.
Storage Incompatibilities: Avoid storage with oxidizers.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 11 - Toxicological Information

Toxicity

Oral (rat) LD_{50}: 3500 mg/kg
Inhalation (human) TC_{Lo}: 100 ppm/8h
Inhalation (rat) LC_{Lo}: 4000 ppm/4h
Intraperitoneal (mouse) LD_{50}: 2642 mg/kg~
Dermal (rabbit) LD_{50}: 17800 mg/kg~
Liver changes, utheral tract, effects on fertility, specific developmental abnormalities (musculoskeletal system) recorded.
NOTE: Substance has been shown to be mutagenic in various assays, or belongs to a family of chemicals producing damage or change to cellular DNA.

Irritation

Skin (rabbit): 15 mg/24h mild
Eye (rabbit): 500 mg - SEVERE

See *RTECS* DA 0700000, for additional data.

Section 12 - Ecological Information

Environmental Fate: If released to the atmosphere, it exist predominantly in the vapor phase based on its vapor pressure where it will photochemically degrade by reaction with hydroxyl radicals (half-life 0.5 to 2 days) and partially return to earth in rain. It will not be subject to direct photolysis. Releases into water will decrease in concentration by evaporation and biodegradation. The time for this decrease and the primary loss processes will depend on the season, and the turbulence and microbial populations in the particular body of water. Representative half-lives are several days to 2 weeks. Some may be adsorbed by sediment but significant bioconcentration in fish is not expected to occur based upon its octanol/water partition coefficient. It is only adsorbed moderately by soil. It will not significantly hydrolyze in water or soil.

Ecotoxicity: LC_{50} Cyprinodon variegatus (sheepshead minnow) 275 mg/l 96 hr in a static unmeasured bioassay; LC_{50} Pimephales promelas (fathead minnow) 12.1 mg/l/96 hr (confidence limit 11.5 - 12.7 mg/l), flow-through bioassay with measured concentrations, 26.1 °C, dissolved oxygen 7.0 mg/l, hardness 45.6 mg/l calcium carbonate, alkalinity 43.0 mg/l; Toxicity threshold (cell multiplication inhibition test): Pseudomonas putida (bacteria) 12 mg/l ; LC_{50} Palaemonetes pugio (grass shrimp, adult) 14,400 ug/l/24 hr in a static unmeasured bioassay; LC_{50} Palaemonetes pugio (grass shrimp, larva) 10,200 ug/l/24 hr in a static unmeasured bioassay; Toxicity threshold (cell multiplication inhibition test): Microcystis aeruginosa (algae) 33 mg/l; Scenedesmus quadricauda (green algae) > 160 mg/l

Henry's Law Constant: 8.44×10^{-3}

BCF: goldfish 1.9

Biochemical Oxygen Demand (BOD): theoretical 2.8%, 5 days

Octanol/Water Partition Coefficient: log $K_{ow} = 3.15$

Soil Sorption Partition Coefficient: $K_{oc} = 164$

Section 13 - Disposal Considerations

Disposal: Consult manufacturer for recycling options and recycle where possible.
Follow applicable federal, state, and local regulations.
Incinerate residue at an approved site.
Recycle containers where possible, or dispose of in an authorized landfill.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

Shipping Name and Description: Ethylbenzene
ID: UN1175
Hazard Class: 3 - Flammable and combustible liquid
Packing Group: II - Medium Danger
Symbols:
Label Codes: 3 - Flammable Liquid
Special Provisions: IB2, T4, TP1
Packaging: **Exceptions:** 150 **Non-bulk:** 202 **Bulk:** 242
Quantity Limitations: **Passenger aircraft/rail:** 5 L **Cargo aircraft only:** 60 L

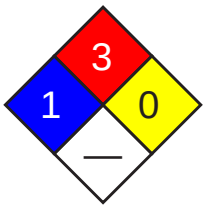
Unleaded Petrol
AUT5000

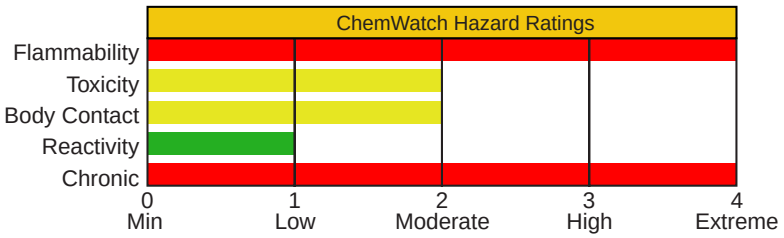
Section 1 - Chemical Product and Company Identification 61

Material Name: Unleaded Petrol **CAS Number:** 8006-61-9
Chemical Formula: Mixture of hydrocarbons
EINECS Number: 232-349-1
ACX Number: X1003056-5
Synonyms: AUTOMOTIVE GASOLINE, LEAD-FREE; GASOLINE; MOTOR FUEL; MOTOR SPIRITS; NATURAL GASOLINE; PETROL; UNLEADED PETROL
General Use: Lead free motor fuel for internal combustion engines, 2-stroke and 4-stroke.

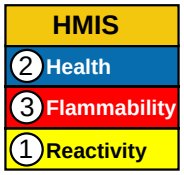


Section 2 - Composition / Information on Ingredients

Name	CAS	%
gasoline	8006-61-9	>90
benzene	71-43-2	5 max.



OSHA PEL **NIOSH REL**



ACGIH TLV
TWA: 300 ppm, 890 mg/m^3;
STEL: 500 ppm, 1480 mg/m^3.

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word

Danger!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Clear liquid; distinctive odor. Irritating to eyes/skin/respiratory tract. Other Acute Effects: dizziness, drunkenness, unconsciousness. Chronic Effects: dermatitis. Possible cancer hazard. Flammable.

Potential Health Effects

Target Organs: skin, eye, respiratory system, central nervous system (CNS)
Primary Entry Routes: inhalation, ingestion, skin contact

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Acute Effects

Inhalation: The vapor is discomforting to the upper respiratory tract and may be harmful if exposure is prolonged. Inhalation hazard is increased at higher temperatures. Acute effects from inhalation of high concentrations of vapor are pulmonary irritation, including coughing, with nausea; central nervous system depression - characterized by headache and dizziness, increased reaction time, fatigue and loss of coordination. If exposure to highly concentrated solvent atmosphere is prolonged this may lead to narcosis, unconsciousness, even coma and possible death. WARNING: Intentional misuse by concentrating/inhaling contents may be lethal. High inhaled concentrations of mixed hydrocarbons may produce narcosis characterized by nausea, vomiting and lightheadedness. Inhalation of aerosols may produce severe pulmonary edema, pneumonitis and pulmonary hemorrhage. Inhalation of petroleum hydrocarbons consisting substantially of low molecular weight species may produce irritation of mucous membranes, incoordination, giddiness, nausea, vertigo, confusion, headache, appetite loss, drowziness, tremors and anesthetic stupor. Massive exposures may produce central nervous system depression with sudden collapse and deep coma; fatalities have been recorded. Irritation of the brain and/or apneic anoxia may produce convulsions. Although recovery following overexposure is generally complete, cerebral micro- hemorrhage of focal post-inflammatory scarring may produce eleptiform seizures some months after the exposure. Pulmonary episodes may include chemical pneumonitis with edema and hemorrhage. The lighter hydrocarbons may produce kidney and neurotoxic effects. Liquid paraffins may produce anesthesia and depressant actions leading to weakness, dizziness, slow and shallow respiration, unconsciousness, convulsions and death. C_{5-7} paraffins may also produce polyneuropathy. Aromatic hydrocarbons accumulate in lipid-rich tissues (typically the brain, spinal cord and peripheral nerves) and may produce functional impairment manifested by nonspecific symptoms such as nausea, weakness, fatigue, vertigo; severe exposures may produce inebriation or unconsciousness. Many of the petroleum hydrocarbons are cardiac sensitizers and may cause ventricular fibrillations.

Eye: The liquid may produce eye discomfort and is capable of causing temporary impairment of vision and/or transient eye inflammation, ulceration. The vapor is discomforting to the eyes. Petroleum hydrocarbons may produce pain after direct contact with the eyes. Slight, but transient, disturbances of the corneal epithelium may also result. The aromatic fraction may produce irritation and lachrymation. The material may produce moderate eye irritation leading to inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.

Skin: The material is moderately discomforting to the skin if exposure is prolonged. The material contains a component that may be absorbed through the skin and may cause drying of the skin, which may lead to dermatitis from repeated exposures over long periods. Toxic effects may result from skin absorption. Open cuts, abraded or irritated skin should not be exposed to this material. The material may accentuate any pre-existing dermatitis condition.

Ingestion: Considered an unlikely route of entry in commercial/industrial environments. The liquid may produce gastrointestinal discomfort and may be harmful if swallowed. Ingestion may result in nausea, pain and vomiting. Vomit entering the lungs by aspiration may cause potentially lethal chemical pneumonitis. Ingestion of petroleum hydrocarbons may produce irritation of the pharynx, esophagus, stomach and small intestine with edema and mucosal ulceration. Resulting symptoms include a burning sensation in the mouth and throat. Large amounts may produce narcosis with nausea and vomiting, weakness or dizziness, slow and shallow respiration, swelling of the abdomen, unconsciousness and convulsions. Myocardial injury may produce arrhythmias, ventricular fibrillation and electrocardiographic changes. Central nervous system depression may also occur. Light aromatic hydrocarbons produce a warm, sharp, tingling sensation on contact with taste buds and may anesthetize the tongue. Aspiration into the lungs may produce coughing, gagging, and a chemical pneumonitis with pulmonary edema and hemorrhage.

Carcinogenicity: NTP - Not listed; IARC - Group 2B, Possibly carcinogenic to humans; OSHA - Not listed; NIOSH - Listed as carcinogen; ACGIH - Class A3, Animal carcinogen; EPA - Not listed; MAK - Not listed.

Chronic Effects: Chronic solvent inhalation exposures may result in nervous system impairment and liver and blood changes. Prolonged or continuous skin contact with the liquid may cause defatting with drying, cracking, irritation and dermatitis following. Chronic poisoning may occur from vapor inhalation or skin absorption. The most significant toxic effect is insidious and irreversible injury to the blood-forming tissue by benzene. Leukemia may develop. Chronic exposure may cause headache, fatigue, loss of appetite and lassitude with incipient blood effects including anemia and blood changes. Gasoline "sniffing" has caused severe nerve damage. Repeated or prolonged exposure to mixed hydrocarbons may produce narcosis with dizziness, weakness, irritability, concentration and/or memory loss, tremor in the fingers and tongue, vertigo, olfactory disorders, constriction of visual field, paresthesias of the extremities, weight loss and anemia and degenerative changes in the liver and kidney. Chronic exposure by petroleum workers to the lighter hydrocarbons has been associated with visual disturbances, damage to the central nervous system, peripheral neuropathies (including numbness and paresthesias), psychological and neurophysiological deficits, bone marrow toxicities (including hypoplasia, possibly due to benzene) and hepatic and renal involvement. Chronic dermal exposure to petroleum hydrocarbons may result in defatting which produces localized dermatoses. Surface cracking and erosion may also increase susceptibility to infection by microorganisms.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 4 - First Aid Measures

Inhalation: Remove to fresh air. Lay patient down. Keep warm and rested.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital, or doctor.

See DOT ERG

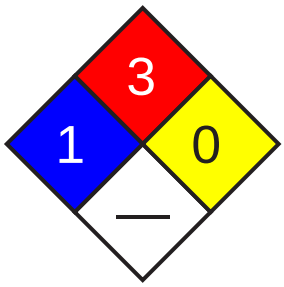
Eye Contact: Immediately hold the eyes open and wash continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids. Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: Immediately remove all contaminated clothing, including footwear (after rinsing with water). Wash affected areas thoroughly with water (and soap if available). Seek medical attention in event of irritation.

Ingestion: Contact a Poison Control Center. If swallowed, do NOT induce vomiting. Give a glass of water.

After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: For acute or short term repeated exposures to petroleum distillates or related hydrocarbons:



1. Primary threat to life from pure petroleum distillate ingestion and/or inhalation is respiratory failure.
2. Patients should be quickly evaluated for signs of respiratory distress (e.g. cyanosis, tachypnea, intercostal retraction, obtundation) and given oxygen. Patients with inadequate tidal volumes or poor arterial blood gases (pO_2 <50 mm Hg or pCO_2 >50 mm Hg) should be intubated.
3. Arrhythmias complicate some hydrocarbon ingestion and/or inhalation and electrocardiographic evidence of myocardial injury has been reported; intravenous lines and cardiac monitors should be established in obviously symptomatic patients. The lungs excrete inhaled solvents, so that hyperventilation improves clearance.
4. A chest x-ray should be taken immediately after stabilization of breathing and circulation to document aspiration and detect the presence of pneumothorax.
5. Epinephrine (adrenalin) is not recommended for treatment of bronchospasm because of potential myocardial sensitization to catecholamines.
Inhaled cardioselective bronchodilators (e.g. Alupent, Salbutamol) are the preferred agents, with aminophylline a second choice.
6. Lavage is indicated in patients who require decontamination; ensure use of cuffed endotracheal tube in adult patients.

Section 5 - Fire-Fighting Measures

Flash Point: -43 °C
Autoignition Temperature: 280 °C
LEL: 1.4% v/v
UEL: 7.6% v/v

See DOT ERG

Extinguishing Media: Foam. Dry chemical powder.
Bromochlorodifluoromethane (BCF) (where regulations permit). Carbon dioxide.

Fire Diamond

General Fire Hazards/Hazardous Combustion Products: Liquid and vapor are highly flammable. Severe fire hazard when exposed to heat, flame and/or oxidizers. Vapor forms an explosive mixture with air. Severe explosion hazard, in the form of vapor, when exposed to flame or spark. Vapor may travel a considerable distance to source of ignition. Heating may cause expansion/decomposition with violent rupture of containers. On combustion, may emit toxic fumes of carbon monoxide (CO).

Fire Incompatibility: Avoid contamination with oxidizing agents, i.e. nitrates, oxidizing acids, chlorine bleaches, pool chlorine etc., as ignition may result.

Fire-Fighting Instructions: Alert fire department and tell them location and nature of hazard. May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or water ways. If safe, switch off electrical equipment until vapour fire hazard removed. Use water delivered as a fine spray to control fire and cool adjacent area. Avoid spraying water onto liquid pools. Do not approach containers suspected to be hot. Cool fire exposed containers with water spray from a protected location. If safe to do so, remove containers from path of fire.

Section 6 - Accidental Release Measures

Small Spills: Remove all ignition sources. Clean up all spills immediately. Avoid breathing vapors and contact with skin and eyes. Control personal contact by using protective equipment. Contain and absorb small quantities with vermiculite or other absorbent material. Wipe up. Collect residues in a flammable waste container.

See DOT ERG

Large Spills: Clear area of personnel and move upwind. Alert fire department and tell them location and nature of hazard. May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or water ways. No smoking, naked lights or ignition sources. Increase ventilation. Stop leak if safe to do so.
Water spray or fog may be used to disperse/absorb vapor. Contain spill with sand, earth or vermiculite. Use only

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

spark-free shovels and explosion proof equipment. Collect recoverable product into labeled containers for recycling. Absorb remaining product with sand, earth or vermiculite. Collect solid residues and seal in labelled drums for disposal. Wash area and prevent runoff into drains.
If contamination of drains or waterways occurs, advise emergency services.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid generating and breathing mist. Avoid all personal contact, including inhalation. Wear protective clothing when risk of exposure occurs. Use in a well-ventilated area. Prevent concentration in hollows and sumps. DO NOT enter confined spaces until atmosphere has been checked. Avoid smoking, bare lights, heat or ignition sources. When handling, DO NOT eat, drink or smoke. Vapor may ignite on pumping or pouring due to static electricity. DO NOT use plastic buckets. Ground and secure metal containers when dispensing or pouring product. Use spark-free tools when handling. Avoid contact with incompatible materials. Keep containers securely sealed. Avoid physical damage to containers. Always wash hands with soap and water after handling. Work clothes should be laundered separately. Use good occupational work practices. Observe manufacturer's storing and handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions.

Recommended Storage Methods: Metal can, metal drum. Packing as recommended by manufacturer. Check all containers are clearly labeled and free from leaks.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: CARE: Use of a quantity of this material in confined space or poorly ventilated area, where rapid build-up of concentrated atmosphere may occur, could require increased ventilation and/or protective gear. Use in a well-ventilated area. If inhalation risk of overexposure exists, wear a NIOSH approved organic-vapor respirator. Correct respirator fit is essential to obtain adequate protection. In confined spaces where there is inadequate ventilation, wear full-face air supplied breathing apparatus. Provide adequate ventilation in warehouse or closed storage areas.

Personal Protective Clothing/Equipment:

Eyes: Safety glasses with side shields; or as required, chemical goggles.
Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Barrier cream with polyethylene gloves or PVC gloves. Safety footwear. Do NOT use this product to clean the skin.

Respiratory Protection:

Exposure Range >300 to 1000 ppm: Air Purifying, Negative Pressure, Half Mask
Exposure Range >1000 to 15,000 ppm: Air Purifying, Negative Pressure, Full Face
Exposure Range >15,000 to 300,000 ppm: Supplied Air, Constant Flow/Pressure Demand, Full Face
Exposure Range >300,000 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Cartridge Color: black

Other: Overalls. Ensure that there is ready access to eye wash unit. Ensure there is ready access to an emergency shower.

Section 9 - Physical and Chemical Properties

Appearance/General Info: Purple, highly flammable, volatile liquid with characteristic sharp odor. Floats on water. Consists of a complex mixture of hydrocarbons with small amounts of residual benzene from the refining operations.

Physical State: Liquid
Odor Threshold: 0.005 ppm
Vapor Pressure (kPa): 53.33 at 20 °C
Vapor Density (Air=1): > 2
Formula Weight: Not applicable.
Specific Gravity (H_2O=1, at 4 °C): 0.72-0.735 at 15 °C
Evaporation Rate: Fast
pH: Not applicable
pH (1% Solution): Not applicable.
Boiling Point: 38.89 °C (102 °F)
Freezing/Melting Point: Not available
Volatile Component (% Vol): 100
Decomposition Temperature (°C): Not available.
Water Solubility: Insoluble

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Presence of incompatible materials. Product is considered stable. Hazardous polymerization will not occur.

Storage Incompatibilities: Avoid storage with oxidizers.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 11 - Toxicological Information

Toxicity
Oral (rat) LD_{50}: 18800 mg/kg

Irritation
Skin (rabbit): 500 mg/24h mild

Section 12 - Ecological Information

Environmental Fate: No data found.
Ecotoxicity: No data found.
Biochemical Oxygen Demand (BOD): 8%, 5 days

Section 13 - Disposal Considerations

Disposal: Consult manufacturer for recycling options and recycle where possible. Follow all applicable federal, state, and local laws. Incinerate residue at an approved site. Recycle containers where possible, or dispose of in an authorized landfil.
BEWARE: Empty solvent, paint, lacquer and flammable liquid drums present a severe explosion hazard if cut by flame torch or welded. Even when thoroughly cleaned or reconditioned, the drum seams may retain sufficient solvent to generate an explosive atmosphere in the drum.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

Shipping Name and Description: Gasoline
ID: UN1203
Hazard Class: 3 - Flammable and combustible liquid

Hydrochloric Acid
HYD2200

Section 1 - Chemical Product and Company Identification 61

Material Name: Hydrochloric Acid **CAS Number:** 7647-01-0
Chemical Formula: ClH
Structural Chemical Formula: HCl
EINECS Number: 231-595-7
ACX Number: X1002202-3
Synonyms: 4-D BOWL SANITIZER; ACIDE CHLORHYDRIQUE; ACIDO CLORHIDRICO; ACIDO CLORIDRICO; ANHYDROUS HYDROCHLORIC ACID; ANHYDROUS HYDROGEN CHLORIDE; AQUEOUS HYDROGEN CHLORIDE; BOWL CLEANER; CHLOORWATERSTOF; CHLOROHYDRIC ACID; CHLOROWODOR; CHLORURE D'HYDROGENE; CHLORURE D'HYDROGENE ANHYDRE; CHLORURO DE HIDROGENO; CHLORWASSERSTOFF; CLORURO DE HIDROGENO ANHIDRO; EMULSION BOWL CLEANER; EPA PESTICIDE CHEMICAL CODE 045901; HYDROCHLORIC ACID; HYDROCHLORIC ACID GAS; HYDROCHLORIDE; HYDROGEN CHLORIDE; HYDROGEN CHLORIDE (HCL); HYGEIA CREME MAGIC BOWL CLEANER; MURIATIC ACID; MURIATIC ACID); NOW SOUTH SAFTI-SOL BRAND CONCENTRATED BOWL CLEANSE WITHMAGIC ACTIO; PERCLEEN BOWL AND URINAL CLEANER; SPIRITS OF SALT; VARLEY'S OCEAN BLUE SCENTED TOILET BOWL CLEANER; VARLEY POLY-PAK BOWL CREME; WHITE EMULSION BOWL CLEANER; WUEST BOWL CLEANER SUPER CONCENTRATED
General Use: Hydrogen chloride is used to produce pharmaceutical hydrochlorides; vinyl chloride from acetylene; alkyl chlorides from olefins and arsenious chloride from arsenious oxide; electronic grade for etching semiconductor crystals. Used in the chlorination of rubber; in organic reactions involving isomerization, polymerization and alkylation; as a catalyst and condensing agent; for making chlorine where economical; in the separation of cotton from wool and cotton de-linting; as flux in the babbitt type of metal alloy; etching semi-conductor crystals.
Hydrochloric acid is used for pickling and heavy duty cleaning of metal parts; rust and scale removal. The production of chlorides; neutralizing bases; a laboratory reagent. For hydrolyzing starch and proteins in preparations for food. As a catalyst and solvent in organic synthesis. As "spirits of salts" for cleaning of lime and masonry from new brickwork. As flux or flux component for soldering; manufacture of "killed spirits".

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word

Danger!

Corrosive Compressed Gas

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Colorless gas; characteristic suffocating, pungent odor. Corrosive. Stored as compressed gas which may cause frostbite. Chronic Effects: erosion of teeth.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Potential Health Effects

Target Organs: eyes, skin, respiratory system, liver (in animals)
Primary Entry Routes: inhalation, skin contact, eye contact
Acute Effects

Inhalation: The vapor is extremely discomforting to the upper respiratory tract, may cause severe mucous membrane damage and may be harmful if inhaled.
Inhalation of quantities of liquid mist may be extremely hazardous, even lethal due to spasm, extreme irritation of larynx and bronchi, chemical pneumonitis and pulmonary edema.
A single severe exposure may cause coughing and choking; bleeding of nose, inflammation and occasionally ulceration of the nose, throat and larynx. Fluid on the lungs followed by generalized lung damage may follow.
Breathing of vapor may aggravate asthma and inflammatory or fibrotic pulmonary disease.
High concentrations cause necrosis of the tracheal and bronchial epithelium, pulmonary edema, atelectasis and emphysema and damage to the pulmonary blood vessels and liver.
Inhalation hazard is increased at higher temperatures.
The vapor from heated material is extremely discomforting to the upper respiratory tract and lungs if inhaled.
Continued severe exposure can result in pulmonary edema and corrosion of tissues in the nose and throat.

Eye: Hydrogen Chloride: The vapor is extremely discomforting to the eyes and is capable of causing pain and severe conjunctivitis. Corneal injury may develop, with possible permanent impairment of vision, if not promptly and adequately treated.
The material may be irritating to the eye, with prolonged contact causing inflammation. Repeated or prolonged exposure to irritants may produce conjunctivitis.
Hydrochloric Acid: Eye contact is extremely painful and may cause rapid corneal damage. The liquid is extremely corrosive to the eyes and is capable of causing severe damage with loss of sight.
The vapor is highly discomforting and may be corrosive to the eyes. The vapor from heated material is extremely discomforting to the eyes.

Skin: The material is corrosive to the skin and may cause chemical burns.
Toxic effects may result from skin absorption. Bare unprotected skin should not be exposed to this material. The material may accentuate any pre-existing skin condition.
The vapor is discomforting to the skin.

Ingestion: Considered an unlikely route of entry in commercial/industrial environments.
The liquid is extremely corrosive if swallowed and is capable of causing burns to mouth, throat, esophagus, with extreme discomfort, pain and may be fatal if swallowed in quantity. Ingestion may result in nausea, abdominal irritation, pain and vomiting.

Carcinogenicity: NTP - Not listed; IARC - Group 3, Not classifiable as to carcinogenicity to humans; OSHA - Not listed; NIOSH - Not listed; ACGIH - Not listed; EPA - Not listed; MAK - Not listed.

Chronic Effects: Chronic exposure may cause discoloration or erosion of the teeth, bleeding of the nose and gums; and ulceration of the nasal mucous membranes.
Repeated exposures of animals to concentrations of about 34 ppm produced no immediate toxic effects.
Workers exposed to hydrochloric acid suffered from gastritis and a number of cases of chronic bronchitis have also been reported.
Repeated or prolonged exposure to dilute solutions may cause dermatitis. Repeated exposure to low vapor concentrations can cause skin tenderness, bleeding of the nose and gums, chronic bronchitis, gastritis.

Section 4 - First Aid Measures

Inhalation: Remove to fresh air.
Lay patient down. Keep warm and rested.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor.

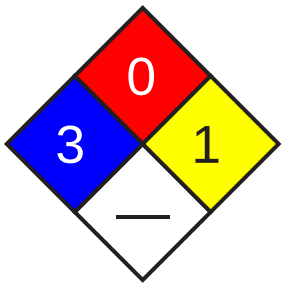
Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.
Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: Immediately flush body and clothes with large amounts of water, using safety shower if available.
Quickly remove all contaminated clothing, including footwear.
Wash affected areas with water (and soap if available) for at least 15 minutes. Transport to hospital or doctor.

Ingestion: Contact a Poison Control Center. Rinse mouth out with plenty of water. Do NOT induce vomiting. Give a glass of water.

After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: For acute or short-term repeated exposures to strong acids:
1.Airway problems may arise from laryngeal edema and inhalation exposure.
Treat with 100% oxygen initially.
2.Respiratory distress may require cricothyroidotomy if endotracheal intubation is contraindicated by excessive swelling.



Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

3. Intravenous lines should be established immediately in all cases where there is evidence of circulatory compromise.
4.Strong acids produce a coagulation necrosis characterized by formation of a coagulum (eschar) as a result of the desiccating action of the acid on proteins in specific tissues.
INGESTION:
1.Immediate dilution (milk or water) within 30 minutes post-ingestion is recommended.
2.Do not attempt to neutralize the acid since exothermic reaction may extend the corrosive injury.
3.Be careful to avoid further vomiting since re-exposure of the mucosa to the acid is harmful. Limit fluids to one or two glasses in an adult.
4.Charcoal has no place in acid management.
5.Some authors suggest the use of lavage within 1 hour of ingestion.
SKIN:
1.Skin lesions require copious saline irrigation. Treat chemical burns as thermal burns with non-adherent gauze and wrapping.
2.Deep second-degree burns may benefit from topical silver sulfadiazine.
EYE:
1.Eye injuries require retraction of the eyelids to ensure thorough irrigation of the conjunctival cul-de-sacs. Irrigation should last at least 20-30 minutes. Do not use neutralizing agents or any other additives. Several liters of saline are required.
2.Cycloplegic drops (1% cyclopentolate for short-term use or 5% homatropine for longer term use), antibiotic drops, vasoconstrictive agents, or artificial tears may be indicated dependent on the severity of the injury.
3.Steroid eye drops should only be administered with the approval of a consulting ophthalmologist.

Section 5 - Fire-Fighting Measures

Flash Point: Nonflammable
Autoignition Temperature: Not applicable
LEL: Not applicable
UEL: Not applicable
Extinguishing Media: Water spray or fog; foam; Bromochlorodifluoromethane (BCF) (where regulations permit); Dry agent; Carbon dioxide.

See DOT ERG

Fire Diamond

General Fire Hazards/Hazardous Combustion Products: Noncombustible liquid. Will not burn, but heat produces highly toxic fumes/vapors.
Heating may cause expansion or decomposition leading to violent rupture of containers. Decomposes on heating and produces toxic fumes of hydrogen chloride. Decomposition may produce toxic fumes of chlorine.
Reacts with metals producing flammable/explosive hydrogen gas. Contact with moisture or water may generate heat causing ignition. Reacts vigorously with alkalis. Moderate fire hazard when in contact with reducing agents.
Fire Incompatibility: Reacts with metals producing flammable/explosive hydrogen gas.
Avoid reactions with metals, metal oxides, hydroxides, amines, carbonates, alkaline materials, acetic anhydride, cyanides, sulphides, sulphites, phosphides, acetylides, borides, carbides, silicides, vinyl acetate, formaldehyde and potassium permanganate, unsaturated organics, metal acetylides, sulphuric acid.
Note: Compatibility with plastics should be confirmed prior to use.
Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
Wear full body protective clothing with breathing apparatus. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation. Cool fire-exposed containers with water spray from a protected location. If safe to do so, remove containers from path of fire. Equipment should be thoroughly decontaminated after use. Water spray or fog may be used to disperse vapor. Do not approach cylinders suspected to be hot. If safe to do so, stop flow of gas.

Section 6 - Accidental Release Measures

Small Spills: DO NOT touch the spill material. Clean up all spills immediately. Wear fully protective PVC clothing and breathing apparatus. Contain and absorb spill with sand, earth, inert material or vermiculite. Use soda ash or slaked lime to neutralize. Collect residues and place in labeled plastic containers with vented lids. Clear area of personnel and move upwind. Avoid breathing vapors and contact with skin and eyes. Do not exert excessive pressure on valve; do not attempt to operate damaged valve. Water spray or fog may be used to disperse vapor.

See DOT ERG

Large Spills: Contact fire department and tell them location and nature of hazard. Clear area of personnel and move upwind. Wear full body protective clothing with breathing apparatus. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation. Stop leak if safe to do so. Remove leaking cylinders to a safe place if possible. Release pressure under safe, controlled conditions by opening the valve. Do not exert excessive pressure on valve; do not attempt to operate damaged valve. Shut off all possible sources of ignition and increase ventilation. Water spray or fog may be used to disperse vapor. Use soda ash or slaked lime to neutralize.
Collect and seal in labeled drums for disposal. Wash spill area with large quantities of water. If contamination of

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

drains or waterways occurs, advise emergency services. After clean-up operations, decontaminate and launder all protective clothing and equipment before storing and reusing. DO NOT touch the spill material. Contain and absorb spill with sand, earth, inert material or vermiculite.
DO NOT USE WATER OR NEUTRALIZING AGENTS INDISCRIMINATELY ON LARGE SPILLS.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid generating and breathing mist and vapor, breathing vapors and contact with skin and eyes.
Avoid physical damage to containers. Use in a well-ventilated area. Wear protective clothing and gloves when handling containers. Handle and open container with care.
WARNING: To avoid violent reaction, ALWAYS add material to water and NEVER water to material. When handling, DO NOT eat, drink or smoke. Always wash hands with soap and water after handling. Work clothes should be laundered separately. Use good occupational work practices. Observe manufacturer's storing and handling recommendations.
Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions are maintained.
Local exhaust ventilation may be required for safe working, i.e. to keep exposures below required standards; otherwise, PPE is required.
Keep dry. Reacts violently with water.
Transport containers on a trolley. Avoid sources of heat. DO NOT transfer gas from one cylinder to another.

Recommended Storage Methods: Packaging as recommended by manufacturer. Check that containers are clearly labeled.
Cylinder. Ensure the use of equipment rated for cylinder pressure. Ensure the use of compatible materials of construction. Valve protection cap to be in place until cylinder is secured, connected. Cylinder must be properly secured either in use or in storage. Cylinder valve must be closed when not in use or when empty. Segregate full from empty cylinders. WARNING: Suckback into cylinder may result in rupture. Use back-flow preventive device in piping.
Hydrochloric acid: Packs of 2.5 litres or less require a child-resistant closure. Glass container or Plastic carboy or Polylined drum.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: If risk of overexposure exists, wear air supplied breathing apparatus. Provide adequate ventilation in warehouse or closed storage areas. Use in a well-ventilated area. Local exhaust ventilation may be required for safe working, i. e. , to keep exposures below required standards; otherwise, PPE is required.
If risk of inhalation or overexposure exists, wear NIOSH-approved respirator or work in fume hood. Hydrogen chloride vapors will not be adequately absorbed by organic vapor respirators.

Personal Protective Clothing/Equipment:

Eyes: Chemical goggles. Full face shield.
DO NOT wear contact lenses. Contact lenses pose a special hazard; soft contact lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Neoprene gloves; rubber gloves. Nitrile gloves.
Safety footwear. Rubber boots.
Hydrochloric acid: Barrier cream and Neoprene gloves or Elbow length PVC gloves. Nitrile gloves.
PVC boots or PVC safety gumboots.

Respiratory Protection:
Exposure Range >5 to <50 ppm: Air Purifying, Negative Pressure, Half Mask
Exposure Range 50 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Cartridge Color: white

Other: Ensure there is ready access to a safety shower; Eyewash unit.
Acid-resistant overalls. Full protective suit. Operators should be trained in procedures for safe use of this material.

Glove Selection Index:

BUTYL	Best selection
BUTYL/NEOPRENE	Best selection
HYPALON	Best selection
NEOPRENE	Best selection
NEOPRENE/NATURAL	Best selection
NITRILE+PVC	Best selection
PE/EVAL/PE	Best selection
SARANEX-23	Best selection
VITON/NEOPRENE	Best selection
PVC	Best selection

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

NITRILE ..... Best selection
NATURAL RUBBER..... Satisfactory; may degrade after 4 hours continuous immersion
NATURAL+NEOPRENE..... Satisfactory; may degrade after 4 hours continuous immersion
NAT+NEOPR+NITRILE ..... Poor to dangerous choice for other than short-term immersion

Section 9 - Physical and Chemical Properties

Appearance/General Info: Hydrogen chloride: Colorless, corrosive gas. Pungent suffocating odor. White fumes in moist air. Soluble in methanol, ethanol, ether and benzene.
Hydrochloric acid: Clear to light yellow (orange tint for inhibited grades) fuming corrosive liquid with sharp, suffocating odor.

Physical State: Hydrogen chloride: Compressed gas; Hydrochloric acid: Liquid
Odor Threshold: 0.26 to 0.3 ppm
Vapor Pressure (kPa): < 24.8 at 25 °C
Vapor Density (Air=1): 1.268 at 20 °C
Formula Weight: 36.461
Specific Gravity (H_2O=1, at 4 °C): < 1.19 at 20 °C
Evaporation Rate: Slow

pH: Hydrochloric acid: < 1
Boiling Point: -85 °C (-121 °F)
Freezing/Melting Point: -114.44 °C (-173.992 °F)
Volatile Component (% Vol): 100
Decomposition Temperature (°C): Not applicable
Water Solubility: 56.1 g/100 cc hot water at 60 °C

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Decomposes in the presence of moisture to produce corrosive acid. May generate sufficient heat to ignite combustible materials. Presence of heat source and direct sunlight (ultra-violet radiation). Product is considered stable under normal handling conditions. Hazardous polymerization will not occur.
Storage Incompatibilities: Hydrogen chloride: Segregate from most common metals and their alloys, alkalis, unsaturated organics, fluorine, metal carbides, metal acetylides, potassium permanganate and sulfuric acid. Compatibility with plastics should be confirmed prior to use.
Hydrochloric acid: Segregate from alkalies, oxidizing agents and chemicals readily decomposed by acids, i.e. cyanides, sulfides, carbonates. Avoid storage with metals, metal oxides, hydroxides, amines, carbonates, alkaline materials, acetic anhydride, cyanides, sulphides, sulphites, phosphides, acetylides, borides, carbides, silicides, vinyl acetate, formaldehyde and potassium permanganate. Reacts with zinc, brass, galvanized iron, aluminum, copper and copper alloys.

Section 11 - Toxicological Information

Toxicity
Inhalation (human) LC_{Lo}: 1300 ppm/30 m
Inhalation (human) LC_{Lo}: 3000 ppm/5 m
Inhalation (rat) LC_{50}: 3124 ppm/60 m
Inhalation (rat) LC_{50}: 4701 ppm/30 m
Oral (rat) LD_{50}: 900 mg/kg

Irritation
Eye (rabbit): 5 mg/30 s - mild

See *RTECS* MW 4025000, for additional data.

Section 12 - Ecological Information

Environmental Fate: No data found.
Ecotoxicity: TL_m Gambusia affinis (mosquito fish) 282 ppm/96 hr (fresh water) /Conditions of bioassay not specified; Lethal Lepomis macrochirus (bluegill sunfish) 3.6 mg/l/48 hr /Conditions of bioassay not specified; LC_{50} Cockle 330 to 1,000 mg/l/48 hr /Conditions of bioassay not specified; LC_{50} Carassius auratus (goldfish) 178 mg/l (1 to 2 hr survival time) /Conditions of bioassay not specified; LC_{50} Shore crab 240 mg/l/48 hr /Conditions of bioassay not specified; LC_{50} Shrimp 100 to 330 ppm/48 hr (salt water) /Conditions of bioassay not specified; LC_{100} Trout 10 mg/l 24 hr /Conditions of bioassay not specified
Biochemical Oxygen Demand (BOD): none

Section 13 - Disposal Considerations

Disposal: Recycle wherever possible. Consult manufacturer for recycling options. Treat and neutralize at an effluent treatment plant. Bury residue in an authorized landfill. Decontaminate empty containers with a lime slurry. Return empty containers to supplier or bury empty containers at an authorized landfill.
Return empty cylinders to supplier.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

Note: This material has multiple possible HMT entries. Choose the appropriate one based on state and condition of specific material when shipped.

Shipping Name and Description: Hydrogen chloride, anhydrous
ID: UN1050
Hazard Class: 2.3 - Poisonous gas
Packing Group:
Symbols:
Label Codes: 2.3 - Poison Gas, 8 - Corrosive
Special Provisions: 3
Packaging: **Exceptions:** None **Non-bulk:** 304 **Bulk:** None
Quantity Limitations: **Passenger aircraft/rail:** Forbidden **Cargo aircraft only:** Forbidden
Vessel Stowage: **Location:** D **Other:** 40

Shipping Name and Description: Hydrochloric acid
ID: UN1789
Hazard Class: 8 - Corrosive material
Packing Group: II - Medium Danger
Symbols:
Label Codes: 8 - Corrosive
Special Provisions: A3, A6, B3, B15, IB2, N41, T8, TP2, TP12
Packaging: **Exceptions:** 154 **Non-bulk:** 202 **Bulk:** 242
Quantity Limitations: **Passenger aircraft/rail:** 1 L **Cargo aircraft only:** 30 L
Vessel Stowage: **Location:** C **Other:**

Shipping Name and Description: Hydrochloric acid
ID: UN1789
Hazard Class: 8 - Corrosive material
Packing Group: III - Minor Danger
Symbols:
Label Codes: 8 - Corrosive

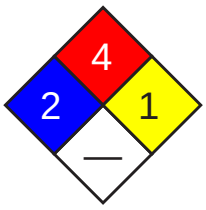
Material Safety Data Sheet Collection
Genium group inc.
1171 RiverFront Center, Amsterdam, NY 12010
(518) 842-4111

Issue Date: 2006-06

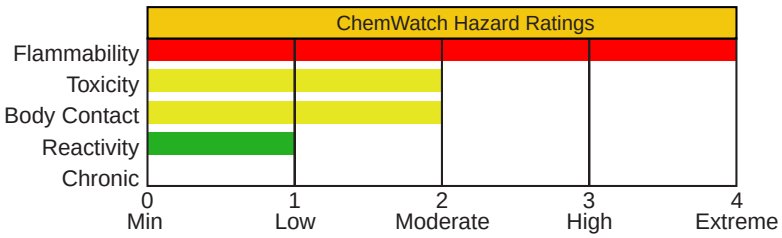
Section 1 - Chemical Product and Company Identification 61

Material Name: Isobutene **CAS Number:** 115-11-7
Chemical Formula: C_4H_8
Structural Chemical Formula: $(CH_3)_2C=CH_2$
EINECS Number: 204-066-3
ACX Number: X1003822-9
Synonyms: Isobutene; ISOBUTYLENE; ASYM-DIMETHYLETHYLENE; GAMMA-BUTYLENE; 1,1-DIMETHYLETHYLENE; ISO-BUTENE; ISOBUTENE; ISOPROPYLIDENEMETHYLENE; LIQUEFIED PETROLEUM GAS; 2-METHYL-1-PROPENE; 2-METHYLPROPENE; 2-METHYLPROPYLENE; 1-PROPENE,2-METHYL-; PROPENE,2-METHYL-; UNSYM. DIMETHYLETHYLENE
General Use: Production of butene polymers used as adhesives, tackifiers, oil additives.
Butyl rubbers, copolymer resins with butadiene, acrylates and methacrylates.
Also to produce anti-oxidants for foods, food supplements, plastics and in production of isooctane and high-octane aviation gasoline.
Used in closed pressurized systems, fitted with safety relief valve.
Vented gas is flammable, denser than air and will spread. Vent path must not contain ignition sources, pilot lights, bare flames.

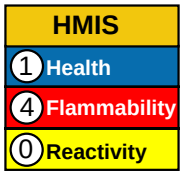


Section 2 - Composition / Information on Ingredients

Name	CAS	%
isobutene	115-11-7	>99



OSHA PEL **NIOSH REL**



ACGIH TLV

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word

Danger!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Colorless gas. Acute Effects: Simple asphyxiant which can displace available oxygen; initial symptoms: rapid respiration, air hunger, diminished mental alertness, impaired muscular coordination. Can form explosive mixtures in air. Flammable.

Potential Health Effects

Target Organs: None reported
Primary Entry Routes: inhalation
Acute Effects
Inhalation: The gas is a simple asphyxiant (precludes access to oxygen) and is harmful if exposure is prolonged and inhalation may cause loss of consciousness.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Acute effects from inhalation of high concentrations of gas / vapor are pulmonary irritation, including coughing, with nausea; central nervous system depression - characterized by headache and dizziness, increased reaction time, fatigue and loss of coordination.
If exposure to highly concentrated atmosphere of gas is prolonged this may lead to narcosis, unconsciousness, even coma, and unless resuscitated, death.
Iso-butene is a simple asphyxiant and may have a narcotic action.
Material is highly volatile and may quickly form concentrated atmosphere in confined or unventilated area. Vapor is heavier than air and may displace and replace air in breathing zone, acting as a simple asphyxiant. This may happen with little warning of overexposure.
Hydrocarbons may sensitize the heart to adrenalin and other circulatory catecholamines; as a result cardiac arrhythmias and ventricular fibrillation may occur. Abrupt collapse may produce traumatic injury.
Central nervous system (CNS) depression may be evident early. Symptoms of moderate poisoning may include giddiness, headache, dizziness and nausea.
Serious poisonings may result in respiratory depression and may be fatal.
The paraffin gases C1-4 are practically non-toxic below their lower flammability limits (18000-50000 ppm). Above this level, incidental effects include CNS depression and irritation but these are reversible upon cessation of the exposure. The C3 and iso-C5 hydrocarbons show increasing narcotic properties; branching of the chain also enhances the effect.
The C4 hydrocarbons appear to be more highly neurotoxic than the C3 and C5 members. Several fatalities due to voluntary inhalation of butane have been reported, possibly due to central, respiratory and circulatory effects resulting from anesthesia, laryngeal edema, chemical pneumonia or the combined effects of cardiac toxicity and increased sympathomimetic effects.
Inhalation of petroleum gases may produce narcosis, due in part to olefinic impurities. Displacement of oxygen in the air may cyanosis.
If present in sufficient quantity these gases may reduce the oxygen level to below 18% producing asphyxiation.
Symptoms include rapid respiration, mental dullness, lack of coordination, poor judgement, nausea and vomiting.
The onset of cyanosis may lead to unconsciousness and death.

Eye: The liquid is highly discomforting and may cause severe cold burns and is capable of causing pain and severe conjunctivitis.
Corneal injury may develop, with possible permanent impairment of vision, if not promptly and adequately treated.
The gas is regarded as non-irritating to the eyes.

Skin: Vaporizing liquid causes rapid cooling and contact may cause cold burns, frostbite.The liquid is discomforting to the skin and may rapidly cause severe cold burns.
Bare unprotected skin should not be exposed to this material.
There is no evidence of skin absorption but contact may cause frostbite,

Ingestion: Overexposure is unlikely in this form.
Considered an unlikely route of entry in commercial/industrial environments.
The liquid is highly discomforting if swallowed and may cause severe cold burns.

Carcinogenicity: NTP - Not listed; IARC - Not listed; OSHA - Not listed; NIOSH - Not listed; ACGIH - Not listed; EPA - Not listed; MAK - Not listed.

Chronic Effects: Chronic overexposure may produce dermatitis.

Section 4 - First Aid Measures

Inhalation: Avoid becoming a casualty and remove to fresh air.
Lay patient down. If breathing is shallow or has stopped, ensure clear airway and apply resuscitation.
If available, medical oxygen should be administered by trained personnel.
Transport to hospital or doctor, without delay.

See DOT ERG

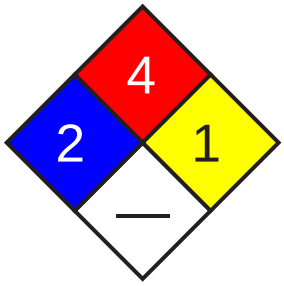
Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.
Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: In case of cold burns (frost-bite): Bathe the affected area immediately in cold water for 10 to 15 minutes, immersing if possible and without rubbing.
Do not apply hot water or radiant heat. Apply a clean, dry dressing.
Transport to hospital or doctor.

Ingestion: Contact a Poison Control Center. DO NOT induce vomiting. Observe the patient carefully. Never give liquid to a person showing signs of being sleepy or with reduced awareness; i.e. becoming unconscious. Give water (or milk) to rinse out mouth. Then provide liquid slowly and as much as casualty can comfortably drink. Transport to hospital or doctor without delay.

After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: For acute or short-term repeated exposures to petroleum distillates or related hydrocarbons:
1.Primary threat to life from pure petroleum distillate ingestion and/or inhalation is respiratory failure.



Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

2.Patients should be quickly evaluated for signs of respiratory distress (e.g. cyanosis, tachypnea, intercostal retraction, obtundation) and given oxygen. Patients with inadequate tidal volumes or poor arterial blood gases (pO_2 <50 mm Hg or pCO_2 >50 mm Hg) should be intubated.
3.Arrhythmias complicate some hydrocarbon ingestion and/or inhalation and electrocardiographic evidence of myocardial injury has been reported; intravenous lines and cardiac monitors should be established in obviously symptomatic patients. The lungs excrete inhaled solvents, so that hyperventilation improves clearance.
4.A chest x-ray should be taken immediately after stabilization of breathing and circulation to document aspiration and detect the presence of pneumothorax.
5.Epinephrine (adrenalin) is not recommended for treatment of bronchospasm because of potential myocardial sensitization to catecholamines.
Inhaled cardioselective bronchodilators (e.g. Alupent, Salbutamol) are the preferred agents, with aminophylline a second choice.
6.Lavage is indicated in patients who require decontamination; ensure use of cuffed endotracheal tube in adult patients.

Section 5 - Fire-Fighting Measures

Flash Point: -76.111 °C
Autoignition Temperature: 465 °C
LEL: 1.8% v/v
UEL: 9.6% v/v
Extinguishing Media: Water spray or fog; dry chemical powder.
Carbon dioxide.
Foam.

See DOT ERG

Fire Diamond

General Fire Hazards/Hazardous Combustion Products: Flammable gas. Liquid and vapor are highly flammable.
Dangerous hazard when exposed to heat, flame and oxidizers.
Gas may form explosive mixtures with air over a wide area.
Decomposes on heating and produces toxic fumes of carbon monoxide (CO) and carbon dioxide (CO_2).
Fire Incompatibility: Avoid contamination with oxidizing agents i.e. nitrates, oxidizing acids, chlorine bleaches, pool chlorine etc. as ignition may result.
Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear full body protective clothing with breathing apparatus. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
Do not extinguish burning gas. If safe to do so, stop flow of gas.
If flow of gas cannot be stopped, leave gas to burn.
Cool fire-exposed containers with water spray from a protected location.
Do not approach cylinders suspected to be hot.
If safe to do so, remove containers from path of fire.
Fight fire from a safe distance, with adequate cover.

Section 6 - Accidental Release Measures

Small Spills: Avoid breathing vapor and any contact with liquid or gas. Protective equipment including respirator should be used. Do NOT enter confined spaces where gas may have accumulated. Shut of all sources of possible ignition and increase ventilation. Clear area of personnel. Stop leak only if safe to so do. Remove leaking cylinders to safe place. Release pressure under safe controlled conditions by opening valve. Keep area clear of personnel until gas has dispersed.

See DOT ERG

Large Spills: DO NOT touch the spill material. Shut off all possible sources of ignition and increase ventilation. Restrict access to area. Clear area of personnel and move upwind.
May be violently or explosively reactive. Wear full body protective clothing with breathing apparatus. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
Avoid spraying water onto liquid pools.
Use extreme caution to avoid a violent reaction.
Stop leak if safe to do so.
DO NOT enter confined places where gas may have collected. Remove leaking cylinders to a safe place. Fit vent pipes. Release pressure under safe, controlled conditions by opening valve. Burn issuing gas at vent pipes.
Do not exert excessive pressure on valve; do not attempt to operate damaged valve.
Keep area clear of personnel until gas has dispersed
Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Use good occupational work practices. Use in a well-ventilated area.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Obtain a work permit before attempting any repairs.
Do not attempt repair work on lines, vessels under pressure.
Atmospheres must be tested and O.K. before work resumes after leakage.
Wear protective clothing and gloves when handling containers.
No smoking, bare lights, heat or ignition sources.
Use spark-free tools when handling. Ground all lines and equipment.
Prevent concentration in hollows and sumps. DO NOT enter confined spaces until atmosphere has been checked.
Gas may travel a considerable distance to source of ignition.
Vapor may ignite on pumping or pouring due to static electricity.
Avoid physical damage to containers.
DO NOT transfer gas from one cylinder to another.
Natural gases contain a contaminant, radon-222, a naturally occurring radioactive gas. During subsequent processing, radon tends to concentrate in liquified petroleum streams and in product streams having similar boiling points.
Industry experience indicates that the commercial product may contain small amounts of radon-222 and its radioactive decay products (radon daughters). The actual concentration of radon-222 and radioactive daughters in process equipment (IE lines, filters, pumps and reactor units) may reach significant levels and produce potentially damaging levels of gamma radiation. A potential external radiation hazard exists at or near any pipe, valve or vessel containing a radon enriched stream or containing internal deposits of radioactive material. Field studies, however, have not shown that conditions exist that expose the worker to cumulative exposures in excess of general population limits. Equipment containing gamma-emitting decay products should be presumed to be internally contaminated with alpha- emitting decay products which may be hazardous if inhaled or ingested.
During maintenance operations that require the opening of contaminated process equipment, the flow of gas should be stopped and a four hour delay enforced to allow gamma-radiation to drop to background levels. Protective equipment (including high efficiency particulate respirators (P3) suitable for radionucleotides or supplied air) should be worn by personnel entering a vessel or working on contaminated process equipment to prevent skin contamination or inhalation of any residue containing alpha-radiation.
Airborne contamination may be minimized by handling scale and/or contaminated materials in a wet state.

Recommended Storage Methods: Packaging as recommended by manufacturer.
Check that containers are clearly labeled.
Cylinder fitted with valve protector cap.
Ensure the use of equipment rated for cylinder pressure.
Ensure the use of compatible materials of construction.
Cylinder valve must be closed when not in use or when empty.
Cylinder must be properly secured either in use or in storage.
WARNING: Suckback into cylinder may result in rupture.
Use back-flow preventive device in piping.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use in a well-ventilated areaIf gas concentrations are high: or If risk of overexposure exists, wear NIOSH-approved respirator.
Correct fit is essential to obtain adequate protection.
Used in closed pressurized systems; fitted with temperature and pressure safety relief valves which are vented to allow safe dispersal.
Provide adequate ventilation in warehouse or closed storage areas.

Personal Protective Clothing/Equipment:

Eyes: Safety glasses with side shields; or as required, chemical goggles.
Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Protective gloves eg. leather gloves or gloves with leather facing. Neoprene rubber gloves.
Safety footwear.

Other: Operators should be trained in correct use & maintenance of respirators Ensure that there is ready access to breathing apparatus.
Protective overalls, closely fitted at neck and wrist. Eye-wash unit.
IN CONFINED SPACES:
1. Non-sparking protective boots.
2. Static-free clothing.
3. Ensure availability of lifeline.
Staff should be trained in all aspects of rescue work.
Ensure there is ready access to an emergency shower.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 9 - Physical and Chemical Properties

Appearance/General Info: Easily liquified flammable gas or colorless highly volatile liquid. Packed as liquid under pressure and remains liquid only under pressure. Sudden release of pressure or leakage may result in rapid vaporization with generation of large volume of highly flammable / explosive gas. Strong gasoline odor. Floats and boils on water giving a flammable / explosive, visible cloud. Soluble in alcohol, ether, benzene and sulphuric acid.

Physical State: Liquefied gas
Odor Threshold: 1.3 to 3.0 mg/m^3
Vapor Pressure (kPa): 182 kPa at 10 °C
Vapor Density (Air=1): 2.01
Formula Weight: 56.11
Specific Gravity (H_2O=1, at 4 °C): 0.59
Evaporation Rate: Very rapid
pH: Not applicable
pH (1% Solution): Not applicable.
Boiling Point: -6.9 °C (20 °F)
Freezing/Melting Point: -140.35 °C (-220.63 °F)
Volatile Component (% Vol): 100
Water Solubility: Practically insoluble in water

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Product is considered stable. Hazardous polymerization will not occur.
Storage Incompatibilities: Avoid contact with oxidizing agents.

The interaction of alkenes and alkynes with nitrogen oxides and oxygen may produce explosive addition products; these may form at very low temperatures and explode on heating to higher temperatures (the addition products from 1,3-butadiene and cyclopentadiene form rapidly at -150 °C and ignite or explode on warming to -35 to -15 C). These derivatives ("pseudo- nitrosites") were formerly used to characterize terpene hydrocarbons.

Exposure to air must be kept to a minimum so as to limit the build-up of peroxides which will concentrate in bottoms if the product is distilled.

The product must not be distilled to dryness if the peroxide concentration is substantially above 10 ppm (as active oxygen) since explosive decomposition may occur. Distillate must be immediately inhibited to prevent peroxide formation. The effectiveness of the antioxidant is limited once the peroxide levels exceed 10 ppm as active oxygen. Addition of more inhibitor at this point is generally ineffective.

Prior to distillation it is recommended that the product should be washed with aqueous ferrous ammonium sulfate to destroy peroxides; the washed product should be immediately re-inhibited.

A range of exothermic decomposition energies for double bonds is given as 40-90 kJ/mol. The relationship between energy of decomposition and processing hazards has been the subject of discussion; it is suggested that values of energy released per unit of mass, rather than on a molar basis (J/g) be used in the assessment. For example, in "open vessel processes" (with man-hole size openings, in an industrial setting), substances with exothermic decomposition energies below 500 J/g are unlikely to present a danger, whilst those in "closed vessel processes" (opening is a safety valve or bursting disk) present some danger where the decomposition energy exceeds 150 J/g.

Avoid reactions with oxidizing agents, organic acids, inorganic acids halogenated compounds, polymerizable esters, oxygen, cyanohydrins and molten sulphur.

Section 11 - Toxicological Information

Toxicity
Inhalation (rat) LC_{50}: 620000 mg/m^3/4h

Irritation
Nil reported

See *RTECS* UD 0890000, for additional data.

Section 12 - Ecological Information

Environmental Fate: No data found.
Ecotoxicity: No data found.
BCF: no food chain concentration potential
Biochemical Oxygen Demand (BOD): none

Section 13 - Disposal Considerations

Disposal: Consult manufacturer for recycling options.
Discharge to burning flare. Return empty cylinders to supplier.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

Note: This material has multiple possible HMT entries. Choose the appropriate one based on state and condition of specific material when shipped.

Shipping Name and Description: Isobutylene *see also* Petroleum gases, liquefied
ID: UN1055
Hazard Class: 2.1 - Flammable gas
Packing Group:
Symbols:
Label Codes: 2.1 - Flammable Gas
Special Provisions: 19, T50
Packaging: **Exceptions:** 306 **Non-bulk:** 304 **Bulk:** 314, 315
Quantity Limitations: **Passenger aircraft/rail:** Forbidden **Cargo aircraft only:** 150 kg
Vessel Stowage: **Location:** E **Other:** 40

Isopropyl Alcohol
ISO5300

Issue Date: 2006-06

Section 1 - Chemical Product and Company Identification 61

Material Name: Isopropyl Alcohol **CAS Number:** 67-63-0
Chemical Formula: C_3H_8O
Structural Chemical Formula: $(CH_3)_2CHOH$
EINECS Number: 200-661-7
ACX Number: X1001458-1
Synonyms: ALCOJEL; ALCOOL ISOPROPILICO; ALCOOL ISOPROPYLIQUE; ALCOSOLVE; ALCOSOLVE 2; AVANTIN; AVANTINE; CHROMAR; COMBI-SCHUTZ; (COMPONENT OF) HIBISTAT; DIMETHYL CARBINOL; DIMETHYLCARBINOL; EPA PESTICIDE CHEMICAL CODE 047501; HARTOSOL; 2-HYDROXYPROPANE; IMSOL A; IPA; ISOHOL; ISOPROPANOL; ISOPROPYL ALCOHOL; ISO-PROPYLALKOHOL; LUTOSOL; 1-METHYLETHANOL; 1-METHYLETHYL ALCOHOL; PETROHOL; PRO; 2-PROPANOL; I-PROPANOL; N-PROPAN-2-OL; PROPAN-2-OL; PROPOL; 2-PROPYL ALCOHOL; I-PROPYL ALCOHOL; SEC-PROPYL ALCOHOL; I-PROPYLALKOHOL; SECONDARY PROPYL ALCOHOL; SPECTRAR; STERISOL HAND DISINFECTANT; TAKINEOCOL; VISCO 1152
Derivation: Treating propylene with sulfuric acid and then hydrolyzing or direct hydration of propylene using superheated steam. Most commonly available as rubbing alcohol (70% IPA).
General Use: As a solvent for gums, shellac, and essential oils, chemical intermediate, dehydrating agent, vehicle for germicidal compounds, de-icing agent for liquid fuels; for denaturing ethyl alcohol, preserving pathological specimens; in extraction of alkaloids, quick-drying inks and oils, and an ingredient of skin lotions, cosmetics, window cleaner, liquid soaps, and pharmaceuticals.

Section 2 - Composition / Information on Ingredients

Name	CAS	%
Isopropyl alcohol	67-63-0	100% vol.

Most commonly sold as 70% isopropyl alcohol (rubbing alcohol).

OSHA PEL
TWA: 400 ppm; 980 mg/m^3.

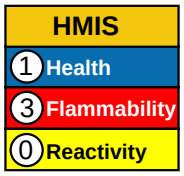
ACGIH TLV
TWA: 200 ppm; STEL: 400 ppm.



IDLH Level
2000 ppm (10% LEL).

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word
Warning!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Volatile liquid. Irritating to eyes/respiratory tract. Other Acute Effects: CNS depression, possible dermatitis, systemic toxicity. Flammable

Potential Health Effects

Target Organs: Eyes, skin, respiratory system.
Primary Entry Routes: Inhalation, ingestion, skin contact/absorption.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Acute Effects

Inhalation: Vapor inhalation is irritating to the respiratory tract and can cause central nervous system depression at high concentrations. Volunteers exposed to 400 ppm for 3 to 5 min experienced mild eye and respiratory irritation. At 800 ppm, irritation was not severe, but most people found the air uncomfortable to breathe.

Eye: Exposure to the vapor or direct contact with the liquid causes irritation and possible corneal burns.

Skin: Some irritation may occur after prolonged exposure.

Ingestion: Accidental ingestions have provided the most information on isopropyl alcohol toxicity. Symptoms include nausea and vomiting, headache, facial flushing, dizziness, lowered blood pressure, mental depression, hallucinations and distorted perceptions, difficulty breathing, respiratory depression, stupor, unconsciousness, and coma. Kidney insufficiency including oliguria (reduced urine excretion), anuria (absent urine excretion), nitrogen retention, and edema (fluid build-up in tissues) may occur. One post-mortem examination in a case of heavy ingestion showed extensive hemorrhagic tracheobronchitis, broncho pneumonia, and hemorrhagic pulmonary edema. Death can occur in 24 to 36 h post-ingestion due to respiratory paralysis.

Carcinogenicity: NTP - Not listed; IARC - Group 3, Not classifiable as to carcinogenicity to humans; OSHA - Not listed; NIOSH - Not listed; ACGIH - Not listed; EPA - Not listed; MAK - Not listed.

Medical Conditions Aggravated by Long-Term Exposure: Dermatitis or respiratory or kidney disorders.

Chronic Effects: Repeated skin contact can cause drying of skin and delayed hypersensitivity reactions in some individuals.

Section 4 - First Aid Measures

See DOT ERG

Inhalation: Remove exposed person to fresh air and support breathing as needed.

Eye Contact: *Do not* allow victim to rub or keep eyes tightly shut. Gently lift eyelids and flush immediately and continuously with flooding amounts of water until transported to an emergency medical facility. Consult a physician immediately.

Skin Contact: *Quickly* remove contaminated clothing. Rinse with flooding amounts of water for at least 15 min. Wash exposed area with soap and water. For reddened or blistered skin, consult a physician.

Ingestion: Never give anything by mouth to an unconscious or convulsing person. Contact a poison control center. Unless the poison control center advises otherwise, have the *conscious and alert* person drink 1 to 2 glasses of water to dilute. Vomiting may be contraindicated because of the rapid onset of central nervous system depression. Gastric lavage is preferred.

After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: Diagnostic test: acetone in urine. Isopropyl alcohol is oxidized in the body to acetone where it is excreted by the lungs or kidneys. Some acetone may be further metabolized to acetate, formate, and finally carbon dioxide. Probable oral lethal dose is 240 mL.

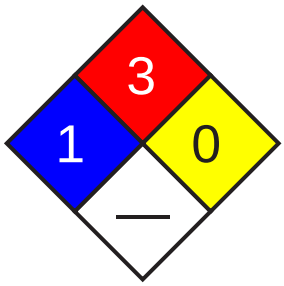
Section 5 - Fire-Fighting Measures

See DOT ERG

Flash Point: 53 °F (12 °C), Closed Cup

Burning Rate: 2.3 mm/min.

Autoignition Temperature: 750°F (399°C)



LEL: 2 % v/v

UEL: 12.7 % v/v at 200 °F

Flammability Classification: Class 1B Flammable Liquid

Extinguishing Media: Carbon dioxide, dry chemical, water *spray* (solid streams can spread fire), alcohol- resistant foam, or fog.

General Fire Hazards/Hazardous Combustion Products: Carbon oxides and acrid smoke. Container may explode in heat of fire. Vapors may travel to an ignition source and flash back. Isopropyl alcohol poses an explosion hazard indoors, outdoors, and in sewers.

Fire Diamond

Fire-Fighting Instructions: If possible without risk, move container from fire area. Apply cooling water to container side until well after fire is out. Stay away from ends of tanks. For massive fire in cargo area, use monitor nozzles or unmanned hose holders; if impossible, withdraw and let fire burn. Withdraw immediately if you hear a rising sound from venting safety device or notice any tank discoloration due to fire. *Do not* release runoff from fire control methods to sewers or waterways. Because fire may produce toxic thermal decomposition products, wear a self-contained breathing apparatus (SCBA) with a full facepiece operated in pressure-demand or positive-pressure mode. Structural firefighters' protective clothing provides only limited protection.

Section 6 - Accidental Release Measures

See DOT ERG

Spill/Leak Procedures: Notify safety personnel, isolate and ventilate area, deny entry, and stay upwind. Shut off ignition sources. Cleanup personnel should protect against vapor inhalation and skin/eye contact. Water spray may reduce vapor, but may not prevent ignition in closed spaces.

Small Spills: Take up with earth, sand, vermiculite, or other absorbent, noncombustible material and place in suitable containers.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Large Spills: For large spills, dike far ahead of liquid spill for later disposal. Do not release into sewers or waterways.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Use non-sparking tools to open containers.
Never eat, drink, or smoke in work areas. Practice good personal hygiene after using isopropyl alcohol, especially before eating, drinking, smoking, using the toilet, or applying cosmetics.

Recommended Storage Methods: Store in a cool, dry, well-ventilated area away from heat, ignition sources, and incompatibles (Sec 10). Install electrical equipment of Class 1, Group D.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: To prevent static sparks, electrically ground and bond all equipment used with and around IPA. Provide general or local exhaust ventilation systems to maintain airborne levels below OSHA PELs (Sec. 2). Local exhaust ventilation is preferred since it prevents contaminant dispersion into the work area by controlling it at its source.

Administrative Controls: Consider preplacement and periodic medical exams of exposed workers with emphasis on the skin, kidneys, and respiratory system. Be extra cautious when using IPA concurrently with carbon tetrachloride because animal studies have shown it enhances carbon tetrachloride's toxicity.

Personal Protective Clothing/Equipment: Wear chemically protective gloves, boots, aprons, and gauntlets to prevent prolonged or repeated skin contact. Nitrile rubber (breakthrough time > 8 hr), Neoprene and Teflon (breakthrough time > 4 hr) are suitable materials for PPE. Do not use PVA, PVC or natural rubber (breakthrough time < 1 hr). Wear protective eyeglasses or chemical safety goggles, per OSHA eye- and face-protection regulations (29 CFR 1910.133). Because contact lens use in industry is controversial, establish your own policy.

Respiratory Protection: Seek professional advice prior to respirator selection and use. Follow OSHA respirator regulations (29 CFR 1910.134) and, if necessary, wear a MSHA/NIOSH-approved respirator. For < 1000 ppm, use any powered, air purifying respirator with organic vapor cartridges or any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s). For < 10,000 ppm, use any supplied-air respirator (SAR) operated in continuous-flow mode. For < 12,000 ppm, use any air- purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister or any SCBA or SAR with a full facepiece. For emergency or entrance into unknown concentrations, use any SCBA or SAR (with auxiliary SCBA) with a full facepiece and operated in pressure-demand or other positive-pressure mode. For emergency or nonroutine operations (cleaning spills, reactor vessels, or storage tanks), wear an SCBA. *Warning! Air-purifying respirators do not protect workers in oxygen-deficient atmospheres.* If respirators are used, OSHA requires a written respiratory protection program that includes at least: medical certification, training, fit-testing, periodic environmental monitoring, maintenance, inspection, cleaning, and convenient, sanitary storage areas.

Other: Separate contaminated work clothes from street clothes. Launder before reuse. Remove isopropyl alcohol from your shoes and clean personal protective equipment. Make emergency eyewash stations, safety/quick-drench showers, and washing facilities available in work area.

Section 9 - Physical and Chemical Properties

Appearance/General Info: Colorless with a slight odor and bitter taste.

Physical State: Liquid
Odor Threshold: 7.84 to 490 mg/m^3
Vapor Pressure (kPa): 44 mm Hg at 25 °F (77 °C)
Formula Weight: 60.09
Density: 0.78505 at 68°F (20 °C)
Refractive Index: 1.375 at 68 °F (20 °C)
Boiling Point: 180.5 °F (82.5 °C)
Freezing/Melting Point: -129.1 °F (-89.5 °C)
Viscosity: 2.1 cP at 77 °F (25 °C)
Surface Tension: 20.8 dyne/cm at 77 °F (25 °C)
Ionization Potential (eV): 10.10 eV
Critical Temperature: 455 °F (235 °C)
Critical Pressure: 47 atm
Water Solubility: > 10 %
Other Solubilities: Soluble in alcohol, ether, chloroform, and benzene. Insoluble in salt solutions.

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Isopropyl alcohol is stable at room temperature in closed containers under normal storage and handling conditions. Hazardous polymerization does not occur. Exposure to heat, ignition sources, and incompatibles.

Storage Incompatibilities: Include acetaldehyde, chlorine, ethylene oxide, acids and isocyanates, hydrogen + palladium, nitroform, oleum, phosgene, potassium *t*-butoxide, oxygen (forms unstable peroxides), trinitromethane, barium perchlorate, tetrafluoroborate, chromium trioxide, sodium dichromate + sulfuric acid, aluminum, aluminum triisopropoxide, and oxidizers. Will attack some forms of plastic, rubber, and coatings.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Hazardous Decomposition Products: Thermal oxidative decomposition of isopropyl alcohol can produce carbon oxides and acrid smoke.

Section 11 - Toxicological Information

Acute Oral Effects:

Rat, oral, LD_{50}: 5045 mg/kg caused a change in righting reflex, and somnolence (general depressed activity).

Human, oral, TD_{Lo}: 223 mg/kg caused hallucinations, distorted perceptions, lowered blood pressure, and a change in pulse rate.

Human, oral, LD_{Lo}: 3570 mg/kg caused coma, respiratory depression, nausea, and vomiting.

Irritation Effects:

Rabbit, eye: 100 mg caused severe irritation.

Rabbit, skin: 500 mg caused mild irritation.

Other Effects:

Rat, inhalation: 3500 ppm/7 hr given from 1 to 19 days of pregnancy caused fetotoxicity.

See *RTECS* NT8050000, for additional data.

Section 12 - Ecological Information

Environmental Fate: On soil, IPA will volatilize or leach into groundwater. Biodegradation is possible but rates are not found in available literature. It will volatilize (est. half-life = 5.4 days) or biodegrade in water. It is not expected to bioconcentrate in fish. In the air, it reacts with photochemically produced hydroxyl radicals with a half-life of one to several days. Because it is soluble, removal by rain, snow or other precipitation is possible.

Ecotoxicity: Guppies (*Poecilia reticulata*) LC_{50} = 7,060 ppm/7 days; fathead minnow (*Pimephales promelas*) LC_{50} = 11,830 mg/L/1 hr. BOD = 133 %/5 days.

Octanol/Water Partition Coefficient: log K_{ow} = 0.05

Section 13 - Disposal Considerations

Disposal: Microbial degradation is possible by oxidizing isopropyl alcohol to acetone by members of the genus *Desulfovibrio*. Spray waste into incinerator (permit-approved facilities only) equipped with an afterburner and scrubber. Isopropyl alcohol can be settled out of water spills by salting with sodium chloride. Note: Salt may harm aquatic life, so weigh the benefits against possible harm before application. Contact your supplier or a licensed contractor for detailed recommendations. Follow applicable Federal, state, and local regulations. Triple rinse containers.

Section 14 - Transport Information

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word

Danger!

Flammable

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Clear, colorless liquid; slight hydrocarbon/mint or terpene-like odor. Irritating to eyes/skin/respiratory tract. Other Acute Effects: CNS and respiratory depression, aspiration pneumonitis. Chronic Effects: nasal/tracheal inflammation. Flammable.

Potential Health Effects

Target Organs: upper respiratory system, central nervous system (CNS)
Primary Entry Routes: inhalation, ingestion
Acute Effects

Inhalation: The vapor is harmful and discomforting to the upper respiratory tract. Acute effects from inhalation of high vapor concentrations may be chest and nasal irritation with coughing, sneezing, headache and even nausea. If exposure to highly concentrated vapor atmosphere is prolonged this may lead to narcosis, unconsciousness, even coma, and unless resuscitated, death. Inhalation of the lower alkyl ethers may produce intoxication, blurred vision, headache, dizziness, excitation, pharyngitis, and irritation of the nose and throat. Convulsions, respiratory distress or paralysis, asphyxia, pneumonitis, and unconsciousness are all serious manifestations of poisoning; liver and kidney damage may occur. Fatalities have been reported. Ethers produce narcosis following inhalation.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Rats exposed to 8000 ppm for 6 hours showed changes in motor activity with the pattern and time course of effects being indicative of transient central nervous system depression. Transient increases in motor activity, on the other hand, were observed in male rats exposed at 800 and 4000 ppm. This finding may reflect an exposure-related stimulant effect or an exaggerated response following recovery from an anesthetic effect. Rats exposed to 1000 ppm, 6 hours/day, 5 days/week for 9 exposures showed lachrymation, conjunctival swelling and corneal changes. A reduced reaction to auditory stimuli was noted at 3000 ppm. There were no other macroscopic pathology findings other than chronic inflammatory changes in the nasal mucosa and trachea.

Eye: The liquid is extremely discomforting to the eyes.
Eye contact with alkyl ethers (vapors or liquid) may produce irritation, redness and lachrymation.

Skin: The liquid is discomforting to the skin and is capable of causing skin reactions which may lead to dermatitis. Bare unprotected skin should not be exposed to this material. Considered to be harmful if it is absorbed by the skin. Alkyl ethers may defat and dehydrate the skin producing dermatoses.
Absorption may produce headache, dizziness, and central nervous system depression.

Ingestion: Considered an unlikely route of entry in commercial/industrial environments. The liquid is extremely discomforting and may be fatal if swallowed. Ingestion may result in nausea, pain, vomiting. Vomit entering the lungs by aspiration may cause potentially lethal chemical pneumonitis. Ingestion of alkyl ethers may produce symptoms to those produced following inhalation.

Carcinogenicity: NTP - Not listed; IARC - Group 2B, Possibly carcinogenic to humans; OSHA - Not listed; NIOSH - Not listed; ACGIH - Class A3, Animal carcinogen; EPA - Not listed; MAK - Not listed.

Chronic Effects: Prolonged or repeated exposure may cause kidney damage.
Rats exposed to 800, 4000 or 8000 ppm, 6 hours/day, 5 days/week, for 13 weeks showed statistically significant increases in the mean absolute and relative weights of liver, kidneys, and adrenal gland in the two higher exposure groups, while mild hematological changes were seen in all animals.
Chronic exposure to alkyl ethers may result in loss of appetite, excessive thirst, fatigue, and weight loss.

Section 4 - First Aid Measures

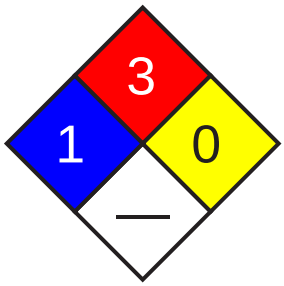
See DOT ERG

Inhalation: Remove to fresh air. Lay patient down. Keep warm and rested. If available, administer medical oxygen by trained personnel. If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor without delay.

Eye Contact: Immediately hold the eyes open and wash continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids. Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.

Skin Contact: Immediately flush body and clothes with large amounts of water, using safety shower if available. Quickly remove all contaminated clothing, including footwear. Wash affected areas with water (and soap if available) for at least 15 minutes. Transport to hospital or doctor.

Ingestion: DO NOT induce vomiting.
Observe the patient carefully. Never give liquid to a person showing signs of being sleepy or with reduced awareness; i.e. becoming unconscious. Give water (or milk) to rinse out mouth. Then provide liquid slowly and as much as casualty can comfortably drink. Transport to hospital or doctor without delay.



After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: Treat symptomatically.

Section 5 - Fire-Fighting Measures

See DOT ERG

Flash Point: -26 °C Closed Cup
Autoignition Temperature: 435 °C
LEL: 1.5% v/v
Extinguishing Media: Foam. Dry chemical powder. BCF (where regulations permit). Carbon dioxide.
Water spray or fog - Large fires only.

Fire Diamond

General Fire Hazards/Hazardous Combustion Products: Liquid and vapor are highly flammable. Severe fire hazard when exposed to heat, flame and/or oxidizers. Vapor forms an explosive mixture with air.
Severe explosion hazard, in the form of vapor, when exposed to flame or spark. Vapor may travel a considerable distance to source of ignition.
Heating may cause expansion/decomposition with violent rupture of containers.
On combustion, may emit toxic fumes of carbon monoxide (CO). May emit poisonous fumes.

Fire Incompatibility: Avoid contact with oxidizing agents and strong acids.

Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
Fight fire from a safe distance, with adequate cover.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

If safe, switch off electrical equipment until vapor fire hazard removed.
Use water delivered as a fine spray to control the fire and cool adjacent area. Avoid spraying water onto liquid pools.
Do not approach containers suspected to be hot. Cool fire exposed containers with water spray from a protective location. If safe to do so, remove containers from path of fire.

Section 6 - Accidental Release Measures

Small Spills: Remove all ignition sources. Clean up all spills immediately.
Avoid breathing vapors and contact with skin and eyes.
Control personal contact by using protective equipment.
Contain and absorb small quantities with vermiculite or other absorbent material. Wipe up. Collect residues in a flammable waste container.
Large Spills: Clear area of personnel and move upwind.
Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear breathing apparatus plus protective gloves. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
No smoking, bare lights or ignition sources. Increase ventilation.
Stop leak if safe to do so. Water spray or fog may be used to disperse/absorb vapor. Contain spill with sand, earth or vermiculite.
Use only spark-free shovels and explosion proof equipment.
Collect recoverable product into labeled containers for recycling.
Absorb remaining product with sand, earth or vermiculite.
Collect solid residues and seal in labeled drums for disposal.
Wash area and prevent runoff into drains.
If contamination of drains or waterways occurs, advise emergency services.
Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Do not allow clothing wet with material to stay in contact with skin.
Avoid all personal contact, including inhalation. Wear protective clothing when risk of exposure occurs. Use in a well-ventilated area. Prevent concentration in hollows and sumps.
DO NOT enter confined spaces until atmosphere has been checked.
Avoid smoking, bare lights, heat or ignition sources. When handling, DO NOT eat, drink or smoke.
Vapor may ignite on pumping or pouring due to static electricity.
Ground and secure containers when dispensing or pouring product. Use spark-free tools when handling.
Avoid contact with incompatible materials.
Keep containers securely sealed. Avoid physical damage to containers.
Always wash hands with soap and water after handling. Work clothes should be laundered separately.
Use good occupational work practice. Observe manufacturer's storing and handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions.
Recommended Storage Methods: Metal can; Metal drum; Metal safety cans. Packing as supplied by manufacturer.
Plastic containers may only be used if approved for flammable liquid.
Check that containers are clearly labeled and free from leaks.
Storage Requirements: Store below 38 deg. C.
Rotate all stock to prevent aging. Use on FIFO (First In-First Out) basis.
Store in original containers in approved flame-proof area.
No smoking, bare lights, heat or ignition sources.
DO NOT store in pits, depressions, basements or areas where vapors may be trapped. Keep containers securely sealed.
Store away from incompatible materials in a cool, dry well ventilated area.
Protect containers against physical damage and check regularly for leaks.
Observe manufacturer's storing and handling recommendations.
Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use in a well-ventilated area.
General exhaust is adequate under normal operating conditions.
Local exhaust ventilation may be required in specific circumstances.
If risk of overexposure exists, wear NIOSH approved respirator.
Correct fit is essential to obtain adequate protection.
Provide adequate ventilation in warehouse or closed storage areas.
Ground and secure containers when dispensing or pouring.
Avoid generation of static electricity. Ground all lines and equipment.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Vapor may ignite on pumping or pouring due to static electricity. Ground and secure containers when dispensing or pouring product.

Personal Protective Clothing/Equipment:

Eyes: Safety glasses. Safety glasses with side shields. Chemical goggles.
Contact lenses pose a special hazard; soft lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Nitrile gloves Safety footwear.

Respiratory Protection:

Exposure Range >40 to 2000 ppm: Supplied Air, Constant Flow/Pressure Demand, Half Mask
Exposure Range >2000 to 40,000 ppm: Supplied Air, Constant Flow/Pressure Demand, Full Face
Exposure Range >40,000 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face
Note: odor threshold unknown

Other: Eyewash unit. Ensure there is ready access to a safety shower.
Impervious apron.

Section 9 - Physical and Chemical Properties

Appearance/General Info: Colorless, highly volatile, highly flammable liquid; ethereal odor.

Physical State: Liquid
Vapor Pressure (kPa): 27.5 at 20 °C
Vapor Density (Air=1): 3.1
Formula Weight: 88.15
Specific Gravity (H_2O=1, at 4 °C): 0.74
Evaporation Rate: Fast
pH: Not applicable

pH (1% Solution): Not applicable
Boiling Point: 55.2 °C (131 °F)
Freezing/Melting Point: -109 °C (-164.2 °F)
Volatile Component (% Vol): 100
Water Solubility: Solubility of water in methyl-tbutyl ether 2 g/100 g

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: WARNING: Long standing in contact with air and light may result in the formation of potentially explosive peroxides.
Product is considered stable. Hazardous polymerization will not occur.

Storage Incompatibilities: May form explosive peroxides on standing or following concentration by distillation. Review of stocks and testing for peroxide content by given tested procedures at 3-monthly intervals is recommended, together with safe disposal of peroxidic samples.
[Peroxide containing residues can often be rendered innocuous by pouring into an excess of sodium carbonate solution] Avoid storage with oxidizers and strong acids.

Section 11 - Toxicological Information

Toxicity
Oral (rat) LD_{50}: 4000 mg/kg
Inhalation (rat) LC_{50}: 23576 ppm/4 H

Irritation
Nil reported

See *RTECS* KN5250000, for additional data.

Section 12 - Ecological Information

Environmental Fate: If released to soil, it will be subject to volatilization. It will be expected to exhibit very high mobility in soil and, therefore, it may leach to groundwater. It will not be expected to hydrolyze in soil. If released to water, it will not be expected to significantly adsorb to sediment or suspended particulate matter, bioconcentrate in aquatic organisms, hydrolyze, directly photolyze, or photooxidize via reaction with photochemically produced hydroxyl radicals in the water, based upon estimated physical-chemical properties or analogies to other structurally related aliphatic ethers. In surface water it will be subject to rapid volatilization with estimated half-lives of 4.1 hr and 2.0 days for volatilization from a river one meter deep flowing 1 m/sec with a wind velocity of 3 m/sec and a model pond, respectively. It may be resistant to biodegradation in environmental media based upon screening test data from a study using activated sludge inocula. Many ethers are known to be resistant to biodegradation. If released to the atmosphere, it will be expected to exist almost entirely in the vapor phase based on its vapor pressure. It will be susceptible to photooxidation via vapor phase reaction with photochemically produced hydroxyl radicals with an estimated half-life of 5.6 days for this process. Direct photolysis will not be an important removal process since aliphatic ethers do not adsorb light at wavelengths >290 nm.

Ecotoxicity: No data found.
Henry's Law Constant: 5.87×10^{-4}
BCF: carp 1.5
Soil Sorption Partition Coefficient: K_{OC} = estimated at 11.2

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 13 - Disposal Considerations

Disposal: Consult manufacturer for recycling options and recycle where possible. Follow applicable federal, state, and local regulations. Incinerate residue at an approved site. Recycle containers where possible, or dispose of in an authorized landfill.
BEWARE: Empty solvent, paint, lacquer and flammable liquid drums present a severe explosion hazard if cut by flame torch or welded. Even when thoroughly cleaned or reconditioned the drum seams may retain sufficient solvent to generate an explosive atmosphere in the drum.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

Shipping Name and Description: Methyl tert-butyl ether
ID: UN2398
Hazard Class: 3 - Flammable and combustible liquid
Packing Group: II - Medium Danger
Symbols:
Label Codes: 3 - Flammable Liquid
Special Provisions: IB2, T7, TP1
Packaging: **Exceptions:** 150 **Non-bulk:** 202 **Bulk:** 242
Quantity Limitations: **Passenger aircraft/rail:** 5 L **Cargo aircraft only:** 60 L
Vessel Stowage: **Location:** E **Other:**

Section 15 - Regulatory Information

EPA Regulations:
RCRA 40 CFR: Not listed
CERCLA 40 CFR 302.4: Listed per CAA Section 112 1000 lb (453.5 kg)
SARA 40 CFR 372.65: Listed
SARA EHS 40 CFR 355: Not listed
TSCA: Listed

Section 16 - Other Information

Disclaimer: Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Material Safety Data Sheet Collection
Genium group inc.
1171 RiverFront Center, Amsterdam, NY 12010
(518) 842-4111

Issue Date: 2006-06

Section 1 - Chemical Product and Company Identification 61

Material Name: Nitric Acid **CAS Number:** 7697-37-2
Chemical Formula: HNO_3
Structural Chemical Formula: HNO_3
EINECS Number: 231-714-2
ACX Number: X1002177-5
Synonyms: ACIDE NITRIQUE; ACIDO NITRICO; AQUA FORTIS; AZOTIC ACID; AZOTOWY KWAS; ENGRAVER'S ACID; ENGRAVERS ACID; HYDROGEN NITRATE; KYSELINA DUSICNE; NITAL; NITRIC ACID; NITRIC ACID OTHER THAN RED FUMING WITH >70% NITRIC ACID; NITRIC ACID OTHER THAN RED FUMING WITH NOT >70% NITRICACID; NITROUS FUMES; NITRYL HYDROXIDE; RED FUMING NITRIC ACID (RFNA); SALPETERSAURE; SALPETERZUUROPLOSSINGEN; WHITE FUMING NITRIC ACID (WFNA)
General Use: Manufacture of organic and inorganic nitrates and nitro compounds for fertilizers, dye intermediates and many organic chemicals.
Used for etching and cleaning metals.
Operators should be trained in procedures for safe use of this material.

Section 2 - Composition / Information on Ingredients

Name	CAS	%
nitric acid	7697-37-2	>95

OSHA PEL
TWA: 2 ppm; 5 mg/m^3.

ACGIH TLV

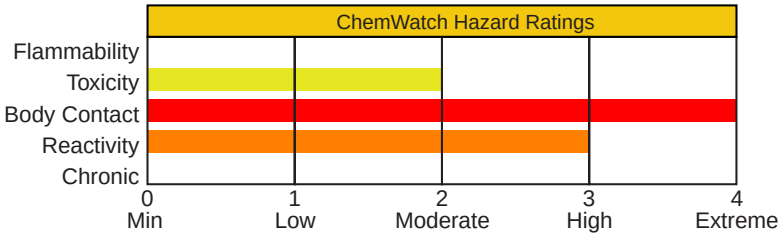
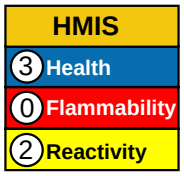
EU OEL
STEL: 2.6 mg/m^3 (1 ppm).

NIOSH REL
TWA: 2 ppm (5 mg/m^3); STEL: 4 ppm (10 mg/m^3).



IDLH Level
25 ppm.



DFG (Germany) MAK
TWA: 2 ppm; PEAK: 2 ppm.

Section 3 - Hazards Identification

Fire Diamond

ANSI Signal Word

Danger!

Corrosive

☆☆☆☆☆ Emergency Overview ☆☆☆☆☆

Clear to yellow fuming liquid; acrid, suffocating odor. Corrosive. Other Acute Effects: lung damage. Chronic Effects: tooth erosion, bronchitis. Strong oxidizer.

Potential Health Effects

Target Organs: eyes, skin, respiratory system, teeth
Primary Entry Routes: inhalation, ingestion, skin contact, eye contact
Acute Effects
Inhalation: The vapor is extremely discomforting and corrosive to the upper respiratory tract and lungs and the material presents a hazard from a single acute exposure or from repeated exposures over long periods.
Inhalation hazard is increased at higher temperatures.
Reactions may occur following a single acute exposure or may only appear after repeated exposures.

Copyright © 2006 by Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited. Judgments as to the suitability of information herein for the purchaser's purposes are necessarily the purchaser's responsibility. Although reasonable care has been taken in the preparation of such information, Genium Group, Inc. extends no warranties, makes no representations, and assumes no responsibility as to the accuracy or suitability of such information for application to the purchaser's intended purpose or for consequences of its use.

Reactions may not occur on exposure but response may be delayed with symptoms only appearing many hours later.
The material may produce respiratory tract irritation which produces an inflammatory response involving the recruitment and activation of many cell types, mainly derived from the vascular system. Unlike most organs the lung can respond to a chemical insult or agent by first trying to remove or neutralize the irritant and then repairing the damage. The repair process, which initially developed to protect mammalian lungs from foreign matter and antigens, may however, cause further damage the lungs when activated by hazardous chemicals. The result is often the impairment of gas exchange, the primary function of the lungs.
Inhalation of nitric acid mist or fumes at 2 to 25 ppm over an 8 hour period may cause pulmonary irritation and symptoms of lung damage.
Only several minutes of exposure to concentrated atmosphere i.e. 200 ppm may cause severe pulmonary damage and even fatality. Death may be delayed for several days.
Exposure to nitric acid fumes (with concurrent inhalation of nitrogen dioxide and nitric oxide) may elicit prompt irritation of the upper respiratory tract leading to coughing, gagging, chest pain, dyspnea, cyanosis if concentrations are sufficiently high and duration of exposure sufficiently long, pulmonary edema.

Eye: The liquid is extremely corrosive to the eyes and contact may cause rapid tissue destruction and is capable of causing severe damage with loss of sight.
The vapor is extremely discomforting to the eyes and is capable of causing pain and severe conjunctivitis.
Corneal injury may develop, with possible permanent impairment of vision, if not promptly and adequately treated.
The material may produce moderate eye irritation leading to inflammation.
Repeated or prolonged exposure to irritants may produce conjunctivitis.
Eye contact with concentrated acid may give no pain, whilst diluted solution causes intense pain and both can cause permanent eye damage or blindness. Burns may result in shrinkage of the eyeball, symblepharon (adhesions between tarsal and bulbar conjunctivae), permanent corneal opacification, and visual impairment leading to blindness.

Skin: The liquid is extremely corrosive to the skin and contact may cause tissue destruction with severe burns.
Bare unprotected skin should not be exposed to this material.
The vapor is highly discomforting to the skin.
The material may cause skin irritation after prolonged or repeated exposure and may produce a contact dermatitis (nonallergic). This form of dermatitis is often characterized by skin redness (erythema) and swelling (edema) which may progress to vesiculation, scaling and thickening of the epidermis. Histologically there may be intercellular edema of the spongy layer (spongiosis) and intracellular edema of the epidermis.
Skin contact causes yellow discoloration of the skin, blisters and scars that may not heal. The skin may be stained bright-yellow or yellowish brown due to the formation of xanthoproteic acid. Dilute solutions may harden the epithelium without producing overt corrosion.

Ingestion: Considered an unlikely route of entry in commercial/industrial environments.
The material is extremely corrosive if swallowed and is capable of causing burns to mouth, throat, esophagus, with extreme discomfort, pain and may be fatal.
Even a small amount causes severe corrosion of the stomach, burning pain, vomiting and shock, possibly causing non-healing scarring of the gastrointestinal tract and stomach. Death may be delayed 12 hours to 14 days or to several months. Such late fatalities are attributed to a chemical lobular pneumonitis secondary to aspiration. Survivors show stricture of the gastric mucosa and subsequent pernicious anemia.

Carcinogenicity: NTP - Not listed; IARC - Not listed; OSHA - Not listed; NIOSH - Not listed; ACGIH - Not listed; EPA - Not listed; MAK - Not listed.

Chronic Effects: Prolonged or repeated overexposure to low concentrations of vapor may cause chronic bronchitis, corrosion of teeth, even chemical pneumonitis.

Section 4 - First Aid Measures

Inhalation: Remove to fresh air.
Lay patient down. Keep warm and rested.
If available, administer medical oxygen by trained personnel.
If breathing is shallow or has stopped, ensure clear airway and apply resuscitation. Transport to hospital or doctor, without delay.

Eye Contact: Immediately hold the eyes open and flush continuously for at least 15 minutes with fresh running water. Ensure irrigation under eyelids by occasionally lifting the upper and lower lids.
Transport to hospital or doctor without delay. Removal of contact lenses after an eye injury should only be undertaken by skilled personnel.
Immediately transport to hospital or doctor. DO NOT delay.

Skin Contact: Immediately flush body and clothes with large amounts of water, using safety shower if available.
Quickly remove all contaminated clothing, including footwear.
Wash affected areas with water (and soap if available) for at least 15 minutes. Transport to hospital or doctor. DO NOT delay.

Ingestion: Contact a Poison Control Center.
Do NOT induce vomiting. Give a glass of water.
Immediately transport to hospital or doctor. DO NOT delay.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

After first aid, get appropriate in-plant, paramedic, or community medical support.

Note to Physicians: For acute or short-term repeated exposures to strong acids:

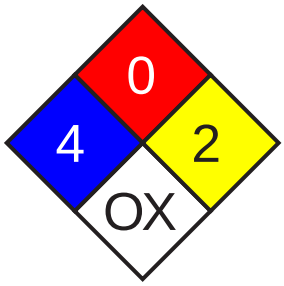
1.Airway problems may arise from laryngeal edema and inhalation exposure.
Treat with 100% oxygen initially.
2.Respiratory distress may require cricothyroidotomy if endotracheal intubation is contraindicated by excessive swelling.
3. Intravenous lines should be established immediately in all cases where there is evidence of circulatory compromise.
4.Strong acids produce a coagulation necrosis characterized by formation of a coagulum (eschar) as a result of the desiccating action of the acid on proteins in specific tissues.

INGESTION:

1.Immediate dilution (milk or water) within 30 minutes post-ingestion is recommended.
2.Do not attempt to neutralize the acid since exothermic reaction may extend the corrosive injury.
3.Be careful to avoid further vomiting since re-exposure of the mucosa to the acid is harmful. Limit fluids to one or two glasses in an adult.
4.Charcoal has no place in acid management.
5.Some authors suggest the use of lavage within 1 hour of ingestion.

SKIN:

1.Skin lesions require copious saline irrigation. Treat chemical burns as thermal burns with non-adherent gauze and wrapping.
2.Deep second-degree burns may benefit from topical silver sulfadiazine.



EYE:

1.Eye injuries require retraction of the eyelids to ensure thorough irrigation of the conjunctival cul-de-sacs. Irrigation should last at least 20-30 minutes. Do not use neutralizing agents or any other additives. Several liters of saline are required.
2.Cycloplegic drops (1% cyclopentolate for short-term use or 5% homatropine for longer term use), antibiotic drops, vasoconstrictive agents, or artificial tears may be indicated dependent on the severity of the injury.
3.Steroid eye drops should only be administered with the approval of a consulting ophthalmologist.

Section 5 - Fire-Fighting Measures

Flash Point: Nonflammable
Autoignition Temperature: Not applicable
LEL: Not applicable
UEL: Not applicable
Extinguishing Media: Water spray or fog; foam, dry chemical powder, or BCF (where regulations permit).
Carbon dioxide.

See DOT ERG

Fire Diamond

General Fire Hazards/Hazardous Combustion Products: Will not burn but increases intensity of fire.
Heating may cause expansion or decomposition leading to violent rupture of containers.
Heat affected containers remain hazardous.
Contact with combustibles such as wood, paper, oil or finely divided metal may cause ignition, combustion or violent decomposition.
May emit irritating, poisonous or corrosive fumes.
Decomposes on heating and produces toxic fumes of nitrogen oxides (NO_x) and nitric acid.

Fire Incompatibility: Oxidizing agents as a class are not necessarily combustible themselves, but can increase the risk and intensity of fire in many other substances.
Reacts vigorously with water and alkali.
Avoid reaction with organic materials/compounds, powdered metals, reducing agents and hydrogen sulfide (H_2S) as ignition may result.
Reacts with metals producing flammable/explosive hydrogen gas.

Fire-Fighting Instructions: Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear full body protective clothing with breathing apparatus. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
Fight fire from a safe distance, with adequate cover.
Extinguishers should be used only by trained personnel.
Use water delivered as a fine spray to control fire and cool adjacent area.
Avoid spraying water onto liquid pools.
Do not approach containers suspected to be hot.
Cool fire-exposed containers with water spray from a protected location.
If safe to do so, remove containers from path of fire.
If fire gets out of control withdraw personnel and warn against entry.
Equipment should be thoroughly decontaminated after use.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 6 - Accidental Release Measures

Small Spills: Dangerous levels of nitrogen oxides may form during spills of nitric acid.
Wear fully protective PVC clothing and breathing apparatus.
Clean up all spills immediately. No smoking, bare lights, ignition sources.
Avoid all contact with any organic matter including fuel, solvents, sawdust, paper or cloth and other incompatible materials, as ignition may result.
Avoid breathing dust or vapors and all contact with skin and eyes.
Control personal contact by using protective equipment.
Contain and absorb spill with dry sand, earth, inert material or vermiculite. DO NOT use sawdust as fire may result.
Scoop up solid residues and seal in labeled drums for disposal.
Neutralize/decontaminate area.
Use soda ash or slaked lime to neutralize.

Large Spills: DO NOT touch the spill material. Restrict access to area.
Clear area of personnel and move upwind. Contact fire department and tell them location and nature of hazard.
May be violently or explosively reactive. Wear full body protective clothing with breathing apparatus. Prevent, by any means available, spillage from entering drains or waterways. Consider evacuation.
No smoking, flames or ignition sources. Increase ventilation.
Contain spill with sand, earth or other clean, inert materials.
NEVER use organic absorbents such as sawdust, paper, cloth; as fire may result. Avoid any contamination by organic matter.
Use spark-free and explosion-proof equipment.
Collect any recoverable product into labeled containers for possible recycling. DO NOT mix fresh with recovered material.
Collect residues and seal in labeled drums for disposal.
Wash area and prevent runoff into drains. Decontaminate equipment and launder all protective clothing before storage and reuse.
If contamination of drains or waterways occurs advise emergency services.
DO NOT USE WATER OR NEUTRALIZING AGENTS INDISCRIMINATELY ON LARGE SPILLS.

Regulatory Requirements: Follow applicable OSHA regulations (29 CFR 1910.120).

Section 7 - Handling and Storage

Handling Precautions: Avoid generating and breathing mist. Do not allow clothing wet with material to stay in contact with skin.
Avoid all personal contact, including inhalation.
Wear protective clothing when risk of exposure occurs.
Use in a well-ventilated area.
WARNING: To avoid violent reaction, ALWAYS add material to water and NEVER water to material.
Avoid smoking, bare lights or ignition sources.
Avoid contact with incompatible materials.
When handling, DO NOT eat, drink or smoke.
Keep containers securely sealed when not in use. Avoid physical damage to containers. Always wash hands with soap and water after handling. Work clothes should be laundered separately.
Launder contaminated clothing before reuse.
Use good occupational work practices. Observe manufacturer's storing and handling recommendations. Atmosphere should be regularly checked against established exposure standards to ensure safe working conditions are maintained.

Recommended Storage Methods: Stainless steel drum. Check that containers are clearly labeled.
Packaging as recommended by manufacturer.

Regulatory Requirements: Follow applicable OSHA regulations.

Section 8 - Exposure Controls / Personal Protection

Engineering Controls: Use in a well-ventilated area.
Local exhaust ventilation may be required for safe working, i. e. , to keep exposures below required standards; otherwise, PPE is required.
If risk of overexposure exists, wear NIOSH-approved respirator.
Correct fit is essential to obtain adequate protection.
In confined spaces where there is inadequate ventilation, wear full-face air supplied breathing apparatus.

Personal Protective Clothing/Equipment:

Eyes: Chemical goggles. Full face shield.
DO NOT wear contact lenses. Contact lenses pose a special hazard; soft contact lenses may absorb irritants and all lenses concentrate them.

Hands/Feet: Bare unprotected skin should not be exposed to this material. Impervious, gauntlet length gloves i.e., butyl rubber gloves or Neoprene rubber gloves or wear chemical protective gloves, e.g. PVC.

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Wear safety footwear or safety gumboots, e.g. Rubber.

Respiratory Protection:

Exposure Range >2 to <25 ppm: Supplied Air, Constant Flow/Pressure Demand, Half Mask

Exposure Range 25 to unlimited ppm: Self-contained Breathing Apparatus, Pressure Demand, Full Face

Other: Operators should be trained in procedures for safe use of this material.

Acid-resistant overalls or Rubber apron or PVC apron.

Ensure there is ready access to an emergency shower.

Ensure that there is ready access to eye wash unit.

Ensure that there is ready access to breathing apparatus.

Glove Selection Index:

BUTYL ..... Best selection
HYPALON ..... Best selection
NEOPRENE..... Best selection
NEOPRENE/NATURAL..... Best selection
PE/EVAL/PE ..... Best selection
SARANEX-23 ..... Best selection
NATURAL RUBBER..... Satisfactory; may degrade after 4 hours continuous immersion
NATURAL+NEOPRENE..... Satisfactory; may degrade after 4 hours continuous immersion
PVC..... Poor to dangerous choice for other than short-term immersion
NITRILE+PVC..... Poor to dangerous choice for other than short-term immersion

Section 9 - Physical and Chemical Properties

Appearance/General Info: Clear, colorless to slightly yellow liquid. Sharp strong odor.
CAUTION: exothermic dilution hazard.
HIGHLY CORROSIVE. Corrosive to most metals. Powerful oxidizing agent.
Darkens to brownish color on aging and exposure to light.

Physical State: Liquid
Odor Threshold: 0.75 to 2.50 mg/m^3
Vapor Pressure (kPa): 8.26
Vapor Density (Air=1): 1.5
Formula Weight: 63.02
Specific Gravity (H_2O=1, at 4 °C): 1.3-1.42
pH: < 1

pH (1% Solution): 1
Boiling Point: 83 °C (181 °F) at 760 mm Hg
Freezing/Melting Point: -42 °C (-43.6 °F)
Volatile Component (% Vol): 100 (nominal)
Decomposition Temperature (°C): Not applicable
Water Solubility: Soluble in all proportions

Section 10 - Stability and Reactivity

Stability/Polymerization/Conditions to Avoid: Presence of heat source and direct sunlight. Storage in unsealed containers. Hazardous polymerization will not occur.

Storage Incompatibilities: Segregate from reducing agents, finely divided combustible materials, combustible materials, sawdust, metals and powdered metals.

Avoid contamination of water, foodstuffs, feed or seed.

Segregate from alkalies, oxidizing agents and chemicals readily decomposed by acids, i.e. cyanides, sulfides, carbonates.

Section 11 - Toxicological Information

Toxicity

Oral (human) LD_{Lo}: 430 mg/kg
Inhalation (rat) LC_{50}: 2500 ppm/1 hr
Unreported (man) LD_{Lo}: 110 mg/kg

Irritation

Nil reported

See *RTECS* QU 5775000, for additional data.

Section 12 - Ecological Information

Environmental Fate: No data found.

Ecotoxicity: LC_{50} Starfish 100-300 mg/l/48 hr /Aerated water conditions; LC_{50} Shore crab 180 mg/l/48 hr /Static, aerated water conditions; LC_{50} Cockle 330-1000 mg/l/48 hr /Aerated water conditions

BCF: no food chain concentration potential

Biochemical Oxygen Demand (BOD): none

Copyright © 2006 Genium Group, Inc. Any commercial use or reproduction without the publisher's permission is prohibited.

Section 13 - Disposal Considerations

Disposal: Recycle wherever possible. Special hazards may exist - specialist advice may be required.
Consult manufacturer for recycling options.
Follow applicable federal, state, and local regulations.
Treat and neutralize at an approved treatment plant.
Decontaminate empty containers. Observe all label safeguards until containers are cleaned and destroyed.
Puncture containers to prevent reuse and bury at an authorized landfill.

Section 14 - Transport Information

DOT Hazardous Materials Table Data (49 CFR 172.101):

Note: This material has multiple possible HMT entries. Choose the appropriate one based on state and condition of specific material when shipped.

Shipping Name and Description: Nitric acid *other than red fuming, with more than 70 percent nitric acid*

ID: UN2031
Hazard Class: 8 - Corrosive material
Packing Group: I - Great Danger
Symbols:
Label Codes: 8 - Corrosive, 5.1 - Oxidizer
Special Provisions: B47, B53, T10, TP2, TP12, TP13
Packaging: **Exceptions:** None **Non-bulk:** 158 **Bulk:** 243
Quantity Limitations: **Passenger aircraft/rail:** Forbidden **Cargo aircraft only:** 2.5 L
Vessel Stowage: **Location:** D **Other:** 44, 66, 89, 90, 110, 111

Shipping Name and Description: Nitric acid *other than red fuming, with not more than 70 percent nitric acid*

ID: UN2031
Hazard Class: 8 - Corrosive material
Packing Group: II - Medium Danger
Symbols:
Label Codes: 8 - Corrosive
Special Provisions: B2, B47, B53, IB2, T8, TP2, TP12
Packaging: **Exceptions:** None **Non-bulk:** 158 **Bulk:** 242
Quantity Limitations: **Passenger aircraft/rail:** Forbidden **Cargo aircraft only:** 30 L
Vessel Stowage: **Location:** D **Other:**

Shipping Name and Description: Nitric acid, red fuming

ID: UN2032
Hazard Class: 8 - Corrosive material
Packing Group: I - Great Danger
Symbols: + - Override definitions
Label Codes: 8 - Corrosive, 5.1 - Oxidizer, 6.1 - Poison *or* Poison Inhalation Hazard *if inhalation hazard, Zone A or B*
Special Provisions: 2, B9, B32, B74, T20, TP2, TP12, TP13, TP38, TP45
Packaging: **Exceptions:** None **Non-bulk:** 227 **Bulk:** 244
Quantity Limitations: **Passenger aircraft/rail:** Forbidden **Cargo aircraft only:** Forbidden
Vessel Stowage: **Location:** D **Other:**

Section 15 - Regulatory Information

EPA Regulations:
RCRA 40 CFR: Not listed
CERCLA 40 CFR 302.4: Listed per CWA Section 311(b)(4) 1000 lb (453.5 kg)

Subject: Transmittal of Remedial Action Plan, Sherwin-Williams Site, 1450 Sherwin Avenue, Emeryville, California, Imminent and Substantial Endangerment Determination and Order and Remedial Action Order, Docket No. IS/E 05/06-007

Dear Ms. Naito:

On behalf of The Sherwin-Williams Company, CDM is pleased to submit the enclosed Remedial Action Plan for the Sherwin-Williams Emeryville, California Site. The Site is the subject of the order issued on May 10, 2006 by the DTSC, entitled "Imminent and Substantial Endangerment Determination and Order and Remedial Action Order, Docket No. IS/E 05/06-007" ("the DTSC Order"). This report was prepared in accordance with Section 5.6 of the DTSC Order.

In accordance with the DTSC Order, this report is presented in both hard (paper) and electronic (as multiple pdf files on a CD) formats. If you have any questions, please call Pawan Sharma, Project Manager for CDM, (925) 296-8054, or Larry Mencin, Environmental Project Manager for the Sherwin-Williams Company, (216) 566-1768.

Very truly yours,

Randall T. Smith, P.E.

Section 1
Introduction and Purpose

On behalf of the Sherwin-Williams Company (S-W), Camp Dresser & McKee Inc. (CDM) has prepared this Remedial Action Plan (RAP) to address remediation of the S-W property located at 1450 Sherwin Avenue in Emeryville, California and a portion of the adjacent former Rifkin property, located at 4525 – 4563 Horton Street, to which hazardous substances have migrated from the S-W property. Collectively the S-W property and this portion of the former Rifkin property are referred to as the "Site" within this document. The Site consists of approximately 10 acres and is identified by Assessor's Parcel numbers 049-1041-006-00, 049-1041-026-02, 049-1041-026-06, 049-1041-026-07, 049-1041-026-04, and 049-1041-005-00. Novartis Vaccines and Diagnostics, Inc. (Novartis) is the current owner of the former Rifkin property.

The RAP was prepared in accordance with the following:

- National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (USEPA, 1990);
- Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA (USEPA, 1988);
- A Guide to Developing and Documenting Cost Estimates During the Feasibility Study (USEPA, 2000);
- US Environmental Protection Agency (USEPA) Region IX Sampling and Analysis Plan Guidance (USEPA, 1997);
- California Health and Safety Code (CHSC) section 25356.1; and
- Department of Toxic Substances Control (DTSC) Imminent and Substantial Endangerment Determination and Order and Remedial Action Order No. 05/06-007 (the Order) (Cal/EPA, 2006b).

1.1 Background

S-W has owned and operated the coatings manufacturing plant at 1450 Sherwin Avenue since the early 1900s. Pesticides containing lead and arsenic were also manufactured at the plant from the 1920s until the late 1940s. The plant converted from oil-based to water-based paint production in 1987. The plant was used for latex paint manufacturing and packaging, storage of raw materials and paint products, and laboratory space until December 2006 when operation of the plant stopped and the plant was decommissioned. S-W initiated plant demolition activities in August 2007, which were completed in early November 2007.

Prior to the issuance of the current DTSC Imminent and Substantial Endangerment Determination and Order and Remedial Action Order No. 05/06-007 (the Order)

(Cal/EPA, 2006b) for the Site on May 10, 2006, the Site was regulated by the Regional Water Quality Control Board, San Francisco Bay Region, (Water Board) under Site Cleanup Requirements Order 98-009.

Several phases of soil and groundwater investigation have been conducted at the Site since 1988. The investigations have revealed that the chemicals of concern (COCs) in the soil and groundwater are metals, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and total petroleum hydrocarbons (TPHs). The investigations concluded that COCs have migrated from the S-W property onto a portion of the adjacent former Rifkin property. Site soil and groundwater data through October 2000 are summarized in the remedial investigation (RI) report (ENTRIX, 2002). Since October 2000, results from periodic groundwater monitoring events have been summarized in a series of reports, the most recent for Second Half 2007 (LFR, 2008). In addition, several investigations have been conducted after October 2000 to complete characterization of the Site and to gather data in support of this FS report; these investigations are further discussed in Section 2.4.

Several interim remedial measures (IRMs) were implemented at the Site in the early 1990s to control the flow of COCs in groundwater off the Site and reduce the potential for human exposure to the COCs. The potential human health effects of the COCs in Site soil and groundwater for current and future scenarios are summarized in the Site risk assessment (RA) reports (EarthRisk, 2002 and Gradient, 2005). The IRMs are still in place at the Site and include a slurry wall, an asphalt cap, extraction and monitoring wells, and a groundwater treatment system.

In late 2006, a feasibility study (FS), including treatability studies, was initiated for selecting the final remedial action for the Site. The findings were presented in a FS report (CDM, 2009b). The FS report was approved by DTSC on May 7, 2009 (Cal/EPA, 2009).

1.2 Purpose

The purpose of the RAP is to summarize the selected final remedial action for the Site and its proposed implementation activities. In addition, the RAP summarizes previous investigations and studies, including evaluation of remedial action alternatives as presented in the FS.

Specific objectives of the RAP are to:

- Identify project administrative responsibilities;
- Present planning, pre-remediation, remediation, and reporting tasks of the selected remedial action; and
- Provide a tentative schedule for the remedial action.

1.3 Project Administration Responsibilities

Several entities and individuals will be responsible for the successful completion of the remedial action. Their specific responsibilities are described below.

Responsible Party: The Sherwin-Williams Company. Larry Mencin is the designated Project Manager for S-W. He is the corporate representative at all agency meetings; he is responsible for assuring that sufficient funding is available to complete the approved remedial activities; he is responsible for communication between senior corporate management and the rest of the remediation project team.

Lead Agency: Department of Toxic Substances Control (DTSC). Janet Naito is the designated Project Manager for the DTSC. She is responsible for assuring that S-W complies with all the requirements in the existing Order. As the lead agency representative, she is responsible for communicating all project activities to senior DTSC management as necessary. She is also responsible for all project communication with the general public, including the immediate residents around the Site. Representatives from the Water Board, City of Emeryville, Novartis, Shell Oil Company, S-W, and the local resident communities, serve advisory roles to the DTSC on this project.

Program Manager: Camp Dresser & McKee Inc. (CDM). CDM is the remediation program manager for the project. Randall Smith is the designated Program Manager for CDM. He and his representatives are responsible for all direct communication between CDM and S-W, and CDM and the DTSC. He is also responsible for the health and safety of all CDM workers and their subcontractors during all phases of site remediation. Working with Mr. Smith will be CDM Design Manager, Construction Manager, Field Environmental Manager, and a Health and Safety Manager.

Remediation Contractors: To Be Determined. S-W will select one or more contractors to perform the work described in this section and presented in more detail in the specifications yet to be prepared. CDM will oversee the remediation management. Selected remediation contractors will be responsible for preparation and implementation of required City permits, a worker Health and Safety Plan, and applicable noise, traffic, dust control, and/or other compliance plan submittals.

1.4 Report Organization

This RAP document is structured as follows:

- **Section 1, Introduction and Purpose**.
- **Section 2, Site Description**. Includes a summary of the Site location, description, and history; and, a summary of previous Site-specific remedial activities, including remedial investigations, risk assessments, current interim remedial measures, and treatability studies.

- **Section 3, Remedial Action Objectives**. Presents project-specific remedial action objectives (RAOs) and underlying applicable or relevant and appropriate requirements (ARARs) and preliminary remediation goals (PRGs).

- **Section 4, Remedial Action Alternatives**. Summarizes the findings of the FS, including identification, description, and evaluation of remedial action alternatives; and presents the basis for the selected action.

- **Section 5, Planning and Pre-Remediation**. Presents the preliminary implementation schedule for the action, planning activities prior to mobilization for the remedy, and pre-remediation Site activities to support the remedy.

- **Section 6, Remediation and Restoration**. Provides details on the implementation of the remediation activities, including excavation, backfill, off-hauling materials, and restoration.

- **Section 7, Post Remediation Monitoring**. Presents a summary of post remedy implementation monitoring.

- **Section 8, References**.

- **Appendix A, Selected Remedial Investigation Figures and Tables**. Presents figures and/or tables from the Site RI report and subsequent investigation reports showing sample locations, extent of impact for various COCs in soil and groundwater, and findings from these investigations.

- **Appendix B, Selected Feasibility Figures and Tables**. Presents figures and tables from the Site FS report showing remedial action alternatives and their evaluation process.

- **Appendix C, Determination of Chemicals of Potential Concern**. Summarizes the methods presented in the HHRA for selection of COCs for the Site, provides updated findings based on remedial investigations conducted subsequent to the HHRA being finalized.

- **Appendix D, Statement of Reasons**. Presents the reasons for selection of the preferred remedial action with respect to the six State of California evaluation criteria.

- **Appendix E, Non-Binding Allocation of Responsibility**. Presents DTSC's preliminary nonbonding allocation of responsibility for addressing contamination at the Site.

- **Appendix F, California Environmental Quality Act Documentation**. Presents DTSC's California Environmental Quality Act (CEQA) Mitigated Negative Declaration for this Site.

- **Appendix G, Selected Public Health Evaluation Figures and Tables**. Presents figures and tables from the Site PHERA report showing performance standards and action levels for COCs to be used during perimeter air monitoring.

- **Appendix H, Confirmation Vadose Zone Soil Sampling and Analysis Plan**. Presents the methods and scope for sampling and analysis of vadose zone soil during excavation.

- **Appendix I, Stockpile Soil Sampling and Analysis Plan**. Presents the methods and scope for sampling and analysis of stockpiles of excavated soils.

- **Appendix J, Criteria for Implementing Active Groundwater Extraction.** Presents the evaluation for determining the appropriate groundwater extraction contingency action criteria for arsenic at the slurry wall breaches along the Union Pacific Railroad property.

- **Appendix K, Contingency Groundwater Extraction Action Evaluation.** Presents the evaluation of groundwater extraction as a possible contingency action after implementation of the preferred remedy.

- **Appendix L, Responsiveness Summary.** Presents DTSC's response to comments submitted during the public comment period for the RAP and the CEQA Mitigated Negative Declaration.

Section 2
Site Description

This section describes the Site and surrounding area, and summarizes the Site history. In addition, summaries of the remedial investigations, risk assessments, interim remedial actions, and treatability studies performed to date at the Site are presented in this section.

2.1 Site Location and Description

The Site consists of the S-W property located at 1450 Sherwin Avenue in Emeryville, California, and a portion of the adjacent former Rifkin property, located at 4525 – 4563 Horton Street, to which hazardous substances have migrated from the S-W property. Figure 2-1 presents the location of the S-W property and the entire former Rifkin property. Figure 2-2 presents a plan view of the Site. This section provides a description of the S-W property, the former Rifkin property, and other adjacent properties.

2.1.1 Sherwin-Williams Property

The S-W property is located at 1450 Sherwin Avenue in Emeryville, Alameda County, California. The S-W property is located on the north side of Sherwin Avenue, between Horton Street and the Union Pacific Railroad (UPRR) lines. S-W has operated at the property since the early 1900's, most recently manufacturing water-based paints at the property. Subsequent to demolition activities that concluded in late November 2007, the property is now covered by asphalt/concrete paved areas, including the foundations for several demolished buildings, and two remaining buildings (Buildings 1 and 31). Past uses for the buildings have included: coating manufacturing; storage of raw materials and coating products; laboratories; and filling and packaging.

2.1.2 Former Rifkin Property

The former Rifkin property is located along the western side of Horton Street, adjacent to the north and east of portions of the S-W property. The former Rifkin property is owned by Novartis. The portion of the former Rifkin property included as part of the Site is currently covered by asphalt and serves as a parking lot.

2.1.3 Adjacent Properties

Properties located adjacent to or within close proximity to the Site include residential, commercial and industrial types. These other properties include: the former Shell Development property (currently South BGR property and 45th Street Artist Co-op); the former Southern Pacific Railroad (SPRR) (currently UPRR); the former Myers Container property and the former Elementis Pigment property (both currently Bay Street Partners LLC property); former Barbary Coast Steel property (currently IKEA Property Inc.); a former Sears Warehouse (currently Bayer-leased warehouse and East Bay Badminton Club); and multi-family residential buildings (i.e., Emeryville Lofts,

Horton Street Lofts, and Artists Co-op Annex). The nearest residences to the Site are opposite Sherwin Avenue and Horton Street, approximately 60 feet from the Site boundaries.

The South BGR/former Shell Development property, located east of Horton Street, consists of a few buildings that are currently leased to Novartis. The former Elementis Pigment property and the former Myers Container property, located northwest of the Site, have been remediated (through excavation with long-term groundwater monitoring) and developed for mixed-use purposes, including high-density residential, commercial, and retail use. The former Barbary Coast Steel property, located to the west of the Site, is currently occupied by an IKEA retail store.

2.2 Site History

This section provides a brief summary of the history of the S-W property and the former Rifkin property. The source of this information is the 2002 ENTRIX Site RI report (ENTRIX, 2002).

2.2.1 History of the Sherwin-Williams Property

From 1871 through 1915, the S-W property and much of the adjacent properties were initially part of a larger property first used as a horse track, known as the Oakland Trotting Park, and then as a gathering place for local aviators, known as the Oakland Aviation Field. By 1915, the field had fallen into disrepair, and the buildings were removed. The property was subdivided into smaller properties to sell to industries interested in moving to the Emeryville area.

The S-W property was part of the early wave of industrial development in the City of Emeryville. One of the earliest references to S-W presence in Emeryville was in the 1923 Oakland Tribune Yearbook. The Tribune indicated new businesses that had moved into their readership area with a location map. This map indicated that S-W built their plant in 1919 on three acres, and by 1923 had increased their property to six acres. A number of industries, warehouses, and railroad services developed over time on the adjacent properties. A general operational history of facilities at the S-W property and several nearby properties is provided below.

Since operations began, the S-W facility has been manufacturing various types of coating products. Lead-arsenate pesticides were also manufactured at the plant from the 1920s until the late 1940s. By 1987, S-W ceased manufacturing oil-based products and until late 2006 manufactured only water-based products.

In approximately 1920, buildings were constructed on the property for general warehouse, paint, and lead arsenate manufacturing and storage. Additional buildings were constructed in 1924 and 1926 for lead arsenate production and lacquer blending. Based on a 1933 aerial photo, areas adjacent to these buildings appear to have been unpaved. During this time, a railroad track spur was present in the middle of the S-W property, and seven sets of railroad tracks were present immediately off-site to the west. A production well to furnish water for the sprinkler system was

located in the north-central portion of the S-W property; the production well was taken offline in the 1980s and destroyed in the 1990s via pressure-grouting. The East Bay Chemical Company was located immediately north of the S-W property, and the east and south sides of the S-W property were bordered by Horton Street and Sherwin Avenue.

In the mid to late 1940s, lead-arsenate production and storage ceased, and only oil-based paints and varnishes were manufactured. By 1956, several of the older buildings at the S-W property had been demolished, and the railroad tracks immediately to the west of the S-W property were removed. New buildings were constructed over the footprint of demolished buildings, and storage tanks were installed to store alcohols and acetates. These chemicals were used in the production of lacquer.

In 1956, the solvents used in the manufacturing process were naphtha and kerosene. Through the 1970s, several types of solvents were used, such as naphtha, styrene, xylene, toluene, ketones, and acetone. Acetone was used as a low-boiling point thinner in some lacquers. Methyl isobutyl ketone was a medium boiling point thinner used in resins, enamels, and lacquers. Nitrocellulose was a binder being used in the early 1970s in the production of lacquers. Toluene and xylene were thinners commonly used in the late 1970s. The liquids were usually stored in aboveground storage tanks.

By 1964, Sherwin-Williams purchased the adjacent property to the west from the Southern Pacific Railroad creating the current 8.3-acre property. A large portion of this property was originally developed into a warehouse (Building 35) that was converted into manufacturing in 1987.

The 1987 switch from oil-based to water-based paint products was reflected by the following changes at the S-W property:

- Dismantling of the solvent tank farm and the removal of most of the solvents and oil.
- Removal of varnish production and storage facilities.
- Removal of the lacquer plant.
- Expansion of the latex and latex-product storage tanks.
- Expansion of water-based paint manufacturing into building 35.

Paint manufacturing operations ceased in December 2006 and the plant was decommissioned. S-W initiated plant demolition activities in August 2007, which were completed in November 2007.

2.2.2 History of Former Rifkin Property

The former Rifkin Property was also originally part of the larger area of the Oakland Trotting Park and later California Jockey Club Race Track until approximately 1915. It is uncertain what types of businesses operated on this property from 1915 to approximately 1928, although it is known that these early businesses included the East Bay Chemical Company.

Based on a chain-of-title search for the former Rifkin Property, during 1928 to 1937, one portion of the property was occupied by Rotary Oil and the other portion was occupied by Rheem Manufacturing and then owned by the Chubbucks. Both of these portions were combined and transferred to the California Container Corporation in 1937, which produced corrugated shipping containers and boxes. In 1958, the Container Corporation of America took control of California Container Corporation and the property. The Concora Corporation owned and operated the property between 1969 and 1978. Rifkin Investments purchased the property in 1978 and rented portions of building space to various small businesses including a small furniture refinisher, a silkscreen company, an automobile body and paint shop, and a foreign auto repair shop. The Chiron Corporation acquired the property in 1996. In 2006, Novartis acquired Chiron Corporation and became the property owner.

Several underground storage tanks (including heating oil, gasoline, coatings, and a diesel tank) existed on the Rifkin property as early as the 1940s.

2.3 Physical and Environmental Characteristics

This section provides a summary of the:

- regional geology;
- site geology;
- groundwater zones underlying the Site and their hydrogeology; and
- surface water system and groundwater-surface water interaction.

The source of this information is the 2002 ENTRIX Site RI report (ENTRIX, 2002).

2.3.1 Regional Geology

The Site is located on the eastern flank of the San Francisco Basin, which roughly corresponds to present day San Francisco Bay (herein referred to as the bay). The bay is formed by a major asymmetrical basement synform within the Coast Range Province. It is bounded on the east by the Hayward Fault and on the west by the San Andreas Fault. The trace of the Hayward Fault occurs in the Berkeley Hills, approximately 3.5 miles to the east of the Site. Basement rock underlying the bay consists of the Franciscan Complex. Bedrock features trend northwest-southeast through the area and have influenced the depositional history of the bay. The

Franciscan bedrock is unconformably overlain by the Early Pleistocene Santa Clara Formation, which consists of continental alluvial fan deposits.

As the Franciscan was uplifted in the eastern portion of the basin, these alluvial fan deposits were themselves eroded and re-deposited. The non-marine alluvial deposits on the eastern flank of the basin have been mapped as the Alameda, San Antonio, and Temescal Formations. The seas flooded the central portion of the basin and the Santa Clara Formation eroded into the Alameda Formation. The Alameda Formation is restricted to the marine units beneath the bay up to and including the Young Bay Mud. The alluvial fan units located between the bay and the hills are referred to as the San Antonio or Temescal Formations.

The basin sank during the time of deposition of the Alameda Formation, allowing marine incursion. The Site, however, continued to be an uplifted zone of continental deposition. The alluvial units of the Temescal Formation range in thickness from 10 to 300 feet and average 100 to 200 feet. The transition from the alluvial fan deposits to the marine bay muds west of the Site occurs approximately along the line of the existing railroad tracks.

The Young Bay Mud of the Alameda Formation currently being deposited in the bay is black, unconsolidated, saturated, organic rich clay containing some gravel and sand layers, shell fragment layers, peat, and organic debris. The mud generally ranges in thickness from 50 to 75 feet. The deeper Yerba Buena Mud (Old Bay Mud) of the Alameda Formation is widespread homogeneous estuarine mud. It consists of black organic-rich clay averaging 25 to 50 feet thick, and typically containing a gravel/shell layer in the middle of the unit. This formation occurs to the west of the Site.

2.3.2 Site Geology

The Site is located on the East Bay Plain, approximately 0.3 miles east of the current bay shoreline and 3.5 miles west of the Hayward Fault. Surface soil elevation ranges between 12 and 18 feet NAVD88 (1988 North American Vertical Datum). Several creeks drain the western Oakland hills, flowing west to the bay. The nearest creek to the S-W property is Temescal Creek, which originates in the Oakland hills at Lake Temescal and enters an engineered channel that runs under/through Oakland and passes along the northern edge of the Site. The Site lies entirely in the drainage basin of Temescal Creek.

The soils underlying the Site consist of Holocene through Early Pleistocene alluvial sediments of the Temescal Formation (ENTRIX, 2002). The Temescal Formation is primarily an alluvial fan deposit, comprised of interfingering lenses of clayey gravel, sandy silty clay, and sand-clay-silt mixtures. Total thickness of the sediments based on deep coring near the Site is approximately 200 to 300 feet. In addition, it is likely that north-south trending shoreline deposits (i.e., eolian sand deposits) have also been placed at the Site, given the shorelines historical vicinity to the Site location, concurrently with the alluvial fan deposits. The Temescal Formation has been penetrated to a depth of approximately 60 feet below ground surface (bgs) at the Site

in boring IS-BH-07 and can be broken down into four general units (fill material, Unit A, aquitard, and Unit B).

The shallowest unit beneath the Site is engineered fill that consists of sands, silts, and gravels with concrete fragments. This fill extends from ground surface and ranges from 0 to 4 feet in thickness. The fill material unconformably overlies Unit A (which includes the A-zone groundwater), which consists predominately of silt and clay with discontinuous lenses of sand from approximately 4 feet to 20 feet bgs. The lenses have been observed to range in thickness from approximately 1 to 10 feet at investigated boreholes and rapidly change in thickness between nearby boreholes. There is evidence of several discontinuous sand zones occurring in Unit A that vary in thickness from 1 to 5 feet between nearby boreholes.

Unit A is underlain by approximately 30 feet of silty clay that acts as a local aquitard separating Unit A from Unit B. The top of the aquitard begins at approximately 25 feet bgs (corresponding to an elevation of approximately -11.5 feet NAVD88). The top of the A/B aquitard appears to be laterally continuous across the Site. Investigations have not revealed evidence of erosional features on the surface of the aquitard.

Unit B (which includes the B-zone groundwater) consists of primarily silty clay and clayey silt beginning at approximately 50 feet bgs. The total depth of Unit B has not been characterized, but the top of Unit B ranges from approximately 45 to 55 feet bgs. Similar to Unit A, Unit B includes discontinuous lenses of silty sand ranging between 1 and 3 feet thick situated between 50 and 60 feet bgs. The A/B aquitard is distinguished from Unit B by the characteristics of the more permeable lenses within the Unit B formation. The lenses in the aquitard consist of clayey sand with some silt, while the Unit B lenses consist of silty sand.

Figure 2-3 presents the locations of three cross sections at the Site. Figures 2-4, 2-5, and 2-6 present these cross sections of Unit A, A/B aquitard, and an upper portion of Unit B for these three transects across the Site.

2.3.3 Hydrogeology

The two zones of groundwater (A-zone and B-zone) are part of a single hydrogeologic unit, containing multiple alluvial fan and eolian shoreline deposits. Accordingly, different groundwater zones beneath the Site are referred to as water-bearing zones rather than aquifers. The A-zone and B-zone groundwater underlying the Site is not currently being used for drinking water supply, and has not been used in the past. The Site is not located within a groundwater recharge area (Norfleet, 1998).

2.3.3.1 Groundwater Flow in the A-Zone

The A-zone is a predominantly shallow, unconfined to semi-confined water-bearing zone. A-zone groundwater is present in relatively thin (approximately 2- to 5-feet thick), discontinuous, lenses of sand that are interbedded within less permeable silty/clayey sediments. Depth to groundwater across the general area of the Site can vary seasonally from approximately 3 to 12 feet bgs. Prior to the installation of the slurry wall and the groundwater extraction system, the direction of groundwater flow

across the Site was predominately west to northwest toward San Francisco Bay and Temescal Creek. Groundwater flow in the northernmost portion of the Site appears to be locally influenced by Temescal Creek. Groundwater flow towards Temescal Creek partially discharges into the Temescal Creek's drainage channel, but not directly into the surface water. Tidal fluctuations occur in areas near the Temescal Creek and affect the amount of groundwater flow entering the drainage channel. The surface water associated with Temescal Creek is further discussed in Section 2.3.4.

The flow of groundwater in the A-zone beneath the Site has been altered by the installation of the slurry wall and the groundwater extraction system in the 1990s (ENTRIX, 2002). The flow inside the slurry wall is generally toward the extraction wells. The groundwater gradient is generally steeper in the southern portion of the area enclosed by the slurry wall and generally flows toward the west in this area. The groundwater flow outside of the slurry wall is toward the west-northwest, generally consistent with pre-slurry-wall groundwater flow regime on the northern portion of the Site, and is influenced by proximity to the slurry wall, groundwater extraction wells, and Temescal Creek.

Based on pumping tests summarized in the RI, the transmissivity has been estimated to range between 4.1 and 633 square feet per day (ft^2/day), and the hydraulic conductivity ranges between 0.28 and 28 feet per day (ft/day). The results of a tidal study also measured transmissivities, and found 18.7 ft^2/day for the northern portion of the Site adjacent to Temescal Creek (ENTRIX, 2002). This value is based upon a month of monitoring, and is considered a more reliable measure of sitewide transmissivity than the short-term pump tests. Pumping tests conducted in February 2007, in support of the soil treatability study and further discussed in Section 2.5, estimated a hydraulic conductivity of approximately 3 ft/day for the A-zone within the central portion of the raised cap part of the Site (CDM, 2007b); this value is within the range reported for the Site in the RI.

Based on an estimated effective porosity of 0.12 (Freeze and Cherry, 1979), the average linear velocity of groundwater beneath the Site is approximately 0.24 ft/day. Groundwater elevations vary seasonally between 4 and 10 feet NAVD88 within the A-zone. Groundwater levels can fluctuate up to 3 feet seasonally, with highest in the wet season between December and February.

2.3.3.2 Groundwater Flow in the B-Zone

The B-zone is a confined unit with several feet of piezometric pressure head above the top of the A/B aquitard. Groundwater elevation measurements have consistently measured a vertical upward hydraulic gradient from the Unit B to the Unit A groundwater zone (ENTRIX, 2002).

The groundwater flow conditions within the B-zone do not appear to have been significantly impacted by the installation of the slurry wall and the groundwater extraction system, indicating the limited permeability of the confining unit separating the A-zone and the B-zone. The groundwater flow direction both before and after the installation of the slurry wall and extraction system is from the southeast toward the

northwest. Pumping tests indicate the transmissivity ranges between 128 and 132 ft^2/day, and a hydraulic conductivity of approximately 28 ft/day (ENTRIX, 2002). Based on an estimated effective porosity of 0.12, the average groundwater linear velocity is approximately 1.07 feet/day. Groundwater elevations vary between 6 and 9 feet NAVD88 within the B-zone and can fluctuate up to 2 feet seasonally. The water levels are highest in the wet season between December and February.

2.3.3.3 Groundwater Use

The 2002 ENTRIX Site RI report concluded that groundwater at the Site cannot feasibly be used for long-term water supply. The conclusion was based on an interpretation of Site data and the exemption criteria set forth in State Water Resources Control Board (SWRCB) Resolution No. 88-63. According to Resolution No. 88-63, waters are considered suitable, or potentially suitable, for municipal or domestic water supply except where:

a. "Total Dissolved Solids (TDS) exceeds 3000 milligrams per liter (mg/L) (5000 microSeimen/centimeter (µS/cm) electrical conductivity);

b. Contamination exists, that cannot reasonably be treated for domestic use; and

c. The source is not sufficient to supply an average sustained yield of 200 gallons per day."

As reported in the 2002 ENTRIX Site RI report, the average TDS across the S-W Property is 1,200 mg/L, and the central portion of the property exceeds 3,000 mg/L on average. Development of the shallow groundwater for supply would likely lead to saltwater intrusion, as documented for several nearby areas in the Norfleet study (1998), and cause expansion of the area that currently exceeds 3,000 mg/L.

2.3.4 Temescal Creek

The Site resides within the Temescal Creek watershed. The northwest extent of the Site borders with Temescal Creek (see Figure 2-2).

2.3.4.1 Temescal Creek Watershed

The Temescal Creek watershed encompasses a 6.68 square mile (sq. mi.) area with headwaters in the Berkeley Hills on the north and south sides of Highway 24. The upper watershed has ridge elevations of approximately 1,200 to 1,300 feet and includes mixed open space and residential lands in the Berkeley Hills. The contributing area upstream of Lake Temescal is about 2.64 sq. mi. and includes the upper main stem of Temescal Creek (1.67 sq. mi.) and the Caldecott Tunnel branch (0.97 sq. mi.). Downstream of Lake Temescal, runoff from the other two upland subbasins, Vicente Branch (0.64 sq. mi.) and Claremont Creek (1.22 sq. mi.), combines with urban runoff within the densely developed lowlands of Berkeley and Emeryville. The mouth of Temescal Creek flows into San Francisco Bay about 0.4 mile north of the highway interchange leading to the Bay Bridge toll plaza, approximately 1,100 feet from the Site (ENTRIX, 2002).

A relatively small percentage of the main and tributary lengths of Temescal Creek still have earth-lined open channels with natural configuration. Those that remain are primarily within the Berkeley Hills. The lower 3.5 miles of the main stem and most of the tributary channel reaches are within engineered underground storm drain systems (ENTRIX, 2002).

2.3.4.2 "Old" Temescal Creek

In the vicinity of the Site, the surface channel of old Temescal Creek between Horton Street and the onsite railroad spur has been replaced by a relocated, underground culvert north of the Site and an open, engineered flood channel extending downstream (west) to Interstate 880. Old Temescal Creek (as part of the main flood channel) was abandoned following the 1968 construction of the flood control project.

The old channel persists as a topographic and drainage feature, although it no longer receives runoff from the upstream watershed. It crosses under Horton Street in two large concrete culverts and passes under the former Rifkin property in a concrete box culvert. Downstream of the former Rifkin property, a short section of the old constructed "U" shape channel exists (5 to 10 feet deep; 10 to 15 feet wide) with vertical banks supported by wood slats (ENTRIX, 2002). The location of the old channel is presented on Figure 2-2.

The old channel discharges through a 5-foot diameter culvert into the concrete-lined flood channel of the re-engineered Temescal Creek upstream of the railroad crossing. The old channel may receive surface flow from storm drains along Horton Street that appear connected, as well as local runoff from other nearby streets. Discharge of groundwater to the old channel was not observed during ENTRIX site visits (November 1998, November 2000, and December 2000) (ENTRIX, 2002). In addition, no flow was observed during CDM site visits in winter of 2006/2007.

2.3.4.3 Lower Temescal Flood Channel

Lower Temescal Creek from Horton Street to San Francisco Bay was constructed as an engineered flood control channel between 1964 and 1968 (ENTRIX, 2002). Within the Site vicinity, the only surface water contributions to the channel are the 5-foot diameter culvert from the old channel and a 21-inch diameter storm-water drain entering from the Sherwin-Williams property. No other storm drains have been observed within the Site vicinity.

Based on improvement plan design and as-built data, the flood control channel has a "U" shaped, concrete-lined cross section approximately 16 feet deep and 25 to 30 feet wide, with a long profile gradient of 0.00083 feet/feet (see Temescal Creek as presented on cross section K-K', Figure 5-3 of the ENTRIX RI, presented in Appendix A of this document) (ENTRIX, 2002).

The channel was excavated about five feet below the previously existing ground surface of old Temescal Creek, with side construction slopes of approximately 1 to 1. The area behind the vertical concrete walls and under the concrete bed was backfilled using filter material, crushed rock, gravel bedding, and reserved earthen materials.

The plans show a subdrain network was constructed under the channel, with pressure relief flap gates rising at intervals along the channel walls to minimize the risk of uplift, buckling, or shifting of the concrete liner. The subdrain network consists of 4-inch perforated pipe buried in the gravel bedding across the channel bed at relatively regular spacing (30 feet) that is connected by perforated pipes paralleling the channel left and right banks. Approximately every 90 to 120 feet along the channel length, vertical risers of 6-inch non-perforated pipe extend outside the channel walls to recessed openings in the concrete walls about two feet above the channel bed. Flap gates using 8-inch Waterman Drainage Gates (model F-10) were installed to allow one-way release of water from the subdrain system into the flood control channel when hydrostatic pressure is sufficient (hinges designed to require <1.0 foot of pressure head). The flap gates were not observed by ENTRIX in November 1998, November 2000, and December 2000) (ENTRIX, 2002).

The flap gates were observed by CDM during a visit in April 2005. The functionality of the flap gates has not been evaluated.

2.4 Previous Investigations, Risk Assessments, and Interim Remedial Actions

This section describes previous remedial investigations, nature and extent of COCs, fate and transport of COCs, groundwater modeling, risk assessments, and interim remedial actions.

2.4.1 Remedial Investigations

Soil, soil gas, and groundwater investigations have been conducted at the Site since 1988. The investigations have revealed that the COCs in the subsurface are metals, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and petroleum hydrocarbons. The investigations concluded that several COCs have migrated from the S-W property onto a portion of the former Rifkin property. Site soil and groundwater data through October 2000 is summarized in the 2002 ENTRIX Site RI report (ENTRIX, 2002). The RI report was approved by the Water Board on October 21, 2002 (Water Board, 2002).

Since October 2000, results from periodic groundwater monitoring events have been summarized in a series of reports. This document utilizes this groundwater data through the December 2007 event (LFR, 2008). In addition, several investigations have been conducted after October 2000 to complete characterization of the Site:

CDM, 2008b. Report of Findings, Soil Characterization Study Addendum, Sherwin-Williams Site, 1450 Sherwin Avenue, Emeryville, California. February 22, 2008.

CDM, 2007d. Report of Findings, Soil Characterization Study, The Sherwin-Williams Company, Emeryville, CA. Camp Dresser & McKee Inc., on behalf of The Sherwin-Williams Company. June 28, 2007.

CDM, 2007h. Data Summary Report for Soil Gas Investigation Activities, Sherwin-Williams Site, 1450 Sherwin Avenue, Emeryville, California. January 30, 2007.

CDM, 2007i. Data Summary Report for Installation and Sampling of Well CDM-1, Sherwin-Williams Site, 1450 Sherwin Avenue, Emeryville, California. January 30, 2007.

CDM, 2005. Report of Findings, December 2004 Subsurface Investigation, 1450 Sherwin Avenue, Emeryville, California. Camp Dresser & McKee Inc. March 2005.

CDM, 2002. Report of Findings, Subsurface Investigation, Former Rifkin Property, Emeryville, California. Camp Dresser & McKee Inc. December 2002.

The 2002 ENTRIX Site RI report concluded that the primary Site-related contaminants present in soil and groundwater beneath the Site include metals (primarily arsenic and lead), VOCs (primarily aromatic constituents and ketones), and petroleum hydrocarbons. Chlorinated constituents were also detected in groundwater samples collected throughout the Site, but in most instances appear to be related to past releases on adjacent properties and not attributable to S-W. Subsequent investigations have confirmed these conclusions.

Appendix A includes selected figures from the RI presenting the extent of impact from various COCs in shallow soil (0 – 3 feet bgs), deep soil (3 – 10 feet bgs), and groundwater (ENTRIX, 2002). In addition, Appendix A includes selected figures and tables from these subsequent subsurface investigations (CDM, 2002; CDM, 2005; CDM, 2007d; CDM, 2007h; CDM, 2007i; and, CDM, 2008b).

Appendix B includes selected figures and tables from the FS presenting summaries of arsenic, lead, total VOCs, and TPH concentrations in vadose zone and saturated zone soil samples across several depth intervals.

2.4.2 Nature and Extent of COCs

2.4.2.1 Metals

The extent of impacts from the release of metals (arsenic and lead) is limited to unsaturated, vadose zone soil, and the soil and groundwater within the Unit A aquifer. Aside from sporadic arsenic concentrations above its cleanup goal, metals have not been detected above cleanup goals in B-zone groundwater samples. Arsenic detected in A-zone groundwater at the Site does not appear to have significantly affected the B-zone groundwater (ENTRIX, 2002 and LFR, 2008). The highest concentration of arsenic detected in B-zone groundwater was 0.32 mg/L at well LF-B5 in April 1996; the latest arsenic concentration in this well was 0.0064 mg/L in October 2007. Arsenic concentrations in B-zone groundwater in 2007 ranged from less than 0.005 mg/L (at well LF-B3) to 0.054 mg/L (at well RP-BW-02).

The highest concentrations of the primary metal and COC at the Site, arsenic, in unsaturated soil were found in the central portion of the S-W property (within the

southern slurry wall area) and in the southern portion of the former Rifkin property (outside the slurry wall area). Arsenic was also detected at concentrations above its California Department of Public Health (CDPH) drinking water Maximum Contaminant Level (MCL) in A-zone groundwater extending from the central portion of the S-W property westward and also to the adjacent former Rifkin property. The extents of other metal COCs in the unsaturated soils and A-zone groundwater at the Site are within the extents of arsenic. In addition, a second area of arsenic in groundwater is present under the central portion of the former Rifkin property, originating from Horton Street (ENTRIX, 2002).

Groundwater monitoring events at the Site and a subsurface investigation on the former Rifkin property have been conducted since the completion of the 2002 ENTRIX Site RI report. The groundwater monitoring events have shown that the extraction wells EX-14, EX-15, and EX-16 on the former Rifkin property are capturing contaminants that have historically migrated from the S-W property (prior to installation of the slurry wall) and historically migrated from a release beneath Horton Street.

In September 2002, CDM conducted a subsurface investigation at the former Rifkin property to:

- characterize the presumed longitudinal axis of the arsenic A-zone groundwater plume on the former Rifkin property, originating from Horton Street;
- evaluate total arsenic in Unit A aquifer saturated soils under the portion of former Rifkin property to which arsenic may have migrated from the S-W property; and
- evaluate the soil-water partition coefficient (K_d) for arsenic.

During the September 2002 investigation (CDM, 2002), CDM collected saturated soil and grab groundwater samples from nine Unit A locations within the former Rifkin property (see figures presented in Appendix A). The results from the investigation yielded the following conclusions:

The Unit A aquifer arsenic plume in the central portion of the former Rifkin property, which originated from a release beneath Horton Street, has appeared to attenuate since the previous characterization of the plume in August 1998. During the August 1998 investigation, arsenic in Unit A aquifer groundwater was reported between 0.063 and 0.12 mg/L along the length of the plume. During the September 2002 investigation, arsenic concentrations ranged from 0.034 to 0.095 mg/L.

In December 2004, CDM conducted a subsurface investigation on the raised cap area and the area immediately west of the raised cap on the S-W property, and on an area of the former Rifkin property immediately adjacent to the S-W property, collectively defined as the study area (CDM, 2005). The objectives of the investigation were to:

- Characterize contaminants in the raised cap material to assess treatment and disposal options for the raised cap material, and

- Better define the horizontal and vertical extent of impacted unsaturated and Unit A aquifer saturated soils under and adjacent to the raised cap.

During the December 2004 investigation, CDM collected raised cap material, unsaturated soil, Unit A aquifer saturated soil, and Unit A aquifer grab groundwater samples from 38 locations within the study area (see figures presented in Appendix A). The results from the investigation yielded the following conclusions:

Unit A aquifer soil at the study area generally consists of clay with interbeds of well graded sand and gravel. The raised cap material consists of asphalt pavement over fill soil/bentonite from excavation of the slurry wall, concrete debris, and historic concrete foundations with rebar.

Arsenic is the predominant (highest concentrations and most widely distributed) metal COC in both unsaturated and Unit A aquifer saturated soils within the study area. The distribution of arsenic generally decreases with depth, with the highest at-depth concentrations detected in boring CDM-SB15, -SB16, and –SB18 (see figures presented in Appendix A). The investigation confirmed that the extent of other metals above cleanup goals in the unsaturated soils and Unit A aquifer saturated soils are within the extent of arsenic.

In the area west of the raised cap, arsenic concentrations in soil diminish to below 24 mg/kg above the A/B aquitard.

In November 2006, CDM installed a new Unit A aquifer well onsite (CDM-1) (see figures presented in Appendix A) in order to evaluate the extent of arsenic present in the areas outside of the southern portion of slurry wall (CDM, 2007i). Due to the presence of Building 35, the southern portion of the arsenic plume could not be contained within the slurry wall system. The groundwater samples from CDM-1 further delineate the lateral extent of the arsenic Unit A aquifer groundwater plume present outside and to the south of the slurry wall system, which are consistent with the results from Unit A aquifer wells LF-3 and LF-11.

2.4.2.2 Organic Compounds

VOCs were detected in Unit A soil and groundwater throughout the Site. In general, the highest concentrations of aromatic constituents (primarily ethylbenzene, toluene, and xylenes) and ketones (primarily acetone) were found in unsaturated soil: (1) along the former Rifkin property/S-W property boundary line (both inside and outside the slurry wall); and (2) in the north-central portion of the S-W property (inside the slurry wall).

In groundwater, the primary VOCs found in A-zone groundwater included: aromatic constituents (benzene, ethylbenzene, toluene, xylenes, and 1,2,4-trimethylbenzene); chlorinated constituents (1,2-dichloroethane (1,2-DCA), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-DCE, trichloroethene (TCE), and vinyl chloride); and ketones (acetone and 2-butanone). Of these VOCs, chlorinated constituents were not historically used at the S-W facility.

Aromatic VOCs (excluding benzene) were detected above their MCLs in A-zone groundwater in two primary areas of the Site: (1) both inside and outside the slurry wall, generally in the area west of Horton Street between former Building 29 and the southern portion of the former Rifkin property and (2) inside the slurry wall on the west-central portion of the S-W property, a former solvent tank farm location. Benzene was detected above its MCL in A-zone groundwater in three primary areas of the Site: (1) within the central area of the slurry wall under the current raised cap area, (2) adjacent to the slurry wall on the southern former Rifkin property and near former Building 35, and (3) along Horton Street at the central portion of the former Rifkin property. Ketones were primarily detected above their MCLs in A-zone groundwater on both sides of the slurry wall at the former Rifkin property and S-W property line.

The highest concentrations of chlorinated constituents were detected in A-zone groundwater in two primary areas of the Site: (1) in the south-central portion of the former Rifkin property and along Horton Street and (2) within the slurry wall near and north of Building 38. In B-zone groundwater, only 1,2-DCA was detected consistently above its MCL in groundwater samples from wells (and detected historically in groundwater samples from borings). The 1,2-DCA concentrations in B-zone groundwater are significantly higher than in A-zone groundwater beneath the S-W property, indicating an upgradient off-site release.

Petroleum hydrocarbons (quantified as both total petroleum hydrocarbon (TPH) in the diesel and gasoline ranges, but likely representing thinners and other raw materials) are present in soil and A-zone groundwater, located primarily (1) inside the boundary of the slurry wall, (2) in the southern part of the former Rifkin property at the boundary with the S-W property, and (3) along Horton Street near the northeastern portion of the former Rifkin property.

For TPH detected in groundwater at the S-W property and in the southern part of the former Rifkin property, TPH in the diesel range appears to represent mineral spirits and mixed oil compounds (rather than diesel fuel) and TPH in the gasoline range appears to represent the lighter fraction of oils (including mineral spirits) and individual VOCs (such as toluene and xylenes) that were detected in soil in these same areas.

The results from the December 2004 investigation (CDM, 2005) yielded the following conclusions concerning organic COCs in soil and groundwater:

- The highest VOC detections in soil at the study area were reported across the raised cap area, primarily from boreholes CDM-SB16, -SB17, -SB18, -SB23, -SB24, and -SB30. The highest detections were from toluene and xylenes.

- VOCs attenuate significantly between the raised cap area and the area to west of the raised cap.

- SVOCs, VOCs, and TPH detected on the former Rifkin property do not appear to be completely from releases on the S-W property.

The results from the November and December 2006 investigation (CDM, 2007h) yielded the following conclusions concerning organic COCs in soil gas:

- VOCs are present in soil gas at the Site, as previously inferred from vadose zone soil and shallow groundwater sample results. The southern portion of the former Rifkin property and the adjacent western portion of the raised cap area have the highest VOCs in soil gas concentrations.

- The presence of these VOCs in the subsurface may be attributed to historic releases of raw materials at the northwest corner of the raised cap area, historic operations by various businesses formerly present on the former Rifkin property, and historic releases on properties located upgradient of the Site and migration of impacted groundwater from these properties to the Site.

- The only VOC detected above its residential soil gas screening level on both the S-W and former Rifkin properties was benzene in 6 of the 9 samples considered representative of soil gas quality (see table and figure presented in Appendix A).

- In addition to benzene, 1,2-dichloroethane was detected above its residential soil gas screening level on the former Rifkin property.

- Methane in soil gas was detected in samples collected at both the S-W and former Rifkin properties. The methane at these areas is attributed to pervasive methanogenic conditions within the silt/clay zones, which is typical of the bay muds, and localized methanogenic conditions within underlying groundwater in sandy zones that have been impacted with organic compounds.

2.4.3 Conceptual Site Model

Pursuant to the NCP and associated California guidance documents, a conceptual site model (CSM) was prepared for the Site. The decision-making framework for Site investigations was developed based on the CSM. The CSM presents the primary and secondary sources of COCs and their release mechanisms to soil, soil gas and groundwater. The CSM was developed based on: known or suspected historical operations at the Site (see Section 2.2); investigation results (see Section 2.4.1 and Section 2.4.2); properties of the chemicals present; suspected chemical release mechanisms based on types of operations conducted and knowledge of where materials were handled; transport mechanisms; and potential exposure scenarios.

A narrative description of the CSM is presented below. The CSM description is based on a forensic evaluation of historical documents, chemical formulations and an understanding of the properties of the COCs and Site data. This CSM adequately describes the nature and distribution of COCs found at the Site. The development of the CSM and underlying arsenic in groundwater attenuation mechanisms at the Site, as discussed below, are consistent with recent publication from USEPA: Monitored

Natural Attenuation of Inorganic Contaminants in Ground Water, Volume 1, Technical Basis for Assessment, dated October 2007 (USEPA, 2007). Figure 2-7 presents an illustration of the CSM for the release and transport of arsenic.

2.4.3.1 Release Mechanisms

The primary release mechanism of COCs to the subsurface is suspected to have been through historic releases of raw and finished materials at the Site. The Site produced lead-arsenate pesticides, coatings, and resins through its history.

The lead-arsenate pesticide manufacturing was centered at the current northern area of the Raised Cap area (see Figure 2-2). The primary raw materials used to generate the lead-arsenate pesticides (where arsenic is in the +5 oxidation state, arsenic [+5]) were litharge (a lead oxide) and arsenic acid (H_3AsO_4, where arsenic is also present as arsenic [+5]). Based on review of historic plant building plans from the 1920s and historical photographs depicting operations, the pesticides appear to have been prepared through the following process:

1. Raw materials included litharge, acid (unknown variety, but most likely multiple types of acids were used) and either arsenic acid and/or raw material for production of arsenic acid (arsenic trioxide and acid, mostly likely nitric acid) were delivered to the Site via railcars and transferred to storage areas and/or containers including wooden vats and/or tanks.

2. Litharge was combined with an acid (unknown, mostly likely acetic acid) to generate lead liquor. The lead liquor was generated in an historic facility building described as a lead tower in which acid was sprayed over a litharge at the top of a tower and allowed to percolate downward through a series of trays. The liquor was collected at the bottom of the tower and likely contained both dissolved lead and lead complex solids.

3. If arsenic acid was generated at the facility, arsenic trioxide would have been combined with an acid to generate arsenic acid. This arsenic acid may have been generated in a historic facility building described as the arsenic acid plant.

4. The arsenic acid and lead liquor were combined in a set of parallel settling chambers where the lead-arsenate precipitate was collected.

5. The precipitate was dewatered in a filter press and further dried in ovens. The dried material was crushed and packaged as a lead-arsenate solid.

Potential release mechanisms for the lead, arsenic, and associated acids include the following:

- Loss to surface and rail ballast of raw materials from storage areas and/or containers during transfer and within the process system;
- Loss to surface of finished materials during packaging and handling (product appeared to be shipped in both wooden barrels and paper sack packaging); and
- Loss to surface of wastewater from settling chambers and presses.

In the above, loss to surface may have involved one or all of the following potential points: building floors, floor drains, floor sumps, and/or bare ground. The daily operations over 25 years could have resulted in thousands of gallons of materials permeating the floor of the manufacturing buildings or pavement, resulting in the presence of COCs in both soil and groundwater.

The primary raw materials used to generate coatings and resins were organic solvents, water-based solvents, oils, polyhydric alcohols, dibasic acids, and pigments. Storage of much of these materials was in aboveground storage tanks located at the northwest corner of the Raised Cap area and near the central portion of the current railroad spur (Figure 2-2). The primary potential release mechanism for these materials appears to have been losses to the ground surface during tank filling or discharge.

As a result of releases, the COCs were present on the ground and floor surfaces and in catchment areas (e.g., cement storage areas, bare ground, sumps, drains, etc). Further releases of COCs, addition of water/liquids (e.g., wash water) or in some cases infiltration (in outside areas that were not covered) caused movement of the COCs into the soils below the surface. In this unsaturated vadose zone, the materials were adsorbed and/or retained in the soil until further liquid releases or mobilization by infiltrating water or other liquids. Eventually some of the COCs (e.g., arsenic, lead, and organic compounds) reached the groundwater and migrated with the groundwater to downgradient areas.

2.4.3.2 Natural Attenuation of Metals

Arsenate trioxide suspected to have been released at the Site would have contained arsenic in its more mobile (arsenic [+3]) state. Arsenic acid and lead-arsenate pesticides released at the Site contained arsenic in its less mobile (arsenic [+5]) state. However, arsenic (+5) in groundwater migrating from the release areas would have been reduced to arsenic (+3) as it encountered more reducing conditions. The relative distribution of oxidizing/reducing conditions is consistent with the CSM. Upgradient groundwater entering the arsenic release areas is less reducing and the arsenic is found primarily in its arsenic (+5) state. However, in the central portion of the Site, due to the reducing conditions in A-zone groundwater caused by releases of organic COCs and naturally occurring organic matter, groundwater in these zones is mildly reducing and both forms of arsenic are found.

Arsenic concentrations in groundwater attenuate by three to four orders of magnitude between the release areas and the downgradient property boundary. Studies were conducted (CDM, 2008b and CDM, 2007d) to further characterize the phases of arsenic present in the subsurface and the mechanisms for its attenuation in groundwater. The findings from these studies indicate a direct relationship between phases and extent of arsenic with the lithology, as discussed below. Although the primary focus of these investigations was the release areas, results from locations outside and downgradient of the release areas also confirm this relationship.

Lead is not mobile in Site soil, as a result, lead has not migrated beyond the current Raised Cap area (Figure 2-2).

2.4.3.3 Arsenic Distribution in High Permeability Sandy Zones

An acidic, arsenic-bearing solution containing organic ligands such as acetate was released into the ground via spills, leaking tanks and pipelines, etc. The acid with organic ligands appears to have dissolved much of the clays and feldspars and chemically attacked the quartz within the aquifer. As the arsenic plume migrated deeper within the aquifer and downgradient (within the High Permeability Sandy Zones under both the Sherwin-Williams and former Rifkin properties), the dissolution reactions appear to have eventually neutralized the water when the solubility of the amorphous silica phase was exceeded, at which point the phase precipitated, forming a coating on the existing grains or cementing grains together. The organic ligands within the High Permeability Sandy Zones were then oxidized due to the introduction of oxygen-bearing precipitates (i.e., amorphous silica phases) into the High Permeability Sandy Zones.

Even after the releases of arsenic ceased, the arsenic plume continued to move farther downgradient, as the arsenic-bearing amorphous silica precipitate provided a continuing source of arsenic to groundwater moving through continuous sand lenses, i.e., along the connected active sand zone flow paths. These connected sand layers are depicted on cross section B-B' (see Figure 2-3 and 2-5). The investigations have confirmed that the sand zones under the release areas on Sherwin-Williams property and under a portion of the former Rifkin property downgradient of the release area contain residual solid-phase arsenic silica precipitates, which through dissolution continue to be a source of arsenic to groundwater. The sand zones that contain residual solid-phase arsenic silica precipitates largely occur within the area bounded by the green line on Figure 2-2; these sand zones and their extents are further discussed in the FS (CDM, 2009b).

Downgradient of the release areas, movement of the arsenic (both arsenite [+3] and arsenate [+5]) in the sand zones appears to be controlled by sorption to aquifer matrix, with arsenate being relatively less soluble and mobile. Investigations have confirmed that in groundwater samples collected from outside the slurry wall system, between the slurry wall and the UPRR lines and areas on the former Rifkin property downgradient of the S-W property, arsenic is more oxidized and reduction-oxidation (redox) conditions are not as reducing as near the release area (CDM, 2008b; CDM, 2007d; CDM, 2007i; CDM, 2005; CDM, 2003; and, CDM, 2002). In the more oxidized

environment downgradient of the release areas, the primary attenuation mechanism for arsenic in groundwater is sorption with, or co-precipitation as, oxyhydroxide compounds within the active sand zone flow paths. Adsorbed arsenic has been observed in samples collected from sandy zones at borings CDM-SB82 and –SB84, and –SB87, located downgradient of the arsenic release areas (CDM, 2008b).

Arsenic (arsenate and arsenite) sorbs to surfaces of a variety of aquifer materials, including iron oxides, aluminum oxides, and clay minerals. Adsorption of arsenate to iron-oxide surfaces is particularly important in reducing groundwater concentrations of arsenic because arsenate adsorbs strongly to iron-oxide surfaces in acidic and near-neutral-pH water. Investigations have also revealed relatively high concentrations of both dissolved iron and manganese in the regions downgradient of the release area which indicates potential for continued sorption of arsenic as iron and manganese oxidation/precipitation is on-going in downgradient, more oxidizing groundwater.

2.4.3.4 Arsenic Distribution in Low Permeability Silt/Clay Zones

The Low Permeability Silt/Clay Zones do not appear to have provided a migration pathway for the released arsenic acid solution plume due to lower hydraulic conductivity, but were subject to diffusion of the arsenic-containing water. Within the clay/silt zones, the organic ligands were isolated from oxidizing surface waters, and together with the natural organic carbon and sulfate in these layers provided conditions favorable for sulfate-reducing bacteria. The organic carbon and sulfate was initially deposited within bay muds and/or salt marsh deposits, which are characterized with hydrogen sulfide (H_2S), indicating the oxidation of organic carbon via sulfate reduction (EKI, 2008; EKI, 1999).

Under sulfate reducing conditions in the low iron/high sulfur environment within the silt/clay zones, which is typical of the bay muds, biological mediated reduction likely resulted in precipitation of orpiment and/or other arsenic sulfides such as realgar. Arsenic sulfides with arsenic to sulfur ratios similar to orpiment were observed in several soil samples analyzed from these silt/clay zones within the arsenic release areas and downgradient areas. Analysis of individual grains from the samples containing arsenic sulfide revealed the presence of arsenic and sulfur within the phases, but no other metals. In addition, oxygen was not present, indicating that the arsenic sulfides being generated within the silt/clay zones did not require the presence of dissolved metals in groundwater.

However, the formation and stability of arsenic sulfide precipitates under reducing conditions, has been described as "quite narrow for relatively high total concentrations of arsenic in groundwater, although site-specific conditions may support precipitation of sulfides" (USEPA, 2007). Yet, others have reported that the specific conditions within the San Francisco Bay margin are ideal for formation of arsenic sulfides where (1) the solubility of the sulfide mineral is exceeded and (2) the groundwater flow rates is slow compared to the arsenic sulfide precipitation rates (O'Day et al., 2004). Also, it is reported that under these conditions the precipitation of arsenic sulfide minerals is often biologically mediated, as certain bacteria (e.g.,

Desulfomaculum) are capable of reducing arsenic (+5) to arsenic (+3) and precipitating orpiment (O'Day et al., 2004).

In addition, under the reducing conditions, arsenic may also sorb onto pyrite, followed by formation of an iron/arsenic/sulfur -type phase, which subsequently converts to As_2S_3 (Bostick et al., 2004). In general, sorption reactions are very fast; on the order of seconds (Langmuir et al., 1985). The redox reaction required to convert sulfate to sulfide is typically slower (half life of minutes to hours). While the abiotic precipitation/dissolution reactions maybe the slowest, occurring on the order of weeks, biological-mediated sulfate-reduction reactions are reported to occur within minutes. Due to the relatively slow groundwater velocity in the low permeability silt/clay zones, there is adequate groundwater residence time for dissolved arsenic within these zones to form arsenic sulfides at the Site. Therefore, the formation of stable arsenic sulfides under the low velocity, high concentration conditions found at the Site is consistent with the findings of other studies of arsenic geochemistry within the San Francisco Bay margin (O'Day et al., 2004).

The bacterially-mediated reaction that forms arsenic sulfide is as follows (O'Day et al., 2004):

$$7CH_2O\ (s)[\text{organic matter}] + 3SO_4^{-2}\ (aq)[\text{from GW}] + 2H_3AsO_4^0\ (aq)\ [\text{from GW}] + 6\ H^+(aq)[\text{from GW}] \rightarrow As_2S_3\ (s)\ [\text{precipitated within the Low Permeability Silt/Clay Zones}] + 7CO_2(g) + 13H_2O(l)$$

The Site samples containing arsenic sulfide minerals had total arsenic concentrations as high as 8,000 mg/kg. However, arsenic sulfides are not a source of arsenic to groundwater at the Site, but a sink. This conclusion is based on the following:

- Under reducing conditions found within the Low Permeability Silt/Clay Zones arsenic sulfides are relatively insoluble, with solubility ranging from less than 0.0075 to 0.750 mg/L (Wilkin et al., 2003).

- The Low Permeability Silt/Clay Zones do not transmit groundwater as fast as the High Permeability Sandy Zones (i.e., the hydraulic conductivity of the Low Permeability Silt/Clay Zones is at least two orders of magnitude less than for the sandy zones).

2.4.3.5 Natural Attenuation Mechanisms for Arsenic

Natural attenuation of arsenic at the Site involves primarily precipitation and sorption. These processes have been influenced by biotransformation of arsenic, specifically arsenic redox cycling. Arsenic has been immobilized by sorption onto aquifer solids and by precipitation of solids incorporating arsenic as a major constituent. The investigations have confirmed that it is the relative ratio of the reactive iron to sulfur that controls the distribution of solid phases of arsenic. The partitioning and stability of the arsenic solids are affected by the redox conditions. Because of the differences in solubility of iron and arsenic sulfides, precipitation of arsenic sulfide is a controlling factor where sulfur predominates under reducing

conditions. Under oxidizing conditions, arsenic is removed from solution by adsorption to or co-precipitation with ferric oxyhydroxides.

The following summarizes the findings from investigations that demonstrate how the natural attenuation processes have been decreasing arsenic concentrations in groundwater downgradient of the release areas. These natural attenuation processes are expected to remain stable over the foreseeable future and are expected to continue decreasing arsenic concentrations in groundwater. This discussion follows the tiered format presented in the Monitored Natural Attenuation of Inorganic Contaminants in Ground Water, Volume 1, Technical Basis for Assessment (USEPA, 2007).

Tier I of the USEPA document calls for demonstration that the groundwater plume is stable and that sorption and/or precipitation onto aquifer solids is occurring where immobilization is the predominant attenuation process. Appendix A presents the findings from the Groundwater Monitoring Plan Assessment report (LFR, 2006). An analysis of the groundwater data reveals that concentrations of arsenic in groundwater have been attenuating over time and distance, within and outside the slurry wall system, from the release areas, with stable and/or decreasing concentrations at downgradient wells LF-11, LF-18, LF-20, LF-24, and LF-25, ranging from less than 0.005 to 0.260 mg/L since 1997 (LFR, 2008). Since its installation in November 2006, arsenic in groundwater concentrations appear to be increasing at well CDM-1, which is located on the S-W property along its boundary with the UPRR property, in an area outside of the slurry wall system. Unlike the other wells mentioned above, CDM-1 is screened in the upper portion of the A-zone; the others are screened across both the upper and lower portions of the A-zone. Appendix A presents a summary of 2007 arsenic concentrations and concentration trend analysis results at Site wells (LFR, 2008).

As presented in Section 2.4.3.3 and 2.4.3.4, the primary mechanisms for this attenuation are the precipitation of the arsenic into sulfide compounds and sorption of arsenic to the aquifer solids. A lesser degree of attenuation is observed outside the slurry wall system, specifically between wells LF-3 and CDM-1/LF-11, than inside the slurry wall system. The attenuation of the arsenic plume outside the slurry wall system, originating in the area around LF-3, is likely affected by historical release of organics in this area of the Site and potentially higher connectivity of sand zones between LF-3 and CDM-1 (CDM, 2007i).

Tier II includes determining the mechanism and rate of the attenuation processes. Given the relationship established between arsenic phases and lithology, one of the mechanisms is the precipitation of arsenic sulfide as groundwater moves from High Permeability Sandy Zones through Low Permeability Silt/Clay Zones. The reducing conditions and presence of sulfur in the Low Permeability Silt/Clay Zones has resulted in the precipitation of the arsenic into sulfide compounds.

Biologically mediated formation of sulfides is typically much faster than the abiotic rate (O'Day et al., 2004). However, even when using the abiotic half life of weeks, there is sufficient residence time within the Low Permeability Silt/Clay Zones for the

precipitation of arsenic sulfide to occur. The fact that the groundwater in contact with the Low Permeability Silt/Clay Zones, such as found in monitoring well LF-26, is in approximate equilibrium with orpiment (CDM, 2008b), confirms that the reaction rates are as fast or faster than the residence time of the groundwater as it passes from High Permeability Sandy Zones through Low Permeability Silt/Clay Zones and then back into High Permeability Sandy Zones.

The other mechanism is the adsorption of arsenic to aquifer matrix within the High Permeability Sandy Zones, and to a lesser extent adsorption of arsenic within the Lower Permeability Silt/Clay Zones. However, based on testing conducting to determine the composition of arsenic bound to soil, arsenic sulfide precipitation appears to be dominant process for the attenuation of arsenic (CDM, 2008b).

Tier III, as presented in the USEPA document, includes the determination of the capacity of the aquifer to attenuate the dissolved mass of contaminant within the plume and the stability of the immobilized contaminant to resist re-mobilization.

Arsenic Sulfide Precipitation

As presented in Section 2.4.3.3, precipitation of arsenic in silt/clay zones into arsenic sulfides was determined to be one of the primary mechanisms for the attenuation of the arsenic plume. The naturally-occurring sulfate concentrations within the Low Permeability Silt/Clay Zones, which is typical of the bay muds, are stable under existing conditions and would remain stable under the proposed remedial alternatives. Sulfate within the Low Permeability Silt/Clay Zones will continue to provide an energy source for the resident bacteria and sulfur source for arsenic precipitation.

In addition, changes in redox conditions could affect the re-mobilization of arsenic sulfide precipitate (e.g., orpiment), within the Low Permeability Silt/Clay Zones. At a pH of 6.75 S.U., such as those conditions observed in monitoring well LF-26 and other downgradient margins of the Site, increases in dissolved oxygen within the Low Permeability Silt/Clay Zones could have an impact on the solubility of orpiment.

However, it does not appear that there would be an adequate source of oxygen to oxidize the arsenic sulfide precipitates. Stoichiometrically, six moles of oxygen are required to oxidize one mole of orpiment, i.e., for every gram of dissolved oxygen increase in water, up to 0.78 gram of arsenic would be dissolved. Based on the stoichiometric oxidation of orpiment as follows:

$$As_2S_{3(s)} + 6O_2 \rightarrow 2As^{+3} + 3SO_4^{2-}$$

Due to competing reactions for dissolved oxygen in a groundwater system, considerably more oxygen would be needed to dissolve one mole of orpiment than is actually present in the system.

The potential for changes in redox conditions from addition of oxygen is limited to: 1) diffusion of oxygen at the groundwater surface; 2) infiltration of rainwater with dissolved oxygen; and 3) movement of groundwater from upgradient containing

dissolved oxygen. Based on Fickian diffusion, less than 1 kilogram of oxygen per year would diffuse from atmospheric oxygen through the groundwater surface to the Low Permeability Silt/Clay Zones at the Site. Infiltration of 30 percent of incident rainwater with a dissolved oxygen content of 8 mg/L would result in approximately 3 kilograms of oxygen per year to the subsurface. Based on a groundwater velocity of 0.5 feet per day and 3 mg/L of dissolved oxygen, the movement of groundwater through the Site would add approximately 9.3 kilograms of oxygen per year, resulting in a total addition of approximately 13.2 kilograms per year of oxygen to the Site.

An analysis of the organic content of the Low Permeability Silt/Clay Zones indicates that sufficient organic carbon is present to maintain reducing conditions and limit oxidation of the arsenic sulfide. Sampling has revealed organic carbon in Site saturated zone soil ranging from 385 mg/kg to 16,900 mg/kg, with an average concentration of approximately 3,200 mg/kg and a 95 percent UCL of the mean of approximately 5,100 mg/kg (ENTRIX, 2002). In the presence of sulfate, i.e., electron acceptor, the anaerobic bacteria will facilitate the formation of arsenic sulfides (i.e., orpiment). Therefore, reduction of sulfate in the presence of organic carbon can be expressed, excluding consideration of nutrients, as follows (Metcalf & Eddy, 1979):

$$6CH_2O + 3SO_4^{2-} \text{ (bacteria)} \rightarrow 6CO_2 + 3S^{2-} + 6H_2O$$

Where two moles of organic substrate (CH_2O) are consumed for each mole of sulfate reduced. Combining the oxidation reaction with reduction reaction, one mole of carbon is needed to reduce each mole of oxygen or approximately 0.375 grams of carbon are needed to reduce each gram of oxygen added to the subsurface.

Based on the estimated volume of low permeability material and an average organic carbon of 3,200 mg/kg, there is enough organic carbon present to maintain the sulfate-reducing conditions at the Site for the foreseeable future.

Therefore, given the transport dynamics of the aquifer and identified geochemical conditions, changes in redox conditions are not anticipated to affect the long-term stability of the arsenic sulfide at the Site.

Arsenic Sorption

As presented in Section 2.4.3.2, adsorption of arsenic in sandy zones was determined to be one of the primary mechanisms for the attenuation of the arsenic plume. The sorbed arsenic in the sandy zones, unlike the arsenic sulfide precipitates generated in silt/clay zones, is in equilibrium with arsenic groundwater concentrations, i.e., is a sink for arsenic rather than a source. The partitioning of arsenic onto aquifer solids is strongly affected by redox conditions, pH, and relative abundance of competing ions.

The soil-water partition coefficient (K_d) for arsenic in these zones expresses the relationship between the arsenic present in soil and groundwater. The K_d is affected by the redox conditions. The redox conditions in the more permeable sandy zones have been reducing due to the presence of elevated anthropogenic organic compounds, which has resulted in bacterial consumption of dissolved oxygen and other potential electron donors (sulfate, nitrate, etc.) (see Section 2.4.2.2). As these

organic compounds attenuate, redox conditions could become less reducing in the permeable sand zones. However, even under relatively low redox conditions, sorption of arsenic has been the primary attenuation mechanism in the areas downgradient of the release area.

As redox conditions become more oxidizing, a higher fraction of dissolved iron in groundwater will precipitate as amorphous iron hydroxides, increasing the opportunity for arsenic adsorption and/or co-precipitation with the iron hydroxides. The adsorption capacity of amorphous iron hydroxides has been measured at approximately 34,000 mg of arsenic per kg of iron hydroxide at a pH value of 7 (Pierce and Moore, 1982).

Therefore, given the transport dynamics of the aquifer and identified geochemical conditions, changes in redox conditions in the more permeable continuous sand zones (currently reducing and becoming more oxidizing in the long-term) should act to enhance the attenuation of dissolved arsenic in groundwater downgradient of the release areas.

2.4.3.6 Natural Attenuation of Organic Compounds

Concentrations of organic compounds in groundwater have also attenuated by several orders of magnitude between the release areas and the downgradient property boundary (LFR, 2008). The attenuation is due to several processes, including naturally occurring biodegradation. Remedial investigations and continued groundwater monitoring for organic COCs have demonstrated this attenuation (ENTRIX, 2002 and CDM, 2005). Concentrations of organic COCs from wells near the downgradient property boundary are below Site cleanup goals.

2.4.4 Risk Assessment

Gradient completed a human health risk assessment (HHRA) of the Site in February 2005. This risk assessment supplements the Current Conditions Risk Screen (CCRS), completed by EarthRisk in 2002. The CCRS evaluated the potential human and ecological exposures to Site COCs assuming existing conditions with the interim remedial measures (IRMs) in place (discussed below in Section 2.4.5). The CCRS concluded that VOCs potentially migrating to the surface and into the air do not present an ecological or human health concern with the IRMs in place, under current conditions.

Since the remediation of COCs at the Site is already anticipated, the final HHRA does not follow the format of a typical baseline HHRA, which would calculate risks assuming that no remediation would be done. Instead, the primary goal of the final HHRA was to develop risk-based target levels (RBTLs), for COCs in soil and groundwater using exposure scenarios that correspond with the anticipated future land uses of the Site. These risk-based remediation standards are intended to be protective of potential human receptors after redevelopment of the Site.

2.4.4.1 Identification of COCs

Based on an evaluation of the remedial investigations conducted, the Site HHRA identified 34 COCs in Site soil and/or groundwater (Gradient, 2005):

1,2,3-trichloropropane	ethylbenzene
1,2,4-trimethylbenzene	iron
1,2-dichloroethane	isophorone
1,2-dichloropropane	lead
1,3,5-trimethylbenzene	manganese
2-butanone	methyl isobutyl ketone
4-chloroaniline	methyl tert butyl ether
acetone	naphthalene
antimony	phenanthrene
arsenic	selenium
barium	silver
benzene	tetrachloroethene
benzo(a)anthracene	toluene
benzo(b)fluoranthene	trichloroethene
benzo(b,k)fluoranthene	vinyl chloride
cadmium	xylenes
chromium	zinc

However, this evaluation in the 2005 HHRA did not include the data set from the December 2004 investigation. The methodologies utilized in the HHRA were applied to the December 2004 investigation data set and five additional COCs in soil and/or groundwater were identified:

chloroform	n-nitrosodiphenylamine
copper	thallium
mercury	

This evaluation is summarized in Appendix C.

2.4.4.2 Exposure Pathways

Exposure pathways for COCs at the Site were evaluated in the HHRA to assess the potential impacts to human health. Based on the analysis presented in the HHRA, it has been concluded that potential human exposure to COCs is limited to soil and groundwater (Note: soil and groundwater includes potential volatilization of COCs and exposure to receptors through soil vapor intrusion pathway) and to the following eight types of potential current and future receptors at the Site:

1. Construction Worker
2. Utility Worker
3. Landscape Worker

4. Commercial Worker
5. Teenage Recreational Visitor
6. Resident on the Ground Floor of a Multifamily Dwelling
7. Resident on the Second Floor (or higher) of a Multifamily Dwelling
8. Resident in a Single Family Home (Unrestricted Residential Use Scenario)

Exposure pathways for COCs at the Site for potential impacts to the environment are comprised of migration of COCs in groundwater to aquatic receptors to the Lower Temescal Flood Channel and San Francisco Bay.

2.4.4.3 Exposure Scenarios

The potential exposure scenarios for the COCs were presented in the HHRA. The primary goal of the final HHRA was to develop RBTLs, for COCs in soil and groundwater using exposure scenarios that corresponded with the anticipated future land uses of the Site, including unrestricted residential use. These risk-based remediation standards are intended to be protective of potential human receptors after redevelopment of the Site. An RBTL is that concentration of a COC that poses no significant adverse health effect for individuals at a specified level of risk. An RBTL reflects exposure patterns for the various receptors expected to use portions of the Site. Thus, there are unique RBTLs for each of the eight potential human receptors, reflecting the manner in which each of these receptors would be exposed to soils and groundwater at the Site.

RBTLs were calculated for individual COCs with both a target risk of 10^{-6} and for a target non-cancer hazard of 1.0. RBTLs based on a target risk of 10^{-5} were also calculated because the arsenic RBTL calculated using a target risk of 10^{-6} resulted in a concentration less than the background arsenic concentration for San Francisco Bay area soils. Unique RBTLs were developed for each receptor consistent with anticipated future land use – residents, recreational visitors, commercial/retail workers, utility workers, landscape workers, and construction workers. A total of 23 combinations of human receptor-type and target risk were evaluated for soil and 18 combinations for groundwater. RBTLs are applicable to all areas of the Site where that particular receptor is selected as the basis of risk management and remediation decisions.

2.4.4.4 Vadose Zone Soil

In the HHRA, Gradient developed RBTLs for COCs in vadose zone soil, which apply to all portions of the Site. Table 2-1 presents these RBTLs for commercial worker and unrestricted resident receptors with a cancer risk target of 1.0E-06 and a non-cancer hazard quotient of 1.0. Leaching of COCs from soil to groundwater at the Site poses a potential threat to the beneficial uses of groundwater. The RBTLs for the soil COCs listed in Table 2-1 have been evaluated against concentrations that would be protective of Site groundwater through comparison with USEPA Region 9 PRGs

migration to groundwater using a dilution attenuation factor of 1.0 and USEPA Region 9 PRGs for tap water (Gradient, 2005).

2.4.4.5 Groundwater

In the HHRA, Gradient also developed RBTLs for COCs in groundwater. For a cancer risk target of 10^{-6} and a non-cancer hazard quotient of 1.0, the most conservative RBTL (i.e., lowest RBTL) are presented in Table 2-2.

2.4.5 Interim Remedial Measures

2.4.5.1 Previous Removal Actions

There have been two removal actions at the Site:

- Between 1973 and 1994, the solvent and oil tank farm and the lacquer plant were removed from the Site. This was primarily due to the conversion from oil-based to water-based paint products. Soils in the area of the solvent tank farm impacted with toluene and other solvents were removed and disposed off-site prior to 1990.

- Based on an investigation of soil samples collected adjacent to the S-W Site, in 1997, soils along Horton Street impacted with arsenic and lead were excavated and disposed off-site.

2.4.5.2 Other Remedial Measures

In the early 1990s, S-W implemented the IRMs under the oversight of the Water Board, recognizing the need to control off-site migration of groundwater and human exposure to soils prior to implementation of a final Site remedy. The IRMs consisted of:

- A soil-bentonite slurry wall and a cement-bentonite slurry wall to contain chemically affected areas and to control the migration of chemically affected groundwater at the Site to off-site areas

- An asphalt and concrete cap and storm water collection system to reduce infiltration of storm water runoff into chemically affected soils

- A groundwater extraction and treatment (GWET) system to pump groundwater from inside the slurry wall in an attempt to create an inward hydraulic gradient across the slurry wall and treat the groundwater

S-W started construction of the slurry wall in 1993. The slurry wall was completed in November 1994. Construction of the cap and storm water collection system occurred between March 1995 and September 1995. The GWET system was installed between June and September 1995 and began operation in October 1995. Details on the installation of the IRMs are provided in the Interim Remedial Measures Completion Report dated April 19, 1996 (LFR 1996).

Between 1997 and 1998, S-W upgraded the IRMs:

- In late 1997, a multipoint collection system was installed to isolate the storm water collection system from infiltration of groundwater
- In 1998, an additional groundwater extraction wells were installed for improving hydraulic control of affected groundwater.

In 1998, LFR conducted an evaluation of the Site IRMs (LFR, 1998). LFR concluded in its evaluation that:

- The IRMs have been moderately effective in controlling off-site migration of impacted groundwater, as they have not consistently maintained an inward hydraulic gradient across the slurry wall
- Frequent system shutdowns have hindered the effectiveness of the IRMs
- Human exposure to impacted soils has been reduced through the installation of the asphalt and concrete cap.

Since the 1998 LFR report, changes made to the GWET system have improved the ability to maintain an inward hydraulic gradient and have increased chemical mass removal. The changes recommended and implemented were:

- Installation and operation of additional groundwater extraction wells, increasing the extraction system well count inside the slurry wall from three to 10, and installation of three extraction wells on the former Rifkin property
- Modifications to the groundwater treatment system technology by replacing the electrochemical co-precipitation system for metal removal (and the biological system for organics removal) with a proprietary reductive precipitation technology and activated coconut-shell based carbon

In 2006, CDM conducted an evaluation of the IRMs (CDM, 2006a). CDM concluded that the slurry wall layout was necessarily constrained by property boundaries to the north, east, and west, and most notably constrained to the south by the footprint of the plant's primary warehousing, production and shipping facility (i.e., Building 35). These physical constraints limited the effectiveness of the slurry wall to fully contain affected groundwater as demonstrated below:

- Soil and groundwater data indicate that prior to the IRMs, arsenic migration occurred northward from the S-W property, onto the former Rifkin property.
- Soil and groundwater data indicate that prior to the IRMs, arsenic migration occurred to the northwest and downgradient from the S-W property, onto the Union Pacific Railroad Emeryville Yard and active main line tracks.

- Soil and groundwater data indicate arsenic migration occurred along or under the northern portion of Building 35, outside of the slurry wall installation, in an area where plant operations limited the access for construction of the slurry wall.

- In general, the slurry wall is an effective barrier to migration of groundwater, as demonstrated by the differential groundwater gradients measured across piezometer/well pairs inside and outside the slurry wall; however, there are known weak points in the wall where utilities and other features penetrate the well and seasonal variations in the gradient direction across the slurry wall near Temescal Creek.

- The spur track within the slurry wall layout is a conduit for storm water infiltration.

- The groundwater extraction system is controlling groundwater elevations within the slurry wall layout. However, maintenance of an inward hydraulic gradient is strongly influenced by the proximity of extraction wells to the wall, the spur track, and the areas of the wall in relation to the northwesterly hydraulic gradient.

- The groundwater treatment system requires extensive operational and maintenance efforts, but has been and is effective at treating influent concentrations to comply with permitted discharge limits.

2.5 Summary of Treatability Study Findings

The CSM was used to assess the adequacy of the Site characterization for evaluation of appropriate response actions, and identify whether more information (i.e., data gap assessment) is required to evaluate possible treatment technologies under these response actions. This data gap assessment revealed additional information was required to evaluate retained groundwater and soil treatment technologies. The proposed methods for filling these data gaps were presented in the *Treatability Study Work Plan* (CDM, 2006b) and subsequent addenda (CDM, 2006a; CDM, 2007f; CDM, 2007e; and CDM, 2007a). The findings from the treatability studies, with respect to groundwater and soil, are summarized below.

2.5.1 In Situ Groundwater Treatment

The data gap analysis revealed the need for additional information to adequately evaluate the potential effectiveness of two in situ groundwater remedial technologies; a passive process and an active process. These two processes are described below.

- **Passive Process**: Use of natural or engineered materials can function to remove arsenic from groundwater via processes including physical adsorption, chemical precipitation, and biological precipitation. Various materials are commercially available and have various capacities for adsorption of arsenic(+3) and arsenic(+5). Some materials are also capable of oxidation of arsenic(+3) to arsenic(+5) which can be more strongly adsorbed to these materials.

Groundwater would passively flow through materials placed in the saturated zone and arsenic would be adsorbed. The materials may need to be periodically replaced if their capacity is exhausted or to maintain effective permeability through the media. Given appropriate oxidation-reduction conditions (either naturally occurring or induced), iron-rich materials can promote arsenic co-precipitation with ferric iron oxyhydroxides. Another passive in situ groundwater treatment option is based on biological production of sulfide that can precipitate arsenic. In this option, in-ground biological reactions could be induced via introduction of a slow release biodegradable electron donor and sulfur to produce sulfide. Upon contact with arsenic-containing groundwater, the sulfide would react with arsenic to generate an arsenic sulfide and precipitate the arsenic from the groundwater. The slow release electron donor and sulfur source may need to be periodically replaced and/or the precipitate periodically removed to maintain effective permeability.

- **Active Process**: Arsenic in groundwater can be treated using an active in situ treatment option via air sparging combined with iron addition to promote arsenic co-precipitation with or adsorption onto formed ferric iron oxyhydroxides. Preliminary laboratory studies were conducted by CDM to evaluate the potential for ferrous iron addition and air sparging for arsenic removal from Site groundwater (CDM, 2005). These studies were successful. However, additional data are needed to supplement the initial findings.

The evaluation of these options was conducted in a phased approach (i.e., Phase I - laboratory screening, Phase II - bench-scale-testing, and Phase III - pilot-scale testing).

2.5.1.1 Phase I Testing

As presented in the *Emeryville Facility Groundwater Treatability Study for Laboratory Screening Studies* (CDM, 2007f), materials selected for treatability testing as passive in situ groundwater treatment options included the following:

- Granular ferric hydroxide (e.g., US Filter GFH and Severn Trent Bayoxide E33)
- Taconite iron ore
- Blast furnace slag
- Steel furnace slag
- Zero-valent iron
- Anaerobic biological process option using slow release electron donor and sulfur source (e.g., Regenesis MRC™)

Granular ferric hydroxide, taconite iron ore, blast furnace slag, and steel furnace slag were tested for their effectiveness as arsenic adsorbents (adsorptive media). Zero-valent iron (ZVI) was evaluated for its effectiveness as a reductant and/or adsorbent for arsenic. The anaerobic biological process option was evaluated as a passive system to precipitate arsenic.

Two active in situ arsenic groundwater process options selected for treatability study testing are:

- Ferrous chloride addition and aeration with optional polymer addition
- Ferrous chloride addition and hydrogen peroxide addition

The addition of ferrous chloride addition and aeration of groundwater results in the formation of fresh ferric oxyhydroxides, which are effective for arsenic adsorption. Aeration functions to promote biodegradation of organic contaminants in groundwater and other biodegradable organic carbon, which impacts whether the formed ferric oxyhydroxide arsenic co-precipitates remain in an oxidized and solid-phase state. Polymer addition to this process facilitates larger floc formation, which is important for settling and/or filtration of solids from groundwater. Hydrogen peroxide can also be used to oxidize added ferrous iron to ferric oxides that can co-precipitate or adsorb arsenic

Conclusions of Laboratory Testing

Passive Adsorption

Analytical results showed that adsorptive media, GFH and Bayoxide E33 in particular, had the greatest arsenic removals; followed by ZVI, taconite iron ore, steel furnace slag, and blast furnace slag. GFH, Bayoxide E33, and ZVI were successful in reducing arsenic concentrations to less than 0.010 mg/L.

GFH, Bayoxide E33, and taconite iron ore resulted in the lowest final dissolved iron concentrations, followed by steel furnace slag and blast furnace slag. ZVI resulted in the highest dissolved iron concentrations. An advantage of dissolved iron generation in a field application is that it can migrate downgradient and eventually become oxidized and adsorb or co-precipitate additional arsenic. A disadvantage of elevated dissolved iron is that is can precipitate and potentially cause aquifer plugging. These passive adsorption tests were only conducted for 48 hours. Over a longer period of time, anaerobic microbial activity by iron-reducing bacteria may also lead to reduction of GFH and Bayoxide E33 and possibly taconite iron ore and result in generation of greater amounts of dissolved ferrous iron.

The higher doses of media resulted in greater reductions of dissolved arsenic when compared to the respective lower dose tests. However, both low and high doses of the media resulted in greater than 50 percent arsenic removal, the performance metric for this Phase I study.

Active Precipitation

Arsenic concentrations were reduced by more than 50 percent in tests using groundwater from LF-10 and MW-5 and the active precipitation process. Arsenic concentrations were reduced to less than 0.010 mg/L with LF-10 groundwater. Greater arsenic removal in MW-5 groundwater tests would likely have occurred if buffer was added to control pH reduction. Reduction of dissolved arsenic

concentrations in LF-10 groundwater to less than 0.010 mg/L required addition of 300 mg/L iron. This iron addition rate resulted in generation of 600 to 700 mg/L TSS.

Oxidative Precipitation

Use of iron-containing materials in the presence or absence of a reducing agent (i.e., dithionite) resulted in maximum generation of about 3 mg/L of dissolved iron after about 5 weeks of incubation. This concentration of dissolved iron was less than 10 percent of the baseline dissolved iron concentration in groundwater from LF-10 and did not significantly contribute to arsenic removal. Hydrogen peroxide addition did promote arsenic removal from LF-10 groundwater because it oxidized ambient dissolved iron. Hydrogen peroxide resulted in minor reduction of TOC and COD in LF-10 groundwater.

Biological Reduction

The biological process for arsenic removal was ineffective with groundwater from EX-8, removing more than 50 percent arsenic in some but not all of the tests. However, arsenic removal was also greater than 50 percent in the absence of added MRC™, indicating that arsenic removal was predominately attributable to factors other than MRC addition.

2.5.1.2 Phase II Testing

In Phase II testing, as outlined in the *Treatability Study Report for Phase II In Situ Groundwater Treatment - Groundwater Column Studies* (CDM, 2007a), bench-scale column studies were conducted on several media combinations to determine their suitability for use in treatment of contaminated groundwater at the Site. The groundwater used in this study was extracted from two wells, LF-10 and CDM-1 at the Site (see figures presented in Appendix A).

Column packing materials were selected based on results from Phase I of the treatability study. In Phase II of the treatability study, five packing materials were studied. The materials used and rationale behind their selection are described below:

- 20% zero valent iron (ZVI), 20% organic compost, 20% gypsum, 40% sand (columns 1, 6, 11, and 16) – This mixture was designed to reduce the quantity of ZVI tested (and thus the full-scale cost) and to provide a source of sulfate (i.e., gypsum) and electron donor (i.e., compost) to promote biogeochemical reduction of sulfate to sulfide and effective arsenic removal. One potential risk from the mixture was the potential for the formation of hydrogen sulfide. ZVI usually precipitates sulfide, but this risk was evaluated during the study.

- 20% ZVI, 20% organic compost, 60% sand (columns 2, 7, 12, and 17) – This mixture was similar to the previous mix but replaces the gypsum with sand. This mixture would not benefit from any positive attributes of the gypsum, but it also would not carry the risk of hydrogen sulfide formation.

- 20% ZVI, 80% taconite (columns 3, 8, 13, and 18) – This mixture was intended to test the potentially synergistic effects of ZVI and taconite while reducing cost compared to pure ZVI. Both materials were effective in the Phase I test. The first batch of taconite procured for the study contained an excessive level of fine particles not consistent with the particle size distribution of ZVI. Only material retained in a #20 sieve was used in the TS. The second batch of taconite used for the study was pre-sieved off-site using the same sieve size.

- 100% Taconite (columns 4, 9, 14, and 19) – This test was intended to further evaluate this material. As noted above, only material retained in a #20 sieve was used in the TS.

- 20% ZVI, 80% sand (columns 5, 10, 15, and 20) – This test was intended to further evaluation of ZVI, but at a lower volumetric fraction to reduce the cost of the mixture.

- 100% Sand (columns 21, and later, 22) – These columns were used as controls to determine any positive or negative effects of the testing configuration that are independent of the packing material.

Testing Setup

Columns 1 through 10 were operated with groundwater from well LF-10 and Columns 11 through 22 were operated with groundwater from well CDM-1. Columns 1 through 5 and 11 through 15 were designed to operate at a hydraulic residence time of approximately 1 day. Columns 6 through 10 and 16 through 21 were designed to operate at a hydraulic residence time of approximately 7 days. Samples were taken from the sampling port installed at the inlet and outlet of the columns.

Conclusions

- All columns with mixtures of 20% ZVI and 80% sand produced effluent with non-detect levels of arsenic for the first month of operation (approximately 50 pore volumes).

- One column with the mixture of ZVI, sand, gypsum and compost, demonstrated arsenic breakthrough above 0.036 mg/L after approximately 50 pore volumes of water from the more contaminated well (CDM-1).

- One column with the mixture of ZVI, sand, and compost, demonstrated arsenic breakthrough above 0.036 mg/L after approximately 50 pore volumes of water from the more contaminated well (CDM-1). A duplicate of this column and other columns with this material and less arsenic loading did not break through.

- All columns containing taconite or taconite mixtures except one demonstrated arsenic breakthrough. One column had arsenic breakthrough at levels below 0.036 mg/L, but the remainder had effluent arsenic concentrations above 0.036 mg/L with less than 1 pore volume of total flow.

Constant head tests indicated that columns filled with 100% taconite had the highest permeability constant, 1.44 centimeters/second (cm/s), while columns containing gypsum had the lowest observed permeability on average (0.011 cm/s). The sand control column had higher permeability as expected (0.96 cm/s). The addition of ZVI and/or compost to sand also reduced its permeability, although not as significantly as the gypsum.

Based on these data collected during the first month, the best-performing material or mix of materials to date is the 20% ZVI and 80% sand mixture. Dilution of this mixture with additional compost or compost and gypsum in place of sand did not provide any measurable benefit with respect to arsenic removal during this first month.

In addition, the Phase II testing results, along with an economic analysis, concluded that an active in situ treatment process may be as cost-effective for in situ treatment of arsenic in groundwater as the tested passive treatment process materials and that an active treatment process involving precipitation should be carried forward into Phase III testing.

2.5.1.3 Phase III Testing

Phase III testing of the passive treatment process, as outlined in the *Treatability Study Report for Phase III In Situ Groundwater Treatment - Groundwater Column Studies* (CDM, 2008c), involved long-term operation of select Phase II testing columns, primarily those with ZVI, sand, and/or compost mixtures, for potential remedial design evaluation.

The Phase III testing of the active treatment process tested a precipitation, coagulation, and flocculation process for either an in situ or ex situ treatment system. In the Phase III testing system, groundwater entered the first stage of the active treatment where iron in the form of ferric chloride or ferrous sulfate was mixed in the groundwater. Air sparging to promote mixing and oxidation of iron and arsenic was also be introduced in stage one. This oxidation step results in iron precipitation and subsequent arsenic precipitation. Polymer, also injected in the first stage of the process, was injected to help the iron oxides form a flocculate to aide in precipitation. The groundwater was then discharged into the second stage of the active treatment, which was designed to provide sufficient residence time for the flocculent to settle out of the groundwater. The final stage, stage 3, provided additional settling for carry over of particulate from stage 2.

In an in situ active treatment system, the treatment stages would be achieved through a series of concrete vaults placed within each of three breaches in the existing slurry wall. Flow through the vaults would be driven by the hydraulic gradient. The aboveground active treatment system would pump groundwater through above ground tanks and clarifiers comprising the 3 treatment stages and into Temescal Creek. An additional option for either active treatment system that was tested was the addition of permanganate in the first stage to break potential arsenic-organic complexes and reduce sludge production.

Conclusions

- One column with the mixture of ZVI, compost, and sand removed high concentrations of arsenic from well CDM-1 groundwater to nondetectable concentrations for approximately 110 pore volumes. However, a duplicate of this column demonstrated arsenic breakthrough above 0.036 mg/L after approximately 45 pore volumes of water.

- Columns with mixtures of sand and ZVI remove arsenic from well CDM-1 groundwater to less than 0.036 mg/L for approximately 50 pore volumes.

- When subjected to the lower concentrations of arsenic from LF-10, both the ZVI/sand and ZVI/sand/compost mixtures continue to remove arsenic to below detection limits for the duration of the study and at least 175 pore volumes of groundwater.

- A larger 6-inch column filled with the ZVI/sand mixture demonstrated similar performance to the corresponding 3-inch column with respect to potential number of pore volumes that could be treated.

- An active process can effectively precipitate arsenic from groundwater extracted from wells CDM-1 and LF-10. Consistent reduction in dissolved concentrations below the 0.036 mg/L threshold was accomplished.

- In the active process, total concentrations were reduced below 0.10 mg/L, but not 0.036 mg/L. It is expected that additional optimizations in chemical dosage and the proportionally larger settling basins that would be used in a full scale system would be sufficient to reduce total concentrations below the 0.036 mg/L threshold consistently.

- In the active process, the optimal chemical doses for treatment of groundwater from LF-10 were approximately 20 mg/L of ferric chloride and 0.078 mg/L of organic polymer. The optimal chemical doses for treatment at CDM-1 were 59 mg/L of ferric chloride, 37 mg/L of sodium hydroxide, 2.6 mg/L of potassium permanganate, and 0.053 mg/L of organic polymer.

With respect to long-term arsenic removal with a PRB process option, the ZVI/compost/sand and ZVI/sand mixtures performed best at the conclusion of Phase III testing. For the purposes of conceptual remediation design within the FS evaluation, the 20% ZVI and 80% sand mixture, with a conservative number of 50 pore volumes of groundwater treatment prior to arsenic breakthrough, will be used as the basis for a PRB process option.

2.5.2 In Situ Soil Treatment

The data gap analysis revealed the need for additional information to adequately evaluate the potential effectiveness of two soil remedial technologies: grout injection and soil mixing. Under both of these in situ soil treatment options, the primary

objective for reducing the mobility of arsenic is decreasing the permeability of the targeted soil mass.

2.5.2.1 Grout Injection

Grout injection can be used to improve soil strength and reduce permeability of targeted soils via injection of grout into the soil through driven probes at low to moderate pressures to permeate the voids. This is accomplished without significantly changing the soil's structure or volume. Effectiveness of this technique is dependent upon the volume or percentage of voids that can be penetrated by the grout mixture. Grout mixture design and proper spacing of the injection points are critical to the effectiveness of the treatment technique.

The grout injection treatability study (CDM, 2007b) followed the procedures outlined below:

1. Pre-grout injection aquifer testing, including installation of an extraction well and two piezometers in the test area.

2. Abandonment of the extraction well and two piezometers in the test area.

3. Grout injection.

4. Post-grout injection aquifer testing, including installation of a new set of one extraction well and two piezometers in the test area.

Grout injection testing consisted of 25 grout injection points in a 5 by 5 grid, within an area approximately 12 feet by 12 feet (plus one additional point outside of this grid). This spacing pattern was selected after a review of the pre-injection aquifer testing results which yielded a higher than expected net aquifer permeability.

The original grout injection treatability plan called for Ultrafine cement in a 3:1 to 5:1 by weight to water grout mixture to be injected at all 25 grout locations. However, due to the lithologies encountered during the installation of the pre-grout injection extraction well and piezometers and the pre-injection aquifer testing results, Type III cement was hypothesized to be potentially suitable in a grout mixture for injection. Therefore, Type III cement was substituted for Ultrafine cement at two grout injection locations.

Results

In summary, the grout injection had a distinct affect on aquifer hydraulics. Using the pre-grout pumping rate of approximately 1 gallon per minute (gpm), the post-grout draw down was so rapid in the pumping well that the extraction lasted only 23 minutes in the May 2007 and only 19 minutes in the July 2007 testing. During pre-grout injection aquifer testing conducted in February 2007, significant draw down of the well was not achieved over an 8-hour pumping period.

However, grout injection only achieved an overall permeability reduction to 10^{-5} cm/sec, which was less than the data quality objective of 10^{-7} cm/sec. In addition, grout injection was accompanied with temporary fluctuations of pH, which may contribute to a release of arsenic into groundwater from the sandy lithologies (i.e., source material for arsenic to groundwater).

2.5.2.2 Soil Mixing

The practice of mixing soil with various reagents, such as cement, lime, and bentonite, has been used in the United States since the mid 1930s. Early applications were used for improving the engineering properties of soil for civil construction projects, including road and dam construction. Current soil mixing techniques involve construction of overlapping piles by injecting cement mixed grout from the tip of a drill rig's auger into the soil.

A bench-scale study for assessing the effectiveness of soil mixing for reducing soil permeability was conducted (CDM, 2007g). The testing included seventeen (17) potential grout mixes with various proportions of potable water, Site groundwater, cement, bentonite and a cement plasticizer. This was performed not only to test a variety of potential cement and bentonite mixes but also to determine whether Site soil and/or groundwater had any adverse effects on the slurry. Nine (9) grout mixes were composed of 100 percent potable water, bentonite content of 2 or 4 percent, cement ranging from 10 to 30 percent and 0 to .3 percent of a cement plasticizer. Eight (8) grout mixes were composed of 50 percent potable water and 50 percent Site water with the same percentage of bentonite, cement and cement plasticizer.

Based on this testing, two grout mixes were selected for permeability testing. The selected grout mixes consisted of a 1:2 grout soil ratio with 4% bentonite, 20% cement and 0.2 cement plasticizer. One mix was composed a 100% potable water and other mix was composed 50% potable water and 50% Site groundwater. Additionally, two samples were prepared at a 1:4 grout to soil ratio, both having 40 percent cement and 0.4 percent cement plasticizer at a 100 percent potable water and a 50-50 potable/groundwater and no bentonite. The second set of samples was tested to evaluate how bentonite affects the hydraulic conductivity of the soil.

Hydraulic conductivity testing was performed on these samples. Test results showed that samples mixed with bentonite achieved lower hydraulic conductivities than samples that did not have bentonite. Soil-grout mixtures exhibited hydraulic conductivities of 10^{-7} cm/sec.

Long-term hydraulic conductivity testing was performed on these soil-grout samples. Testing was conducted over 76 days and readings were recorded every two to four days. Long-term permeability is lower than short-term permeability and range from 4.6×10^{-8} to 7.3×10^{-9} cm/sec.

In both cases the soil-grout mixes with bentonite had a lower hydraulic conductivity than the sample without bentonite. The hydraulic conductivity was not affected by the water conditions.

Results

The bench-scale studies demonstrated that soil mixing can achieve a reduction in permeability of less than 10^{-7} cm/sec. While soil mixing caused an increase in pH due to the bentonite and cement in the mix, this was offset by actual mixing of the sandy lithologies containing the amorphous silica phase with more reducing sandy clay and clay material,. Analyses of both potable and Site groundwater run though the bench-scale mixes showed no increase in arsenic concentration in the leachate.

In support of including soil mixing within potential remedial action alternatives based solely on the favorable results from the scale testing, CDM presented DTSC with a memorandum (CDM, 2008a) presenting an overview of soil mixing technology, including:

- History and use of soil mixing,
- Its use as the industry standard for improving soil characteristics and for environmental remediation,
- Recognition and acceptance of soil mixing by regulatory agencies, and
- Soil mixing design and construction procedures, including effectiveness bench testing for design and implementation sequence (consistent with the standard of practice in the industry).

Section 3
Remedial Action Objectives

This section presents the remedial action objectives (RAOs) for the remedial action and their associated cleanup goals. RAOs were developed based on action-, location-, and chemical-specific federal and state applicable or relevant and appropriate requirements (ARARs), as well as on appropriate federal, state, and local criteria, advisories, guidance, and proposed standards (i.e., TBCs). RAOs are also based on site-specific human health and environmental exposure concerns identified in the Site RA documents, which are based on the data generated from remedial investigations.

3.1 Applicable or Relevant and Appropriate Requirements

CERCLA, as amended by Superfund Amendments and Reauthorization Act, and analogous California regulations, require that remedial actions achieve a level of cleanup that protects human health and the environment. In addition, cleanup actions generally must attain ARARs, which are standards, criteria, or limits promulgated under federal or state law. Only those state standards that are promulgated, identified by the state in a timely manner, and more stringent than federal requirements may be considered ARARs (40 CFR 300.400 (g) (4)). An ARAR may describe a cleanup requirement that is either "applicable" or "relevant and appropriate." The identification of ARARs is site-specific and involves the following two-part analysis:

- Assessing the applicability of a given requirement; and
- If a given requirement is not applicable, evaluating whether it is relevant and appropriate.

3.1.1 Definition of ARARs

An applicable requirement is a promulgated federal or state standard or other substantive environmental protection requirement, criteria, or limitation that specifically addresses a hazardous constituent, remedial action, location, or other circumstance at a Superfund site. For a requirement to be "applicable," the remedial actions or the circumstances at the site must be within the intended scope and authority of the requirement. For example, MCLs are standards that must be met by owners/operators of public drinking-water supply systems. MCLs are applicable "at the tap" and are enforced by either the USEPA or the state for water supplied by a public water supply system.

A "relevant and appropriate" requirement is a promulgated federal or state standard or other substantive environmental protection requirement, criteria, or limitation that addresses problems or situations similar to those encountered, even though the requirement is not legally "applicable." In some circumstances, a requirement may be "relevant" but not appropriate for the site-specific situation. Such a requirement would not be an ARAR for the Site. If only part of a requirement is "relevant and

appropriate," the portion that is not considered "relevant and appropriate" need not be addressed. If a determination is made that a requirement is both "relevant and appropriate," such a requirement should be given the same consideration as an "applicable" requirement. The criteria for determining relevance and appropriateness are listed in 40 CFR 300.400 (g) (2) of the NCP as follows:

i. The purpose of the requirement and the purpose of the CERCLA action;

ii. The medium regulated or affected by the requirement and the medium contaminated or affected at the CERCLA site;

iii. The substances regulated by the requirement and the substances found at the CERCLA site;

iv. The actions or activities regulated by the requirement and the remedial action contemplated at the CERCLA site;

v. Any variances, waivers, or exemptions of the requirement and their availability for the circumstances at the CERCLA site;

vi. The type of place regulated and the type of place affected by the release or CERCLA action;

vii. The type and size of structure or facility regulated and the type and size of structure or facility affected by the release or contemplated by the CERCLA action;

viii. Any consideration of use or potential use of affected resources in the requirement and the use or potential use of the affected resource at the CERCLA site; and

ix. Non-promulgated federal and state standards, policies, advisories, guidance documents, and local requirements are not ARARs. However, they are considered to be other criteria and guidelines to be considered (TBCs) when remediating to protect human health and the environment.

3.1.2 Types of ARARs

There are three types of ARARs: chemical-, action-, and location-specific:

- Chemical-specific ARARs are health- or risk-based concentration limits for specific hazardous substances or contaminants. Examples of this type of ARAR are federal and state drinking-water standards.

- Action-specific ARARs are technology-based requirements that are triggered by the type of remedial action under consideration. Examples of action-specific ARARs

are the National Pollutant Discharge Elimination System (NPDES) requirements, which prohibit discharge of pollutants to waters of the United States unless a permit is issued in conformance with Clean Water Act standards. RCRA regulations for hazardous waste generation, handling, transportation, storage, treatment, and disposal are another example of an action-specific ARAR.

- Location-specific ARARs impose restrictions on certain types of activities, based onsite characteristics. Examples of location-specific ARARs include restrictions on activities in wetlands, flood plains, and historical sites.

3.1.3 Identification Process for ARARs/TBCs

NCP §300.430 (b) (9) provides for identification of potential ARARs and TBCs to be initiated during the scoping phase of the project. However, the ARAR and TBC identification process continues throughout the RI/FS process, as a better understanding is gained of site conditions, site contaminants, and remedial action alternatives. Table 3-1 provides a summary of ARARs and TBCs for the Site remedial action.

3.1.3.1 Settlement Agreement between Sherwin Williams and Novartis

In Table 3-1, the settlement agreement between S-W and Novartis is identified as a TBC. Therefore, the current provisions of the settlement agreement were used for evaluation purposes in the FS (CDM, 2009b). Based on ongoing discussions, S-W and Novartis are renegotiating this agreement and therefore, the provisions of this TBC will need to change in order to implement the remedial action presented in this RAP. Modification to the agreement will be addressed by DTSC through the RAP review and approval process.

3.2 Remedial Action Objectives

RAOs are media-specific remediation goals for protecting human health and the environment. RAOs specify the compounds of concern, exposure routes and receptors, and remediation goals for each exposure route. They are developed based on action-, location-, and chemical-specific federal and state ARARs, as well as on appropriate federal, state, and local criteria, advisories, guidance, and proposed standards (i.e., TBCs). They are also based on the site-specific human health and environmental exposure concerns identified in the HHRA, which is based on the data generated during the RI.

The following RAOs are identified for the Site remedial actions:

- Minimize direct contact/ingestion by humans with Site soil containing COCs at concentrations exceeding the cleanup goals;

- Minimize migration of and/or inhalation of airborne dust by humans from the Site containing COCs at concentrations exceeding the cleanup goals;

- Minimize exposure to and inhalation by humans of volatile organic COCs at concentrations in indoor air exceeding the cleanup goals;
- Minimize risk to down-gradient ecological receptors from off-site groundwater migration containing COCs at concentrations exceeding the cleanup goals; and
- Minimize on-site human contact with groundwater containing COCs at concentrations exceeding the cleanup goals.

RAOs can be fulfilled by one or more of the following processes: reducing the mass, volume, toxicity, or mobility of the COCs and reducing the potential exposure pathways for the COCs.

3.3 Cleanup Goals

Cleanup goals, serving as quantitative proposed cleanup goals for the RAOs, are developed based on action levels as defined in ARARs, TBCs, and/or the Site HHRA. The cleanup goals are "conservatively calculated threshold values below which particular chemicals are believed to present no significant risk to humans or natural resources that might be exposed to the particular hazardous material." (USEPA, 2004).

Chemical specific-cleanup goals were developed from two general sources: concentrations based on appropriate or relevant and applicable requirements (ARARs); and concentrations based on risk assessments. Concentration-based ARARs for selection of cleanup goals included: USEPA Region IX PRGs; California Environmental Protection Agency (CalEPA) California Human Health Screening Levels (CHHSLs); Regional Water Board Basin Plan numerical water quality objectives; California DHS MCLs; and the Office of Environmental Health Hazard Assessment (OEHHA) Public Health Goals (PHGs).

The development of remedial goals (RGs) constitutes a core component of the development and screening of potential remedial alternatives conducted during the Feasibility Study. It should be noted that until the final remedy is selected, these cleanup goals, whether ARARs-based or risk-based, constitute initial guidelines, not final RGs (NCP, 40CFR 300.430(e)(2)(i)).

As summarized in Section 2.4.5, the HHRA (Gradient, 2005) presented site-specific RBTLs for various human activity and exposure assumptions. The cleanup goals presented in Table 3-2 for soil are based on these RBTLs for the unrestricted resident exposure scenarios, with the exception of arsenic. The arsenic cleanup goal is the proposed naturally occurring background concentration.

For groundwater, concentration-based ARARs/TBCs for selection of cleanup goals included: DTSC California Human Health Screening Levels (CHHSLs); Regional Water Quality Control Board (Water Board) Basin Plan numerical water quality objectives; Water Board Environmental Screening Levels (ESLs); and California

Department of Health Services (CDHS) Maximum Contaminant Levels (MCLs). A summary of groundwater cleanup goals are presented in Table 3-3.

The USEPA advises that exceeding a cleanup goal concentration "suggests that further evaluation of the potential risks that may be posed by site contaminants is appropriate" (USEPA, 1999). The USEPA advises that further evaluation steps may include "consideration of ambient levels in the environment, or a reassessment of the assumptions contained in the screening level estimates (e.g., appropriateness of route-to-route extrapolations)" (USEPA, 1999).

3.3.1 Comparative Analysis

A comparative analysis of laboratory analytical results from soil samples collected was conducted against the soil cleanup goals identified above. All the soil COCs have been detected above their respective cleanup goals within vadose zone soil at the Site. However, the extents of these soil COC detections are bounded within the extent of arsenic.

A comparative analysis of laboratory analytical results from groundwater samples collected through March 2006 was conducted against the groundwater cleanup goals identified above. The following COCs have been detected above their respective cleanup goals within groundwater under the Site (S-W property and portion of the former Rifkin property):

- 1,2-dichloroethane
- 1,2,3-trichloropropane
- acetone
- arsenic
- methyl tert butyl ether
- toluene
- xylenes

The following COCs have been detected above their cleanup goals in groundwater immediately downgradient of the Site (including that portion of the former Rifkin property not considered part of the Site):

- 1,2-dichloroethane
- arsenic
- methyl tert butyl ether
- toluene

Arsenic is the only inorganic COC detected in groundwater above its cleanup goal. The other COCs are organic and attenuate significantly across the Site and are at or near their cleanup goals at the downgradient property boundary. The organic COCs are expected to continue to attenuate into the future and eventually decrease to concentrations below their cleanup goals.

FEDERAL								
I. Contaminant Specific								
	A.		Clean Air Act (CAA) (42 USC 7401-7642) (40 CFR 50-69)	Remediation of soil or groundwater that could produce a vapor or dust discharge would be required to meet National Ambient Air Quality Standards (NAAQS).	**X**	**X**	**X-RA**	
	B.		Clean Water Act (CWA) as amended by the Water Quality Act of 1987 (33 USC 1251-1376) (40 CFR 100-149)	Storm run off water, extracted groundwater, or soil remediation process water from the Site discharged to a surface water body (including discharge to a storm drain or flood channel) would require attainment of Water Quality Criteria.	**X**	**X**	**X-A**	
		1	Maximum Contaminant Levels (MCLs)	MCLs may be used to establish water discharge standards and groundwater remediation standards.		**X**	**X-A**	
		2	Maximum Contaminant Levels Goal (MCLGs)	Some contaminants of concern (COCs) present in soil and groundwater may not yet be formally regulated and MCLGs may provide guidance for remediation standards for water discharge.		**X**		**X**
		3	Secondary Maximum Contaminant Levels (SMCLs) (40 CFR 143.3)	The aquifer is a potential drinking water source. Therefore, quality of color or odor of the water source should be considered.		**X**		**X**
II. Location Specific								
	A.		Resource Conservation and Recovery Act (RCRA) as amended by Hazardous and Solid Waste Amendments (HSWA) (42 USC 7401-7462) (40 CFR 260-280)	The treatment facility for remediation of soil or groundwater (if the soil or groundwater is considered to be a hazardous waste) may be required to be a certain minimum distance from a fault and not within a floodplain.	**X**	**X**	**X-RA**

					Soil	*Water*		
	B.		Executive Order on Flood Plain Management (Exec. Order No. 11,988) (40 CFR 6.302 and Appendix A)	Remedial Actions occurring in a floodplain should avoid adverse effects, minimize potential harm, restore and preserve natural and beneficial values. Federal agencies are directed to ensure that planning programs reflect consideration of floodplain management	**X**	**X**	**X-RA**	
	C.		National Archaeological and Historical Preservation Act (16 USC 469) (36 CFR Part 65)	Requires action to recover and preserve artifacts if removal action threatens significant scientific, prehistoric, historic, archeological data. No = historic artifacts are currently known to be present at the Site. However, due to Emeryville's Bay shoreline location and the existence of known nearby archaeological sites, there is a potential of encountering previously unrecorded Native American cultural resources at the Site.	**X**	**X**	**X-RA**	
	D.		National Historic Preservation Act (NHPA) (16 USC 470 et seq.) (36 CFR Part 800)	Established to preserve historic properties. Buildings 1 and 31 are designated Tier 1 (primary architectural significance) in the Park Avenue Overlay District. These buildings contribute to the National Register-eligible Emeryville Historic Industrial District	**X**	**X**	**X-A**	
	E.		Endangered Species Act (16 USC 1531 et seq.) (50 CFR Part 17, 200, 402) (40 CFR 6.302(h))	Remedial actions should avoid disturbance of endangered or threatened species or to terrain which is habitat for endangered or threatened species. No known endangered species or their habitat are present at this Site.	**X**	**X**	**X-RA**	
	F.		Fish and Wildlife Coordination Act (16 USC 661et seq.) (33 CFR Parts 320-330)	Designed to protect waters where fish, plant life, or bird life exist. Water discharge from any potential Site soil or groundwater remediation is not expected to enter surface waters.	**X**	**X**	**X-RA**

Section 4
Remedial Action Alternatives

In this section of the RAP, the FS is summarized by presenting remedial action alternatives considered in the FS and the basis for the selected action (CDM, 2009b).

Remedial action alternatives were developed using combinations of technologies and process options that passed the screening. These alternatives contain both soil and groundwater treatment options combined to provide Site-wide treatment of contamination.

4.1 Description of Remedial Action Alternatives

The following alternatives were developed from the retained process options (see Appendix B). These options were combined to form alternatives that address groundwater and soil/soil gas contamination rather than presenting separate alternatives for each contaminated media type.

- **Alternative 1 –** No Action
- **Alternative 2 –** Limited Action
- **Alternative 3A –** Vadose Zone Excavation/Active *In-Situ* Groundwater Treatment/Rifkin Excavation/Groundwater Monitoring/LUCs
- **Alternative 3B –** Vadose Zone Excavation/S-W Source Area Soil Mixing/Active *In-Situ* Groundwater Treatment/Rifkin Excavation /Groundwater Monitoring/LUCs
- **Alternative 3C –** Vadose Zone Excavation/S-W Source Area Excavation/Rifkin Groundwater Extraction and Aboveground Treatment/MNA/Groundwater Monitoring/LUCs
- **Alternative 4A –** Vadose Zone Excavation/Upgradient Interceptor Drain Installation/Passive *In-Situ* Groundwater Treatment/Rifkin Excavation/ Groundwater Monitoring/LUCs
- **Alternative 4B –** Vadose Zone Excavation/Upgradient Interceptor Drain Installation/Active *In-Situ* Groundwater Treatment/Rifkin Excavation/ Groundwater Monitoring/LUCs
- **Alternative 5A –** Vadose Zone Excavation/Excavation Upgradient of Interceptor Drain/Downgradient Interceptor Drain Installation/Passive *In-Situ* Groundwater Treatment/Rifkin Excavation/Groundwater Monitoring/LUCs

- **Alternative 5B –** Vadose Zone Excavation/Excavation Upgradient of Interceptor Drain/Downgradient Interceptor Drain Installation/Active *In-Situ* Groundwater Treatment/Rifkin Excavation/Groundwater Monitoring/LUCs

- **Alternative 6 –** Vadose Zone Excavation/Source Area Excavation/MNA/ Groundwater Monitoring/LUCs

- **Alternative 7 –** A-Zone Aquifer Excavation/LUCs

Each alternative is described in detail below.

4.1.1 Alternative 1 – No Action

Alternative 1 would discontinue operations of the existing GWETS and storm water management practices. The Site would be left "as is" after completion of demolition activities in November, retaining the slurry wall and existing paved sections of the Site, and ongoing long-term groundwater monitoring. Under Alternative 1, the raised cap materials would remain on-Site and there would be no immediate cleanup on former Rifkin property. Existing LUCs such as prohibitions on the use of A-zone groundwater as a drinking water source would continue to be applied to future Site development. No new LUCs would be implemented for residual chemical concentration.

4.1.2 Alternative 2 – Limited Action

Under Alternative 2, the IRMs present at the Site, for both S-W and former Rifkin properties, would continue to be managed, including, groundwater elevation monitoring of piezometer pairs along the slurry wall as part of the ongoing long-term groundwater monitoring, GWETS operations and maintenance, and storm water management practices. The existing pavement after completion of demolition activities in November 2007 would be maintained to control infiltration to groundwater. The raised cap materials would remain on-Site. Existing LUCs would be retained and a new set of LUCs would be implemented prohibiting consumptive use of A-zone groundwater from areas where concentrations in extractable groundwater exceed MCLs, restricting subsurface drilling or excavation on the Site, and requiring the use of appropriate personal protective equipment (PPE) for any necessary subsurface work.

4.1.3 Alternative 3A – Vadose Zone Excavation/Active *In-Situ* Groundwater Treatment/Rifkin Excavation/Groundwater Monitoring/LUCs

Alternative 3A includes several components for addressing contaminated soils and groundwater on both the S-W and former Rifkin properties. Detailed descriptions of these components are presented below and proposed locations for each component are presented graphically on Figure 4-1.

4.1.3.1 Removal of Raised Cap

The raised cap material and old foundations under the raised cap would be removed. Approximately 7,000 cubic yards of debris and soil would be removed and transported to an appropriate disposal/reuse facility. This excavated material is anticipated to contain hazardous waste, which would be transported to a Class I hazardous waste landfill for treatment and disposal.

4.1.3.2 Vadose Zone Excavation

Vadose zone soil on the S-W and former Rifkin properties would be excavated in order to achieve the vadose zone soil cleanup for arsenic of 24 mg/kg on each property. The planned limits of soil excavation extend approximately 285 feet along Horton Street (60 feet on the former Rifkin property and 225 feet on the S-W property) and approximately 330 feet west of Horton Street, or approximately 95,000 square feet. In addition, elevated detections of arsenic in vadose zone soil are present at locations outside these limits, including SA-AH-01 (110 mg/kg), SB-7AB (130 mg/kg), CDM-SB50 (200 mg/kg), and SA-BH-04 (211 mg/kg). Vadose zone soil surrounding these locations would also be removed to a radius of 10 feet surrounding each location. These four locations are presented on Figure 4-1.

The vadose zone soil would be excavated to an average depth of approximately 7.5 feet, the approximate depth to groundwater across this area. Approximately, 26,500 cubic yards of vadose zone soil across the Site would be excavated and transported to and disposed at an appropriate landfill. This excavated soil is anticipated to contain hazardous waste, which would be transported to a Class I hazardous waste landfill for treatment and disposal.

Confirmation sampling and analysis would be conducted to confirm that the vadose zone soil cleanup goal for arsenic is met. In order to meet this goal, additional, excavation beyond the limits presented above may be needed.

4.1.3.3 Backfill, Compaction, Grading, and Installation of Cover

All areas undergoing excavation would be backfilled to grade with fill material, compacted, and graded for storm water management. In order to control infiltration into groundwater, the backfill areas would be re-paved and/or vegetated and would direct water runoff along the Site surface towards the Temescal Creek channel.

4.1.3.4 Active Groundwater Treatment System

Groundwater would pass through slurry wall breaches and be treated through an *In-Situ* treatment system through precipitation, coagulation, and flocculation systems. At each slurry wall breach location, shown on Figure 4-1, would be formed through the existing slurry wall. Breaching would be accomplished by installing the system into the barrier, and sealing the space between the system and the barrier wall with flowable low-permeability backfill.

An *in-situ* active treatment system would be installed at each breach of the slurry wall. The conceptual design of the active treatment system involves the following treatment steps:

- Groundwater would flow into a 25-ft tall drainage maintenance structure through multiple pipes that span the height of the aquifer at the gate.
- Groundwater would be aerated via flow from an air compressor located above ground.
- Ferric chloride, which reacts with dissolved arsenic to form co-precipitants, would be added to the water in the aeration basin through a meter pump and tank.
- Organic polymer to assist with flocculation and settling would be added to the water in the aeration basin through a metering pump and tank.
- Groundwater would flow into one or two additional maintenance structures, where precipitants have sufficient residence time to settle out.
- Treated groundwater would flow out of the settling basins through another series of pipes, and into a gravel distribution trench.

A groundwater flow and fate and transport model was used to develop the design flow rates and arsenic concentrations at these breaches. The model results are presented in Appendix B of the FS.

In order to evaluate the effectiveness of the system, groundwater monitoring wells would be placed within and downgradient of the system. Monitoring of these wells is further discussed below.

4.1.3.5 Extending the Existing Slurry Wall

A slurry wall extension would be constructed in locations shown on Figure 4-1 in order to capture the existing plume that has been identified to the south of the existing slurry wall. The slurry wall extension would be approximately 340 linear feet and tie back into the southern end of the existing slurry wall**.**

A breach in the existing slurry wall near this extension, as shown on Figure 4-1, would be installed to prevent mounding and facilitate impacted groundwater between the existing and extended slurry wall system to migrate across the Site and toward the active groundwater treatment systems at the northern slurry wall breaches.

4.1.3.6 LUCs

LUCs would be established to maintain the long-term permanence of this remedy and to control future human exposure. These LUCs would prohibit the use of A-zone groundwater beneath the Site; restrict the future land use on the S-W portion of the Site; and facilitate continued access to and operation and maintenance of remediation

and monitoring facilities on the Site. LUCs on the former Rifkin property would not preclude proposed redevelopment plan for the former Rifkin property, which includes a high-rise tower option with installation of piles and pile caps.

4.1.3.7 Former Rifkin Property Remedial Actions

Under Alternative 3A, remedial actions on the former Rifkin property would consist of: excavation of vadose zone soils above background (as discussed above), excavation of impacted saturated soils, breaching of existing slurry wall along the south end of the former Rifkin property, installation of two interceptor trenches with associated membrane barriers to control hydraulic gradient on the former Rifkin property by directing groundwater flow toward the S-W property, and groundwater monitoring to support the effectiveness of these interceptor trenches. As part of this alternative, a contingency would be to pump from the trench systems, if needed, to direct groundwater flow toward the S-W property. The proposed redevelopment plan for the former Rifkin property, which includes a high-rise tower option with installation of piles and pile caps, is not inconsistent with, and would not impede implementation or long-term operations, maintenance, and monitoring (OM&M) of this alternative.

Excavation of vadose zone soils with arsenic concentrations greater than 24 mg/kg is included within the 95,000 square-foot area discussed above. Saturated zone soils within the portion of the source area located on the former Rifkin property, estimated to be present to a depth of approximately 18 feet bgs, would be excavated as shown on Figure 4-1. This excavated soil is anticipated to contain hazardous waste, which would be transported to a Class I hazardous waste landfill for treatment and disposal. In addition, saturated zone soils in areas with documented VOCs in soil gas concentrations above the cleanup goals, outside of the arsenic source area, would be excavated to address any soil vapor issues. This saturated soil volume has been estimated to be approximately 5,400 additional cubic yards.

All areas undergoing excavation would be backfilled with low-permeability fill material (approximately 0.283 ft/day under this alternative), compacted, and graded for storm water management. An asphalt cover would be placed over these areas and the area would be returned to current use as a parking lot. The cover would prevent infiltration into groundwater.

Based on the proposed redevelopment plan for the former Rifkin property, it is anticipated that for the high-rise tower option up to 4,000 cubic yards of vadose and saturated zone soils could be excavated during installation of piles and pile caps. For soil excavated and removed for Site development that requires increased handling and disposal due to concentrations of arsenic or other COCs, S-W would be responsible for reimbursement to Novartis of the incremental costs. This incremental increase in this operation is considered part of this alternative and S-W would prepare a risk management plan stating their responsibilities.

The existing slurry wall along the south side of the former Rifkin property along the boundary with the S-W property would be breached and replaced with a high permeability interceptor trench. The interceptor trench would be located on the S-W property and be designed to capture and redirect groundwater flow from S-W property away from the former Rifkin property. The trench would be approximately 325 feet long, extend to approximately 18 feet bgs, and be designed to maintain a hydraulic gradient (as demonstrated by potentiometric data collected from both the S-W and former Rifkin properties) away from former Rifkin property, other than that within the drain itself. A second interceptor drain approximately 150 linear feet in length would be installed to capture and redirect flow from the B-line on the former Rifkin property and onto the S-W property.

These trenches are designed to maintain hydraulic gradient of impacted groundwater away from and minimize potential arsenic mass migration to the former Rifkin property. Based on this design basis, the trenches would be approximately 30 inches wide, approximately 18 feet deep and be located as shown on Figure 4-1. The trenches would be backfilled with 3/8 inch minus material and contain a basal perforated pipe to reduce flow resistance from the backfill material. With this design, the trenches would have an effective permeability of approximately 500 ft/day. Soil excavated from the installation of these trenches is anticipated to contain hazardous waste, which would be transported to a Class I hazardous waste landfill for treatment and disposal.

4.1.3.8 Groundwater Monitoring and MNA of Organic COCs

Groundwater monitoring would be performed after implementation of this alternative. The groundwater monitoring program would consist of three parts, demonstrating the overall effectiveness of the remedy, monitoring the performance of the active treatment systems, and demonstrating hydraulic containment and arsenic concentrations in the interceptor trenches on the former Rifkin property.

Overall effectiveness of the remedy would be demonstrated through groundwater samples collected at upgradient and downgradient points along the existing slurry wall as well as at the drain of the interceptor trenches on the former Rifkin property.

Through sampling and analysis of groundwater, trends in the changes in COC concentrations in groundwater would be demonstrated. These monitoring data would be used to evaluate the effectiveness of the remedy outlined in Alternative 3A, and would serve as a demonstration over time of MNA of all organic COCs through comparison with Site data collected prior to remedial action implementation. This comparison would be conducted annually and summarized as part of the five-year review of the S-W property following completion of remedial action.

The performance of the active treatment system would be demonstrated through the collection and evaluation of groundwater samples from wells immediately upgradient and downgradient of the active system.

4.1.3.9 Operations, Maintenance, and Monitoring of Installed Components

This alternative includes long-term operations, maintenance, and monitoring (OM&M) of several installed components, including the surface cover, groundwater treatment system, slurry wall and/or breach system, interceptor trenches and/or drains, groundwater monitoring well network, and/or LUCs. As such, this alternative would include an OM&M plan, OM&M agreement with Site property owners, and financial assurance to DTSC for continued OM&M of these components.

4.1.4 Alternative 3B – Vadose Zone Excavation/Source Area Soil Mixing/Active *In-Situ* Groundwater Treatment/Rifkin Excavation /Groundwater Monitoring/LUCs

Alternative 3B is the same as Alternative 3A with the exception of the inclusion of soil mixing on the S-W property. The proposed layout of all Alternative 3B components is presented graphically on Figure 4-2.

4.1.4.1 Soil Mixing

In-situ soil mixing, as described in Section 2.5.2.2, would be implemented in the A-zone saturated soil within the source area on the S-W property. Soil mixing on the S-W property will complement the excavation performed on the former Rifkin property. The A-zone saturated soils in the source area would be mixed to a depth of approximately 25 feet bgs and would be tied into the A/B aquitard. The final soil mix will have a permeability of approximately 0.000283 ft/day under this alternative. Since soil mixing increases the total soil volume through introduction of the cement mix, the volume of expanded treated soil within the source mixing area would be excavated, transported to, and disposed at an appropriate landfill consistent with the procedures for the vadose zone excavation. The expanded treated soil located above the groundwater table would not be left in place to serve as backfill for the vadose zone, as it would contain total arsenic concentrations above the remediation goal for vadose zone soil.

A groundwater flow and fate and transport model was used to develop the design flow rates and arsenic concentrations at these breaches. The model results are presented in Appendix B of the FS.

4.1.5 Alternative 3C - Vadose Zone Excavation/S-W Source Area Excavation/Rifkin Groundwater Extraction and Aboveground Treatment/MNA/Groundwater Monitoring/LUCs

Alternative 3C includes the following components for addressing soil and groundwater contamination, as they were described under Alternative 3A:

- Removal of Raised Cap
- Vadose Zone Excavation
- Installation of a Cover

- Extending and Breaching Existing Slurry Wall
- LUCs
- Groundwater Monitoring and MNA of COCs
- Operations, Maintenance, and Monitoring of Installed Components

For the S-W property, Alternative 3C would also include source area excavation; breaching and extending the existing slurry wall; and, MNA for arsenic and other COCs as described below.

For the former Rifkin property, Alternative 3C includes installation of an interceptor trench, located on the S-W property, adjacent to the east/west S-W/Rifkin property boundary. A membrane barrier would be placed on one side of the trench, along the property boundary, to prevent groundwater flow toward the former Rifkin property. The trench would have a similar construction to those presented in Alternative 3A. The trench would be approximately 30 inches wide, approximately 25 feet deep and be located as shown on Figure 4-3 The trench would be backfilled with 3/8 inch minus material and contain a basal perforated pipe to reduce flow resistance from the backfill material. With this design, the trench would have an effective permeability of approximately 500 ft/day.

Alternative 3C also contains provisions for operating and maintaining a GWETS, as described under Alternative 2, however the groundwater extraction and treatment would apply only to groundwater extracted from an extraction well on the former Rifkin property and an extraction well on the S-W property. The two extraction wells would contain the arsenic plume underlying the former Rifkin property, as described below.

The proposed layout of Alternative 3C is presented graphically in Figure 4-3.

4.1.5.1 Source Area Excavation

Alternative 3C includes excavation of source area saturated soils on the S-W property. The limits of this excavation are illustrated on Figure 4-3. The source area saturated soils would be removed down to the A/B aquitard (approximately 25 feet bgs) on the S-W property, corresponding to approximately 25,300 cubic yards of saturated soil. The source area excavation would remove source material to groundwater in order to support natural attenuation of the downgradient arsenic concentrations. The MNA sampling would demonstrate the naturally occurring attenuation of arsenic and other COCs in the groundwater over time following the source removal.

During backfill operations of the saturated zone, a reagent (e.g., organic-based tannin or inorganic powdered sulphite) would be added with the backfill material to minimize the potential adverse affects to arsenic sulfides present in the subsurface. The purpose of the reagent would be to act as an oxygen scavenger so that a minimal amount of dissolved oxygen is introduced to the subsurface. As shown on Figure 4-3, the majority of the areas undergoing excavation would be backfilled with low-permeability fill material (approximately 0.283 ft/day under this alternative),

compacted, and graded for storm water management. The remaining area would be backfilled with high-permeability fill material (approximately 28.3 feet/day for this alternative). The high-permeability fill material would be placed downgradient of the interceptor trench and would serve to collect and distribute groundwater into the surrounding, natural formation.

4.1.5.2 Continued Groundwater Extraction and Treatment for Former Rifkin Property

Active groundwater extraction underlying the former Rifkin property would continue, with aboveground treatment of the extracted water at a treatment facility relocated to the northeast corner of the S-W property, adjacent to Horton Street and former Rifkin property. This continued groundwater extraction would continue to prevent further migration of dissolved arsenic plume on the former Rifkin property.

Groundwater elevation monitoring at the Site would continue, as the means to demonstrate effectiveness of the barrier/trench/extraction system on maintaining an inward gradient towards the S-W property along the east/west S-W/Rifkin property boundary. As part of this alternative, a contingency would be to increase extraction rates from the trench/extraction system and/or install additional extraction points, if needed, to direct groundwater flow toward the S-W property.

The proposed redevelopment plan for the former Rifkin property, which includes a high-rise tower option with installation of piles and pile caps, is not inconsistent with, and would not impede implementation or long-term operations, maintenance, and monitoring (OM&M) of this alternative.

Based on the proposed redevelopment plan for the former Rifkin property, it is anticipated that for the high-rise tower option up to 4,000 cubic yards of vadose and saturated zone soils could be excavated during installation of piles and pile caps. For soil excavated and removed for Site development that requires increased handling and disposal due to concentrations of arsenic or other COCs, S-W would be responsible for reimbursement to Novartis of the incremental costs. This incremental increase in this operation is considered part of this alternative and S-W would prepare a risk management plan stating their responsibilities.

4.1.5.3 Breaching and Extending the Existing Slurry Wall

A slurry wall extension would be constructed in locations shown on Figure 4-3 in order to have the existing plume that has been identified to the south of the existing slurry wall migrate through the Site, toward the breaches in the slurry wall. The slurry wall extension would be approximately 340 linear feet along the western property line toward Sherwin Avenue. Unlike Alternatives 3A and 3B which address S-W source material through containment, Alternative 3C removes source material from the S-W property. Therefore, the slurry wall extension under this alternative does not need to tie back into the southern edge of the existing slurry wall.

In order to restore groundwater flow across the S-W property, the existing slurry wall would be breached at locations shown on Figure 4-3. Breaching would be accomplished by removing and replacing the low-permeability materials in the wall with high-permeability fill.

A breach in the existing slurry wall near this extension, as shown on Figure 4-3, would be installed to prevent mounding of groundwater upgradient of this extension and to facilitate impacted groundwater south of the existing slurry wall and east of the extension to migrate across the Site before exiting the Site at the northern slurry wall breaches. This extended migration across the Site is designed to promote additional attenuation of COCs present in the area of the Site, specifically arsenic, prior to migration to downgradient properties.

A groundwater flow model was used to develop the design flow rates at these breaches. Alternative 3C does not include treatment at the breaches and hence does not require a groundwater fate and transport analysis for design of the breaches. The model results are presented in Appendix B of the FS.

4.1.5.4 MNA of COCs in Groundwater

Under Alternative 3C, COC concentration data in groundwater collected in MNA sampling and analysis would provide lines of evidence supporting the occurrence of attenuation of COCs in groundwater. Sampling and analysis of groundwater samples upgradient and downgradient of the existing slurry wall would be performed after completion of source area excavation. This data set would be compared to historical groundwater data to demonstrate long-term decreasing trends in COC concentrations over time across the Site and in downgradient, off-site groundwater. As part of this alternative, a contingency to treat groundwater, if needed, would be implemented in the event that COC concentrations migrating off-site through the slurry wall breaches are not attenuating to the cleanup goals in a reasonable timeframe.

4.1.5.5 LUCs and OM&M Plan

S-W understands that some additional LUCs are needed for Alternative 3C, as compared to Alternative 3A. S-W has access from the current owner to operate, monitor, and maintain (OM&M) a groundwater extraction system on the former Rifkin property. The proposed redevelopment plan for the former Rifkin property, which includes a high-rise tower option with installation of piles and pile caps, is not inconsistent with, and would not impede implementation or long-term OM&M of this system. However, DTSC has advised S-W that the following LUCs will be required for the S-W property and the former Rifkin property to assure DTSC that potential future changes in land use and property ownership do not impair the effectiveness of this alternative:

- Land use restrictions to facilitate OM&M of a groundwater extraction system on the former Rifkin property;

- Land use restriction to facilitate OM&M of a groundwater conveyance system on the former Rifkin property and treatment system on the S-W property;

- Land use restrictions to prevent interference with and operation and maintenance of a groundwater monitoring well network for the Site; and

- Land use restrictions to prevent interference with and operation and maintenance of interceptor trench, slurry wall and breach systems on the S-W property.

In addition, DTSC has advised S-W that an operations, maintenance, and monitoring (OM&M) agreement with financial assurance for OM&M of the groundwater extraction, conveyance and treatment systems and for any other installed feature incorporated in the alternative will be required. The OM&M agreement would apply for both the S-W property and the former Rifkin property. Financial assurance for implementation of the OM&M agreement for the Site would be provided by S-W.

4.1.6 Alternative 4A – Vadose Zone Excavation/Upgradient Interceptor Drain Installation/Passive *In-Situ* Groundwater Treatment/Rifkin Excavation/ Groundwater Monitoring/LUCs

Alternative 4A includes the following components for addressing soil and groundwater contamination, as they were described under Alternative 3A:

- Removal of Raised Cap
- Vadose Zone Excavation
- Installation of a Cover
- Extending and Breaching Existing Slurry Wall
- LUCs
- Groundwater Monitoring and MNA of COCs
- Operations, Maintenance, and Monitoring of Installed Components

In addition to these common components, Alternative 4A also includes construction of an interceptor drain to capture and direct clean groundwater flow upgradient of the source area. The proposed layout of all Alternative 4A components is presented graphically on Figure 4-4.

A groundwater flow and fate and transport model was used to develop the design flow rates and arsenic concentrations at these breaches and the design flow rates for the interceptor drain. The model results are presented in Appendix B of the FS.

4.1.6.1 Upgradient Interceptor Drain

Alternative 4A includes installation of an interceptor drain to collect groundwater upgradient of the S-W property and route this water around the impacted soils into areas downgradient of the Site. The upgradient interceptor drain would extend along all but the western side of the existing slurry wall and down to tie into the new extension of the existing slurry wall (See Figure 4-4 of the FS in Appendix B) for a

total length of 1575 linear feet. The drain design would consist of a 30-inch nominal drain excavated approximately 25 feet to the A/B aquitard. The drain would contain a membrane liner and concrete barrier on one side, prohibiting collection of any impacted groundwater flow from the S-W property. The interceptor drain would replace the slurry wall sections that border the former Rifkin property. The drain would be backfilled with 3/8 inch minus material and would contain a basal perforated pipe to reduce flow resistance from the backfill material. With this design, the trench would have an effective permeability of approximately 500 ft/day.

4.1.6.2 Passive Treatment System

The existing slurry wall would be breached via caisson installation. The caissons filled with reactive media assumed to consist of 20% zero-valent iron (ZVI) and 80% playground sand based on the Phase II treatability study. The reactive caissons would be surrounded by a corridor of caissons backfilled with bentonite or similar low-permeability material that would act as gates to funnel groundwater through the entire length of the treatment zone.

Gravel or similar high-permeability material would be used to backfill additional caissons located immediately upgradient and downgradient of the reactive caissons, to provide mixing and improved distribution of groundwater through the reactive gate.

Each of these backfills would be installed as flowable slurry with high pressure, so as to avoid the formation of voids during backfill when the caisson casing is removed. The number and configuration of the caissons depends on expected influent flow rates and concentrations at each location in each alternative.

The conceptual design and cost estimate for this type of treatment is based on 30 years of operation. However, because of the relative lack of long-term performance data for this type of removal technology, there is uncertainty in the long-term performance. Therefore, some maintenance and rehabilitation costs are included in the cost estimate as a contingency measure.

4.1.6.3 Rifkin Excavation

Under Alternative 4A, all impacted vadose and saturated soil material on the former Rifkin property upgradient of interceptor drain would be excavated, up to 15 feet bgs. The volume of saturated soil contained within the limits of this excavation as shown on Figure 4-4 would be approximately 14,300 cubic yards. The excavation would encompass that portion of former Rifkin property extending from the S-W property north to the B-line. The excavated area would be backfilled with low-permeability fill material (approximately 0.283 ft/day under this alternative).

This excavation would effectively remove all contaminated source material in contact with A-zone groundwater. Installation of the upgradient interceptor drain would prevent migration of impacted groundwater from the S-W property to the former Rifkin property.

4.1.7 Alternative 4B – Vadose Zone Excavation/Upgradient Interceptor Drain Installation/Active *In-Situ* Groundwater Treatment/Rifkin Excavation/ Groundwater Monitoring/LUCs

Alternative 4B is identical to Alternative 4A except that downgradient groundwater would be treated with an active treatment system, as presented under Alternative 3A. The proposed layout of all Alternative 4B components is presented graphically on Figure 4-5.

The active system for Alternative 4B would be similar in conceptual design as that presented for Alternative 3A.

4.1.8 Alternative 5A – Vadose Zone Excavation/Excavation Upgradient of Interceptor Drain/Downgradient Interceptor Drain Installation/Passive *In-Situ* Groundwater Treatment/Rifkin Excavation/Groundwater Monitoring/LUCs

Alternative 5A includes several components for addressing soil and groundwater contamination on both S-W and former Rifkin properties described under Alternatives 3A and/or 4A as listed below:

- Removal of Raised Cap
- Vadose Zone Excavation
- Extending and Breaching Existing Slurry Wall
- Passive Groundwater Treatment
- Installation of a Cover
- Rifkin Excavation
- LUCs
- Groundwater Monitoring and MNA of COCs
- Operations, Maintenance, and Monitoring of Installed Components

Alternative 5A also includes construction of an interceptor drain to capture and direct clean groundwater flow downgradient of the source area. The proposed layout of all Alternative 5A components is presented graphically on Figure 4-6.

A groundwater flow and fate and transport model was used to develop the design flow rates and arsenic concentrations at these breaches and the design flow rates for the interceptor drain. The model results are presented in Appendix B of the FS.

4.1.8.1 Saturated Soil Excavation

Under Alternative 5A, all impacted, saturated soil impacted upgradient of the interceptor drain would be excavated, to 25 feet bgs under S-W property and 15 feet bgs on the former Rifkin property. The limits of this excavation are shown on Figure 4-6. The volume of saturated soils removed within these excavations would

correspond to 14,300 cubic yards on the former Rifkin property and 38,600 cubic yards on the S-W property. Excavated areas would be backfilled with clean material, compacted and graded for storm water control. The excavated area would be backfilled with low-permeability fill material (approximately 0.283 ft/day under this alternative) on the former Rifkin property and lower-permeability fill material (approximately 0.0283 ft/day under this alternative) on the S-W property.

4.1.8.2 Downgradient Interceptor Drain

Alternative 5A includes installation of an interceptor drain to collect groundwater downgradient of the Site source areas and route this water downgradient for treatment. The downgradient interceptor drain would extend along the western side of the former Rifkin property and the existing raised cap area and down to tie into the extension of the existing slurry wall for a total length of 1,100 linear feet. The drain design would consist of a 30 inch nominal drain excavated approximately 25 feet to the A/B aquitard. The drain would contain a membrane liner and concrete barrier on one side, prohibiting collection of any impacted groundwater flow from the S-W property. The drain would be backfilled with 3/8 inch minus material and would also contain a basal perforated pipe to reduce flow resistance from the backfill material. With this design, the trench would have an effective permeability of approximately 500 ft/day.

4.1.9 Alternative 5B – Vadose Zone Excavation/Excavation Upgradient of Interceptor Drain/Downgradient Interceptor Drain Installation/Active *In-Situ* Groundwater Treatment/Rifkin Excavation/Groundwater Monitoring/LUCs

Alternative 5B is identical to Alternative 5A except that downgradient groundwater would be treated via *in-situ* active treatment system described in detail under Alternative 3A. The proposed layout of all Alternative 5B components is presented graphically on Figure 4-7.

4.1.10 Alternative 6 – Vadose Zone Excavation/Source Area Excavation/MNA/Groundwater Monitoring/LUCs

Alternative 6 includes the same components for addressing soil and groundwater contamination described under Alternatives 3A listed below:

- Removal of Raised Cap
- Vadose Zone Excavation
- Installation of a Cover
- Groundwater Monitoring and MNA of COCs
- Operations, Maintenance, and Monitoring of Installed Components

Alternative 6 also includes excavation of source area soils on the S-W and former Rifkin properties and extending and breaching the slurry wall. Alternative 6 also includes MNA for COCs, similar to Alternative 3C. In addition, Alternative 6

contains a contingency plan including a vapor intrusion control system for the former Rifkin property to mitigate potential exposure pathways should future property development include erection of buildings over areas with elevated levels of VOCs in soil gas. The proposed layout of all Alternative 6 components is presented graphically on Figure 5-8.

For the former Rifkin property, Alternative 6 includes installation of an interceptor trench, located on the S-W property, adjacent to the east/west S-W/Rifkin property boundary, as described in Alternative 3C. A membrane barrier would be placed on one side of the trench, along the property boundary, to prevent groundwater flow toward the former Rifkin property. The trench would have a similar construction to those presented in Alternative 3A. The trench would be approximately 30 inches wide, extend to the top of the aquitard, approximately 25 feet deep, and be located as shown on Figure 4-8. The trench would be backfilled with 3/8 inch minus material and contain a basal perforated pipe to reduce flow resistance from the backfill material. With this design, the trench would have an effective permeability of approximately 500 ft/day.

4.1.10.1 Source Area Excavation

In addition to vadose zone excavation, Alternative 6 includes excavation of source area saturated soils on the S-W and former Rifkin properties. The limits of these excavations are shown on Figure 4-8. The source area saturated soils would be removed down to the A/B aquitard (approximately 25 feet bgs) on the S-W property and to 18 feet bgs on the former Rifkin property (Section 4.2.3.1), corresponding to approximately 25,300 and 4,600 cubic yards of saturated soil on each property, respectively.

The source area excavation would remove source material to groundwater in order to support natural attenuation of the downgradient arsenic and other COC concentrations. Saturated soils in areas with documented VOCs in soil gas concentrations above the PRGs, outside of the source area, would be addressed through MNA The MNA sampling described below would demonstrate the naturally occurring attenuation of arsenic and other COCs in the groundwater over time following the source removal.

During backfill operations of the saturated zone, a reagent (e.g., organic-based tannin or inorganic powdered sulphite) would be added with the backfill material to minimize the potential adverse affects to arsenic sulfides present in the subsurface. The purpose of the reagent would be to act as an oxygen scavenger so that a minimal amount of dissolved oxygen is introduced to the subsurface.

As shown on Figure 4-8, the majority of the areas undergoing excavation would be backfilled with low-permeability fill material (approximately 0.283 ft/day under this alternative), compacted, and graded for storm water management. The remaining area would be backfilled with high-permeability fill material (approximately 28.3 feet/day for this alternative). The high-permeability fill material would be placed

downgradient of the interceptor trench and would serve to collect and distribute groundwater into the surrounding, natural formation. As part of this alternative, a contingency would be to pump from the high-permeability fill material and/or trench, if needed, to direct groundwater flow toward the S-W property. As such, backfill design considerations for both the S-W property and the former Rifkin property would be further assessed as part of remedial design of this alternative.

4.1.10.2 Breaching and Extending the Existing Slurry Wall

As presented in Alternative 3C, a slurry wall extension would be constructed in locations shown on Figure 4-8 in order to have the existing plume that has been identified to the south of the existing slurry wall migrate through the Site, toward the breaches in the slurry wall. The slurry wall would be constructed in accordance with procedures described in Section 2.4.5. The slurry wall extension would be approximately 340 linear feet along the western property line toward Sherwin Avenue. Unlike Alternatives 3A and 3B which address source material through containment, Alternative 6 does not. Therefore, the slurry wall extension under this alternative does not need to tie back into the southern end of the existing slurry wall**.**

A breach in the existing slurry wall near this extension, as shown on Figure 4-8, would be installed to prevent mounding of groundwater upgradient of this extension and to facilitate impacted groundwater south of the existing slurry wall and east of the extension to migrate across the Site before exiting the Site at the northern slurry wall breaches. This extended migration across the Site is designed to promote additional attenuation of COCs present in the area of the Site, specifically arsenic, prior to migration to downgradient properties, as discussed below.

A groundwater flow model was used to develop the design flow rates at these breaches. Alternative 6 does not include treatment at the breaches and hence does not require a groundwater fate and transport analysis for design of the breaches. The model results are presented in Appendix B of the FS.

4.1.10.3 MNA of COCs in Groundwater

As in Alternative 3C, COC concentration data in groundwater collected in MNA sampling and analysis would provide lines of evidence supporting the occurrence of attenuation of COCs in groundwater. Sampling and analysis of groundwater samples upgradient and downgradient of the existing slurry wall would be performed after completion of source area excavation. This data set would be compared to historical groundwater data to demonstrate long-term decreasing trends in COC concentrations over time across the Site and in downgradient, off-site groundwater. As part of this alternative, a contingency to treat groundwater, if needed, would be implemented in the event that COC concentrations migrating off-site through the slurry wall breaches or across the former Rifkin property are not attenuating to the cleanup goals in a reasonable timeframe.

4.1.10.4 LUCs

LUCs would be established to maintain the long-term permanence of this remedy and to control future human exposure. These LUCs would prohibit the use of A-zone groundwater beneath the Site; restrict the future land use on the S-W portion of the Site; and facilitate continued access to and operation and maintenance of remediation and monitoring facilities on the Site. LUCs on the former Rifkin property would not preclude proposed redevelopment plan for the former Rifkin property, which includes a high-rise tower option with installation of piles and pile caps.

4.1.11 Alternative 7 – A-Zone Aquifer Excavation /LUCs

Alternative 7 includes the following components in common with Alternative 3A and 4A:

- Removal of Raised Cap
- Installation of a Cover
- LUCs
- Operations, Maintenance, and Monitoring of Installed Components

Alternative 7 also includes excavation of all impacted, saturated A-zone saturated soil from both the S-W property and former Rifkin properties vertically to the A/B aquitard and laterally to the 24 mg/kg background arsenic concentration and/or 0.036 mg/L arsenic concentration for aquatic protection. An estimated 194,000 cubic yards of vadose zone and saturated soils would be excavated, transported off-site, and replaced with clean soil.

The A/B aquitard would remain in place to protect the integrity of the B-zone aquifer. Groundwater monitoring would be postponed until completion of remedial activities. Groundwater monitoring would resume with installation of several new (replacement) wells as necessary and implementation of the groundwater monitoring plan. With the entire affected A-zone aquifer removed and replaced, groundwater monitoring would only be required for a maximum of two or three annual monitoring events to demonstrate residual concentrations in groundwater. The removal of the A-zone aquifer does not include MNA monitoring.

The proposed layout of all Alternative 7 components is presented graphically on Figure 4-9.

4.2 Evaluation of Remedial Action Alternatives

Based on a screening evaluation against effectiveness, implementability, and cost, the following alternatives were retained for detailed analysis:

- **Alternative 1 –** No Action

- **Alternative 2 –** Limited Action

- **Alternative 3A –** Vadose Zone Excavation/Active *In-Situ* Groundwater Treatment/Rifkin Excavation/Groundwater Monitoring/LUCs

- **Alternative 3B –** Vadose Zone Excavation/S-W Source Area Soil Mixing/Active *In-Situ* Groundwater Treatment/Rifkin Excavation /Groundwater Monitoring/LUCs

- **Alternative 3C –** Vadose Zone Excavation/ S-W Source Area Excavation/Rifkin Groundwater Extraction and Aboveground Treatment/MNA/Groundwater Monitoring/LUCs

- **Alternative 6 –** Vadose Zone Excavation/Source Area Excavation/MNA/ Groundwater Monitoring/LUCs

- **Alternative 7 –** A-Zone Aquifer Excavation/LUCs

A detailed and comparative analysis of these retained alternatives was performed. The comparative analysis is summarized in Table 7-1 of the FS (see Appendix B). This analysis applies nine Federal NCP evaluation criteria to each alternative listed above. These criteria are grouped into the following three categories: threshold criteria, primary balancing criteria, and modifying criteria.

4.2.1 Threshold Criteria

Two threshold criteria relate directly to the statutory compliance of the alternative: (1) overall protection of human health and the environment and (2) compliance with ARARs. A given alternative must meet these criteria to be considered as a remedy.

4.2.1.1 Overall Protection of Human Health and Environment

Under this criterion, the adequacy of the protection afforded by a remedial action must be addressed. How risks will be eliminated, reduced, or controlled through treatment, engineering controls, or ICs must be described.

4.2.1.2 Compliance with ARARs

Under this criterion, the means by which a given remedial alternative will meet the ARARs identified in Section 3 must be established. Compliance with the chemical, location, and action-specific ARARs must be attained by the alternative to be considered as a remedy.

Existing settlement agreement between S-W and Novartis is identified as a TBC. Based on ongoing discussions, S-W and Novartis may renegotiate this agreement and therefore, the provisions of this TBC may change.

4.2.2 Primary Balancing Criteria

Five primary balancing criteria address the technical and cost criteria for each alternative: (1) long-term effectiveness and permanence; (2) reduction of toxicity,

mobility, or volume through treatment; (3) short-term effectiveness; (4) implementability; and (5) cost.

4.2.2.1 Long-Term Effectiveness and Permanence

Under this criterion, the effectiveness and permanence of the remedial action is established in terms of risk remaining at the site after the remedial action. The adequacy and reliability of LUCs required with the alternative are evaluated to determine if appropriate risk management of the treatment residuals or untreated waste is in place.

4.2.2.2 Reduction of Toxicity, Mobility, or Volume through Treatment

Under this criterion, the degree and quantity of contaminant toxicity, mobility, and/or volume reduction by use of the specified treatment is evaluated. The anticipated performance of a treatment technology employed by remedial action in terms of long-term reliability of the treatment process and the type and quantity of treatment residuals is discussed.

4.2.2.3 Short-Term Effectiveness

Under this criterion, the impacts on the community, site workers, and the environment during the construction and implementation phase are evaluated. This phase lasts through the construction phase of the remedial action. The duration until protection is achieved is also considered. In addition to the impacts on human health, the potential adverse environmental impacts during the construction are evaluated.

4.2.2.4 Implementability

Under this criterion, the technical and administrative feasibility of implementing the alternative is evaluated. The availability of needed materials and services is also considered. The technical feasibility considerations include the technical difficulties anticipated in construction, reliability of the selected technology, and ease of implementing the remedy. Administrative feasibility considers coordination of interested parties, as well as any required permits.

4.2.2.5 Cost

Under this criterion, estimates are made of capital costs, engineering expenses, and the present worth of future O&M and periodic costs. Cost estimates are developed according to *A Guide to Developing and Documenting Cost Estimates During the Feasibility Study* (EPA 2000). All alternatives have the same future land use and site development cost components. While flexibility has been incorporated into each alternative for the location of remedial facilities, the selection of cleanup levels, the time frame in which remedial action will be completed, and the project scope and duration must be defined in order to provide a cost estimate. As a result, a number of assumptions must be made to provide cost estimates for the various remedial alternatives. Important assumptions specific to each alternative are summarized in the description of the alternative.

The levels of detail employed in making these estimates are approximate, but are considered appropriate for making choices between alternatives. The information provided in the cost estimate is based on the best available information regarding the anticipated scope of the remedial alternatives. The cost estimate is expected to be within +50/-30 percent of the actual cost. The costs are discussed with respect to the following items:

- Capital costs consist of direct (construction) and indirect (non-construction and overhead) costs.
- O&M costs refer to post-construction cost items necessary to ensure the continued effectiveness of a remedial action and typically consist of long-term labor, power, and material costs.
- Periodic costs include items that are required intermittently at greater than 1-year intervals.

A present worth analysis has been used to normalize all capital, O&M, and periodic costs of a remedial alternative. In this analysis, all capital costs are assumed to be incurred within the first year of implementation. Future O&M and periodic costs are included and reduced by the appropriate future value/present worth discount factor of 3 percent.

4.2.3 Modifying Criteria

Two modifying criteria relate directly to the regulatory and community acceptance of the alternative. These criteria will be addressed by DTSC through the RAP review and approval process.

4.3 Basis for Selected Remedial Action

Based on the individual and comparative analyses performed in the FS, the selected alternative is Alternative 6 - Vadose Zone Excavation/Source Area Excavation MNA/ Groundwater Monitoring/LUCs (CDM, 2009b).

The following summarizes the rationale for selection of Alternative 6 as the preferred alternative:

- It provides for the best combination of overall protection to both human health and the environment, and long-term effectiveness and permanence. It is equal to the other alternatives with respect to the other NCP criteria, excluding cost evaluation.
- It provides the best fit with the RAOs, in particular for minimizing risk to downgradient ecological receptors from off-site groundwater migration. As Alternative 6 removes the source of arsenic to groundwater, it provides for the best assurance for long-term protection of ecological receptors. In addition, the removal of the source will prevent further migration of arsenic onto the former Rifkin property.

- Alternative 6 also does not include long-term operation of a treatment system (aboveground or in place) at the Site. This attribute is favorable as it reduces potential need for future evaluation and intrusive operations/modifications to remedy elements (i.e., removal of sludge, change out of reactive media, rehabilitation of extraction wells, etc.).

- It provides the flexibility with respect to S-W plans for future redevelopment of the facility. Other than Alternative 7, Alternative 6 removes the most impacted soils at the Site and reduces the areas within the Site that require LUCs for future redevelopment.

4.4 State Evaluation Process

The evaluation and selection of Alternative 6 as the preferred remedial alternative through the NCP process complies with State evaluation process identified in California H&SC Section 25356.1(c). The six State evaluation criteria correlate with the nine NCP criteria as presented above. A draft statement of reasons for selection of the preferred alternative, correlating to the six State evaluation criteria, is included in Appendix D. The statement of reasons also proposes a preliminary non-binding apportionment of responsibility for the Site, which is included in Appendix E.

4.4.1 Health and Safety Risks

This criterion evaluates the current and future health and safety risks associated with no remediation and with implementing the preferred alternative. This criterion is fully considered under NCP evaluation criterion of Overall Protection of Human Health and Environment.

4.4.2 Beneficial Uses of Site Resources

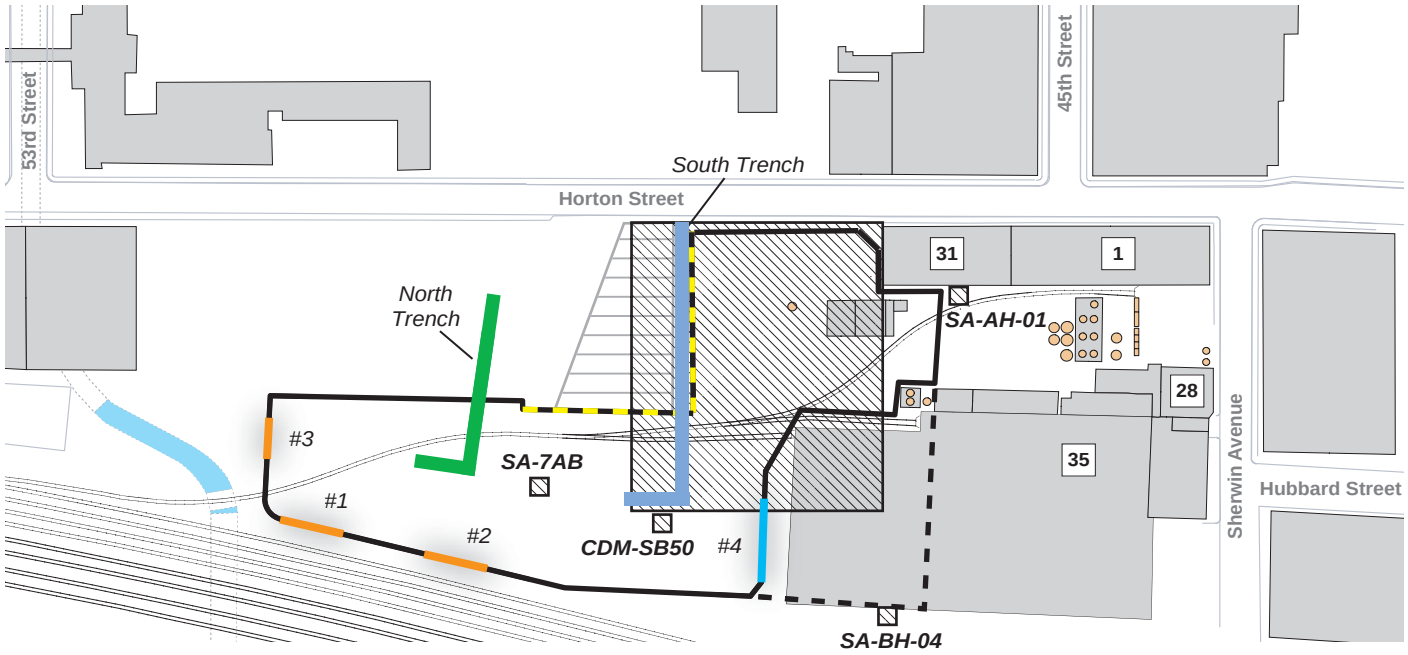
This criterion evaluates present and potential future beneficial uses of Site resources. This criterion is fully considered under the NCP criterion of Overall Protection of Human Health and Environment and Compliance with ARARs. In the development of RAOs for this Site (Section 3.2), a Site beneficial uses analysis was conducted.

4.4.3 Effect of Remedial Actions on Groundwater Resources

This criterion evaluates the effect of the preferred alternative on Site groundwater resources. The NCP criterion of Overall Protection of Human Health and Environment and Compliance with ARARs fully incorporate this State criterion.

4.4.4 Site-Specific Characteristics

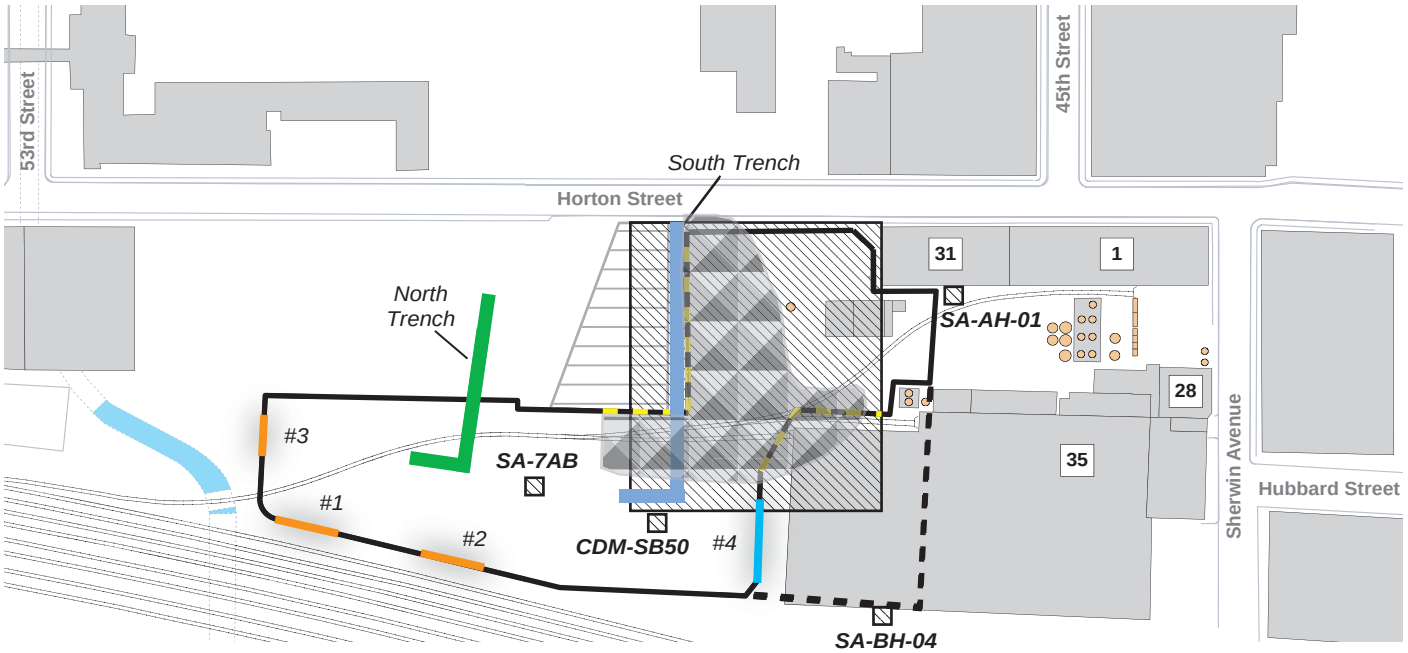
This State criterion requires remedy selection evaluation to consider Site-specific characteristics. Remedy selection considered all Site-specific characteristics, such as Site geology, hydrogeology, chemicals, and previous remedial actions. Extensive Site characterization has been conducted. This State criterion is fully considered in the NCP criterion of Long-Term Effectiveness and Permanence, Short-Term Effectiveness, and Implementablity.



4.4.5 Cost-Effectiveness of Alternative Remedial Action Measures

This criterion evaluates the relative cost-effectiveness of various remediation alternatives in light of their expected success in meeting RAOs. This State criterion is fully considered in the NCP criteria entitled Long-Term Effectiveness and Permanence, and Cost.

4.4.6 Potential Environmental Impacts of Remedial Action



This criterion evaluates the potential environmental impacts of the preferred alternative. The NCP criteria of Short-Term Effectiveness and Long-Term Effectiveness and Permanence consider environmental impacts during and after remedy implementation. In addition, CEQA documentation (see Appendix F) also evaluates environmental impacts from the remedy.

Section 5
Planning and Pre-Remediation

This section presents descriptions of the anticipated remedy implementation schedule and details activities to be conducted during the remediation planning stage.

5.1 Preliminary Implementation Schedule

The general remedy implementation schedule described here presents remediation planning and implementation activities in its appropriate time sequence. Following approval by DTSC, the remedy will be implemented in accordance with the planning and design elements presented in this section. Remedy implementation is divided into five sets of activities:

- Planning,
- Pre-remediation,
- Remediation,
- Restoration, and
- Reporting.

Figure 5-1 presents a preliminary schedule for the remedy implementation. The schedule may change upon review and approval of the RAP. Further changes to the schedule may become apparent during preparation of the remedial design implementation plan (RDIP), submittal of remediation contractor plans, coordination with other Site activities, and/or procurement of local permits.

Work hours at the Site during remedy implementation activities will be 7:00 a.m. to 6:00 p.m. Work and transportation days are anticipated to be Monday through Friday, although weekend work may occur depending upon the schedule of activities. Weekend work hours will be 9:00 a.m. to 6:00 p.m., if necessary. These hours and work days may be modified based on conditions encountered during remediation.

5.2 Planning

Key activities to be conducted during the remediation planning stage include:

- Publication of the Public Notice and Fact Sheet;
- Preparation of Remedial Design Implementation Plan (RDIP); and,
- Selection of the remediation contractors.

These planning activities are identified on the preliminary project schedule presented in Figure 5-1.

5.3 Pre-Remediation

Key activities to be conducted during the Pre-Remediation stage include:

- Procurement of appropriate construction-related permits, including but not limited to: the Bay Area Air Quality Management District's Permit to Construct and Permit to Operate and Rule 8 Notification; Water Board's Notice of Intent for Coverage under the General Construction Storm Water Permit; Alameda County's well abandonment and construction permits; and appropriate wastewater discharge permit(s);
- Shutdown of the onsite groundwater extraction and treatment system. The system cessation would occur four weeks prior to remediation contractor mobilization to allow for adequate time to remove piping and equipment;
- Proper abandonment of Site wells within the excavation limits and wells not included in the post-remedy implementation groundwater monitoring[1], a list of existing wells proposed for abandonment is presented in Table 5-1 and their locations shown on Figure 5-2;
- Submittal of required RDIP for DTSC review and approval. Components of the RDIP will include: Dust and Vapor Control Plan (DVCP), Perimeter Air-Monitoring Plan (PAMP), and Transportation Plan; Health and Safety Plan (HASP); Operations, Maintenance and Monitoring Plan (OM&M Plan); Storm Water Pollution Prevention Plan (SWPPP); and, an updated schedule for remedy implementation; and
- Coordination of remediation construction-related activities with Novartis operations, including communication protocols, use of the former Rifkin parking area, schedule constraints, and Site security.

5.3.1 Health and Safety Plans

A Site HASP for onsite workers and a Community Safety Plan will be developed and included in the RDIP.

The Site HASP will generally consist of: identification of physical and chemical hazards; minimum training requirements for Site workers; criteria for upgrading levels of personal protective equipment (PPE); emergency information (e.g., directions to the nearest hospital and emergency telephone numbers); and administrative requirements (e.g., documentation of training and safety tailgate meetings).

During most of the remediation construction, PPE for Site workers is anticipated to be Level D (i.e., hard hats, steel-toed boots, chemical resistant gloves, ear protection, and

[1] Certain wells outside the excavation limits are not suitable for a long-term groundwater monitoring program due to their construction as large-diameter wells that would require large volume purge prior to sampling, monitoring wells not screened properly across the aquifer, or located away from critical post-remedy implementation groundwater flow patterns.

eye protection). Level C PPE (i.e., respiratory protection) may be required in some areas until the results of personal air monitoring indicate that it is unnecessary. Dust and vapor control measures will be implemented to limit exposure to COCs. Personal air monitoring will be performed using individual air pumps and hand held ionizing detectors for selected Site workers.

The Community Safety Plan will provide information for the community regarding the measures to control exposures to chemicals in soil and groundwater that could be released during the implementation. In addition, the Community Safety Plan will present the protocols for implementing the PAMP and for providing the air monitoring results from the PAMP. The substance of the Community Safety Plan will be presented to the community during a meeting prior to remediation.

5.3.2 Storm Water Pollution Prevention Plan

A SWPPP will be developed to address issues that could arise during rainfall events. A Notice of Intent (NOI) will be filed with the State Water Resources Control Board for coverage under the State's General Permit for Construction Activities. State guidelines for storm water control will be followed, including, but not limited to, silt fences and hay bales to limit erosion and/or off-site movement of sediment. The detailed methods for sediment control will be provided in the SWPPP.

Section 6
Remediation and Restoration

This section provides an expanded description for the implementation of the selected remedy (FS alternative 6, see Section 4). While this section describes specific design and technical components for remedy implementation, the final design, as presented in the RDIP, may be different, but will achieve the identified objectives.

During remedy implementation, potential exposure to COCs could occur from inhalation of dust and organic vapors generated during soil handling. The DTSC-approved Public Health Evaluation of the Remedial Alternative (PHERA) (CDM, 2009a) document determined that use of appropriate emission control technologies (e.g., dust, vapor, and odor controls) can effectively control potential exposure of the community to unacceptable concentrations of COCs during remedy implementation. This section provides additional details on the emission control and monitoring procedures.

Major activities to be conducted during remedy implementation are:

- Establishment of Site exclusion zones, security areas and signage;
- Mobilization of contractor equipment to the Site;
- Establishment of the Site construction office;
- Installation of monitoring systems;
- Installation of roadway within the Site and within roadway easement along western Site boundary;
- Abandonment of selected groundwater monitoring wells;
- Extraction and treatment of soil vapors within and underlying the Raised Cap;
- Removal, handling, and off-site disposal of the Raised Cap;
- Installation of shoring system for excavation along Horton Street;
- Dewatering of groundwater from the excavation and on-site water treatment;
- Excavation, handling, and off-site disposal of material;
- Installation of slurry wall breaches;
- Extension of existing slurry wall;
- Backfilling and compaction of imported fill in the excavation;
- Installation of groundwater monitoring wells; and
- Demobilization of remediation equipment.

6.1 Construction Area Layout and Controls

Remedy implementation activities will utilize many of the remaining building slabs for equipment and supplies storage, waste stockpiling and handling prior to off-site transport and disposal. Building foundations that do not interfere with the excavation will be left in place pending further redevelopment of the Site.

Figure 6-1, Preliminary Site Layout and Controls, presents a preliminary layout of work areas and general Site controls for the remedy implementation activities. This figure is intended as a general guideline. The final layout is subject to refinements during preparation of the RDIP and will be established by the remediation contractor.

6.1.1 Engineered Controls During Remediation

Remedy implementation activities will include engineered controls to reduce short-term exposure risks from releases of COCs to the environment and/or community in the form of dust, vapors, and/or surface water runoff. Remedy implementation activities are presented in Table 6-1, under individual rows. Categories of potential emissions are listed as column headings in the table. Engineered controls for these emission types comprise the columns in Table 6-1.

6.1.1.1 Dust Control

A Dust and Vapor Control Plan (DVCP) will be prepared in accordance with the remediation specifications and compliance requirements as applicable. The DVCP will identify techniques, supplies, and equipment needed to control dust emissions during remedy implementation. The DVCP will include but are not limited to the following elements for dust control: water sprays/mist, surfactants, wetting agents, dust suppressants, covers, and windscreens. The DVCP will be reviewed by the DTSC prior to remedy implementation as part of the RDIP. The DVCP will be consistent with the findings presented in the PHERA regarding appropriate use of dust controls.

If observations or measurements, or complaints from people in the community indicate a need for more stringent dust control, the contractor will increase the magnitude and frequency of the dust control. If further dust control measures are needed due to winds, the contractor may be required to stop certain portions of the work until conditions improve or the contractor employs satisfactory compliance methods.

6.1.1.2 Vapor and Odor Control

The highest VOC concentrations are anticipated to be encountered during excavation in the northwest portion of the planned excavation area. The DVCP will identify techniques, supplies, and equipment needed to control vapor emissions during remedy implementation. The DVCP will include, but not be limited to, the following elements for vapor and odor control: water spray/mist; vapor suppressant foam; and covers. The DVCP will be reviewed by the DTSC prior to remedy implementation as part of the RDIP.

Prior to removal of the Raised Cap, a network of vapor extraction wells will be installed on the Raised Cap and surrounding vadose zone soil excavation area. These vapor extraction wells will be utilized to remove stagnant VOCs present in the Raised Cap material and vadose zone soils prior to excavation. The vapor stream will be treated through a combination of adsorption media. The soil vapor extraction and treatment system will be operated pursuant to a BAAQMD permit.

The vapor extraction system is expected to operate for up to four weeks prior to excavation activities. The total VOC concentrations are expected to decrease and stabilize (as monitored at the influent of the vapor treatment system) to equilibrium with mass transfer processes that are generating the vapors from VOCs absorbed to soil and dissolved in water. The extracted soil vapor will be field monitored for total VOC concentrations. Removal of the Raised Cap and soil excavation will be initiated when total VOC concentrations reach relatively stabilized levels. Portions of the soil vapor extraction system will continue to operate during the removal of the Raised Cap and soil excavation activities. Vapor extraction wells will be removed as the Raised Cap removal and soil excavation proceeds. In addition, during Raised Cap removal and soil excavation, potential volatilization of VOCs will be managed through engineering controls.

Perimeter air monitoring will be used to confirm the effectiveness of vapor control methods. If vapor emission concentrations at the perimeter are detected above pre-set action levels (as presented in Section 6.2.1), vapor control methods will be modified until vapor concentrations are reduced below the action levels.

During Raised Cap removal and soil excavation, odors associated with Site COCs will be managed through engineering controls. During remedy implementation, odors unrelated to impacted soil/debris (i.e., odors not associated with COCs) could also be generated. These types of odors will also be controlled during remedy implementation, using the same engineering controls as those for odors associated with COCs.

6.1.1.3 Surface Water Runoff Control

An array of isolated sumps, pumps, and hoses are used currently at the S-W Site for storm water management. This current storm water management system would continue under a construction SWPPP during remedy implementation, as discussed in Section 5.

This current storm water management system replaced the former underground piping network. This former network has been plugged through installation of temporary plugs at several locations in the main storm sewer connecting to Temescal Creek channel. These plugs are routinely monitored for effectiveness. Storm water is collected in the sumps and pumped directly to the Temescal Creek channel.

The construction SWPPP will be developed to address issues that could arise during rainfall events during remedy implementation. As part of the SWPPP, sections of the

main storm sewer connecting to Temescal Creek channel will be removed and filled with grout to create permanent plugs. The remaining parts of the existing system will continue to operate as needed during remedy implementation.

Water that has been in contact with impacted materials, and water extracted from the excavation, will be isolated from non-impacted storm water by construction and maintenance of berms. This contact water will be treated on-site and discharged to Temescal Creek, discharged to the sanitary sewer (if permitted), or transported off-site for treatment and discharge.

6.2 Monitoring of Engineering Controls

The engineered controls for limiting potential short-term exposures from releases of COCs to the environment and/or community in the form of dust, vapors, and/or surface water runoff, will be monitored to confirm their effectiveness. In addition to health-based exposure risks, monitoring is needed to confirm control of noise, odor, and vibration.

The DTSC-approved Public Health Evaluation of the Remedial Alternative (PHERA) (CDM, 2009a) document determined performance standards to be used during air monitoring for evaluating the effectiveness of dust and vapor controls. The performance standards are concentrations of respirable COCs in air that should not be exceeded, as defined in Table 6-2 and 6-3. Adherence to performance standards helps to provide protection of people in the community from unacceptable exposure to COCs. The performance standards established in the PHERA for the COCs are summarized in Tables 6-2 and 6-3.

Action levels for respirable dust and total VOCs were developed by which COCs can be evaluated immediately as remedy implementation activities proceed. Particulate matter with an effective diameter of less than or equal to 10 microns (µm) (PM10) is considered respirable (National Ambient Air Quality Standards). The action levels established in the PHERA for total VOCs and PM10 are summarized in Tables 6-2 and 6-3, respectively.

6.2.1 Perimeter Air Monitoring and Sampling

As discussed in Section 5, a Site safety plan will be developed to address personal protective equipment (PPE) for Site workers and visitors and personal air monitoring for Site workers to evaluate the potential for exposure. This section focuses on perimeter air monitoring and sampling to evaluate potential exposure to the community.

During material handling activities (i.e., excavation, loading, stockpiling, etc.), perimeter air monitoring will be conducted to confirm the effectiveness of dust and vapor controls. As presented on Figure 6-1, air monitoring stations are anticipated to be placed along all perimeters of the Site. Final number and location of the stations is subject to refinements during preparation of the RDIP.

S-W has operated a meteorological station at the Site since August 2002. The station records wind speed, direction, temperature, and rainfall at 30-minute intervals. The station, was originally located in the approximate center of the S-W property at the end of the then existing rail car loading dock extending north from the northeast corner of former Building 35 and was positioned approximately 20 feet above ground. The station was relocated to a nearby utility pole in July 2007, prior to Site demolition activities. The station data collected between August 2002 and July 2007 confirmed a predominantly on-shore wind direction from the west northwest, with average wind speeds of 3 mph and recorded gusts as high as 9 mph from this direction. Existing Site wind data indicate maximum recorded winds from the south southeast at 18 mph. The existing meteorological station, or a replacement unit, will remain operational to monitor changes in wind direction during remedy implementation.

As part of the RDIP, a Perimeter Air-Monitoring Plan (PAMP) will be prepared for review and approval by DTSC and implemented. The PAMP will include the following tasks (subject to DTSC approval):

- **Real-time dust monitoring –** This task will involve using fixed-location direct-reading monitor at the perimeter air monitoring stations to measure PM10 concentrations at the Site boundaries. The dust monitors will consist of ThermoMIE brand DataRam units or equivalent that reliably respond to PM10 concentrations as low as 0.1 microgram per cubic meter (µg/m3). The dust monitors will be used to automatically record PM10 concentrations, and provide an alert if the PM10 action level is exceeded. The proposed locations for these monitors during remedy implementation are shown on Figure 6-1, subject to refinements during preparation of the RDIP. Additionally, during construction operations, portable dust monitors will be utilized near on-site activities so that real-time feedback can be provided to adjust construction operations and/or dust controls to limit potential exceedance of the PM10 action level at the perimeter air monitoring stations.

- **Real-time VOC Monitoring –** Volatile organic compounds (VOCs) concentrations will be measured utilizing portable field gas chromatographs (GCs) such as a Photovac Voyager GC or equivalent. The GCs measure volatile organic compounds by passing the air sample through an analytical detector and electronically measuring the resulting response. The GCs will be configured to operate in total and compound-specific modes so that total and individual VOC concentrations can be quantified and compared to the VOC action levels. The GC instrument will be selected to reliably respond to total VOC concentrations as low as 1 part per billion by volume (ppbv). Additionally, during construction operations, portable total VOC monitors will be utilized near on-site activities so that real-time feedback can be provided to adjust operations and/or vapor controls to limit potential exceedance of the VOC action levels at the perimeter air monitoring stations.

- **Time-integrated ambient air sampling and analysis for VOCs –** During the initial weeks of remedy implementation, 24-hour time-integrated perimeter air samples will be collected daily for VOC analysis. Collection will be performed using high-volume size selective inlet (SSI) samplers located in the predominantly downwind position. This high-volume air sampling will be performed each work day during removal of the Raised Cap material. Data collected from these sampling events will be compared to VOC performance standards and correlated with real-time total VOC concentrations. Once a reliable correlation is established, a modified, reduced sampling frequency will be proposed to DTSC and implemented after DTSC approval. Daily sampling will be maintained on periods of work during which the highest VOC-impacted soil excavation activities will occur.

- **Time-integrated ambient air sampling and analysis for Arsenic –** During the initial weeks of remedy implementation, two consecutive 4-hour time-integrated perimeter air samples during dust generating work hours (8:00 a.m. to 4:00 p.m.) and one 16-hour time-integrated perimeter air samples during non dust generating hours will be collected daily will be collected daily for respirable arsenic analysis. As needed on any given day, a third four-hour sample will be collected if dust generating work persists outside these hours, and the non-work hour sample will become a 12-hour time-integrated sample. Collection and analysis of these samples on a daily basis will allow for confirmation that both the acute (4-hour) performance standard and subchronic performance standard for arsenic are being met. Collection will be performed using high-volume size selective inlet (SSI) samplers located in a predominantly downwind position. This high-volume air sampling will be performed each work day during removal of the Raised Cap material. Data collected from these sampling events will be compared to performance standards for arsenic to correlate real-time PM10 readings with respirable arsenic concentration. Daily sampling will continue at the start of the soil excavation activities. Once a reliable correlation is established, a modified, reduced sampling frequency will be proposed to DTSC and implemented after DTSC approval. Daily sampling will be maintained on periods of work during which the highest arsenic-impacted soil excavation activities will occur.

- **Time-integrated ambient air sampling and analysis for Lead–** During the initial weeks of remedy implementation, 24-hour time-integrated perimeter air samples will be collected daily for respirable lead analysis. Collection and analysis of this sample on a daily basis will allow for confirmation that the performance standard for lead is being met. Collection will be performed using high-volume size selective inlet (SSI) samplers located in a predominantly downwind position. This high-volume air sampling will be performed each work day during removal of the Raised Cap material. Data collected from these sampling events will be compared to performance standards for lead to correlate real-time PM10 readings with respirable lead concentration. Once a reliable correlation is established, a modified, reduced sampling frequency will be proposed to DTSC and implemented after DTSC approval. Daily sampling will be maintained on periods

of work during which the highest lead-impacted soil excavation activities will occur.

Comparison of detected COC concentrations in air with its respective performance standards will be used to confirm the validity of the developed action levels. Action levels will also be compared to real-time dust and vapor levels. Comparison of measured dust and vapor levels with the action levels and VOC odor thresholds will be used to adjust the dust, vapor, and odor control measures, if needed.

6.2.1.1 Action Level Exceedance and Adjustment

If the air monitoring action levels are exceeded, Site air emission controls will be evaluated and adjusted, as necessary. If during a consecutive 4-hour period in a single work day the average PM10 measurements exceeds the acute PM10 action level or if the rolling-average PM10 and/or total VOC measurement exceeds the respective subchronic action level, operations will be reviewed, the cause for the exceedance determined, and appropriate actions taken. As necessary, remedy implementation activities will be suspended until the cause is identified and additional control measures are implemented.

The action levels are based on calculations that utilize existing Site Raised Cap material, soil, and groundwater data. As the air samples to be collected during remedy implementation are analyzed to determine actual COC concentrations in air during remedy implementation, the action level calculations may be revised based on the correlation between soil/groundwater COC concentrations to those in air, i.e., update the VOC action levels.

6.2.2 Noise Monitoring

Emeryville Noise Ordinance No. 03-002, dated August 19, 2003, specifies the requirements for minimizing noise-related impacts during remedy implementation. Specifically, general construction noise (Section 5-13.05 of the Noise Ordinance) shall be limited to weekdays from 7:00 am to 6:00 pm. Although not anticipated for this remedy implementation, pile driving and similarly loud activities are limited to weekdays from 8:00 am to 5:00 pm. More restrictive hours for allowable construction noise may be established as appropriate, given the surrounding neighborhood and type of noise.

Weekend work, and/or work outside the established weekday time limits, may be allowed at the discretion of the City Manager, the Planning and Building Director, or the Public Works Director. Weekend construction work, if allowed, would be limited to 9:00 am to 6:00 pm.

Remedy implementation activities are anticipated to be conducted during the allowable weekday construction noise time limits. Activities related to Site security, such as stockpile maintenance, may be conducted during night-time hours, if needed. If activities are proposed outside of the weekday allowable construction noise time limits, the remediation contractor will apply to the City for a waiver, as described in

Section 5-13.06 of the Ordinance. The procedures for waiver application require submittal of a description of the type of work to be performed, the type of equipment to be used, notifications to neighbors, and, among other requirements, a description of the types of construction practices to be used to minimize noise.

As appropriate, the source(s) of the noise will be identified and additional noise reduction methods and supplies will be used including, but not limited to, those presented below:

- Relocate stationary equipment (if feasible) to minimize noise impacts on the community;
- Provide portable enclosures for stationary equipment and particularly noisy areas on the Site;
- Use self-adjusting ambient-sensitive back-up alarms, manually-adjustable alarms on low setting, use of observers, and/or schedule activities so that alarm noise is minimized;
- Install and maintain intake and exhaust mufflers on all equipment, particularly pneumatic impact tools;
- Install acoustically attenuating shields, shrouds, or enclosures on noise producing equipment;
- Line or cover hoppers, conveyor transfer points, storage bins and chutes with sound-deadening media;
- Minimize the use of air or gasoline-driven hand tools;
- Maintain all equipment such that parts of vehicles and loads are secure against rattling and banging; and/or
- Use shields, impervious fences, or other physical sound barriers, to inhibit transmission of noise to sensitive receptors.

6.3 Vapor Extraction and Treatment

Prior to removal of the Raised Cap, a network of vapor extraction wells will be installed from the surface to above the groundwater table on the Raised Cap and surrounding vadose zone soil excavation area. These vapor extraction wells will be utilized to remove stagnant VOCs present in the Raised Cap material and vadose zone soils prior to excavation. The vapor stream will be treated through a combination of adsorption media, including zeolite and activated carbon. The soil vapor extraction and treatment system will be operated pursuant to a BAAQMD permit.

The system as currently developed consists of a network of vapor extraction wells each piped to a corresponding vapor extraction-blower unit (SVE Unit). Figure 6-2 shows a plan view of the soil vapor extraction area and the proposed locations for extraction wells, SVE units, and treatment system. The proposed well locations are based on preliminary design data and the spacing of the vapor extraction wells will be refined during preparation of the RDIP.

It is anticipated that up to three electric-powered SVE units will operate simultaneously to extract soil vapor from across the Site. The SVE units will consist of a positive displacement blower; a liquid-vapor separation tank with auto discharge pump and level switches to remove moisture from vapor stream; and a heat exchanger to allow vapor stream temperature adjustment for optimum treatment efficiency.

Effluents from each SVE units will be directed to the treatment system, which is anticipated to include both zeolite and granular activated carbon vessels to effectively capture the range of anticipated organic vapors. The effluent will not be thermally treated. Treated vapor with COC concentrations below BAAQMD's emission trigger levels will be discharged to the atmosphere. The treated vapor emission will be monitored per BAAQMD permit requirements.

The SVE and treatment system will operate for up to four weeks prior to initiation of excavation activities. During this time, the initially stagnant total VOC concentrations are expected to decrease and stabilize (as monitored at the influent of the vapor treatment system) to an equilibrium with mass transfer processes that are generating the vapors from VOCs absorbed to soil and dissolved in water. The extracted soil vapor will be field monitored for total VOC concentrations. When total VOC concentrations reach relatively stabilized levels, the extracted soil vapor will be sampled and the samples analyzed by a State-certified laboratory for VOC concentrations. These VOC concentrations will be compared to those modeled in the PHERA, and as appropriate VOC actions levels modified.

Portions of the SVE system will continue to operate as excavation activities are initiated with the removal of the Raised Cap and vadose zone soil excavation. Phased shutdown of the SVE system will be performed as the excavation proceeds to encompass the entire SVE area.

6.4 Removal of Raised Cap

After the implementation, operation, and subsequent removal of the vapor extraction system, the first stage of excavation will be the removal of the Raised Cap material, down to the underlying former building foundations and piping where encountered. The RDIP will present the techniques, supplies, and equipment to conduct the removal of the Raised Cap. The RDIP will be provided to DTSC for review prior to remedy implementation.

The combination of impacted soil, concrete rubble, and possibly other material will be loaded for off-site transport and disposal. It is estimated that approximately 7,000 cubic yards of Raised Cap material will be removed. It is anticipated that surface asphalt and some of the concrete can be segregated for off-site recycling. For evaluation purposes it is assumed that all other Raised Cap material will be hazardous waste and will therefore require transport under hazardous waste manifests to an appropriate disposal facility.

The types of heavy equipment anticipated to be used during removal of the Raised Cap will include:

- Tracked diesel-powered excavator to excavate soil and segregate concrete;
- Tracked diesel-powered excavator with hydraulic attachments (jack hammer & nibbler) for breaking and processing concrete foundations for shipment;
- Front-end loader, for placing excavated soil and processed concrete into a dump truck; and
- One or two 25-yard off road dump trucks, for transporting soil from the excavation to the stockpile area.

6.5 Shoring Along Horton Street

Due to Site constraints and the proximity of the excavation to Horton Street and Building 31, shoring systems will be required. The design for the shoring system(s) will be provided to DTSC as part of the RDIP. It is anticipated that two different systems will be utilized.

For areas along Horton Street with excavation up to 25 feet in depth, it is anticipated that a retaining wall utilizing a solider pile with lagging system will be constructed. The location of this deep shoring wall is presented on Figure 6-1 and will be approximately 60 feet in length.

Specialized equipment using vertical augers will be utilized to generate large-diameter boreholes on the Site along Horton Street. It is anticipated that the boreholes will be installed at approximately eight-foot centers. In the area of vadose zone excavation, the boreholes will be less than 25 feet deep (typical depth of the A/B aquitard). In the area of the saturated zone excavation, the boreholes (a total of nine) will be approximately 50 feet deep.

Soldier piles will be installed in the bottom of the boreholes. In the area of the vadose zone excavation, it is anticipated the soldier piles will be up to 25 feet deep with the lower portion encased in structural concrete. In the area of the saturated zone excavation, it is estimated the soldier piles will be about 50 feet long with the lower 25 feet encased in structural concrete. For these deeper soldier piles, boreholes will be installed using casing and bentonite slurry to control heave.

Excavation of vadose and saturated zone soils along Horton Street will be completed to allow installation of lagging between soldier piles as the excavation is lowered. The lagging will consist of steel plates behind the soldier pile flanges driven in advance of the excavation. As the excavation is advanced into the saturated zone, additional lagging will be installed.

As the excavation proceeds deeper into the saturated zone, a dewatering system will be implemented (see Section 6.6). Counterforts will be installed to provide lateral support to the retaining wall. Each counterfort will be perpendicular to the soldier piles and installed at alternating soldier piles (for a total of up to 6 counterforts). The length of counterfort slots is estimated at 25 to 35 feet and the depth will be to the top of the A/B aquitard. Fill slots will be filled to form the counterfort buttresses for the soldier pile wall. After installation of the counterforts, the saturated soil between the counterforts will be excavated, to a maximum depth equal to the depth of the counterforts. Details on excavation implementation are discussed in Section 6.7.

For areas along the west side of Building 31, vadose zone soil along the building will be excavated and sloping, instead of retaining wall utilizing soldier piles with lagging system, will be installed. The slope will have a horizontal to vertical distance ratio of 1.5: 1 outside the base of building 31's footing. After installation of the slope, the vadose zone soil in areas north of building 31 will be excavated.

It is anticipated that the entire shoring activity, including soil excavation and handling, will take up to four weeks. After this has been completed, remaining saturated soils will be excavated. Shoring on other sides of the excavation will consist of benching and over-excavating with a 1.5:1 horizontal to vertical slope.

Upon completion of excavation/backfilling, counterforts will be removed and soldier piles will be cut flush to the surface.

6.6 Excavation Dewatering

Dewatering of the excavation will consist of using one or more sump pumps installed at the bottom of the excavation on the S-W property. Water collected within the sump(s) will be pumped to the Dewatering Equipment Storage and Pretreatment Unit, and subsequently the groundwater treatment system (Figure 6-1). By pumping water from sumps installed on the S-W property, the water table on the S-W property will be lower compared to the former Rifkin property, inducing groundwater flow towards the S-W property. As a result, contaminated groundwater from the S-W property will not migrate towards the former Rifkin property. Based on groundwater pump tests conducted at the Site, it is anticipated that a maximum of 10 gallons per minute of groundwater will be generated from the dewatering system.

Groundwater extracted from the sump will be conveyed into a dewatering settling tank system (the Dewatering Equipment Storage and Pretreatment Unit) and subsequently pumped to the existing and/or a new groundwater treatment system prior to discharge to Temescal Creek or to the POTW under permit, or transported

offsite for treatment and disposal/reuse. Figure 6-1 presents the preliminary locations of the pretreatment and treatment units. The final layout is subject to refinements during preparation of the RDIP and will be established by the remediation contractor.

The excavation dewatering activities will be limited to the A-zone aquifer and are anticipated to have a de minimis effect on the distribution of contaminants in groundwater near the Site.

6.7 Soil Excavation and Handling

Approximately 57,000 cubic yards of soil will be excavated for off-site disposal. Some of the excavated soil is anticipated be hazardous waste and will require transport under hazardous waste manifests to an appropriate disposal facility. The RDIP will present the techniques, supplies, and equipment to conduct the excavation and soil handling activities. The RDIP will be provided to DTSC for review prior to remedy implementation.

The types of heavy equipment needed during soil excavation are anticipated to include:

- Tracked diesel-powered excavators;
- Front-end loaders, for managing stockpiles and placing excavated soil into a dump truck;
- Two or more 25-yard off road dump trucks, for transporting soil from the excavation to the stockpile staging area;
- Dewatering system including sump within the excavation, above-ground pump, settling tank system, and groundwater treatment system (treated water will be discharged to Temescal Creek);
- Water trucks for spraying/misting for dust control; and
- Foam unit for applying vapor suppressant foam.

Vadose zone soil on the S-W and former Rifkin properties will be excavated in order to achieve the vadose zone soil cleanup for arsenic of 24 mg/kg on each property. The planned vadose zone excavation limits are presented on Figure 6-1. The planned limits of soil excavation extend approximately 285 feet along Horton Street (60 feet on the former Rifkin property and 225 feet on the S-W property) and approximately 330 feet west of Horton Street, or approximately 95,000 square feet. In addition, elevated detections of arsenic in vadose zone soil are present at locations outside these limits, including SA-AH-01 (110 mg/kg), SB-7AB (130 mg/kg), CDM-SB50 (200 mg/kg), and SA-BH-04 (211 mg/kg). Vadose zone soil surrounding these locations would also be removed to a radius of 10 feet surrounding each location. The vadose zone soil would

be excavated to an average depth of approximately 7.5 feet, the approximate depth to groundwater across this area.

Confirmation sampling and analysis, as described in Appendix H, would be conducted to confirm that the vadose zone soil cleanup goal for arsenic is met. In order to meet this goal, additional, excavation beyond the limits presented above may be needed.

In addition to vadose zone soil, the excavation includes removal of saturated zone soil identified as source of COCs to groundwater (CDM, 2009b). The planned saturated zone excavation limits are presented on Figure 6-1. The source area saturated soils would be removed down to the A/B aquitard (approximately 25 feet bgs) on the S-W property and to 18 feet bgs on the former Rifkin property. Confirmation of final source area removal extents will be based on geologic observation for permeable materials along the sidewalls of the excavation below the groundwater table.

6.8 Waste Stockpiles

Waste stockpiles will be used during remedy implementation. The design criteria for managing the stockpiles will be detailed in the RDIP and is anticipated to include the following:

- The waste stockpiles will be located on the former Building 35 concrete slab.
- If additional area is needed, additional waste stockpiles will be located on areas covered by existing asphalt pavement, as shown on Figure 6-1. The final layout is subject to refinements during preparation of the RDIP and will be established by the remediation contractor.
- This exterior paved area will first be inspected for cracks, and repairs will be made as necessary to create or maintain an integral surface.
- Berms and lined cement barriers (i.e., k-rails) will be constructed around the waste stockpile area as needed to control possible water run-on and runoff. The existing surface grade and pumping system will be used to control and capture water. The design of berms around these areas, and the construction supplies used for the berms & barriers, will be provided in the RDIP.
- Any accumulated water within the bermed area(s) will be pumped into a dewatering settling tank and subsequently pumped to the groundwater treatment system prior to discharge or off-site disposal.
- Waste stockpiles will be covered with nylon-reinforced polyethylene or sprayed with stabilizing foam each night, on weekends, and all other non-work days, or when the pile is not being actively worked. If polyethylene covers are used they will be secured with ties or a sufficient number of sandbags or other weighted objects designed to keep the cover in place.

- While the stockpiles are in operation, the berms and cover will be inspected several times daily, including non-work days, to detect evidence of tears, loose seams, punctures, and the presence of water and proper functioning of water collection and removal systems.

The use of waste stockpiles is intended to accommodate scheduling imbalances between relatively continual excavation activity and intermittent loading and transport as well as allow for sampling and profiling as described in Appendix I. It is anticipated that the volume of stockpiled material will be equivalent to 5 days of excavation, i.e., up to an estimated 5,000 cubic yards. If the rate of accumulation exceeds this amount, excavation activities will be slowed down and, if possible, loading and transport activities will be accelerated until material handling flow rates are approximately equal.

6.9 Loading and Off-Site Transport

Materials removed from the Site for off-site disposal is anticipated to vary in waste classifications. The determination of waste classifications will be made in accordance with applicable regulations and disposal facility acceptance criteria.

The testing, manifest tracking, and record-keeping requirements will be conducted in accordance with Title 40 CFR Section 268.7 and 22CFR Chapter 18, Article 332 CCR. A manifest will be generated for each load of hazardous waste leaving the Site. The weight of material will either be recorded by on-site scales, or will be estimated at the Site and confirmed by weigh tickets generated at the receiving disposal facility. The manifest will be signed by an authorized S-W representative or agent and will accompany the load of material to the disposal facility.

Materials removed from the Site will be transported by rail and/or truck. The RDIP will identify the techniques, supplies, and equipment needed to perform the loading and transport of the materials. The RDIP will be provided to DTSC for review prior to remedy implementation. General descriptions of loading and transport activities for each transport modes are discussed below.

6.9.1 Rail Car

To the extent possible, materials removed from the Site will be loaded into rail cars for transport for off-site disposal. Rail cars may be loaded on the existing spur track within the Site as shown on Figure 6-1. However to maintain efficient production, an additional rail spur on the S-W property may be needed. To the extent rail cars can be used for off-site transport, S-W will work with UPRR and the transport/disposal contractor to utilize the UPRR Emeryville Yard tracks for rail car staging. Both empty rail cars and rail cars containing excavated soil would be staged at the UPRR Emeryville Yard tracks.

The estimated duration of rail car loading is dependent on the availability and location of the rail cars.

It is anticipated that off-site transport of some portion of the materials removed from the Site may occur by truck. Not all disposal facilities accept material by rail car as they are not located along railroads.

6.9.2 Truck

Figure 6-1, Preliminary Site Layout and Controls, depicts the plan for trucking of excavated materials off-site and the trucking of clean backfill onto the Site. The final layout is subject to refinements during preparation of the RDIP and will be established by the remediation contractor.

If all materials removed from the Site were to be trucked, the duration for truck loading and off-site transport is estimated at 9 to 18 weeks. This duration is based on the approximate 64,000 cubic yards of materials to be excavated, an in-place material density of 1.4 tons per cubic yard, 20 tons of material per truckload, and 50 to 100 truck trips per day. The actual rates of loading will vary due to on-site logistics and/or truck availability.

Material will be loaded into truck trailers, which will be covered and secured prior to leaving the Site to limit dust or odor emissions. Truck and trailer wheels will be decontaminated and inspected prior to leaving the Site. A Transportation Plan will be prepared in accordance with Health and Safety Code Section 25169.3 and DTSC's Guidance for Developing Transportation Plans for Removal or Remedial Actions (DTSC, 2001). The Transportation Plan will present the procedures to be used by the hauler to protect the public during the transportation process. Specific aspects to be addressed in the Transportation Plan include: container selection, Site entry and egress, routing and supervision of transportation activities. The Transportation Plan will be included in the RDIP for review and approval by DTSC.

It is anticipated trucks will approach the Site northbound on Halleck Street to Sherwin Avenue, and then enter into the property, as shown on Figure 6-1. Once on-site, the trucks will follow roadways identified by the contractor. It is anticipated that loaded trucks will leave through the plant truck entrance north of former building 35, cross the easement on the City's property and proceed southbound on Halleck Street, across Park Avenue, under 40th Street, and south to 32nd Street. From 32nd Street, trucks will access Mandela Parkway to Grand Avenue and freeway connections. Necessary traffic or encroachment permits for use of these streets will be obtained from the Cities of Emeryville and Oakland. Figure 6-3, Preliminary Truck Transportation Route Map, shows the regional truck route anticipated for transport of excavated materials from the Site and backfill to the Site.

6.9.3 Decontamination

A decontamination station will be setup (see Figure 6-1) at the Site. During excavation and material handling activities, equipment and vehicles will be decontaminated and inspected prior to leaving the Site. Trucks, rail cars, and equipment will be decontaminated using dry brush and/or wet rinsing. Rinse water will be collected, tested, and disposed of in accordance with applicable regulatory

requirements. Trucks, rail cars, and equipment exiting the Site will be inspected and logged for compliance with the Site decontamination requirements.

6.10 Slurry Wall Breach and Extension

As excavation and backfill operations are nearing completion, the slurry wall will be breached in two locations along the western, down gradient property boundary and one up gradient location near the north end of former building 35, and extend the existing slurry wall south along the western property boundary to Sherwin Avenue (see Figure 6-1). The detailed design for the slurry wall breaches and extension will be provided to DTSC prior to remedy implementation as part of the RDIP. General descriptions of these activities are discussed below.

The existing slurry wall will be breached to provide an outlet for groundwater that accumulates within the formerly closed slurry wall system, or to provide a pathway for groundwater flow from areas outside the formerly closed slurry wall system into these areas, specifically the arsenic-impacted groundwater in the vicinity of well LF-3.

The slurry wall breaches will consist of three components: an upgradient collection zone; a connector zone crossing the existing slurry wall; and, a distribution zone to disperse the flow back into the regional flow system. The locations for the slurry wall breaches have been selected to be placed in areas where permeable soils are present to provide a hydraulic connection with the existing groundwater flow. Figure 6-1 presents the locations of the breaches and Figure 6-3 presents details of the slurry wall breaches.

The upgradient, or the collection portion, of the breach system will be excavated to the top of the A/B aquitard, using an appropriate method to maintain the stability of the excavation and allow placement of a high permeability backfill (i.e., a graded sand or gravel) and drain pipe. A drain pipe will be placed at a depth of 5 feet below the seasonal low water table (approximately 0 feet NAVD88). This collector trench will be installed a minimum of 10 feet upgradient of the confirmed location of the existing slurry wall, approximately parallel to the orientation of the wall. The downgradient distributor trench will be constructed in a similar manner on the downgradient side of the existing slurry wall. This distributor trench will overlap the upgradient collector trench by approximately 30 percent of its length. Two to three connector trenches will be excavated, using the same methods, to a minimum depth of 2 feet below the elevation of the drain pipe in the collector and distributor trenches (approximate trench bottom elevation of -2 feet NAVD88). These connector trenches will be excavated to cross the slurry wall at a right angle, and intersect the collector and distributor trenches. The connector trenches will also include the drain pipe, which will either be directly connected to the drain pipes in the adjacent trenches, or be placed in contact with the other lines in the open trench to allow efficient hydraulic communication between all segments of the breach system.

The backfill in the breaches will consist of a graded sand or gravel to control the potential mobilization of fines from the formation into the trenches. The permeability of this backfill will be specified at a minimum of 500 ft/day. Piezometers will be installed into the collector and distributor trenches to allow monitoring of the hydraulic performance of the breaches.

The slurry wall breach backfill will be delivered by truck. It is estimated 35 truckloads of backfill will be needed for the breaches.

In conjunction with the breaching operation, the existing slurry wall will be extended south along the western property boundary to Sherwin Avenue (see Figure 6-1). This wall extension will modify groundwater flow through the upgradient slurry wall breaches. It is anticipated that this slurry wall will be constructed using a long reach tracked excavator and the installation of a bentonite slurry mixture or flexible membrane. As with the breaches, the excavated material will be sampled and if found acceptable will be reused on-site. If off-site disposal is required and the material is transported by truck, approximately 70 truckloads will be required. On-site mixing and staging of bentonite slurry may be performed in the area designated as the waste staging area (see Figure 6-1). The importation of the bentonite slurry will require the delivery of approximately 70 truckloads.

Together, the three slurry wall breaches, surrounding existing slurry wall segments along Temescal Creek channel and UPRR tracks, and the slurry wall extension will be used to control groundwater flow at the Site. The other existing slurry wall segments that will remain after remedy implementation, along the former Rifkin property boundary and within the Site, are not required to maintain appropriate groundwater flow conditions. Groundwater monitoring to assess the performance of the slurry wall segment and breach system is discussed in Section 7.

6.11 Excavation Backfilling

Backfilling below the groundwater table will occur concurrently with excavation. Geotechnically appropriate backfill will be delivered to the Site in trucks or rail cars. Figure 6-3, Preliminary Truck Transportation Route Map, shows the regional truck route proposed for transport to and from the Site.

If possible, backfill will be brought to the Site in the trucks or rail cars used for off-site disposal of excavated materials. Backfill stockpiles will be kept separate from the waste stockpiles (see Figure 6-1). The RDIP will present the techniques, supplies, and equipment needed to perform the backfilling activities.

Truck traffic into and out of the Site will follow the Transportation Plan and as described in Section 6.9. Import fill will be unloaded on-site. It is anticipated that one or more loaders and 25-yard off road trucks will be used to move fill from the stockpile area to the excavation for placement and compaction.

As shown on Figure 6-1, the majority of the areas undergoing excavation will be backfilled with low-permeability backfill (approximately 0.283 ft/day). The remaining area will be backfilled with high-permeability fill backfill (approximately 28.3 feet/day). The high-permeability backfill will be placed downgradient of an interceptor trench and will serve to collect and distribute groundwater into the surrounding formation. During backfill operations of the saturated zone, a reagent (e.g., organic-based tannin or inorganic powdered sulphite) will be added with the backfill. The purpose of the reagent is to act as an oxygen scavenger to control oxidation-reduction conditions in the subsurface. Increased oxidation has the potential to mobilize solid phase arsenic that may be present in the surrounding, natural formation. The reagent will be selected to minimize potential detrimental impacts to the soil or groundwater quality and to avoid generating odors. The RDIP will present the techniques and equipment needed to confirm the backfill operations meet the designed permeability values.

As part of the selected remedy, a contingency would be to pump from the high-permeability backfill and/or trench, if needed, to direct groundwater flow toward the S-W property. As such, backfill design considerations for both the S-W property and the former Rifkin property will be included as part of the RDIP.

During backfill operations, an interceptor trench will be placed on the S-W property, adjacent to the S-W/Rifkin property boundary as shown on Figure 6-1. A membrane barrier will be placed on one side of the trench, along the property boundary, to prevent groundwater flow toward the former Rifkin property. The trench will be approximately 30 inches wide, approximately 25 feet deep and be located as shown on Figure 6-1. The trench will be backfilled with 3/8 inch minus backfill and contain a basal perforated pipe to reduce flow resistance from the backfill. With this design, the trench will have an effective permeability of approximately 500 ft/day. The trench will be closed on the Horton Street side with the membrane barrier. The membrane barrier will be tied into the aquitard without compromising its integrity, i.e., the excavation will be limited in extent and, as appropriate, conducted through slurry to maintain adequate downward force to prevent heaving.

Final surface elevation following excavation and backfill will conform to redevelopment plans, if appropriate, and/or target Site elevations, to the extent practical. If redevelopment construction will not immediately follow completion of remedy implementation, then the S-W property will be graded to an elevation consistent with the Horton Street sidewalk and the adjoining Site elevation along the rail spur. The area will be sloped and re-paved and/or vegetated, and would direct water runoff along the Site surface towards the Temescal Creek channel. The remaining portions of the spur track outside of the excavation limits will be removed and/or paved as part of remedy implementation. The former Rifkin property will be backfilled to a final elevation consistent with the remaining parking area, repaved, and striped.

6.12 Reporting

During remedy implementation activities, summaries of work activities will be provided to DTSC. These summaries will include material excavation locations, results from waste characterization of excavated materials, results from confirmatory soil samples, and results from air monitoring and sampling.

After remedy implementation is completed, a completion report will be prepared and submitted to DTSC. The report will document all activities performed, including definition of the actual extent of excavation, collection of soil samples, classification and/or treatment of waste, final disposition of waste, air monitoring and sampling, and all analytical reports of waste characterization, soil confirmatory samples, and air sampling.

Photographic documentation will be provided including pictures of excavated materials prior to removal and the final configuration of the excavation. The report will detail deviations from this RAP or the RDIP, if any, and provide an explanation for the deviations.

Table 6-1
Summary of Engineered Controls for Short-Term Exposure Risks
Sherwin-Williams Emeryville Remedial Action Plan

Implementation Activity	*Dust Control*	*Vapor Control*	*Surface Water Runoff Control*
Excavation	Water sprays/mist, surfactants, wetting agents, dust suppressants, covers, and windscreens.	Water spray/mist, vapor suppressant foam, covers, and vapor extraction and treatment.	Water runoff entering excavation will be pumped to holding tanks and pretreatment prior to being routed to a groundwater treatment system along with other water from excavation dewatering.
Shoring	Water spray/mist system.	Shroud over auger to collect vapors and direct vapors through treatment system, if needed, and/or use of vapor suppressant foam or vapor oxidation media will be applied.	Berms will divert surface water runoff contacting Site materials towards the excavation so it may be collected and sent to groundwater holding and treatment system.
Stockpiling and Handling	Water spray/mist; covers on stockpiles; slow vehicle speeds to control dust.	Vapor suppressant foam, vapor oxidation media, covers, and vapor extraction and treatment.	Berms and lined k-rail barriers will divert water runoff from contaminated stockpiles towards the excavation so it may be collected and sent to groundwater holding and treatment system. Berms and k-rail will divert water runoff from clean backfill stockpiles through filter system for discharge to surrounding storm water system.
Loading	Water spray/mist; covers over loaded trucks and/or rail cars; slow vehicle speeds to control dust; minimize drop heights during loading.	Bag contaminated soils in transports. Covers over loaded trucks and/or rail cars; minimize drop heights during loading.	Berms will divert water runoff contacting contaminated Site materials towards the excavation so it may be collected and sent to groundwater holding and treatment system.
Backfilling	Water spray/mist.	Not Applicable.	Berms will divert water runoff away from the excavation. Excess precipitation into the excavation will be pumped so it may be collected and sent to groundwater holding and treatment system.

Section 7
Post Remediation Monitoring

This section presents descriptions of the anticipated post remediation activities. These activities will include OM&M of installed components, including a Land Use Covenant (LUC); groundwater monitoring; remedy effectiveness evaluation; and, annual reporting.

7.1 Operations, Maintenance, and Monitoring Program

Along with the remedy implementation completion report (as discussed in Section 6.12), an Operations, Maintenance & Monitoring Plan ("OM&M Plan") will be submitted to DTSC after remedy implementation. The OM&M Plan will outline provisions for long-term operations, maintenance, and monitoring (OM&M) of installed components of the remedy. These components include the surface cover, slurry wall and breach system, interceptor trench with membrane barrier, groundwater monitoring well network, and a LUC. A draft of the OM&M Plan will be included with the RDIP for DTSC review.

The OM&M Plan will present background information on Site conditions, remedial actions, and residual COCs in the subsurface above cleanup goals. The OM&M Plan will include Site maps depicting areas of known subsurface COC extents. The OM&M Plan will provide a soil gas evaluation strategy, soil management plan and updated construction HASP for potential post-remediation activities (e.g., Site development). The OM&M Plan will include financial assurance for OM&M of the installed components and an agreement between Site property owners for continued access.

7.1.1 Soil Gas Evaluation

The OM&M Plan will outline the strategy, locations, methods, and protocols for evaluating soil gas conditions at the Site after excavation and backfilling are completed. In addition, the plan will include appropriate engineering controls that would be implemented as part of redevelopment if post-excavation sampling reveals that residual soil gas is present above indoor air protective levels. Engineering controls could include: increased building indoor air ventilation; sub-slab depressurization; and/or vapor barriers in combination with other controls.

7.1.2 Soil Management

During post-remediation activities (e.g., Site development) and OM&M, soil and/or groundwater containing residual Site COCs may be encountered. The OM&M Plan will outline the procedures for managing soil and groundwater generated from Site activities, including: dust control; excavated soil stockpile management; soil sampling procedures and disposition characterization procedures; and, groundwater dewatering and treatment. In addition, the OM&M Plan will outline procedures for implementing storm water pollution control measures at the Site during construction

activities and Site maintenance activities. Best management practices to control storm water runoff at the Site will include, where necessary: 1) covering of soil stockpiles; 2) berming the Site to contain runoff; 3) installation of storm drain filters to remove sediments prior to discharge; and 4) installation of hay bales at appropriate locations to contain storm water runoff and to enhance settling of solids. The OM&M Plan will include a listing of agencies to be notified prior to initiating onsite activities, which may expose or disturb soil or groundwater containing residual Site COCs.

7.1.3 Health and Safety

The HASP will address worker health and safety during implementation of future activities that require excavation in areas of the Site where residual COCs are present. The HASP will provide personal air monitoring requirements during subsurface activities, dust control, and PPE. The HASP will be prepared in accordance with Occupational Health and Safety Administration (OSHA) 29 CFR 1910.120 guidelines and Title 8 CCR Section 5192. The HASP will be submitted separately detailing health and safety procedures, compliance with OSHA and air monitoring during construction.

7.1.4 Site Maintenance

Current and future owners, occupants, managers, and contractors, who are delegated or authorized to perform property maintenance or construction will be required to comply with the measures identified in the OM&M Plan for long-term maintenance of the Site. The provisions of the Site maintenance will also be incorporated into the LUC.

7.1.5 Land Use Covenants

As part of the OM&M Plan, Land Use Covenants (LUCs) will be recorded to identify specific land use restrictions associated with the Site. The LUCs will preclude owners, operators or occupants of the property from drilling, boring, or otherwise encountering the water table through excavation or other means unless expressly permitted in writing by the DTSC.

The LUCs will require that the Site be developed in a manner that maintains and preserves the integrity of the remedy, allows OM&M of installed features of the remedy, controls potential future human exposure to residual COCs in the subsurface, and controls potential future pathways from the Site to Temescal Creek channel (e.g., storm sewers). The LUCs will also require future utilities to be placed above the groundwater table, or with engineering controls if below the groundwater, to limit potential preferential movement of groundwater toward Temescal Creek channel along the utilities. Future development must be consistent with the assumptions for future use of the Site that were developed to constrain the groundwater model design conditions on which the remedy is based, particularly for implementation of natural attenuation to achieve the cleanup goals within a reasonable time period (CDM, 2009b).

The LUCs will be designed so that future owners/occupants will not have direct contact with the shallow groundwater during either redevelopment or future use unless permitted in writing by the DTSC. The LUCs will include language that indicates owners or occupants of the property should not drill, bore, otherwise construct, or use a well for the purpose of extracting water for any use, including, but not limited to, domestic, potable, or industrial uses, unless expressly permitted in writing by the DTSC. It will also require access to and non-interference with installed features of the remedy and the groundwater-monitoring network. In addition, the LUCs will also require unfettered access to and non-interference with the DTSC's access to the Site to conduct inspections, surveillance, monitoring or other activities necessary to protect public health safety or the environment.

Engineering controls will be used to support the LUCs. When the Site is developed, engineering controls will be used to limit surface water infiltration and potential exposure to residual COCs at the Site. Engineering controls will consist of the use of hardscape surfaces, including soil, asphalt, concrete, aboveground planters and building foundations.

The LUCs will not preclude redevelopment of the former Rifkin property in a manner consistent with the Novartis (formerly Chiron) Preliminary Development Plan (PDP) approved by the City of Emeryville on June 7, 1996. The PDP includes a high-rise tower option with installation of piles and pile caps (CDM, 2009b).

7.2 Groundwater Monitoring Program

A Groundwater Monitoring Plan will be prepared that outlines provisions for a long-term groundwater monitoring program. The purpose of the groundwater monitoring program is to collect data to evaluate the effectiveness of the soil excavation, backfill, and slurry wall breaches/extension. The effectiveness of this remedy will be evaluated based on its ability: (1) to promote natural attenuation of residual COCs in groundwater, primarily arsenic; (2) to achieve Site cleanup goals within a reasonable timeframe; and (3) to control groundwater movement through the Site without producing long-term groundwater mounding.

The groundwater monitoring program will consist of:

- Designation of a well network;
- Collection and evaluation of depths to groundwater and concentrations of COCs in groundwater in the well network;
- Development of criteria and methodologies to evaluate data that are collected; and
- Development of contingency actions with a decision framework for their initiation.

To the extent feasible, depths to groundwater and concentrations of COCs will be evaluated in the same monitoring well network. Statistical analysis will be used to

evaluate trends in the concentration data. The depth to groundwater, and COC concentrations and concentration trends will be evaluated to determine if contingency action(s) are needed to achieve Site cleanup goals.

Based on the timing and nature of future redevelopment and future construction activities, and/or results from the groundwater monitoring program, it may be necessary to modify the groundwater monitoring network or monitoring requirements at some point in the future. As such, at any time after implementation of the remedy, S-W may provide written recommendations to DTSC to modify the groundwater monitoring program presented in this document. S-W will implement the changes to the groundwater monitoring program only after approval by DTSC.

7.2.1 Groundwater Monitoring Well Locations

After soil excavation, backfill, and installation of slurry wall breaches/extension, twelve (12) additional groundwater monitoring wells (CDM-101 thru CDM-112) and three piezometers (PZ-101, PZ-102, and PZ-103) will be installed at the Site. Also, a contingent groundwater monitoring well (CDM-113) may be installed (see Section 7.2.2.1). In addition, 27 existing Site monitoring wells will continue to be utilized as part of the groundwater monitoring network. Figure 7-1 provides the tentative locations for these 12 additional groundwater monitoring wells, the contingent monitoring well, and 3 additional piezometers, along with the existing monitoring wells that will remain.

Tables 7-1 and 7-2 provide a summary of construction details and locations for the wells to be included in this monitoring program during and after remedy implementation, respectively. As discussed in Section 5 of the RAP, all other existing wells associated with the Site will be destroyed prior to remedy implementation. Table 5-1 provides a listing of wells that will be destroyed. Proposed additional groundwater monitoring wells on the former Rifkin property will be installed at the same time that the proposed wells on the S-W property are installed, unless the property owner initiates redevelopment on the former Rifkin property that would require a separate installation schedule.

The new groundwater monitoring wells will be similar in construction to the remaining A-zone wells present at the Site. Specifically, they will be 2-inch diameter wells screened across the upper portion of the A-zone, approximately 10 feet in total screen length from an elevation of approximately 8 to -2 feet NAVD88 (North American Vertical Datum of 1988). The new piezometers will be 1 inch in diameter, screened across the upper portion of the A-zone, approximately 10 feet in total screen length from an elevation of approximately 8 to -2 feet NAVD88. For selected monitoring wells, soil boring and grab groundwater investigations in these respective well location areas may be conducted after remedy implementation to confirm the locations and design of the wells prior to their installations.

7.2.1.1 Excavated and Backfilled Area on Former Rifkin Property

Two (2) of the new proposed wells (CDM-101 and CDM-102) will be installed within the excavated and backfilled area on the former Rifkin property, at or near the locations shown on Figure 7-1. CDM-101 and CDM-102 will be installed within low permeability fill.

7.2.1.2 Excavated and Backfilled Area on S-W Property

Two (2) of the new proposed wells (CDM-103 and CDM-104) and the new proposed piezometer (PZ-101) will be installed within the excavated and backfilled area on the S-W property, at or near the locations shown on Figure 7-1. PZ-101 and CDM-103 will be installed within low permeability fill and CDM-104 within high permeability fill.

7.2.1.3 North Side on Former Rifkin Property

Selected existing wells on the former Rifkin property located outside of the excavated and backfilled area will be retained (see Figure 7-1). These existing wells to be retained are: EX-14, EX-15, LF-35, LF-36, LF-37, LF-38, LF-39, LF-40, LF-41, LF-42, MW-1, MW-2, MW-3, RP-1, RP-2, RP-3, RP-4, and RP-5. Six (6) of these existing wells on the former Rifkin property (RP-1, LF-41, LF-36, RP-2, RP-4, and RP-5) will be used as "Rifkin Guard Wells" to verify that additional migration of arsenic and other S-W COCs is not occurring northward across the former Rifkin property.

These wells discussed above are located outside and to the north of the excavated and backfilled area, and will be protected during remedy implementation.

7.2.1.4 North Side on Horton Street

Six existing wells on Horton Street will be retained: LF-12, LF-13, LF-27, LF-28, LF-29, and LF-30 (see Figure 7-1). These wells are located outside and upgradient or cross gradient to the excavated and backfilled area on the SW property and former Rifkin property. Of these wells, LF-12 and LF-28 will be utilized to monitor conditions not affected by the source area.

7.2.1.5 Central Site on S-W Property

Two (2) of the new proposed wells (CDM-105 and CDM-106) will be installed in the central area of the S-W portion of the Site, at or near the locations shown on Figure 7-1. Based on groundwater modeling of conditions after remedy implementation, as presented in Appendix B of the FS (CDM, 2009b), these wells are projected to be downgradient of excavated and backfilled area wells CDM-103 and CDM-104 and upgradient of the slurry wall breaches.

In addition, two (2) of the new proposed wells (CDM-110 and CDM-111) will be installed outside and cross gradient to the excavated and backfilled area on the S-W property, at or near the location shown on Figure 7-1. These proposed wells will be utilized to monitor conditions not affected by the source area.

Two (2) new proposed piezometers will be installed, one near the northeast corner of the S-W property (in the vicinity of existing piezometer LF-PZ-15) and one west of Building 31 (in the vicinity of existing piezometer LF-PZ-11). The piezometers will assist with evaluating the groundwater movement patterns.

7.2.1.6 West Side on S-W Property

Two (2) of the new proposed wells (CDM-107 and CDM-108) will be installed within the downgradient portions of the slurry wall breach locations, at or near the locations shown on Figure 7-1. These two wells will be located within the S-W property.

In addition, one (1) of the new proposed wells (CDM-109) will be installed west, on the downgradient side, of the slurry wall extension, at or near the location shown on Figure 7-1. This proposed well will be located within the S-W property.

7.2.1.7 West Side on Union Pacific Railroad Property

Existing wells LF-24 and LF-25, located on the western, downgradient side of the Union Pacific Railroad property, will be retained (see Figure 7-1). Based on groundwater modeling of conditions after remedy implementation, as presented in the FS (CDM, 2009b), wells LF-24 and LF-25 are projected to be downgradient of wells CDM-107, CDM-108, and CDM-109, and upgradient of the Temescal Creek channel.

7.2.1.8 North Side on S-W Property

Existing well LF-18 on the S-W property will be retained (see Figure 7-1). LF-18 is located outside of the slurry wall system, near the Temescal Creek channel.

7.2.1.9 South Side on Sherwin Avenue

One (1) of the new proposed monitoring wells (CDM-112) will be installed along Sherwin Avenue, at or near the location shown on Figure 7-1. The well will be used to constrain the southern plume extent and assist with evaluating the groundwater movement patterns.

7.2.2 Monitoring Frequency and Sample Analysis

This section presents the monitoring and analysis programs 1) during remedy implementation and 2) for the first four years after remedy implementation.

7.2.2.1 Groundwater Quality Sampling and Analysis

During Remedy Implementation

Table 7-1 provides a summary of the groundwater well monitoring program during remedy implementation.

Dewatering during soil excavation and backfill is expected to temporarily alter groundwater movement paths and, as a result, may draw impacted, upgradient groundwater onto or further onto the former Rifkin property (i.e., drawing groundwater from the east side of Horton Street towards the former Rifkin property). This water movement may also result in the movement of offsite chemical(s) toward

the former Rifkin property. As such, the six Rifkin Guard Wells and well MW-3, which are located closest to apparent source(s) of upgradient, offsite plume(s), will be sampled quarterly during remedy implementation. Results from these samples will be used to assess potential impacts to groundwater on the former Rifkin property from potential spreading of upgradient, offsite plume(s). Any changes in arsenic concentrations for these seven wells that occur during remedy implementation can thus be evaluated.

Groundwater samples from these seven wells will be collected in accordance with methodology for well sampling presented in the existing project Groundwater Monitoring Plan Assessment (LFR, 2006a) and Quality Assurance Project Plan (LFR, 2006b). The samples will be analyzed for arsenic by EPA Method 6010B and VOCs by EPA Method 8260B. In addition, the samples will be measured for the following field parameters during sample collection:

- Temperature
- pH
- Turbidity
- Dissolved Oxygen
- Oxidation-Reduction Potential
- Specific Conductivity

The field parameter results will be used to support the representativeness of the well samples and monitor the relative distribution of oxidizing/reducing conditions.

After Remedy Implementation

Table 7-2 provides a summary of the groundwater well monitoring program after remedy implementation.

With the exception of wells CDM-103, CDM-104, and CDM-112 which will be sampled annually, new monitoring wells installed on the S-W property will be sampled on a semi-annual basis for the first two years after remedy implementation. Following these two years, data from the well samples and the data quality objectives will be used to determine if semi-annual sampling should continue or whether the frequency can be reduced to annual.

If the arsenic concentration for a Rifkin Guard Well or well MW-3 increases above its respective historical maximum detection during remedy implementation, the frequency of groundwater sampling for that well will continue on a quarterly basis after remedy implementation. Quarterly sampling for the well will continue until statistical analysis of the results demonstrates that the arsenic concentration for the well is stable or decreasing; the frequency of sampling for the well will then be

adjusted to semi-annual. Historical maximum arsenic detections for the Rifkin Guard wells and well MW-3 are listed in Table 7-1.

If no increases in arsenic concentrations are observed for these seven wells during remedy implementation, the frequency of groundwater sampling and analysis for arsenic for the Rifkin Guard Wells and all other Site wells for the first four years after remedy implementation will be in accordance with Table 7-2.

If arsenic concentrations in groundwater samples collected from any of the six Rifkin Guard Wells or well MW-3 increase to greater than 500 µg/L during remedy implementation, an additional monitoring well (to be designated CDM-113) would be installed on the former Rifkin property, near former grab groundwater sampling locations RP-BH-012 and CDM-SB1, approximately 120 feet northwest of MW-3 along Horton Street. Well CDM-113 would be similar in construction to the 10 proposed new wells for the Site and would monitor the migration of arsenic in groundwater that could have been pulled onto the former Rifkin property from upgradient, offsite plume(s) during remedy implementation. The frequency of groundwater sampling for CDM-113 would be on a quarterly basis until such time that the data demonstrate that arsenic concentrations are stable or decreasing for CDM-113. The frequency of sampling would then be adjusted to semi-annual.

Groundwater samples will be collected in accordance with the methodology for well sampling presented in the existing project Groundwater Monitoring Plan Assessment (LFR, 2006a) and Quality Assurance Project Plan (LFR, 2006b). The samples will be analyzed for arsenic by EPA Method 6010B and VOCs by EPA Method 8260B. In addition, the samples will be measured for the following field parameters during sample collection:

- Temperature
- pH
- Turbidity
- Dissolved Oxygen
- Specific Conductivity
- Oxidation-Reduction Potential

The field parameter results will be used to support the representativeness of the well samples and monitor the relative distribution of oxidizing/reducing conditions.

7.2.2.2 Depth to Groundwater Measurements

During Remedy Implementation

Table 7-1 provides a summary of the groundwater well monitoring program during remedy implementation.

Dewatering during soil excavation and backfill is anticipated to alter groundwater movement paths and, as a result, may draw upgradient, offsite plume(s) onto or further onto the former Rifkin property. As such, groundwater elevation data will be collected monthly from the six Rifkin Guard Wells and well MW-3. These seven wells are located closest to apparent source(s) of upgradient, offsite plume(s). The monthly data sets will be used to assess potential impacts to groundwater movement conditions on the former Rifkin property regarding potential spreading of upgradient, offsite plume(s) and potential changes in arsenic concentrations for these seven wells.

After Remedy Implementation

Table 7-2 provides a summary of the groundwater well monitoring program for the first four years after remedy implementation.

As the remedy has been designed to control groundwater movement, groundwater elevation data will be collected monthly for the first year from the six Rifkin Guard Wells and well MW-3 to monitor whether groundwater movement patterns are consistent with projected design groundwater model conditions for the remedy, as presented in the FS (CDM, 2009b). The first year's data set will be used to evaluate the effectiveness of the slurry wall segments to divert groundwater, and the effectiveness of the slurry wall breaches to facilitate groundwater movement. After the first year, if groundwater elevations and movement patterns are consistent with projected design conditions, the frequency of groundwater elevation monitoring will be revised to quarterly. The quarterly elevation monitoring data sets will be utilized to continue evaluation of potential seasonal variation in groundwater movement. The frequency of groundwater elevation monitoring will be reevaluated annually.

Should future construction activities affect groundwater movement or rates of infiltration (e.g., redevelopment of the former Rifkin property or S-W property), monthly monitoring will be reinitiated during and post-construction for a period of at least one year to monitor whether groundwater movement patterns continue to be consistent with projected design groundwater model conditions.[1] If groundwater elevations and movement patterns are consistent with projected design conditions, groundwater elevation monitoring will return to its previously established frequency.

Changes to the frequency of groundwater elevation monitoring resulting from a determination that groundwater movement patterns are inconsistent with projected design conditions are further discussed in Section 7.2.5.3.

[1] Based on the type and location of future construction activities, there may be a future need to modify the groundwater monitoring network. As such, S-W may provide written recommendations to DTSC to modify the groundwater monitoring program presented in this document. S-W will implement the changes to the groundwater monitoring program only after approval by DTSC.

7.2.3 Groundwater Quality Effectiveness Criteria

After remedy implementation, samples from the groundwater monitoring wells will be analyzed to evaluate the effectiveness of the remedy. Table 7-3 provides a summary of the groundwater quality effectiveness criteria to be utilized to evaluate the effectiveness of the remedy. The criteria are discussed below.

7.2.3.1 Excavated and Backfilled Area on Former Rifkin Property

It is anticipated that COC concentrations in groundwater within this area will fluctuate after remedy implementation, as the groundwater comes into equilibrium with the backfill material and surrounding groundwater conditions. Samples from wells CDM-101 and CDM-102 will be analyzed to evaluate whether COC concentrations in groundwater in this area are stable or decreasing by no later than four years after remedy implementation. In addition, samples from these wells will be analyzed to evaluate whether arsenic concentrations in this area are less than 5,000 µg/L by no later than four years after remedy implementation.

7.2.3.2 Excavated and Backfilled Area on S-W Property

It is anticipated that COC concentrations in groundwater within this area will fluctuate after remedy implementation, as the groundwater comes into equilibrium with the backfill material and surrounding groundwater conditions. Therefore, samples from wells CDM-103 and CDM-104 will be analyzed to evaluate whether, COC concentrations in groundwater in this area are stable or to decreasing by no later than four years after remedy implementation.

7.2.3.3 North Side on Former Rifkin Property

Samples from the Rifkin Guard Wells will be analyzed to evaluate whether arsenic concentration trends are statistically stable or decreasing after remedy implementation.

7.2.3.4 Central Site on S-W Property

Samples from wells CDM-105 and CDM-106 will be analyzed to determine if there is potential movement of COCs in groundwater toward the west side groundwater monitoring wells CDM-107 and CDM-108.

Samples from wells CDM-110 and CDM-111 will be analyzed to determine if there is potential change in groundwater quality outside of the area affected by the excavated and backfilled area.

7.2.3.5 West Side on S-W Property

Samples from wells CDM-107 and CDM-108 will be analyzed to evaluate whether trends of COC concentrations in groundwater migrating offsite through the slurry wall breaches toward the Union Pacific Railroad property are statistically stable or decreasing, and whether arsenic concentrations exceed 250 µg/L for CDM-107 or 500 µg/L for CDM-108. These arsenic concentration criteria are based on protection of Temescal Creek channel and further discussed in Section 7.3.1.2.

Samples from well CDM-109 will be analyzed to evaluate the effectiveness of the slurry wall extension in containing the onsite groundwater plume and to evaluate whether trends of COC concentrations in groundwater present outside the slurry wall are statistically stable or decreasing.

7.2.3.6 West Side on Union Pacific Railroad Property

Samples from wells LF-24 and LF-25 will be analyzed to evaluate whether COC concentrations in groundwater near the Temescal Creek channel are less than Site cleanup goals or whether their trends are statistically stable or decreasing. Since installation in 1996, arsenic concentrations in samples from these wells have been stable or decreasing. Arsenic concentrations in samples from monitoring well LF-24 since the time of installation in 1996 have been less than 36 µg/L. Arsenic concentrations for LF-25 have been less than 36 µg/L since 2006 and are currently demonstrating a decreasing trend.

7.2.3.7 North Side on S-W Property

Samples from well LF-18 will be analyzed to evaluate whether COC concentrations in groundwater near the Temescal Creek channel are less than Site cleanup goals or whether their trends are statistically stable or decreasing.

7.2.3.8 South Side on Sherwin Avenue

Samples from well CDM-112 will be analyzed to evaluate whether COC concentrations in groundwater in this area are less than Site cleanup goals or whether their trends are statistically stable or decreasing.

7.2.4 Groundwater Movement Effectiveness Criteria

Table 7-3 provides a summary of the groundwater movement criteria to be utilized to monitor the effectiveness of the remedy. The criteria are further discussed below.

7.2.4.1 Groundwater Movement Patterns

Measurements of depths to groundwater in Site wells will be monitored to determine if long-term groundwater movement patterns within the S-W property are consistent with projected design groundwater model conditions for the remedy, as presented in the FS (CDM, 2009b), or as updated during preparation of the RDIP. These conditions include groundwater movement towards the slurry wall breaches and the absence of long-term, localized groundwater mounding.

7.2.4.2 Depths to Groundwater

Groundwater elevation measurements will be evaluated to determine if the depths to groundwater are sufficient to avoid a surface expression of groundwater with a goal of minimizing potential inundation of subsurface utility corridors.

7.2.4.3 Arsenic Mass Flux between CDM-101, CDM-102, CDM-104, and PZ-101

Groundwater elevation measurements, along with concentrations of arsenic in groundwater, from CDM-101, CDM-102, CDM-104, and/or PZ-101 will be evaluated to determine if the net arsenic mass flux within the excavated and backfilled area between the locations of these proposed wells is towards the S-W property west of the former Rifkin property.

As appropriate, the criterion of net mass flux towards the S-W property could be evaluated for other COCs. However, it is not likely to be needed for other COCs as their concentrations for these wells are anticipated to be approximately equal.

7.2.5 Remedy Effectiveness Evaluation

After remedy implementation, the groundwater monitoring data sets will be utilized to evaluate the effectiveness of the remedy and determine if contingency action(s) are needed to achieve Site cleanup goals. The following text summarizes the evaluation process and criteria to be used to determine the need for contingency actions.

7.2.5.1 Groundwater Quality for Wells CDM-101 thru CDM-104, CDM-107 thru CDM-109, CDM-112, LF-18, LF-24, LF-25, and Rifkin Guard Wells

COC concentration trends for these 17 wells will be evaluated by statistical testing, including but not limited to the Mann-Kendall (Gilbert, 1997) nonparametric statistical test. Consistent with U.S. EPA guidance (EPA, 1994), a significance level of 0.05 (i.e., a 95% confidence level) will be used in applying the Mann-Kendall nonparametric test. If an increasing COC concentration trend is found, the frequency of monitoring for the well will be increased to monthly for three months and the 95% UCL concentrations from these four events (the previous scheduled event and subsequent three monthly events) will be used in the Mann-Kendall nonparametric test in place of the previous quarterly event result. If this re-evaluation demonstrates a return to a stable or decreasing COC concentration trend, the frequency of monitoring for the well will return to its previously established frequency listed in Table 7-2. Otherwise, S-W will provide written recommendations to DTSC for implementation of a contingency action (see Section 7.3).

If during establishment of a statistical arsenic concentration trend for wells CDM-107 and CDM-108, arsenic concentrations exceed 250 µg/L for CDM-107 or 500 µg/L for CDM-108, S-W will provide written recommendations to DTSC for implementation of a contingency action (see Section 7.3). These arsenic concentration criteria are based on protection of Temescal Creek channel and further discussed in Section 7.3.1.2.

7.2.5.2 Groundwater Quality for Wells CDM-101 and CDM-102

If four years after remedy implementation the arsenic concentration threshold criterion of 5,000 µg/L is exceeded in samples from either wells CDM-101 or CDM-102, S-W will provide written recommendations to DTSC for implementation of a contingency action (see Section 7.3).

7.2.5.3 Groundwater Movement Patterns

An estimate of groundwater flow direction and hydraulic gradient will be performed following each groundwater elevation monitoring event. The groundwater flow direction and measured hydraulic gradient then will be compared to the projected design groundwater model conditions for the remedy, as presented in the FS (CDM, 2009b), or as updated during preparation of the RDIP. As discussed in Section 7.2.2, the first assessment of this criterion will be conducted after the first year of monthly groundwater elevation monitoring. The groundwater movement conditions that will be monitored as part of the annual assessment will include:

- The slurry wall extension controls groundwater movement to the north and south in the area south of CDM-111;
- Net groundwater movement within the Excavated and Backfilled Area on S-W Property is toward the interceptor trench or the wall breaches near the Union Pacific Railroad property, and not toward Horton Street;
- Net groundwater movement within Excavated and Backfilled Area on Former Rifkin Property is to the north-northwest;
- Net groundwater movement from the high permeability fill area surrounding CDM-104 is toward the slurry wall breaches near the Union Pacific Railroad property, and not toward the former Rifkin property; and
- Mounding of groundwater, to the extent it occurs, is seasonal and generally follows above average precipitation events and does not result in net groundwater movement toward the Rifkin property, movement of water over the top of the slurry wall, or flow around the slurry wall extension.

If the first assessment determines that groundwater movement patterns are consistent with projected design conditions, the frequency of groundwater elevation monitoring will proceed to quarterly as discussed in Section 7.2.2.

If the first assessment or any subsequent annual assessment determines that groundwater movement patterns differ significantly from projected design conditions, S-W will provide written recommendation to DTSC for either implementation of additional monitoring/investigation steps or a contingency action.

Additional monitoring/investigation may include but is not limited to continued/return to monthly groundwater monitoring for an additional year, at

which time a follow up assessment would be made and the monitoring revised as appropriate. Possible contingency action is discussed in Section 7.3.

7.2.5.4 Depths to Groundwater

If one year after remedy implementation the depth to groundwater in any well is measured at or less than four (4) feet bgs, monthly monitoring will be reinitiated for the well to determine if depth to groundwater is exhibiting a rising trend. If the depth to groundwater from three consecutive monthly events is greater than four (4) feet bgs, the frequency of monitoring for the well will return to its previously established frequency. Otherwise, monthly monitoring will continue. If the depth to groundwater in any well is measured at or less than three (3) feet bgs, S-W will provide written recommendations to DTSC for implementation of a contingency action (see Section 7.3).

7.2.5.5 Arsenic Mass Flux between CDM-101, CDM-102, CDM-104, and PZ-101

The projected groundwater model design conditions are intended to prevent long-term (steady-state) groundwater and residual COC movement within the excavated and backfilled area between the locations of these proposed wells towards the former Rifkin property. This additional criterion for monitoring the effectiveness of the remedy includes maintaining a positive mass flux from the former Rifkin property to the S-W property for each COC. As discussed in Section 7.2.4.3, this criterion is anticipated to apply only to arsenic.

After each groundwater elevation monitoring event for the three wells and one piezometer, the hydraulic gradient within the excavated and backfilled area on the former Rifkin property and the contiguous backfilled area to the west, on the S-W property will be calculated. Using the transect method (API, 2003), the arsenic mass flux in groundwater through the cross-sectional area underlying the Rifkin/S-W property line between these wells will be calculated for each event by the following equation:

$$w = (C)(K)(i)(A)(CF)$$

where, w = chemical mass flux through the transect (g/day)
C = concentration of chemical through the transect (mg/L)
K = hydraulic conductivity at the transect (cm/sec)
i = hydraulic gradient at the transect (cm/cm)
A = cross-sectional area associated with the transect (ft^3)
CF = conversion factor, 80.3 (ft/cm)/(sec/day)(L/ft^3)(g/mg)

The calculated mass flux, w, value for each event will include both the magnitude and direction. The direction will be based on assigning a positive hydraulic gradient, i, if groundwater movement is toward Rifkin and negative for movement away from Rifkin. The concentration, C, for each event will be either (1) the concentration of CDM-104 if the groundwater movement is toward Rifkin, or (2) the average of the

arsenic concentration of CDM-101 and CDM-102 if groundwater movement is away from Rifkin.

Due to the uncertainty introduced by variations in percent recovery; quality control; and matrix interferences, there will be inherent variations in the precision and bias of laboratory analytical results for the groundwater samples from the wells used in the flux calculations. Therefore, a default tolerance limit of 20 percent will be used to determine if concentrations are considered different for use in calculating mass flux, i.e., mass flux, w, will be set at zero for each event where arsenic concentrations from wells CDM-101, 102, and CDM-104 differ by or less than 20 percent. As appropriate, this criterion would be applied to other COCs, if concentrations of other COCs for these three wells differ by more than 20 percent.

After the first year of monthly groundwater monitoring, the monthly arsenic mass flux values will be summed to calculate the annual net arsenic mass flux. Each of the monthly mass flux values will represent an approximately equal duration (i.e., one month). If this first year net arsenic mass flux is negative (movement of arsenic away from Rifkin), groundwater monitoring will proceed to quarterly, as discussed in Section 7.2.2.

If the net arsenic mass flux during the first year or any subsequent year is positive (movement of arsenic toward Rifkin), S-W will provide written recommendation to DTSC for either implementation of additional monitoring/investigation steps or a contingency action.

Additional monitoring/investigation may include, but is not limited to, continued/return to monthly groundwater monitoring at these wells for an additional year, at which time a follow up assessment would be made and the monitoring revised as appropriate. Possible contingency action is discussed in Section 7.3.

If the net arsenic mass flux during the first year or any subsequent year exceeds the equivalent to arsenic concentrations of 500 µg/L with a groundwater migration rate of 1 foot/day, S-W will provide written recommendation to DTSC for contingency action (see Section 7.3).

7.3 Contingency Action

Section 7.2.5 presented the criteria for which written recommendations to DTSC for contingency action will be required. The recommendations for contingency action will be consistent with best engineering practices to minimize the potential for any further spread of the COCs and to strive to restore a stable or decreasing groundwater plume. Such contingency action may include, but not be limited to: additional soil excavation and backfill; modifications to permeability of placed fill; in-situ groundwater treatment or in-place geochemistry modifications within the Site or at the slurry wall breaches; modification to the groundwater containment system; and/or active groundwater extraction and treatment.

The submittal to DTSC for the recommended contingency action would also include effectiveness evaluation criteria for the contingency action. S-W would implement the contingency action after approval by DTSC.

7.3.1 Active Groundwater Extraction and Treatment

7.3.1.1 Criteria for Rifkin Guard Wells

If verified arsenic concentrations in samples from any Rifkin Guard Well during evaluation of the contingency action exceed the criteria listed in Table 7-4, S-W will provide written recommendations to DTSC to implement active groundwater extraction and treatment with disposal/reuse of treated water. The objective of the groundwater extraction contingency action, to address exceedance of the Rifkin Guard Well criteria, would be to prevent further migration of arsenic contaminated groundwater onto the former Rifkin property. For this action, further arsenic migration is defined as northerly groundwater movement across the alignment of the Rifkin Guard Wells.

The submittal to DTSC for active groundwater extraction would also include criteria for evaluating the effectiveness of the extraction. Consistent with existing DTSC procedures, S-W would implement active groundwater extraction and evaluate its effectiveness. This evaluation would include consideration of (1) terminating active groundwater extraction and returning to the original remedy (i.e., natural attenuation of arsenic in groundwater) if criteria listed in Table 7-5 are met, or (2) implementation of additional contingency action, if criteria listed in Table 7-5 are not met.

7.3.1.2 Criteria for Wells CDM-107 and CDM-108

If verified arsenic concentrations in samples from CDM-107 or CDM-108 during evaluation of the contingency action exceed the criteria listed in Table 7-4, S-W will provide written recommendations to DTSC to implement active groundwater extraction and treatment with disposal/reuse of treated water. The objective of the groundwater extraction contingency action, to address exceedance of the CDM-107/108 criteria, would be to prevent further migration of arsenic contaminated groundwater through one or both of the slurry wall breaches along the Union Pacific Railroad property, as necessary, to maintain protection of Temescal Creek channel. Supporting information for the contingency action criteria for arsenic listed in Table 7-4 for CDM-107 and CDM-108 is presented in Appendix J.

The submittal to DTSC for active groundwater extraction would also include criteria for evaluating the effectiveness of the extraction. Consistent with existing DTSC procedures, S-W would implement active groundwater extraction and evaluate its effectiveness. This evaluation would include consideration of (1) terminating active groundwater extraction and returning to the original remedy (i.e., natural attenuation of arsenic in groundwater) if criteria listed in Table 7-5 are met, or (2) implementation of additional contingency action if criteria listed in Table 7-5 are not met.

7.3.1.3 Implementation of Active Groundwater Extraction

The objective of the active groundwater extraction contingency action would be to control further migration of arsenic impacted groundwater on the former Rifkin property or through the slurry wall breaches. A contingency action that includes groundwater extraction would be implemented within the area of the higher permeability backfill on the S-W property (as discussed in Section 6). The uniform nature of this higher permeability backfill would facilitate enhanced hydraulic communication with surrounding native materials, backfill in the remainder of the Site, and the interceptor trench.

Using the groundwater model for the Unit A aquifer (A-zone) developed for the FS (CDM, 2009b), a groundwater extraction scenario has been evaluated for conditions anticipated to be present after implementation of the preferred remedy. Based on the groundwater model simulation results, a single groundwater extraction well within the higher permeability backfill on the S-W property would be sufficient to simultaneously meet the objectives of contingency actions for both the former Rifkin property and the slurry wall breaches. Under this selected groundwater extraction scenario, a pumping rate of approximately 3.1 gallons per minute (gpm) from this well would be sufficient to maintain a hydraulic capture zone that extends to the Rifkin Guard Wells and the downgradient slurry wall breach nearest to the source area. The model indicates that of the two downgradient slurry wall breaches along the Union Pacific Railroad property, the one associated with well CDM-108 is the more likely to first have potential increases in COC concentrations that would trigger a need for contingency action.

The groundwater model simulation results include a presentation of the steady-state potentiometric surface contours and particle tracking showing groundwater movement in the A-zone that would develop due to pumping from this single groundwater extraction well within the high permeability backfill on the S-W property. The results demonstrate that this contingency groundwater extraction action would adequately provide control of migration of COCs in groundwater. Details of the groundwater model evaluation and simulation results are included in Appendix K.

7.4 Reporting

Results from post-remediation activities will be provided to DTSC on a quarterly basis for the first four years, at which time an evaluation will be made as to appropriate reporting frequency. These reports will include summaries of OM&M events and results of the groundwater monitoring program. The reports will detail deviations from this OM&M and groundwater monitoring plans, if any, provide an explanation for the deviations and recommendations for future actions or changes to monitoring protocols. If at anytime, data or other information indicates that there is an immediate issue or impact to human health or environment, this data or information will be reported immediately to DTSC.

bgs: below ground surface

toc: top of casing

PVC: polyvinyl chloride

SS: stainless steel

a - Designated Rifkin Guard Well.

1 - Monitoring program is only for the first four years after remedy implementation.

2 - Depth to groundwater measured monthly for first year and then quarterly for next three years; should there be a change in the rate of infiltration that affects groundwater flow conditions, monthly monitoring would be reinitiated for at least one year.

3 - Field parameters include: temperature, pH, turbidity, dissolved oxygen, oxidation-reduction potential, and specific conductivity.

4 - Frequency of monitoring for arsenic for this well will be quarterly if arsenic concentrations for this well increases above its historical maximum detection during remedy implementation; otherwise, the frequency will be semi-annually.

5 - In addition to the 12 proposed wells presented in this table, a thirteenth contingent well (CDM-113) will be installed if arsenic concentrations from any of the Rifkin Guard Wells or MW-3 increase to above 500 micrograms per liter (ug/L) during remedy implementation; CDM-113 would be installed in the vicinity of soil boring locations CDM-SB1 and RP-BH-012, approximately 120 feet northwest of MW-3 along Horton Street. If installed, the well would be monitored and sampled similar to LF-36.

6 - Frequency of monitoring for arsenic for this well will be semi-annually for the first two years; if after two years arsenic concentration is stable to decreasing, frequency of monitoring will be modified to annually; otherwise, it will remain semi-annually.

Table 7-3
Remedy Effectiveness Evaluation Criteria
Sherwin-Williams Emeryville Remedial Action Plan

Groundwater Quality Effectiveness Criteria [1]	
Well	**Remedy Effectiveness Evaluation Criteria**
Former Rifkin Property	
CDM-101	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing four years after remedy implementation, and arsenic is less than 5,000 ug/L four years after remedy implementation
CDM-102	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing four years after remedy implementation, and arsenic is less than 5,000 ug/L four years after remedy implementation
RP-1[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
RP-2[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
RP-4[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
RP-5[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
LF-36[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
LF-41[a]	Arsenic concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
Sherwin-Williams Property	
LF-18	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
CDM-103	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
CDM-104	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
CDM-107	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
CDM-108	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
CDM-109	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
CDM-112	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
Union Pacific Property	
LF-24	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing
LF-25	COC concentrations are less than Site cleanup goals or their trends are statistically stable to decreasing

Groundwater Movement Effectiveness Criteria
1. Long-term groundwater flow patterns are consistent with projected design groundwater model conditions.
2. Long-term arsenic in groundwater mass flux at the Rifkin/S-W property line between CDM-101/CDM-102 and PZ-101/CDM-104 is westward, from the former Rifkin property to the S-W property.
3. Absence of long-term groundwater mounding at the Site.
4. Depths to groundwater at all wells are more than 3 feet below ground surface.

Notes:

COC: chemical of concern

ug/L: microgram per liter

a - Designated Rifkin Guard Well.

1 - Wells not presented do not have groundwater quality remedy effectiveness evaluation criteria. In addition to the wells indentified on the former Rifkin property, contingent well CDM-113 (see Table 7-2), if installed, would be monitored and evaluated for remedy effectiveness, similar to LF-36.

Table 7-4
Criteria for Implementing Active Groundwater Extraction
Sherwin-Williams Emeryville Remedial Action Plan

Well	Criteria for Implementing Active Groundwater Extraction [1]
Former Rifkin Property (Guard) Wells	
RP-1[a]	Increasing arsenic concentration trend with concentration greater than higher of 150 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation
RP-2[a]	Increasing arsenic concentration trend with concentration greater than higher of 75 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation
RP-4[a]	Increasing arsenic concentration trend with concentration greater than higher of 75 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation
RP-5[a]	Increasing arsenic concentration trend with concentration greater than higher of 75 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation
LF-36[a]	Increasing arsenic concentration trend with concentration greater than higher of 75 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation
LF-41[a]	Increasing arsenic concentration trend with concentration greater than higher of 150 ug/L or 150% of the maximum arsenic concentration detected for the well prior to or during remedy implementation
Sherwin-Williams Property Wells	
CDM-107	Increasing arsenic concentration trend with concentration greater than 250 ug/L
CDM-108	Increasing arsenic concentration trend with concentration greater than 500 ug/L

Notes:

COC: chemical of concern

ug/L: microgram per liter

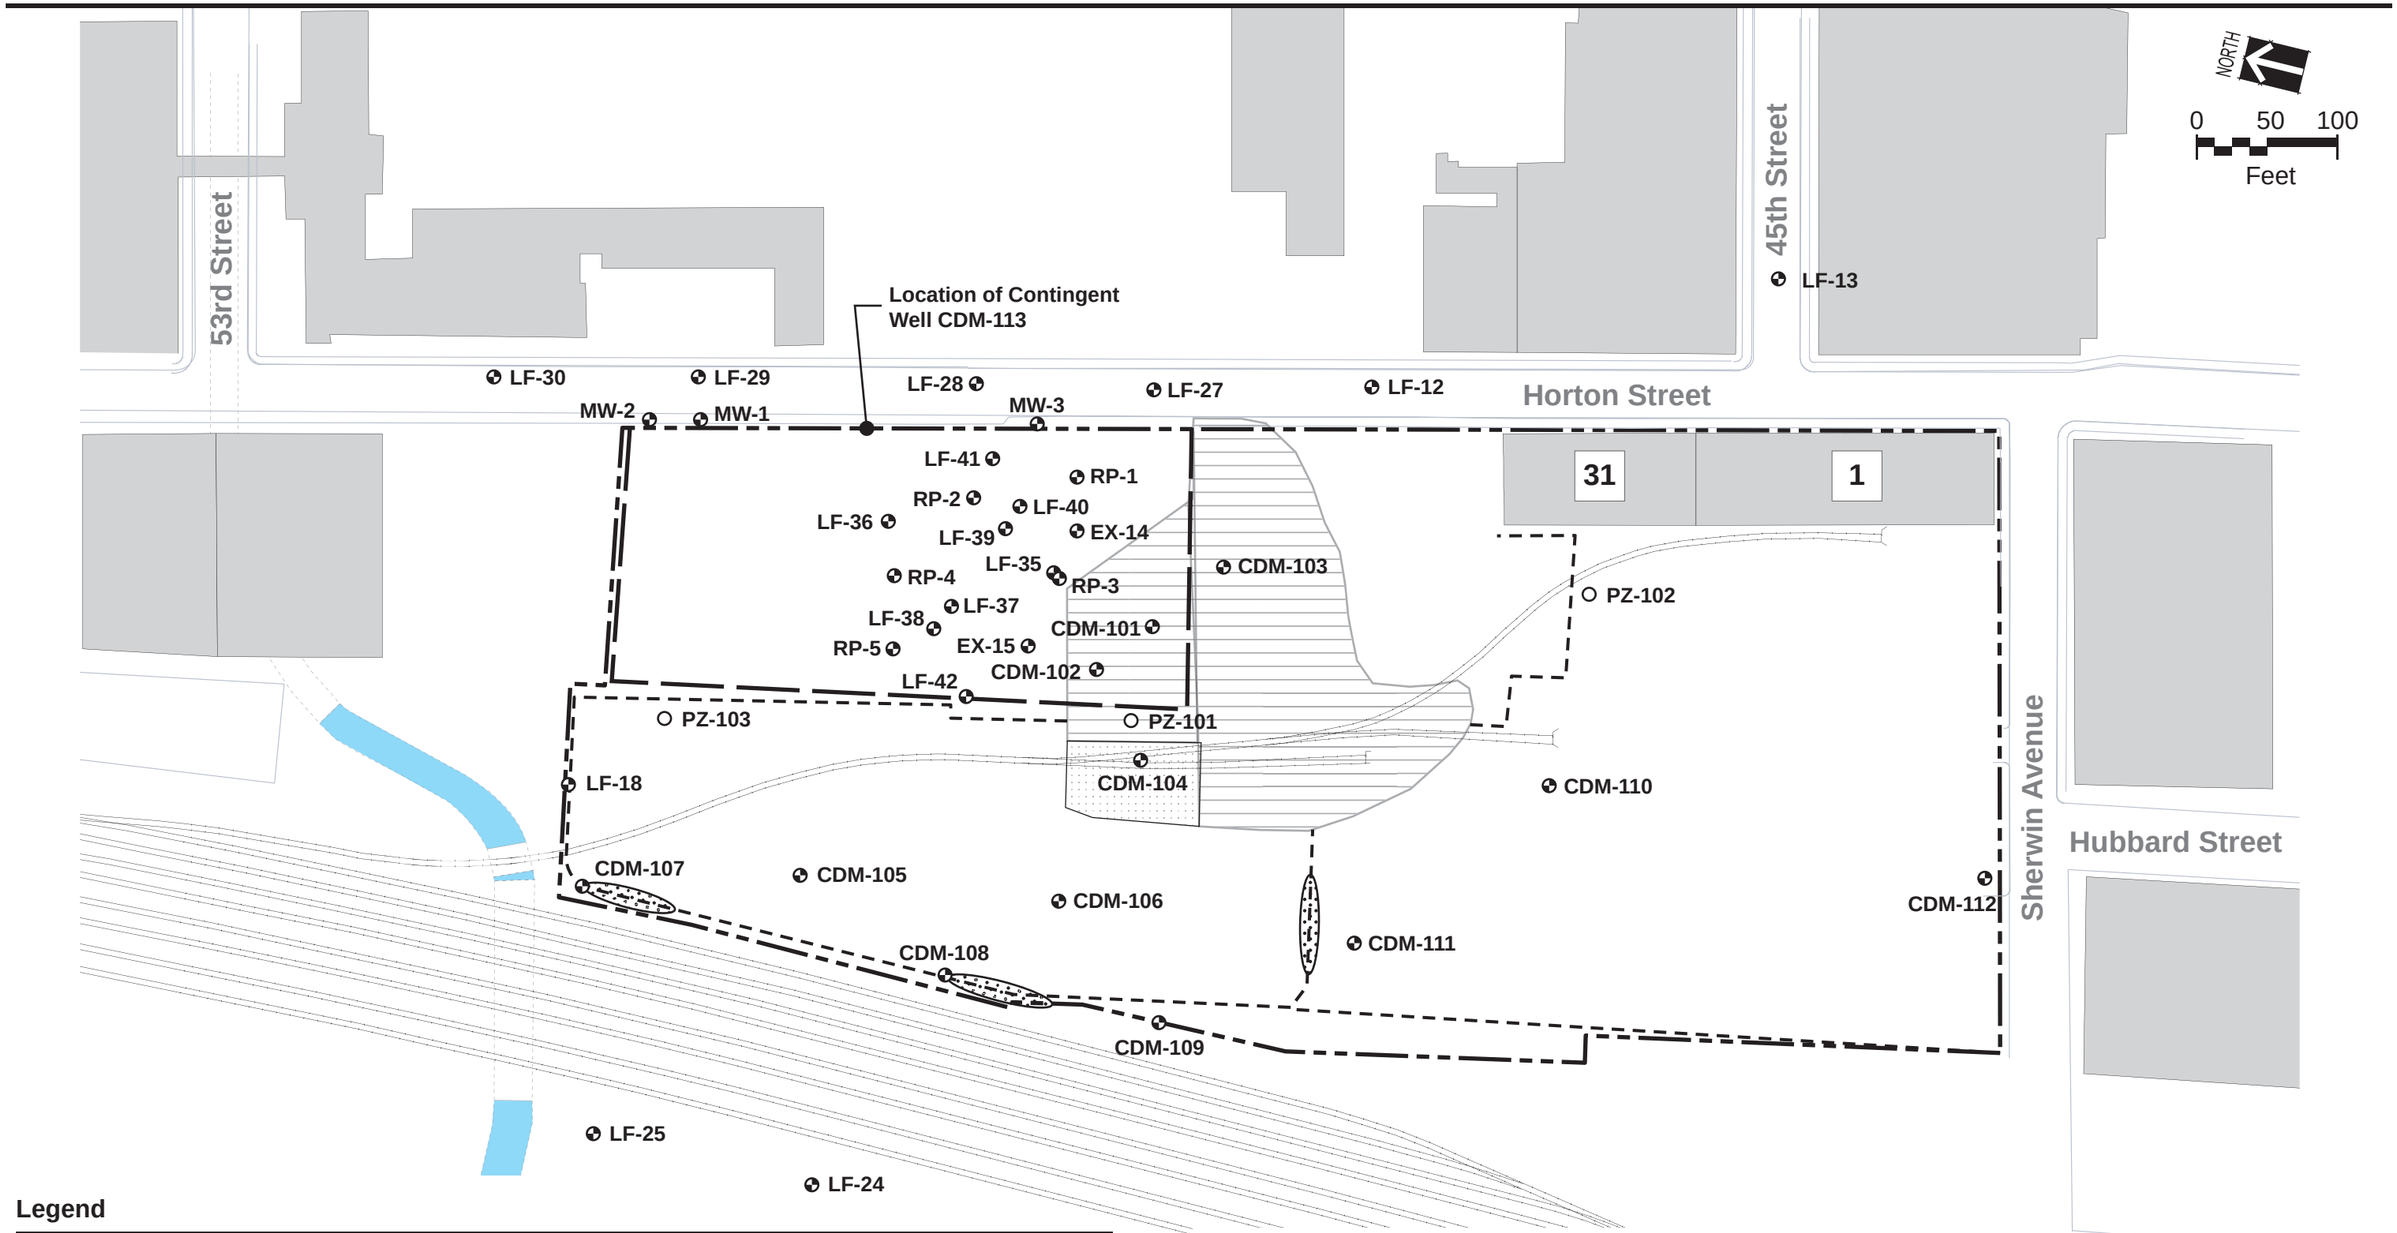
a - Designated Rifkin Guard Well.

1 - Wells not presented do not have criteria for implementing active groundwater extraction.

Table 7-5
Criteria to Terminate Active Groundwater Extraction
Sherwin-Williams Emeryville Remedial Action Plan

Well	*Criteria to Terminate Active Groundwater Extraction and Return to Monitored Natural Attenuation* [1]	*Maximum Arsenic Concentration Detected from Well thru April 2008* [2]
Former Rifkin Property		
RP-1[a]	Arsenic concentration less than higher of 100 ug/L or maximum arsenic concentration detected prior to or during remedy implementation	95
RP-2[a]	Arsenic concentration less than higher of 50 ug/L or maximum arsenic concentration detected prior to or during remedy implementation	37
RP-4[a]	Arsenic concentration less than higher of 50 ug/L or maximum arsenic concentration detected prior to or during remedy implementation	15
RP-5[a]	Arsenic concentration less than higher of 50 ug/L or maximum arsenic concentration detected prior to or during remedy implementation	11
LF-36[a]	Arsenic concentration less than higher of 65 ug/L or maximum arsenic concentration detected prior to or during remedy implementation	65
LF-41[a]	Arsenic concentration less than higher of 100 ug/L or maximum arsenic concentration detected prior to or during remedy implementation	97
Sherwin-Williams Property		
CDM-107	Arsenic concentration less than 250 ug/L	Not applicable [3]
CDM-108	Arsenic concentration less than 500 ug/L	Not applicable [3]

Notes:



ug/L: microgram per liter

a - Designated Rifkin Guard Well.

1 - Wells not presented do not have criteria to terminate active groundwater extraction and return to monitored natural attenuation.

2 - LFR Inc. 2008. Combined Groundwater and NPDES Self-Monitoring Report, Sherwin-Williams Facility, 1450 Sherwin Avenue, Emeryville, California. July 30.

3 - CDM-107 and CDM-108 to be installed during remedy implementation.

EMERYVILLE SITE STATUS

June 1, 2015

___ = project completed ___ = project inactive

1. **UPRR Parcel D**
   - City oversight under the MOU, consultant is Erler & Kalinowki (EKI)
   - Status: draft NFA submitted to DTSC and Water Board
   - DTSC stated that it can't concur if concentrations remaining above residential levels without a deed restriction. DTSC has not yet reviewed the draft NFA. No comments from Water Board.
   - Preliminary draft deed restriction submitted to M. Biddle on 11/30/09, and to M. Niebanck on 10/27/10.

2. **Horton Landing Park**
   - City oversight under the MOU and cleanup grant; consultant is EKI
   - Status: the final Responsiveness Summary was sent to M. Niebanck on August 10, 2010.
   - Next Steps: Implement site cleanup; prepare completion report and Conditional No Further Action.

3. **Greenway at 59th Street, HSP Properties**
   - City oversight under the MOU cleanup by HSP under Polanco; HSP consultant is Sequoia Environmental & Engineering Corporation (Sequoia).
   - Status: K. Toth of DTSC concurred with the City's Conditional NFA via letter dated March 18, 2013.
   - Next Steps: project completed.

4. **64th and Christie Proposed Residential Building**
   - City oversight under the MOU
   - TMG = owner, PES = consultant
   - Status: DTSC concurred with the City's conditional approval on 12/29/10. On 6/14/12, Will Mast of PES called to discuss changes to the collection of confirmation samples on the two sides of the property where excavation would extend to the property boundary, i.e., no samples would be collected. Because the requested changes were extensive, Will stated he would prepare a written request to be sent to DTSC for comment/concurrence. On 10/24/12, Will Mast called to say that remediation is beginning. I reminded him of the changes he requested and that he was going to prepare a written request. He said he will submit it in a few days. Nothing was received. Emailed a reminder on 11/26/2012 that all samples must be collected unless we receive approval from DTSC for fewer samples. No reply was received. Emailed W. Mast asking about the status of the project on 6/28/2013, but no reply was received.
   - In April 2015, the City was contacted that the remediation was completed. A meeting was held with the City, TMG, and PES to discuss remediation on 4/16/15. A draft Remediation Implementation Report was received on 5/1/15; comments were provided on 5/6/15. A revised Remediation Implementation Report was received on 5/18/15; comments were provided on 5/20/15. K. Toth of DTSC was contacted on 5/18/15 regarding the pending Remediation Implementation Report to be submitted.
   - Next Steps: Submit draft Remediation Implementation Report to K. Toth, incorporate her comments, and prepare the Conditional No Further Action for her concurrence.

5. **48th Street Community Garden**
   - Cleanup grant; consultant = Weiss
   - Status: K. Toth of DTSC concurred with the City's Conditional NFA via email dated March 5, 2013.

- Next Steps: project completed.

6. **3706 San Pablo Ave and 1025 West MacArthur**
   - Cleanup grant; consultant = Weiss
   - Status: Revised Draft Site Cleanup Plan (SCP) was submitted to the Agencies on 8/5/2014. Received comments from DTSC via email on 8/6/2014, and discussed comments from M. Johnson over the telephone on 8/26/14. Submitted the Conditional Approval to the Mark Johnson of the Water Board on 8/28/14; received concurrence from the Water Board on 8/29/14. Working with the Water Board regarding DTSC comment about long-term groundwater monitoring; a deed restriction under Water Board oversight will be recorded as part of the remediation to prevent future use of groundwater beneath the site. A public meeting was held on 9/24/14, and the SCP was finalized on 11/14/14.
   - Next Steps: Implement remediation, prepare the completion report, and prepare the Conditional No Further Action for Water Board Concurrence.

7. **5701 Hollis Street Greenway**
   - City oversight under the MOU; City-owned property; consultant is Ninyo&Moore (N&M).
   - Status: Concurrence with the City's Conditional No Further Action was received from K. Toth of DTSC via email on August 16, 2013 and from M. Johnson of the Water Board on October 2, 2013.
   - Next Steps: project completed.

8. **Former UPRR Parcels 1, 2, 3, 4, 4a, 6, 7, and 8**
   - Consultant is EKI
   - Status: remediation complete; draft completion report reviewed
   - Next Steps: EKI and the City are trying to obtain additional information from UPRR re soil volumes excavated, etc., but the status is unknown. Prepare draft deed restriction when receive comments from M. Biddle on draft Parcel D deed restriction.

In the matter of:	)	Docket No. HSA-O&MEA 11/12-096
	)	
Sherwin-Williams	)	
1450 Sherwin Avenue	)	OPERATION AND MAINTENANCE
Emeryville, CA 94608	)	AGREEMENT
	)	
Proponent:	)	
	)	Health and Safety Code
The Sherwin-Williams Company	)	Section 25355.5 (a)(1)(C)
101 Prospect Avenue, 4M	)	
Cleveland, OH 44115	)	

The California Department of Toxic Substances Control (DTSC) and land owner The Sherwin-Williams Company (Proponent) enter into this Operation and Maintenance Agreement (Agreement) for the Proponent's property located at 1450 Sherwin Avenue, Emeryville, Alameda County, California, 94608 and a portion of the adjacent former Rifkin property located at 4525-4563 Horton Street, Emeryville, Alameda County, California, 94608, to which hazardous substances have migrated from the Proponent's property. Collectively the Proponent's property and this portion of the former Rifkin property are referred to as the "Site". Novartis Vaccines and Diagnostics, Inc. (Novartis) is the current owner of the former Rifkin property. The Site consists of approximately 10 acres and was formerly identified by Assessor's Parcel Numbers 049-1041-026-02, 049-1041-026-04, 049-1041-026-06, 049-1041-026-07, 049-1041-005-00 and 049-1041-006-00. The Assessor's Office has subsequently consolidated these Assessor's Parcel Numbers for the two properties and assigned the following new numbers: 049-1041-026-15 for the Proponent's property and 049-1544-001-01 for the former Rifkin property. DTSC and Proponent agree as follows:

1. Jurisdiction. This Agreement is entered into by DTSC and Proponent pursuant to Health and Safety Code section 25355.5(a)(1)(C) which authorizes DTSC to enter into an enforceable agreement to oversee the investigation and/or remediation of a release or threatened release of any hazardous substance at or from the Site, and to oversee the operation and maintenance of any remediation system installed at the Site.

2. Remediation System. After completion of the remedy as described in the Remedial Action Plan (RAP), including removal of over 100,000 tons of impacted vadose zone and saturated zone soils and operation of a groundwater pump and treat system, a long-term groundwater Remediation System was installed consisting of a slurry wall with breaches, an interceptor trench with a membrane barrier, and vadose zone and saturated zone backfill with differing permeabilities, all part of an integrated design to passively control and regulate groundwater movement. The Remediation System also includes a groundwater monitoring well network and monitoring program to evaluate the effectiveness of the groundwater remedy, a soil gas monitoring network and program to evaluate post-remedy soil gas conditions, and a Covenant of Environmental Restrictions recorded on the Property. A site location map and the

assessor's parcel map are attached as Exhibit A and Exhibit B. A site map or diagram showing the location(s) of the Remediation System is attached as Exhibit C.

3. Operation and Maintenance of Remediation System. Operation and maintenance of the Remediation System are required at the Site, and shall be left in place, and operated and maintained by Proponent or with DTSC's approval, any successor property owner. Operation and maintenance of the Remediation System will continue at the Site until and except to the extent that DTSC authorizes Proponent in writing to discontinue or modify part or all of the Remediation System.

4. Implementation of Operation and Maintenance Plan. Proponent shall fully implement the DTSC-approved Operation and Maintenance Plan dated December 11, 2012, and approved by DTSC on December 17, 2012, or any other Operation and Maintenance Plan subsequently approved by DTSC. The current DTSC-approved Operation and Maintenance Plan is attached hereto as Exhibit D, and that Plan or any other Operation and Maintenance Plan subsequently approved by DTSC are hereby incorporated into this Agreement by reference, including any requirements for inspections, monitoring, reporting and record keeping.

5. Modification or Discontinuation of Remediation System. Before modifying or discontinuing any Remediation System component, Proponent shall submit a written request for DTSC's authorization for any modification or discontinuation of the Remediation System or any part thereof, including but not limited to the Operation, Maintenance, and Monitoring Plan, the slurry wall, membrane, backfill, groundwater monitoring well network and/or program, and soil gas monitoring point network and/or program, at least 60 days, to the extent feasible, prior to the intended date of any proposed modification or discontinuation. The written request to DTSC shall include the reasons for the request, a detailed description of any work to be done or modification to be made, and a map showing the exact location of the proposed work. Proponent may seek DTSC's authorization for any such modification or discontinuation of the Remediation System or any part thereof, if: (a) Proponent has met the remediation objectives for the site; or (b) the modification would better or more efficiently and/or more cost-effectively achieve the remediation objectives; or (c) the Remediation System could not achieve the remediation objectives and other cleanup methods will be implemented; or (d) it has been demonstrated that the maximum achievable remediation has occurred; or (e) the modification would be a suitable replacement for an existing component that interferes or otherwise unnecessarily affects development or future use of the property.

6. DTSC-Required Modification. DTSC may require modification, replacement, or additions to the Remediation System if the Remediation System or part of thereof is not achieving the remediation objectives or is not protecting human health or the environment. DTSC may require additional evaluations, designs and the construction and operation of facilities to achieve these objectives. Proponent reserves all of its rights, defenses and remedies available to Proponent under law or equity.

7. Five-Year Review. Proponent shall review and reevaluate the Remediation System after a period of five years from the completion of construction and startup of the Remediation System and every 5 years thereafter, until Proponent demonstrates that it has met the remedial goals for the Site or DTSC issues a written determination that no further five-year reviews are required. The review and reevaluation shall be conducted to determine if human health and the environment are being adequately protected by the Remediation System. Within 30 days before the end of each five-year period, Proponent shall submit a five-year review workplan to DTSC for review and approval. The first five-year review workplan will be submitted by June 1, 2017. Within 60 days of DTSC's approval of the workplan, Proponent shall implement the workplan and submit a report of the results of the five-year review. The report shall describe the results of all sampling analyses, tests and other data generated or received by Proponent and evaluate the adequacy of the implemented remedy in protecting human health and the environment. As a result of any review work performed under this Agreement, DTSC may require Proponent to perform additional review work or modify the review work previously performed by Proponent.

8. Quality Control/Quality Assurance (QC/QA). All sampling and analysis conducted by Proponent under this Agreement shall be performed in accordance with the QC/QA procedures submitted by Proponent and approved by DTSC pursuant to this Agreement.

9. Financial Assurance. Proponent must assure that sufficient funds are available to implement all the requirements of this Agreement and to pay DTSC's costs as specified in Paragraph 10. Proponent has established a letter of credit as the financial assurance mechanism that meets DTSC's requirements pursuant to California Code of Regulations, title 22, section 66265.143.

10. Cost Recovery and Payment.

10.1. Proponent agrees to pay for all of DTSC's costs incurred, in accordance with law, in implementing this Agreement, including costs of overseeing the work performed by Proponent, and in responding to any contamination at the Site. Cost recovery may be pursued by DTSC pursuant to applicable state or federal laws or common law. DTSC will invoice Proponent for DTSC's costs on a quarterly basis. Proponent reserves all of its rights, defenses and remedies available to Proponent under law or equity.

10.2. All payments made by Proponent pursuant to this Agreement shall be by check payable to the "Department of Toxic Substances Control", and bearing on its face the project code for the Site (Site # 200956) and the docket number of this Agreement (Docket No. HSA-O&MEA 11/12-096). Upon request by Proponent, DTSC may accept payments made by credit cards. Payments by check shall be sent to:

Department of Toxic Substances Control
Accounting Office

1001 I Street, 21st Floor
P.O. Box 806
Sacramento, California 95812-0806

A photocopy of the check shall be sent concurrently to DTSC's Project Manager.

10.3. DTSC shall retain all cost records associated with the work performed under this Agreement as may be required by state law. DTSC will make all documents that support DTSC's cost determination available for inspection and copying upon request in accordance with the Public Records Act, Government Code section 6250 et seq.

11. Endangerment During Implementation.

11.1. Proponent shall notify DTSC's Project Manager promptly upon learning of the actual release and/or threatened release of hazardous substances, as defined in Health and Safety Code section 25320, at the Site that may present an imminent and substantial endangerment to the public health or welfare or to the environment. Within seven days of learning of the actual release and/or threatened release, Proponent's Project Manager shall furnish a report to DTSC, signed by Proponent's Project Manager, setting forth the conditions and events that occurred and the measures taken in response thereto.

11.2. In the event DTSC determines that any activity (whether or not pursued in compliance with this Agreement) may pose an imminent or substantial endangerment to the health or safety of people on the Site or in the surrounding area or to the environment, DTSC may order Proponent to conduct additional activities or to stop further implementation of this Agreement for such period of time as may be needed to abate the endangerment. DTSC may request that Proponent implement interim measures to address any immediate threat or imminent or substantial endangerment. Proponent reserves all of its rights, defenses and remedies available to Proponent under law or equity.

12. Site Access. Proponent shall provide, and/or obtain access to the Site and take all reasonable efforts to obtain access to offsite areas to which access is necessary to implement this Agreement. Such access shall be provided to DTSC's employees, contractors, and consultants at all reasonable times to the extent allowed by law. Such access shall also be provided to any other Proponent who is in compliance with this Agreement for the purpose of conducting activities pursuant to this Agreement or for activities deemed necessary by DTSC to meet the objectives of this Agreement. Nothing in this paragraph is intended or shall be construed to limit in any way the right of entry or inspection that DTSC or any other agency may otherwise have by operation of law.

13. Sampling, Data and Document Availability. When requested by DTSC, Proponent shall make available for DTSC's inspection, and shall provide an electronic

copy of, unprivileged data and information related to the performance of this Agreement. For all final reports, Proponent shall submit one hard (paper) copy and one electronic copy with all applicable signatures and certification stamps as a text-readable Portable Document Formatted (pdf) file Adobe Acrobat or Microsoft Word formatted file to DTSC's Project Manager. Proponent reserves all of its rights, defenses and remedies available to Proponent under law or equity.

14. Record Preservation. Proponent shall retain, during the implementation of this Agreement and for a minimum of ten years after its termination, all data, reports, and other documents generated in accordance with this Agreement. If DTSC requests that some or all of these documents be preserved for a longer period of time, Proponent shall either comply with the request, deliver the documents to DTSC, or provide DTSC with a copy of the documents at Proponent's expense prior to destruction.

15. Notification of Field Activities. Proponent shall inform DTSC at least seven calendar days in advance of all field activities pursuant to this Agreement and shall allow DTSC and its authorized representatives to take duplicates of any samples collected by Proponent pursuant to this Agreement.

16. Project Managers. DTSC has designated Nina Bacey as their Project Manager and the Proponent has designated Larry Mencin as their Project Manager. Each Project Manager shall be responsible for overseeing the implementation of this Agreement and for designating a person to act in his/her absence. All communications between DTSC and Proponent, and all notices, documents and correspondence concerning the activities performed pursuant to this Agreement shall be directed through the Project Managers. Each party may change its Project Manager with at least seven days prior written notice.

17. Proponent's Consultant and Contractor. All work performed pursuant to this Agreement shall be under the direction and supervision of a professional engineer or professional geologist, licensed in California, with expertise in hazardous substances site cleanup. Proponent's Project Manager, contractor or consultant shall have the technical expertise sufficient to fulfill his or her responsibilities. Within 14 days of the effective date of this Agreement, Proponent shall notify DTSC's Project Manager in writing of the name, title, and qualifications of the professional engineer or professional geologist and of any contractors or consultants and their personnel to be used in carrying out the work under this Agreement in conformance with applicable state law, including but not limited to, Business and Professions Code sections 6735 and 7835.

18. DTSC Review and Approval. All work performed pursuant to this Agreement is subject to DTSC's review and approval. If DTSC determines that any report, plan, schedule or other document submitted for approval pursuant to this Agreement fails to comply with this Agreement or fails to protect public health or safety or the environment, DTSC may (a) return comments to Proponent with recommended changes and a date by which the Proponent must submit to DTSC a revised document incorporating or addressing the recommended changes; or (b) modify the document in consultation with

Proponent and approve the document as modified. All DTSC approvals and decisions made regarding submittals and notifications will be communicated to Proponent in writing by DTSC's Branch Chief or his/her designee. No informal advice, guidance, suggestions or comments by DTSC regarding reports, plans, specifications, schedules or any other writings by the Proponent shall be construed to relieve Proponent of the obligation to obtain such written approvals.

19. Amendments. This Agreement, including the DTSC-approved Operation and Maintenance Plan, may be amended or terminated by mutual written agreement of DTSC and Proponent. Such amendment or termination shall be effective the third business day following the day the last party signing the amendment or termination sends its notification of signing to the other party. The parties may agree to a different effective date.

20. Incorporation of Exhibits, Plans and Reports. All exhibits are incorporated into this Agreement by reference. All plans, schedules and reports that require DTSC's approval and are submitted by Proponent pursuant to this Agreement are incorporated in this Agreement upon DTSC's approval.

21. Reservation of Rights. DTSC reserves all of its statutory and regulatory powers, authorities, rights, and remedies under applicable laws to protect public health or the environment, including the right to recover its costs incurred therefor. Proponent reserves all of its rights, defenses and remedies available to Proponent under law or equity.

22. Non-Admission of Liability. By entering into this Agreement, Proponent does not admit to any finding of fact or conclusion of law set forth in this Agreement or any fault or liability under applicable laws or equity.

23. Proponent Liabilities. Nothing in this Agreement shall constitute or be considered a covenant not to sue, release or satisfaction from liability by DTSC for any condition or claim arising as a result of Proponent's past, current, or future operations or ownership of the Site.

24. Government Liabilities. The State of California or DTSC shall not be liable for any injuries or damages to persons or property resulting from acts or omissions by Proponent or by related parties in carrying out activities pursuant to this Agreement, nor shall the State of California or DTSC be held as a party to any contract entered into by Proponent or its agents in carrying out the activities pursuant to this Agreement.

25. Third Party Actions. In the event that Proponent is a party to any suit or claim for damages or contribution relating to the Site to which DTSC is not a party, Proponent shall notify DTSC in writing within 10 days after service of the complaint in the third-party action. Proponent shall pay all costs incurred by DTSC relating to such third-party actions, including but not limited to responding to subpoenas. Proponent's agreement

to pay DTSC's costs shall not prevent Proponent from seeking recovery of such costs from the party bringing the litigation.

26. California Law. This Agreement shall be governed, performed and interpreted under the laws of the State of California.

27. Severability. If any portion of this Agreement is ultimately determined not to be enforceable, that portion will be severed from the Agreement and the severability shall not affect the enforceability of the remaining provisions of the Agreement.

28. Parties Bound. This Agreement applies to and is binding, jointly and severally, upon Proponent and its agents, receivers, trustees, successors and assignees, if any, and upon DTSC and any successor agency that may have responsibility for and jurisdiction over the subject matter of this Agreement. Proponent shall ensure that its contractors, subcontractors and agents receive a copy of this Agreement.

29. Effective Date. The effective date of this Agreement is the date of signature by DTSC's authorized representative after this Agreement is first signed by Proponent's authorized representative. Except as otherwise specified, "days" means calendar days.

30. Representative Authority. Each undersigned representative of the party to this Agreement certifies that she or he is fully authorized to enter into the terms and conditions of this Agreement and to execute and legally bind the party to this Agreement.

31. Counterparts. This Agreement may be executed and delivered in any number of counterparts, each of which when executed and delivered shall be deemed to be an original, but such counterparts shall together constitute one and the same document.

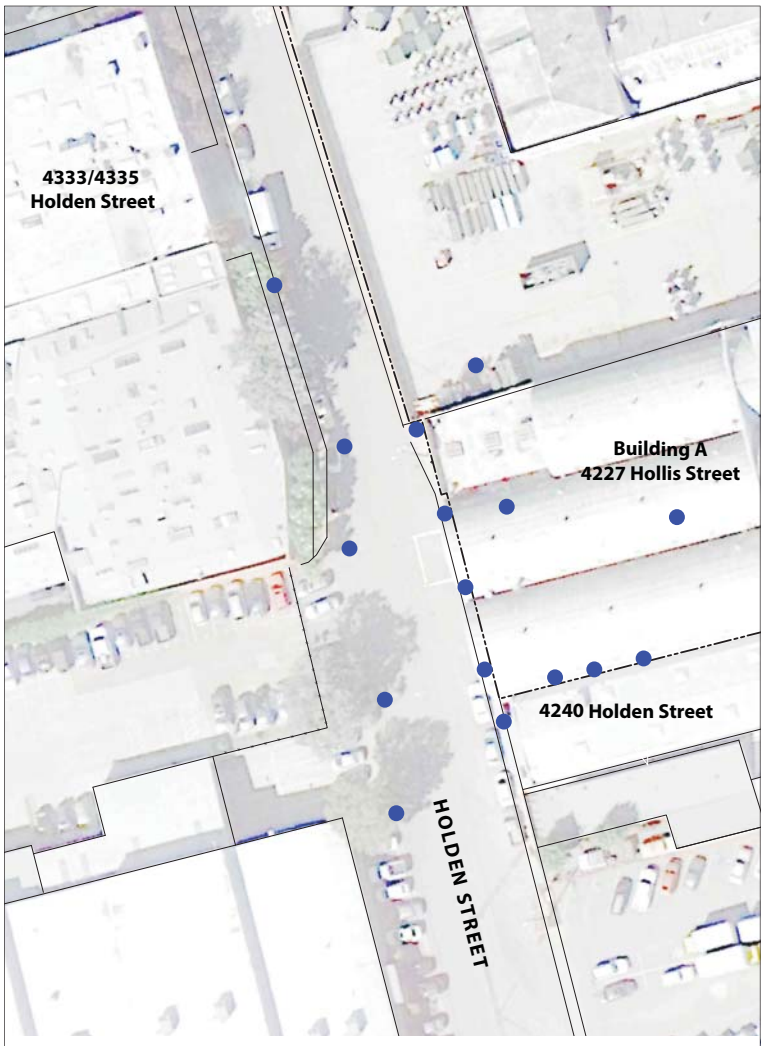
COMMUNITY Notice



The mission of DTSC is to protect California's people and environment from harmful effects of toxic substances through the restoration of contaminated resources, enforcement, regulation and pollution prevention.

Emeryville Materials Facility
4525 Hollis Street, Emeryville, California 94608

The California Department of Toxic Substances Control (DTSC) wants to update the community on Pacific Gas and Electric Company's (PG&E) environmental investigations of the Emeryville Materials Facility (site) located at 4525 Hollis Street in Emeryville, California (Figure 1).

Off-site Sampling Results

PG&E collected samples of soil, groundwater, and soil gas (air spaces in between particles of soil) from beneath Holden Street and the adjacent sidewalks, near the residences located at 4333 and 4335 Holden Street, and the commercial building located at 4240 Holden Street (Figure 1). Samples of soil, groundwater, and soil gas in this area contain tetrachloroethene (PCE) and trichloroethene (TCE). You may find sampling results in a study called a human health risk evaluation. This evaluation concluded that the calculated health risk to Emeryville residents or workers who live or work near the site falls within the range that DTSC considers safe.

(Figure 1)

On-site Work

Prior environmental assessment activities identified the solvents PCE and TCE above state environmental screening levels in soil, soil gas, and groundwater beneath, and immediately next to, Building A, which is located at 4227 Hollis Street. PCE and TCE are compounds historically found in industrial solvents.

An environmental cleanup will be needed to address the presence of PCE and TCE in soil, soil gas, and groundwater. PG&E has begun to evaluate cleanup alternatives for the contamination associated with Building A. PG&E will continue its groundwater sampling on a quarterly basis beneath Building A and beneath Holden Street.

For More Information

The off-site risk evaluation and other site related documents can be found at the information repository:

Emeryville City Hall
1333 Park Avenue
Emeryville, CA 94608
(510) 596-4300

Hours: Monday - Friday, 9:00 a.m - 5:00 p.m. - to view documents speak with the front desk attendant.

You may also review these project documents at www.envirostor.dtsc.ca.gov/public/

The full administrative record for the site is available at:

Department of Toxic Substances Control - File Room
700 Heinz Avenue
Berkeley, CA 94710
(510) 540-3800 – call for an appointment
Hours: Monday through Friday, 8:00 a.m.-5:00 p.m.

If you have questions about this project, please call either:

- Nathan Schumacher, DTSC Public Participation Specialist, toll free at (866) 495-5651, (916) 255-3650 or by email at nathan.schumacher@dtsc.ca.gov; or
- Homayune Atiqee, DTSC Project Manager, at (510) 540-3838 or by email at homayune.atiqee@dtsc.ca.gov.

If you are from the media, please contact:

- Sandy Nax, DTSC Public Information Officer, at (916) 327-6114 or by email at sandy.nax@dtsc.ca.gov.

NOTICE TO HEARING IMPAIRED INDIVIDUALS: TYY users may use the California Relay Service at 1-877-735-2929 or (711). Please see contact name at the end of report.

COVENANT TO RESTRICT USE OF PROPERTY

ENVIRONMENTAL RESTRICTION

Re: County of Alameda, Assessor Parcel Number (APN) 049-1041-26-15, former Sherwin-Williams Coatings Manufacturing Facility, 1450 Sherwin Avenue, Emeryville, CA, DTSC Site Code Number (200956).

This Covenant and Agreement ("Covenant") to restrict the use of the property is made by and between The Sherwin-Williams Company (the "Covenantor"), the current Owner of property situated at 1450 Sherwin Avenue in the City of Emeryville, County of Alameda, State of California (the "Property"), and the California Department of Toxic Substances Control (the "Department"). Pursuant to Civil Code section 1471, the Department has determined that this Covenant is reasonably necessary to protect present or future human health or safety or the environment as a result of the presence on the Property of hazardous materials as defined in Health and Safety Code section 25260. The Covenantor and Department, collectively referred to as the "Parties," hereby agree pursuant to Civil Code section 1471 and Health and Safety Code section 25355.5, to restrict the use of the Property as set forth in this Covenant. The Parties further agree that the Covenant shall conform to the requirements of California Code of Regulations, title 22, section 67391.1 and shall run with the land.

* Recording fee waived per govt code 27383

ARTICLE I
STATEMENT OF FACTS

1.01. Property Location. The Property, totaling approximately 8.55 acres, is more particularly described and depicted in the attached Exhibits "A", the legal description of the Property, and "B", Alameda County Assessor's Map. The Property with the address of 1450 Sherwin Avenue is located in Emeryville, CA, in the area now generally bounded by Horton Street to the east; Sherwin Avenue to the south; the Temescal Creek Channel and the property currently owned by Novartis Vaccine and Diagnostics (Novartis) to the north; and Parcel D owned by the City of Emeryville and the Union Pacific Railroad Emeryville Yard to the west. The Property is also identified as Alameda County Assessor's Parcel No. 049-1041-26-15.

1.02. Installed Remedial Features. A limited portion of the Property is more particularly depicted in Exhibit C, and is referred to as the "Installed Remedial Features." These Installed Remedial Features are described in Section 1.03 and include the following: a slurry wall with breaches, an interceptor trench, a high permeability backfill, a contingent groundwater extraction riser, low permeability soil backfill, and groundwater monitoring wells.

1.03. Remediation. The Property has been remediated pursuant to a Remedial Action Plan ("RAP") developed in accordance with Health and Safety Code, division 20, chapter 6.8 under the oversight of the Department. The RAP, which referenced the Human Health Risk Assessment ("HHRA") previously approved by the California Regional Water Quality Control Board (CRWQCB) in December 2005 and reviewed by the Department as part of its approval of the RAP, and the Mitigated Negative Declaration ("MND") prepared pursuant to the California Environmental Quality Act, Public Resources Code section 21000 *et seq.*, were released for public review and comment and subsequently approved by the Department on June 14, 2010. The RAP was based on the Remedial Investigation ("RI"), the HHRA and the Feasibility Study

("FS") conducted by the Covenantor. Following the Department's approval of the RAP and MND, the Covenantor prepared a Remedial Design Implementation Plan ("RDIP") that was approved by the Department on June 30, 2011. The remedy completion and RDIP modifications were documented in the Remedy Implementation Completion Report ("RICR") approved by the Department on August 7, 2012. The RAP requires a land use covenant that imposes Environmental Restrictions as are accomplished through this Covenant as part of the site remediation, because volatile organic compounds and arsenic, which are hazardous substances as defined in Health and Safety Code section 25316, and hazardous materials as defined in Health and Safety Code section 25260, remain above unrestricted cleanup goals as defined in the RAP in groundwater and/or soil vapor beneath the Property.

The remedial activities included excavation and offsite disposal of unsaturated and saturated soil containing arsenic, lead, and volatile organic compounds (VOCs) including benzene, toluene, and xylenes at concentrations above unrestricted cleanup goals, and installation of the following remedial features: retention of the existing slurry wall that was installed in 1994; extension of the slurry wall; breaches in three locations in the slurry wall to provide for specific groundwater flow channels; installation of a low permeability vertical barrier and high permeability channel to direct groundwater flow; placement of low permeability soil backfill to minimize water infiltration, and installation of groundwater monitoring wells. These Installed Remedial Features and their functions are described in more detail in the following paragraphs and their locations are identified in Exhibit C. The groundwater extraction and treatment system, originally installed as part of the interim remedial measures, is no longer required to control hydraulic gradient, and was shut down and removed in 2011 as part of the final remedy implementation.

The operation and maintenance of the Installed Remedial Features is pursuant to the Operation and Maintenance Plan dated December 11, 2012, (Operation and Maintenance Plan) as approved by the Department on December 17, 2012 and an Operation and Maintenance Agreement between Covenantor and the Department.

Slurry Wall, Slurry Wall Extension, Slurry Wall Breaches. Modifications were made to the existing slurry wall system and were designed to aid in natural groundwater

flow across the Property. These modifications are illustrated in Exhibit C. The slurry wall extension and breaches are designed to function passively to direct groundwater flow to the west, without active operation or maintenance.

Interceptor Trench, High Permeability Backfill, Contingent Groundwater Extraction Riser. A synthetic vertical barrier, designed to divert natural groundwater flow away from the Novartis property and towards the west Property boundary slurry wall breaches, was installed along the northern Property boundary with the Novartis property. The vertical barrier consists of high density polyethylene panels, 60 mil. thick, with high-permeability fill (rock) adjacent to and along the southern side. The barrier and rock fill extend approximately 25 feet below surface (to elevation -14 NAVD88). The high permeability fill area also includes a horizontal perforated pipe that will serve as a contingent groundwater flow channel connected to an in-ground rock fill area. The locations of these features are illustrated in Exhibit C. The rock fill area can be actively pumped to extract groundwater if the passive flow channel and barrier are not sufficient to effect adequate groundwater migration. The interceptor trench and rock sump are designed to function without active operation or maintenance.

Soil Placement to Minimize Water Infiltration. Low permeability soil backfill with a gravel cover was placed across certain areas of the Property. The post-excavation surface areas of the Property are graded so that surface water (precipitation) is directed to a shallow surface swale sloped towards an existing storm drain basin in the northwest corner of the Property. This storm drain basin is plumbed to the Temescal Creek Channel. The final grade plan, swale, and storm drain basin are shown in Exhibit C.

Groundwater Monitoring Wells and Periodic Access for Monitoring. The Operation and Maintenance Plan describes the purpose and need for periodic groundwater elevation and/or quality monitoring in order to verify the effectiveness of the approved remedy. Physical access to these groundwater monitoring wells must be protected.

1.04 Basis for Environmental Restrictions. Groundwater elevation at the Property varies seasonally and is found at 3 to 12 feet below ground surface.

Contaminants in groundwater were compared to California Department of Health Service's Maximum Contaminant Levels (MCL), CRWQCB's Environmental Screening Levels (ESL), risk based threshold levels established in the HHRA, or the CRWQCB Marine Water Quality Objective (MWQO) (arsenic). Contaminants found in groundwater that exceed these screening level goals are: 1,2-dichloroethane, 1,2,3-trichloropropane, acetone, methyl tertiary-butyl ether, toluene, xylenes, and arsenic. The lowest of these screening levels were approved by the Department as Site cleanup goals for groundwater, as follows in milligrams per liter (mg/L):

Contaminant	Cleanup Goal	Reference
1,2-dichloroethane	0.0005 mg/L	ESL
1,2,3-trichloropropane	0.005 mg/L	ESL
Acetone	1.5 mg/L	ESL
Methyl tertiary-butyl ether	0.013 mg/L	MCL
Toluene	0.15 mg/L	MCL
Xylenes	0.02 mg/L	ESL
Arsenic	0.036 mg/L	MWQO

The Department concludes that the use of contaminated groundwater presents an unacceptable threat to human health and safety.

Soil vapor has been found to contain certain volatile organic compounds (benzene and ethylbenzene) at concentrations in excess of residential California Human Health Screening Levels (CHHSLs). The Department concludes that these volatile organic compounds could present an unacceptable threat to human health and safety in building indoor air.

The completed remedial actions described in the RAP and RDIP removed impacted shallow and saturated soils. The remedial actions included installation of the engineered features described in Section 1.03 which are intended to provide long-term control of, and monitoring of, groundwater migration and quality. The Department has concluded that the Property, as remediated, and subject to the Environmental Restrictions of this Covenant, does not present an unacceptable threat to human health or safety, or the environment.

ARTICLE II
DEFINITIONS

2.01. Department. "Department" means the California Department of Toxic Substances Control and includes its successor agencies, if any.

2.02. Environmental Restrictions. "Environmental Restrictions" means all provisions, covenants, restrictions, prohibitions, requirements, terms and conditions of this Covenant.

2.03. Improvements. "Improvements" means buildings, roads, driveways, improved parking areas, wells, pipelines, utilities, structures, fixtures, equipment or facilities.

2.04. Lease. "Lease" means lease, rental agreement, or any other document that creates a right to use or occupy any portion of the Property.

2.05. Occupant. "Occupant" means Owners and any person or entity entitled by ownership, leasehold, or other legal relationship to the right to occupy any portion of the Property.

2.06. Owner. "Owner" means the Covenantor, and all successors in interest including heirs and assigns, who at any time hold title to all or any portion of the Property.

ARTICLE III
GENERAL PROVISIONS

3.01. Runs with the Land. This Covenant sets forth Environmental Restrictions that apply to and encumber the Property and every portion thereof no matter how it is

improved, held, used, occupied, leased, sold, hypothecated, encumbered, or conveyed. This Covenant: (a) runs with the land pursuant to Health and Safety Code section 25355.5 and Civil Code section 1471; (b) inures to the benefit of and passes with each and every portion of the Property; (c) is for the benefit of, and is enforceable by the Department; and (d) is imposed upon the entire Property unless expressly stated as applicable only to a specific portion thereof.

3.02. Binding upon Owners/Occupants. Pursuant to Health and Safety Code section 25355.5, Civil Code section 1471, and Civil Code section 1466, this Covenant binds all Owners of the Property, their heirs, successors, assignees, agents, and employees for the benefit of the Department, during their respective successive periods of ownership or occupancy such that an Owner's or Occupant's rights and obligations under this Covenant shall terminate upon transfer, expiration, or termination of the Owner's or Occupant's interest in the Property; except that such Owner's or Occupant's liability for, and defenses to, any violations of the Environmental Restrictions of this Covenant or any acts or omissions during such ownership or occupancy shall survive any transfer, expiration or termination of the Owner's or Occupant's interest in the Property.

3.03. Incorporation into Deeds and Leases. This Covenant shall be incorporated by reference in each and every deed and Lease for any portion of the Property.

3.04. Conveyance of Property. The Owner shall provide written notice to the Department not later than thirty (30) days after any conveyance of any ownership interest in the Property (excluding Leases, and mortgages, liens, and other non-possessory encumbrances). The written notice shall include the name and mailing address of the new Owner of the Property and shall reference the site name and site code as listed on page one of this Covenant. The notice shall also include the Assessor's Parcel Number (APN) noted on page one. If the new Owner's property has been assigned a different APN, each such APN that covers the Property must be provided. The Department shall not, by

reason of this Covenant, have authority to approve, disapprove, or otherwise affect proposed conveyance, except as otherwise provided by law.

3.05. Costs of Administering the Covenant to be paid by Owner. The Department has already incurred and will in the future incur costs associated with the administration of this Covenant. Therefore, the Covenantor hereby covenants for the Covenantor and for all subsequent Owners that, pursuant to California Code of Regulations, title 22, section 67391.1(h), the Owner agrees to pay the Department's costs in administering the Covenant.

ARTICLE IV
RESTRICTIONS AND REQUIREMENTS

4.01. Prohibited Uses. (a) Any use of the Property which may adversely affect the integrity and effectiveness of the Installed Remedial Features is prohibited; and

(b) Groundwater shall not be used for any purposes other than groundwater monitoring as described in the Operation and Maintenance Plan or upon the Department's advance written approval of a Groundwater Management Plan.

4.02. Soil Management.

(a) No activities that will disturb the soil (e.g., excavation, grading, removal, trenching, filling, earth movement, mining, or drilling) shall be allowed on the Property without the Department's advance written approval of a Soil Management Plan.

(b) Any soils brought to the surface shall be managed in accordance with all applicable provisions of the Soil Management Plan.

4.03. Prohibited Activities. The following activities shall not be conducted at the Property:

(a) Drilling for any water, oil, or gas without prior written approval by the Department.

(b) Extraction of groundwater or removal of groundwater (such as during excavation dewatering), without prior written approval by the Department in a Groundwater Management Plan.

(c) Installation of preferential pathways for groundwater (e.g., unprotected utilities placed below the groundwater table), except those approved by the Department in writing to be solely for the protection, operation and maintenance of the Installed Remedial Features~~, is prohibited~~.

(d) Construction or other development activities which are inconsistent with the Installed Remedial Features.

4.04. Soil Vapor. Prior to construction or other development of the Property, the Owner shall submit to the Department, and obtain the Department's approval of, an evaluation of soil vapor conditions and indoor air quality. The Department may require further investigation and/or implementation of engineering controls to address the potential for indoor vapor intrusion.

4.05. Non-Interference with Installed Remedial Features.

(a) Activities that may disturb the Installed Remedial Features described in sections 1.02 and 1.03 above, shall not be permitted on the Property without prior written approval by the Department.

(b) All uses and development of the Property shall preserve the integrity or effectiveness of the Installed Remedial Features described in sections 1.02 and 1.03 above.

(c) The Installed Remedial Features described in sections 1.02 and

1.03 above shall not be altered or removed without prior written approval by the Department.

4.06. Access for Department. The Department shall have reasonable right of entry and access to the Property for inspection, monitoring, and other activities consistent with the purposes of this Covenant as deemed necessary by the Department, in order to protect the public health or safety, or the environment.

4.07. Access for Implementing Operation and Maintenance. The entity or person responsible for implementing the Department-approved Operation and Maintenance Plan, shall have reasonable right of entry and access to the Property for the purpose of implementing the Operation and Maintenance Plan until the Department determines that no further Operation and Maintenance are required.

4.08. Inspection and Reporting Requirements. The Owner shall conduct an annual inspection of the Property verifying compliance with this Covenant, and shall submit an annual inspection report to the Department for its approval by July 31st of each year. The annual inspection report must include the dates, times, and names of those who conducted the inspection and reviewed the annual inspection report. It also shall describe how the observations were performed that were the basis for the statements and conclusions in the annual inspection report (e.g., drive by, fly over, walk in, etc.). If violations are noted, the annual inspection report must detail the steps taken to return to compliance. If the entity implementing the Operation, Maintenance and Monitoring Plan identifies any violations of this Covenant during the annual inspections or at any other time, the entity must within 14 calendar days of identifying the violation: determine the identity of the party in violation, send a letter advising the party of the violation of the Covenant, and demand that the violation cease immediately. Additionally, copies of any correspondence related to the violation of this Covenant shall be sent to the Department within 14 calendar days of its original transmission.

ARTICLE V
ENFORCEMENT

5.01. Enforcement. Failure of the Owner or Occupant to comply with this Covenant shall be grounds for the Department to require modification or removal of any Improvements constructed or placed upon any portion of the Property in violation of this Covenant. Violation of this Covenant, including but not limited to, failure to submit, or the submission of any false statement, record or report to the Department, shall be grounds for the Department to pursue administrative, civil, or criminal actions, as provided by law.

ARTICLE VI
VARIANCE, REMOVAL, AND TERM

6.01. Variance from Restriction. Any person may apply to the Department for a written variance from any or all of the Environmental Restrictions imposed by this Covenant. Such application shall be made in accordance with Health and Safety Code section 25223.

6.02 Removal of Restriction. Any person may apply to the Department to remove any or all of the Environmental Restrictions imposed by this Covenant. Such application shall be made in accordance with Health and Safety Code section 25224.

6.03 Term. Unless ended in accordance with paragraph 6.02, by law, or by the Department in the exercise of its discretion, this Covenant shall continue in effect in perpetuity.

ARTICLE VII
MISCELLANEOUS

7.01. No Dedication Intended. Nothing set forth in this Covenant shall be

construed to be a gift or dedication, or offer of a gift or dedication, of the Property, or any portion thereof to the general public or anyone else for any purpose whatsoever.

7.02. Recordation. The Covenantor shall record this Covenant, with all referenced Exhibits, in the County of Alameda within 14 calendar days of the Covenantor's receipt of a fully executed original.

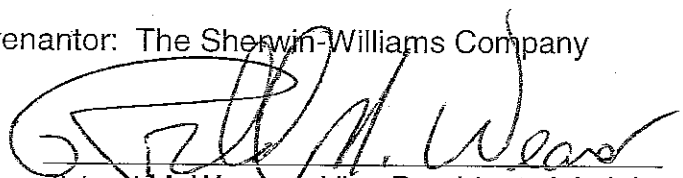
7.03. Notices. Whenever any person gives or serves any Notice ("Notice" as used herein includes any demand or other communication with respect to this Covenant), each such Notice shall be in writing and shall be deemed effective: (1) when delivered, if personally delivered to the person being served or to an officer of a corporate party being served, or (2) five calendar days after deposit in the mail, if mailed by United States mail, postage paid, certified, return receipt requested:

To Owner: Office of The General Counsel
The Sherwin-Williams Company
Attn: Secretary & General Counsel
101 Prospect Ave., N.W.
Cleveland, OH 44115

And To Dept.: Department of Toxic Substances Control
700 Heinz Avenue
Berkeley, California 94710
Attention: Nina Bacey, Project Manager

Any party may change its address or the individual to whose attention a Notice is to be sent by giving written Notice in compliance with this paragraph.

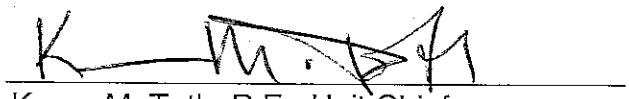
7.04. Partial Invalidity. If this Covenant or any of its terms are determined by a court of competent jurisdiction to be invalid for any reason, the surviving portions of this Covenant shall remain in full force and effect as if such portion found invalid had not been included herein.



7.05. Statutory References. All statutory references include successor provisions.

7.06. Incorporation of Attachments. All attachments and exhibits to this Covenant are incorporated herein by reference.

7.07. Covenantor's Right to a Separate Covenant. The Department acknowledges that Covenantor has the right under Civil Code section 1471 to record a separate covenant on the Property without the Department as a signatory on the separate covenant.



IN WITNESS WHEREOF, the Parties execute this Covenant.

Covenantor: The Sherwin-Williams Company

LEGAL DESCRIPTION

The land referred to herein is situated in the State of California, County of Alameda, City of Emeryville, and described as follows:

PARCEL ONE:

PARCEL "A" AS REFLECTED ON THE DOCUMENT ENTITLED "LOT LINE ADJUSTMENT PLAT MAP: DATED SEPTEMBER 1, 1993 AND RECORDED SEPTEMBER 30, 1994, SERIES NO. 94-220319 ALAMEDA COUNTY RECORDS, DESCRIBED AS FOLLOWS:

BEING ALL OF PARCEL 1, AS DESCRIBED IN THE DEED RECORDED NOVEMBER 16, 1962 ON REEL 726, IMAGE 270, ALAMEDA COUNTY RECORDS, ALSO BEING ALL OF PARCEL 1, AS DESCRIBED IN THE DEED RECRODED SEPTEMBER 20, 1963 ON REEL 996, IMAGE 946, ALAMEDA COUNTY RECORDS, ALSO BEING ALL OF PARCELS 1 AND 2, AS DESCRIBED IN THE DEED RECORDED DECEMBER 31, 1964 ON REEL 1405., IMAGE 341, ALAMEDA COUNTY RECORDS, ALSO BEING A PORTION OF THE PARCEL OF LAND AS DESCRIBED IN THE DEED RECORDED OCTOBER 14, 1920 IN BOOK 3003 OF DEEDS AT PAGE 128, ALAMEDA COUNTY RECORDS, DESCRIBED AS FOLLOWS:

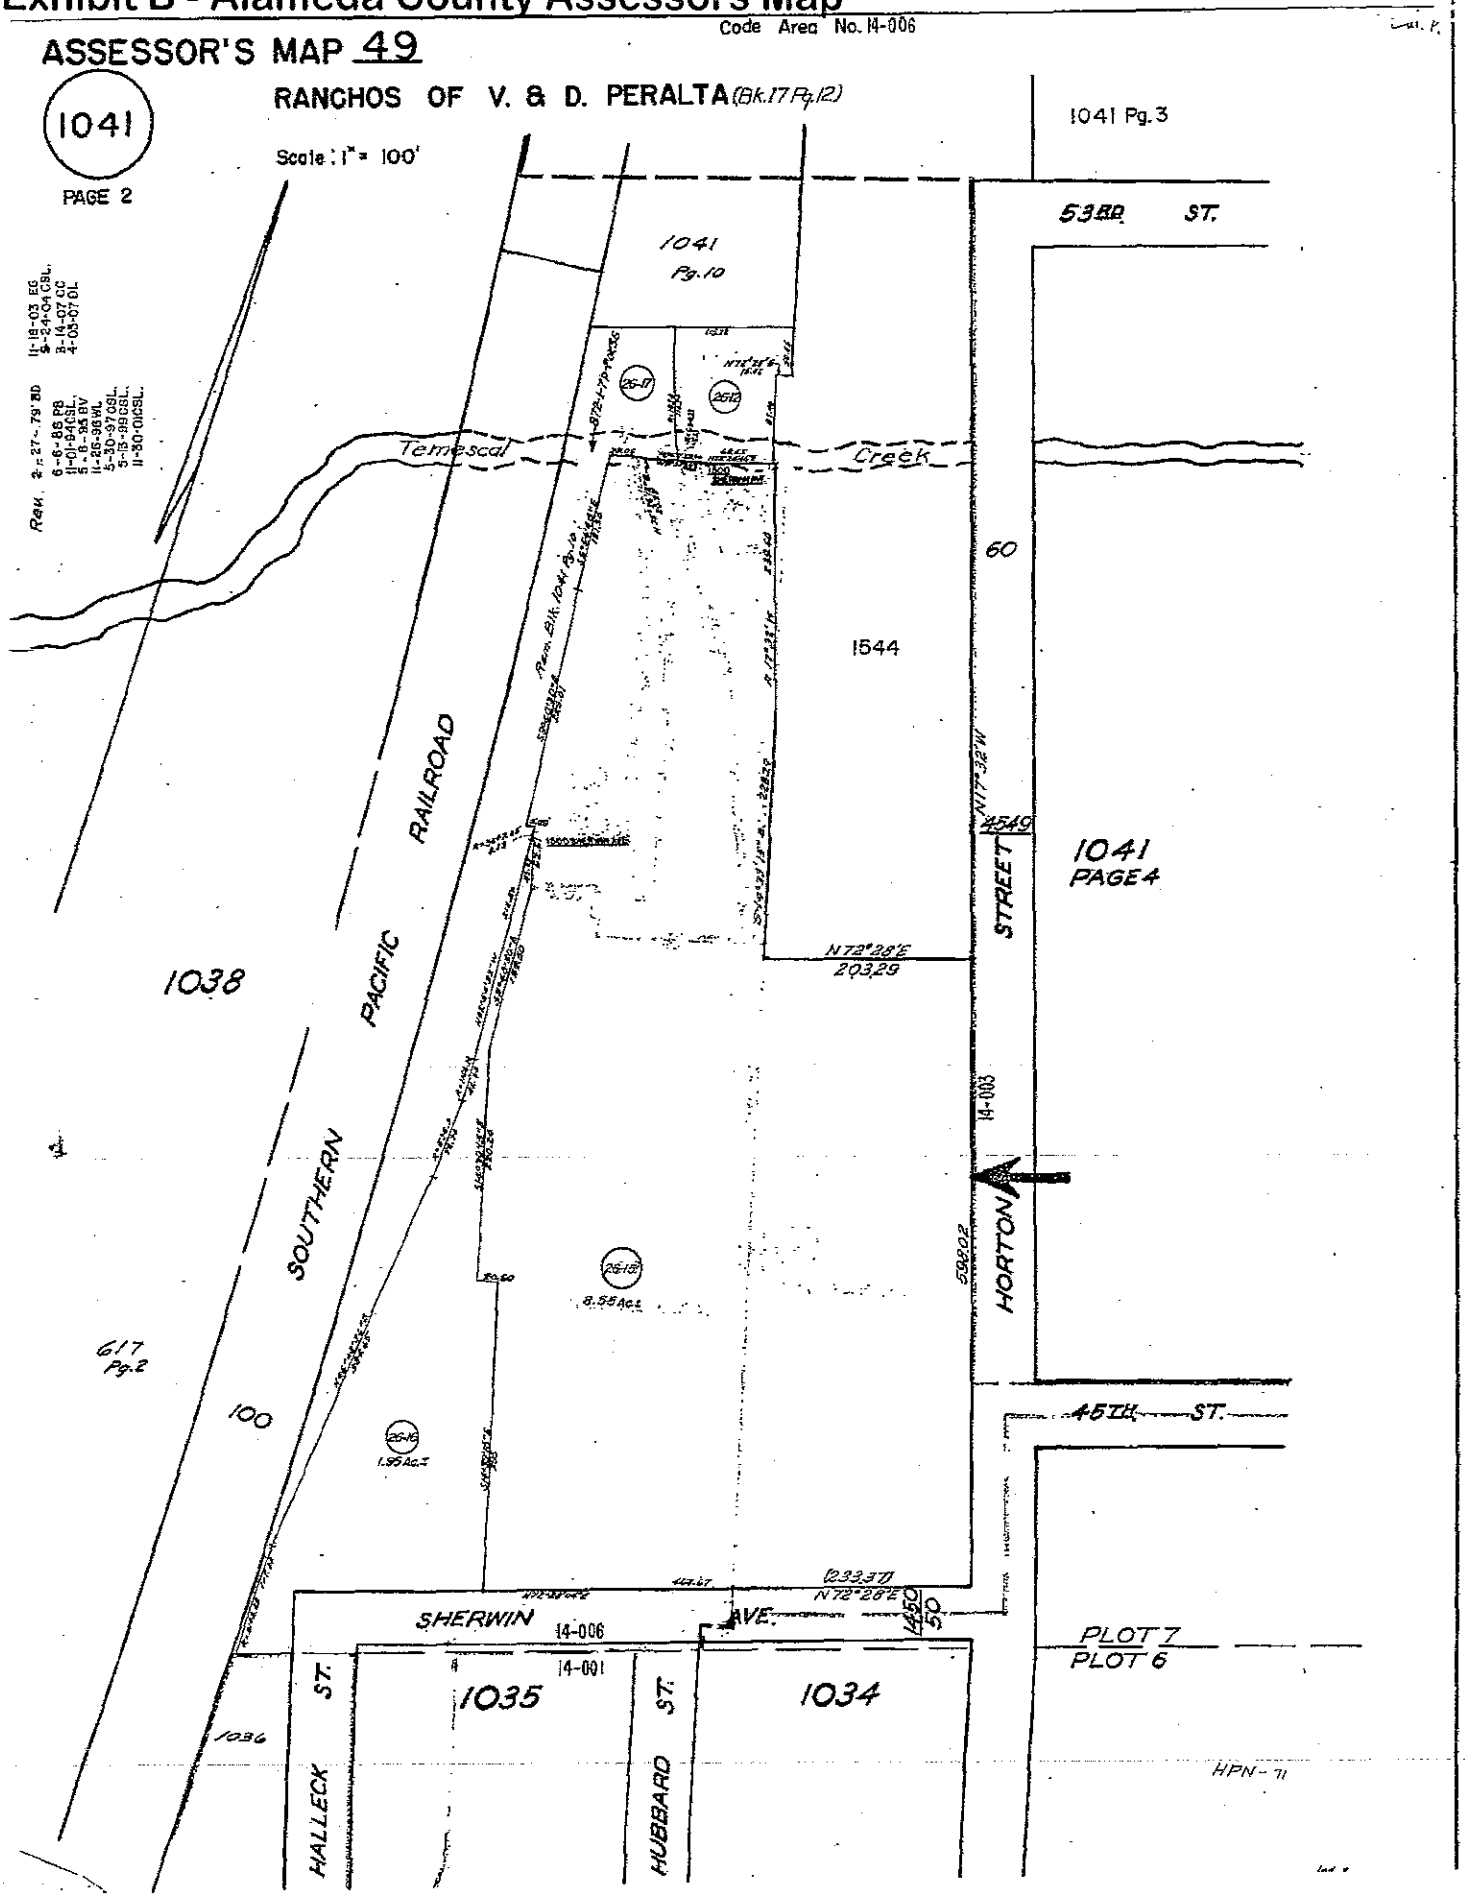
BEGINNING AT THE SOUTHEASTERLY CORNER OF PARCEL 1 AS DESCRIBED IN SAID DEED RECORDED NOVEMBER 16, 1962, SAID CORNER BEING THE INTERSECTION OF THE NORTHERLY LINE OF SHERWIN AVENUE AND THE WESTERLY LINE OF HORTON AVENUE; THENCE ALONG THE SOUTHERLY LINE OF THE LAST SAID PARCEL 1, SOUTH 72 DEGREES 28 MINUTES 00 SECONDS WEST, 233.37 FEET TO THE SOUTHEASTERLY CORNER LINE OF SAID PARCEL 1 AS DESCRIBED IN SAID DEED RECORDED SEPTEMBER 20, 1963; THENCE ALONG THE SOUTHERLY LINE AND THE WESTERLY LINE OF LAST SAID PARCEL 1 THE FOLLOWING FIVE COURSES: SOUTH 72 DEGREES 28 MINUTES 00 SECONDS WEST, 235.30 FEET; THENCE NORTH 14 DEGREES 39 MINUTES 15 SECONDS WEST, 295.00 FEET; THENCE SOUTH 75 DEGREES 20 MINUTES 45 SECONDS WEST, 20.50 FEET; THENCE NORTH 14 DEGREES 39 MINUTES 15 SECONDS WEST, 220.24 FEET; THENCE NORTH 03 DECREES 40 MINUTES 30 SECONDS WEST, 159.50 FEET TO THE SOUTHWESTERLY CORNER OF PARCEL 1, AS DESCRIBED IN SAID DEED RECORDED DECEMBER 31, 1964; THENCE ALONG THE WESTERLY AND NORTHERLY LINE OF LAST SAID PARCEL 1 THE FOLLOWING FIVE COURSES; NORTH 14 DEGREES 39 MINUTES 15 SECONDS WEST, 52.51 FEET; THENCE SOUTH 75 DEGREES 20 MINUTES 45 SECONDS WEST, 6.09 FEET; THENCE NORTH 03 DEGREES 40 MINUTES 30 SECONDS WEST 229.01 FEET THENCE NORTH DEGREES 56 MINUTES 48 SECONDS WEST, 131.30 FEET; THENCE NORTH 75 DEGREES 26 MINUTES 12 MINUTES EAST, 44.59 FEET TO THE MOST NORTHERLY CORNER OF LAST SAID PARCEL 1; THENCE NORTH 75 DEGREES 28 MINUTES 26 SECONDS EAST, 37.50 FEET TO THE NORTHWESTERLY CORNER OF PARCEL 2, AS DESCRIBED IN LAST SAID DEED, RECORDED DECEMBER 31, 1964; THENCE ALONG THE NORTHERLY LINE AND EASTERLY PROLONGATION OF SAID NORTH LINE OF SAID PARCEL 2, NORTH 75 DEGREES 20 MINUTES 45 SECONDS EAST, 84.63 FEET TO THE EASTERLY LINE OF PARCEL 2, AS DESCRIBED IN SAID DEED RECORDED OCTOBER 14, 1920; THENCE ALONG SAID EASTERLY LINE SOUTH 14 DEGREES 39 MINUTES 15 SECONDS EAST, 468.18 FEET TO THE NORTHERLY LINE OF PARCEL 1, AS DESCRIBED IN SAID DEED RECORDED NOVEMBER 16, 1962; THENCE ALONG SAID NORTHERLY AND EASTERLY LINE OF THE LAST SAID PARCEL 1 THE FOLLOWING TWO COURSES: NORTH 72 DEGREES 28 MINUTES 00 SECONDS EAST, 203.29 FEET; THENCE SOUTH 17 DEGREES 32 MINUTES 00 SECONDS EAST, 598.02 FEET TO THE POINT OF BEGINNING.

A) EXCEPTING ALL OF THE MINERALS AND MINERAL ORES OF EVERY KIND AND CHARACTER NOW KNOWN TO EXIST OR HEREAFTER DISCOVERED UPON, WITHIN OR UNDERLYING SAID LAND OR THAT MAY BE PRODUCED THEREFROM, INCLUDING, WITHOUT LIMITENG THE GENERALITY OF THE FOREGOING, ALL PETROLEUM, OIL, NATURAL GAS AND OTHER HYDROCARBON SUBSTANCES AND PRODUCTS DERIVED THEREFROM, TOGETHER WITH THE EXCLUSIVE AND PERPETUAL RIGHT OF INGRESS AND EGRESS BENEATH THE SURFACE OF SAID LAND BELOW A DEPTH OF 500 FEET TO EXPLORE FOR, EXTRACT, MINE AND REMOVE THE SAME, AND TO MAKE SUCH USE OF THE SAID LAND BELOW SAID DEPTH AS IS NECESSARY OR USEFUL IN CONNECTION THEREWITH, WHICH USE MAY INCLUDE LATERAL OR SLANT DRILLING, BORING, DIGGING OR SINKING OF WELLS, SHAFTS OR TUNNELS; PROVIDED, HOWEVER, SHALL NOT USE THE SURFACE OF SAID LAND IN THE EXERCISE ANY OF SAID RIGHTS, SHALL NOT DISTURB THE SURFACE OF SAID LAND OR ANY IMPROVEMENTS THEREON, AND SHALL NOT USE OR PENEYRATE SAID LAND WITHIN 500 FEET OF THE SURFACE THEREOF, AS RESERVED IN THE DEED RECORDED SEPTEMBER 20, 1963, REEL 996, IMAGE 946, ALAMEDA COUNTY RECORDS AND IN THE DEED RECORDED DECEMBER 31, 1964, ON REEL 1405, IMAGE 341, SERIES NO. AW-209382, ALAMEDA COUNTY RECORDS.

B) THAT PORTION THEREOF GRANTED IN THE DEED TO CHIRON PROPERTIES, INC., A CALIFORNIA CORPORATION, RECORDED AUGUST 5, 2004, SERIES NO. 2004-357995, OFFICIAL RECORDS.

PARCEL TWO:

A NON-EXCLUSIVE EASEMENT FOR ROADWAY PURPOSES, AS CREATED IN TEE DEED RECORDED SEPTEMBER 30, 1983, ON REEL 996, IMAGE 946, SERIES NO. AU-156519, ALAMEDA COUNTY RECORDS. DESCRIBED AS FOLLOWS:



BEGINNING AT A POINT IN THE SOUTHERLY LINE OF THAT CERTAIN 0.010 ACRE PARCEL OF LAND DESCRIBED IN THE DEED DATED AUGUST 3, 1925 FROM THE MAE ESTATE TO SOUTHERN PACIFIC RAILROAD COMPANY RECORDED AUGUST 8, 1925, IN BOOK 1123, PAGE 11, ALAMEDA COUNTY RECORDS, DISTANT THEREON SOUTH 72 DEGREES 28 MINUTES WEST, 205.26 FEET FROM THE MOST EASTERLY CORNER OF SAID 0.010 OF AN ACRE PARCEL OF LAND (SAID SOUTHERLY LINE BEING ALSO THE NORTHERLY LINE OF PLOT NO.6 AS SHOWN ON KELLERSBERGER'S MAP OF THE RANCHOS OF VINCENTE AND DOMINGO PERALTA); THENCE NORTH DEGREES 00 MINUTES WEST LEAVING SAID SOUTHEASTERLY LINE 123.18 FEET TO A POINT IN A LINE PARALLEL WITH AND DISTANT 255.00 FEET WESTERLY; MEASURED AT RIGHT ANGLES, FROM THE EASTERLY LINE OF LAND DESCRIBED AS PARCEL NO. 2 IN THE DEED DATED OCTOBER 7, 1920, FROM THE MAE ESTATE TO SOUTHERN PACIFIC RAILROAD COMPANY, RECORDED OCTOBER 14, 1920 IN BOOK 3003 OF DEEDS, PAGE 128, ALAMEDA COUNTY RECORDS; THENCE NORTH 14 DEGREES 39 MINUTES 15 SECONDS WEST ALONG SAID PARALLEL LINE 204.91 FEET; THENCE NORTH 32 DEGREES 00 MINUTES 30 SECONDS WEST 51.96 FEET TO A POINT IN A LINE PARALLEL WITH AND DISTANT 270.50 FEET WESTERLY, MEASURED AT RIGHT ANGLES, FROM SAID EASTERLY LINE OF PARCEL NO. 2; THENCE ORTH 14 MARCH 39 MINUTES 15 SECONDS WEST ALONG LAST SAID PARALLEL LINE 200.70 FEET; THENCE NORTH 03 DEGREES 40 MINUTES 30 SECONDS WEST 211.56 FEET; THENCE NORTH 75 DEGREES 20 MINUTES 45 SECONDS EAST 5.09 FEET TO A POINT IN A LINE PARALLEL WITH AND DISTANT 225.13 FEET WESTERLY, MEASURED AT RIGHT ANGLES FROM SAID EASTERLY LINE OF PARCEL NO.2; THENCE SOUTH 14 DEGREES 39 MINUTES 15 SECONDS EAST ALONG LAST SAID PARALLEL LINE 52.51 FEET; THENCE SOUTH 03 DEGREES 40

MINUTES 30 SECONDS EAST 159.50 FEET TO A POINT IN A LINE PARALLEL WITH AND DISTANT 255.50 FEET WESTERLY, MEASURED, AT RIGHT ANGLES, FROM SAID EASTERLY LINE OF PARCEL NO.2; THENCE SOUTH 14 DEGREES 39 MNUTES 15 SECONDS EAST ALONG LAST SAID PARALLEL LINE 220.24 FEET; THENCE NORTH 75 DEGREES 20 MINUTES 45 SECONDS EAST 20.50 FEET TO A POINT IN A LINE PARALLEL WITH AND DISTANT 235.00 FEET WESTERLY, MEASURED AT RIGHT ANGLES, FROM SAID EASTERLY LINE OF PARCEL NO. 2; THENCE SOUTH 14 DECREES 39 MINUTES 15 SECONDS EAST ALONG LAST SAID PARALLEL LINE 355.08 FEET TO THE POINT OF BEGINNING.

Site History

The Site is bounded by Horton Street to the east, the former Rifkin Property and Temescal Creek to the north, Sherwin Street to the south and railroad tracks to the west. The Site is currently defined as the Sherwin-Williams' property located at 1450 Sherwin Street and a portion of the adjacent former Rifkin Property located at 4525-4563 Horton Street impacted by hazardous materials from the Sherwin-Williams property. The area is mixed use, comprised primarily of industrial and commercial properties with some residential use. Sherwin-Williams Company owns and operates a coatings manufacturing plant onsite. The plant has been in operation since the early 1900s, manufacturing various types of coating products. Sherwin-Williams also produced lead-arsenate pesticides at the plant from approximately the 1920s until the late 1940s. The plant is currently used for latex paint manufacturing, packaging and storage of raw materials and paint products and laboratory space.

Land Use Restrictions

DISCLAIMER: The land use restrictions listed under the site management requirements are only an abbreviated summary of the land use restrictions, and may not encompass all restrictions and notification requirements placed on a property. For complete land use restriction information please see the Land Use Restriction document by, clicking on the "VIEW COVENANT" link.

	DATE RECORDED	SITE MANAGEMENT REQUIREMENTS
[VIEW COVENANT]	12/19/2012	• LAND USE COVENANT • NO GROUNDWATER EXTRACTION AT ANY DEPTH WITHOUT APPROVAL • ACTIVITIES PROHIBITED WHICH DISTURB THE REMEDY AND MONITORING SYSTEMS WITHOUT APPROVAL • NOTIFY AFTER CHANGE OF PROPERTY OWNER • NO OIL OR GAS EXTRACTION AT ANY DEPTH

[VIEW DOCS]	Work Notice	6/10/2011	Work notice announcing start of Raised Cap removal anticipated to begin the week of 6/20/2011. Next community open house scheduled for 6/30/2011 at Emeryville City Council Chambers.
[VIEW DOCS]	Work Notice	4/15/2011	Work notice announcing drilling to collect soil samples, installation of 44 soil vapor extraction wells to remove soil vapors and abandonment of 62 monitoring wells.
[VIEW DOCS]	Technical Workplan	7/30/2010	Work Plan approved. The Work Plan proposes to collect lithologic information to test assumptions made in the groundwater model to support the design of the final remedy. The Work Plan also proposes to collect soil for waste disposal companies to use in preparing how to handle the soil safely and appropriately.
[VIEW DOCS]	CEQA - Initial Study/ Neg. Declaration	6/14/2010	DTSC approved the Final Negative Declaration and prepared a Notice of Determination after responding to the comments received.
[VIEW DOCS]	Remedial Action Plan	6/14/2010	DTSC approves Final Remedial Action Plan. Remedial Design scheduled to be submitted in September 2010, with implementation tentatively scheduled to begin in late-February/March 2011.
[VIEW DOCS]	Long Term Monitoring Report	5/26/2010	No significant changes noted from previous reports.
[VIEW DOCS]	Fact Sheets	10/23/2009	Fact Sheet for the Draft Remedial Action Plan and CEQA Mitigated Negative Declaration approved for distribution to the Sherwin-Williams Site mailing list.
[VIEW DOCS]	September 2009 Monthly Summary Report	10/8/2009	Report accepted.
[VIEW DOCS]	August 2009 Monthly Summary Report	9/3/2009	Report accepted. DTSC anticipates issuance of its comments on the Draft RAP and to continue its CEQA evaluation this month.
[VIEW DOCS]	July 2009 Monthly Summary Report	8/17/2009	Report adequate. Still working on draft RAP and CEQA Initial Study.
[VIEW DOCS]	Monthly Summary Report	7/21/2009	During June 2009, the groundwater extraction and treatment system continued to operate. Sherwin-Williams and DTSC met wih the City of Emeryville to discuss potential CEQA issues associated with the proposed alternative described in the Feasibility Study. The CWG review draft Remedial Action Plan was sent out to the Consultative Work Group (CWG).

[VIEW DOCS]	Monitoring Report	5/8/2009	The groundwater extraction and treatment system operated for at least one hour a day for 78 days during the current quarter. 944,100 gallons of water was extracted and treated (representing an average flow rate of 8.41 gpm during days of normal operation). The treatment system removed approximately 138 pounds of arsenic and 10 pounds of VOCs.
[VIEW DOCS]	Feasibility Study Report	5/7/2009	Approved Feasibility Study Report and PHERA Report together. PHERA Report found that potential releases of chemicals of concern from soil, soil gas and groundwater during excavation could be controlled with sufficient dust and vapor controls. Therefore, proposed excavation of approximately 64,000 cubic yards of soil is considered implementable and the FS Report is approved.
[VIEW DOCS]	* RAGS Part C Report	5/7/2009	DTSC approved the Public Health Evaluation of the Remedial Alternative (PHERA) that analyzed the potential risks to the surrounding community from the implementation of the proposed cleanup action at the Site. The evaluated cleanup action consists of digging up approximately 70,000 cubic yards of soil containing arsenic, lead and/or volatile organic compounds (VOCs) over a six-month period and transporting it for offsite disposal.
[VIEW DOCS]	April 2009 Monthly Report	5/6/2009	April Monthly Summary Report. Sherwin-Williams submitted the final Feasibility Study (FS) and Public Health Evaluation of the Remedial Alternative (PHERA) Reports. Conducted a briefing for the Artist's Coop regarding the PHERA Report.
[VIEW DOCS]	Fact Sheets	4/14/2009	Fact Sheet describing the Public Health Evaluation of the Remedial Alternative mailed out on 4/14/2009 to the Sherwin-Williams site mailing list.
[VIEW DOCS]	March 2009 Monthly Report	4/6/2009	Monthly Report for March 2009 adequately documents activities conducted during March 2009.
[VIEW DOCS]	January 2009 Monthly Summary Report	2/9/2009	Continuing to work on the PHERA and the revised FS Report
[VIEW DOCS]	Combined Groundwater & NPDES Report for October 1 to December 30, 2008	2/9/2009	The groundwater extraction and treatment system (GWETS) operated for at least one hour/day during 83 days of the current quarter (October 1 to December 30, 2008). 648,500 gallons of water was extracted and treated, removing approximately 192 pounds of arsenic and 4 pounds of VOCs.
[VIEW DOCS]	December 2008 Monthly Summary Report	1/8/2009	Continuing to work on the PHERA and revised Feasibility Study.
[VIEW DOCS]	November 2008 Monthly Status Report	12/8/2008	Report accepted.
[VIEW DOCS]	October 2008 Monthly Report	11/12/2008	Monthly Summary Report notes that work continues on the Feasibility Study and Public Health Assessment for the Remedial Alternative (PHERA). CWG meeting also held to discuss PHERA.
[VIEW DOCS]	Technical Report	11/8/2008	Letter report summarizing the results of additional investigation conducted in support of the Remedial Action Plan and Remedial Design.
[VIEW DOCS]	July 1 to September 30, 2008 Combined Groundwater and NPDES Self-Monitoring Report	10/30/2008	Treatment system operated for approximately 84 days with the largest shutdown of less than 48 hours. 448,840 gallons of water were treated, removing approximately 18 pounds of arsenic and 0.3 pounds of VOCs. Average flow rate was approximately 4.1 gpm during the days of normal operation.
[VIEW DOCS]	Operations and Maintenance Report	10/9/2008	Report is prepared to comply with Water Board's NPDES permit requirements. No significant issues noted.
[VIEW DOCS]	September 2008 Monthly Report	10/8/2008	Report discusses activities conducted during September 2008; proposed for October 2008 and projected for November 2008.
[VIEW DOCS]	Risk Assessment Workplan	10/6/2008	Work plan approved with comments to be addressed in the PHERA Report.
[VIEW DOCS]	August Monthly Status Report	9/5/2008	August 2008 Monthly Status Report accepted.
[VIEW DOCS]	July 2008 Monthly Report	8/12/2008	Monthly status report accepted.
[VIEW DOCS]	June 2008 Monthly Report	7/15/2008	Report accepted.
[VIEW DOCS]	Monitoring Report	7/11/2008	In addition to coordinating groundwater monitoring events with the adjacent South Bayfront site, DTSC has asked that Sherwin-Williams incorporate South Bayfront data in its figures. These figures will be submitted under separate cover.
[VIEW DOCS]	May 2008 Monthly Report	6/6/2008	Report accepted.
[VIEW DOCS]	April 2008 Monthly Report	5/7/2008	Monthly report accepted.

[VIEW DOCS]	Technical Workplan	4/23/2008	Workplan was approved for implementation with modifications.
[VIEW DOCS]	Technical Workplan	4/23/2008	Workplan will install 12 borings to provide additional lithologic description around areas being considered for slurry wall breaches, conduct a B-Zone pump test to gather data for potential dewatering, and collect soil samples for waste treatment facilities. The workplan was approved with modifications. Work will start April 29, 2008.
[VIEW DOCS]	March 2008 Monthly Report	4/9/2008	March 2008 Monthly Report accepted.
[VIEW DOCS]	Fact Sheets	3/19/2008	Final fact sheet sent to RP's consultant for distribution.
[VIEW DOCS]	Treatability Study Report	3/18/2008	DTSC has no comments on this document; document accepted.
[VIEW DOCS]	February 2008 Monthly Report	3/11/2008	Monthly report accepted with one modification. The report should reflect the abandonment of three groundwater monitoring wells on UPRR Parcel D property in March 2008 and the proposed soil borings and Groundwater Zone B pump test that may begin in late-March/early-April.
[VIEW DOCS]	Treatability Study Report	2/26/2008	DTSC approved finalizing this report on 2/11/2008. Final report received 2/26/2008.
[VIEW DOCS]	Treatability Study Report	2/26/2008	DTSC approved finalizing reports on 2/11/2008. Final documents received 2/26/2008.
[VIEW DOCS]	January 2008 Monthly Summary Report	2/7/2008	Report accepted.
[VIEW DOCS]	Monitoring Report	1/30/2008	Report accepted. Groundwater extraction system was shutdown 8/15/2007 and treatment system was shutdown on 8/22/2007 to accomodate building demolition activities. System was brought back on-line 12/3/2007, with full normal operation beginning 12/7/2007.
[VIEW DOCS]	Treatability Study Report	1/29/2008	Comments on the report adequately addressed; no additional comment/response exchange or further revision to the report required.
[VIEW DOCS]	December 2007 Monthly Status Report	1/11/2008	December 2007 Monthly Status Report received.
[VIEW DOCS]	*Correspondence - Received	12/17/2007	Letter notifying DTSC that the groundwater extraction and treatment system was successfully restarted and became fully operational as of December 7, 2007. The groundwater extraction and treatment system was offline for approximately 15 weeks to allow for demolition of several onsite structures. No cahnges were made to the treatment system. There is a new layout for the conveyance lines.
[VIEW DOCS]	Monitoring Report	12/14/2007	DTSC received document on 12/14/2007. Report documents groundwater level measurements conducted at the former Rifkin property on Friday, November 9, 2007 and groundwater level measurements collected at piezometers on 10/26/2007 through 11/15/2007.
[VIEW DOCS]	Monitoring Report	12/14/2007	DTSC received the report on 12/14/2007. The report documents the results of depth to groundwater monitoring conducted at the former Rifkin property on Friday, October 12, 2007 and weekly groundwater level monitoring conducted at site piezometers from 9/28/2007 through 10/19/2007.
[VIEW DOCS]	November 2007 Monthly Status Report	12/11/2007	Report accepted.
[VIEW DOCS]	October 2007 Monthly Report	11/6/2007	Report accepted. Additional public participation activities are being discussed.
	Fieldwork	10/17/2007	Semiannual groundwater monitoring event completed.
[VIEW DOCS]	September 2007 Monthly Report	10/4/2007	Monthly Report discusses ongoing temporary shutdown of the GWETS and demolition activities.
[VIEW DOCS]	Treatability Study Report	9/24/2007	Report presents results of the Phase III Grout Injection Pilot Test but does not interpret results. Interpretation will be provided in Feasibility Study Report.
[VIEW DOCS]	August 2007 Monthly Summary Report	9/5/2007	August 2007 Monthly Summary Report submitted and accepted.
[VIEW DOCS]	Fact Sheets	8/29/2007	DTSC sent final copy of the fact sheet and mailing list to consultant to mail out. Consultant mailed out fact sheet on 9/4 and DTSC received on 9/5.
[VIEW DOCS]	July 2007 Monthly Summary Report	7/30/2007	July 2007 Monthly Summary Report accepted.
[VIEW DOCS]	June 2007 Monthly Summary Report	6/29/2007	Monthly summary report accepted
[VIEW DOCS]	Public Participation Plan / Community Relations Plan	6/29/2007	Public Participation Specialist signed the Public Participation Plan.
	Treatability Study		The study found that the vast majority of the arsenic within the site soils is bound within amorphous silica. Therefore, the mobility of arsenic in the soils will be controlled by the

[VIEW DOCS]	Report	6/28/2007	stability of the amorphous silica. Amorphous silica becomes unstable (the solubility increases) at pH values above about 9-10.
[VIEW DOCS]	Treatability Study Workplan	6/28/2007	Workplan outlines which materials will be further tested in column tests as described in the initial treatability study workplan.
[VIEW DOCS]	Monitoring Report	5/22/2007	Report adequately documents groundwater sounding event conducted during the first quarter 2007. Groundwater sampling occurred in April 2007.
[VIEW DOCS]	April 2007 Monthly Status Report	5/4/2007	
	Fieldwork	4/20/2007	Sounding event completed.
[VIEW DOCS]	Technical Report	4/12/2007	Report indicates that further study is necessary in the next Phase to evaluate arsenic within the amorphous silica matrix within the groundwater table.
[VIEW DOCS]	Technical Report	3/19/2007	Report discusses the laboratory bench scale testing conducted to determine an appropriate grout mixture for pilot testing insitu injection in Phase III.
[VIEW DOCS]	February 2007 Monthly Status Report	3/2/2007	Report accepted; no significant comments
[VIEW DOCS]	Technical Report	3/1/2007	No comments on document. The information gathered will be evaluated as part of the feasibility study and the monitoring well will be incorporated into the groundwater monitoring program for the Site.
[VIEW DOCS]	Technical Report	3/1/2007	No comments on document. Information gathered will be evaluated as part of the feasibility study.
[VIEW DOCS]	January 2007 Monthly Report	2/5/2007	Report accepted.
[VIEW DOCS]	Monitoring Report	1/30/2007	Report adequate.
[VIEW DOCS]	Feasibility Study Workplan	1/16/2007	FS Workplan approved with modifications and comments to be addressed in the FS Report.
[VIEW DOCS]	December 2006 Monthly Report	1/8/2007	Report accepted.
[VIEW DOCS]	Treatability Study Workplan	12/19/2006	Workplan approved with modifications. Field work will begin 12/14/2006.
[VIEW DOCS]	November 2006 Monthly Status Report	12/1/2006	Report accepted
	Fieldwork	11/30/2006	Monitoring well installed 11/28/06; soil vapor samples collected 11/29/06 and 11/30/06.
[VIEW DOCS]	Fact Sheets	11/17/2006	Work Notice approved for distribution.
[VIEW DOCS]	Technical Report	11/15/2006	Approved report. One additional monitoring well will be installed.
[VIEW DOCS]	Remedial Investigation Workplan	11/14/2006	Soil vapor sampling work plan approved with modifications. Work scheduled for week of 11/27.
[VIEW DOCS]	October 2006 Monthly Status Report	10/30/2006	Monthly Status Report
[VIEW DOCS]	Monitoring Report	10/30/2006	Report accepted.
[VIEW DOCS]	September Monthly Status Report	9/29/2006	Report submitted by Sherwin-Williams
[VIEW DOCS]	August 2006 Monthly Status Report	9/5/2006	Report accepted.
[VIEW DOCS]	Monitoring Plan	8/22/2006	Groundwater monitoring plan amended and approved.
[VIEW DOCS]	July 2006 Monthly Report	8/4/2006	Report accepted
[VIEW DOCS]	Monitoring Report	7/28/2006	Report accepted. Addresses quarterly period from April 1 to June 30, 2006.
[VIEW DOCS]	June 2006 Monthly Status Report	7/5/2006	Monthly Progress report submitted.
[VIEW DOCS]	Monitoring Report	6/27/2006	Report accepted, no significant comments.
[VIEW DOCS]	Unilateral Order (I/SE, RAO, CAO, EPA AO)	5/10/2006	
[VIEW DOCS]	April 2006 Monthly Report	5/1/2006	Monthly report has been submitted
[VIEW DOCS]	Fact Sheets	4/28/2006	FactSheet issued that identified DTSC as the new regulatory lead agency. It includes a community survey for the project.
[VIEW DOCS]	March 2006 Monthly Report	4/3/2006	Submitted via electronic mail
[VIEW DOCS]	February 2006 Monthly Activities	3/2/2006	This report is submitted in accordance with a SFRWQCB order.

	Summary Report		
[VIEW DOCS]	AB 2061 - Designation	2/23/2006	Site Designation Committee transferred lead agency status to DTSC due to changes in site conditions and proposed reuse.
[VIEW DOCS]	January 2006 Status Report	2/1/2006	This report was submitted to the San Francisco Regional Water Quality Control Board as required by their order.

Mr. Larry Mencin
The Sherwin-Williams Company
101 Prospect Avenue
N.W. Cleveland, Ohio 44115-1075

Dear Mr. Mencin:

The Department of Toxic Substances Control (DTSC) has reviewed the Data Summary Report for Groundwater Monitoring Activities for the Period from July 1, 2014 through December 31, 2014, for the Sherwin-Williams Site, dated January 8, 2015. It is hereby approved.

If you have any questions, please feel free to contact me at Juanita.bacey@dtsc.ca.gov or (510) 540-2480.

Sincerely,

Nina Bacey, Project Manager
Brownfields and Environmental Restoration Program

Site History

Site is a vacant parcel located to the north of the intersection of Sherwin Avenue and Halleck Street in Emeryville, California. The Site is bounded by the Sherwin-Williams Site on the east and north, Union Pacific Railroad tracks on the west, and the southern edge of Sherwin Avenue on the South. It incorporates the Technichem facility's Solid Waste Management Unit #6 on the southwest corner of the Site adjacent to the building that formerly housed Technichem. The City of Emeryville is preparing the Site for redevelopment. Under the MOA between the City of Emeryville, DTSC and the Water Board, the City provided oversight for the Redevelopment Agency's site characterzation activities and development of a Final Cleanup Plan for the Site.

Site History

This site, which has been in operation since the early 1920s, historically served as a PG&E Materials Distribution Center. The site has served as a warehouse, repair shop and storage yard for transformers, capacitors, and other electrical supplies. The portion of the Materials Distribution Center north of 53rd Street was purchased by Chiron Corporation in the early 1990's and is now utilized by Chiron's successor, Novartis.

The former Southern Pacific Right-of-Way was located adjacent to PG&E's Materials Distribution Center. The section of the former Right-of-Way north of 53rd Street is currently owned by Novartis Corporation, and the section south of 53rd Street is owned by Wareham Development.

Land Use Restrictions

DISCLAIMER: The land use restrictions listed under the site management requirements are only an abbreviated summary of the land use restrictions, and may not encompass all restrictions and notification requirements placed on a property. For complete land use restriction information please see the Land Use Restriction document by, clicking on the "VIEW COVENANT" link.

[VIEW DOCS]	Materials Facility	Building A Area	Work Notice	8/27/2013	Work Notice for additional well installation near Building A approved and mailed out.
[VIEW DOCS]	Materials Facility	Building A Area	Risk Assessment Report	7/31/2013	DTSC has approved the offsite indoor air risk evaluation. The risk evaluation concluded that under current site conditions, there was no significant indoor air risk to nearby residents and workers.
[VIEW DOCS]	Materials Facility		Site Characterization Report	7/16/2013	DTSC has approved the site investigation addendum report, which documents the results of additional soil and groundwater sampling in the Building A area and along the historical insulating oil pipeline.
[VIEW DOCS]	Materials Facility		Site Characterization Report	5/2/2013	DTSC has approved the supplemental report, which documents the results of sampling performed at the site in 2011.
	Materials				

	Facility		Fieldwork	3/15/2013	Additional groundwater investigation performed at the site.
[VIEW DOCS]	Materials Facility		Work Notice	2/25/2013	Work notice informing the community of additional soil and groundwater sampling at the site was finalized.
[VIEW DOCS]	Materials Facility		Site Characterization Workplan	2/14/2013	Workplan for additional groundwater investigation in the Building A area and along the historical mineral oil pipeline.
[VIEW DOCS]	Chiron/Novartis Property		5 Year Review Reports	12/10/2012	Five-Year review completed for the Restricted Excavation Area located on Novartis property in Emeryville. The five-year review concluded that the remedy selected for the site, capping and institutional controls, remained protective of public health and the environment.
[VIEW DOCS]	Materials Facility		Annual Oversight Cost Estimate	10/30/2012	Annual DTSC oversight cost estimate mailed to project proponent.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Annual Oversight Cost Estimate	10/30/2012	Annual DTSC oversight cost estimate mailed to responsible party.
	Materials Facility	Building A Area	Fieldwork	9/28/2012	Supplemental soil vapor sampling performed at the site.
[VIEW DOCS]	Materials Facility	Building A Area	Work Notice	9/21/2012	Work notice mailed out for additional soil gas sampling in the Building A area.
	Materials Facility	Building A Area	Fieldwork	6/18/2012	Resampling of current soil vapor wells along Holden St. and installation of two new vapor wells was performed.
[VIEW DOCS]	Materials Facility		Risk Assessment Workplan	6/14/2012	Workplan for the site wide baseline risk assessment approved by DTSC.
[VIEW DOCS]	Materials Facility	Building A Area	Work Notice	6/6/2012	Work notice for supplemental soil vapor sampling approved by DTSC.
	Materials Facility	Building A Area	Fieldwork	11/9/2011	Soil gas, hydropunch, and monitoring well sampling completed in and downgradient of Building A.
[VIEW DOCS]	Chiron/Novartis Property		* Land Use Restriction Monitoring Report	11/7/2011	
[VIEW DOCS]	Materials Facility		Work Notice	10/18/2011	Work notice for offsite soil gas and groundwater sampling mailed out.
[VIEW DOCS]	Materials Facility		Annual Oversight Cost Estimate	10/13/2011	annual cost estimate for fiscal year 2011-12 finalized.
	Materials Facility		Fieldwork	4/1/2011	Fieldwork during the supplemental investigation consisted of soil, groundwater, and soil gas sampling.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	* Land Use Restriction Monitoring Report	1/4/2011	
[VIEW DOCS]	Materials Facility		Remedial Investigation Workplan	9/27/2010	DTSC has approved the "Revised Additional Site Investigation Workplan" for the PG&E Emervyile Materials Facility. The workplan proposes additional soil, groundwater, and soil gas investigation at the site in order to address data gaps that exist at the site.
[VIEW DOCS]	Materials Facility		Annual Oversight Cost Estimate	8/26/2010	Annual cost estimate for DTSC oversight for the fiscal year 2010-11.
[VIEW DOCS]	Materials Facility		Site Characterization Report	5/18/2010	
[VIEW DOCS]	Materials Facility		Voluntary Cleanup Agreement	12/21/2009	VCA for the PG&E Materials Facility fully executed.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Land Use Restriction - Site Inspection/Visit	12/3/2009	DTSC inspected the portions of the asphalt parking lot, landscaped areas, sidewalk and Chiron Way that comprise the Restricted Excavation Area. The area appeared to be in good condition, with no visible signs of significant cracking or damage.
[VIEW DOCS]	Materials Facility		De-Certification	1/14/2009	PG&E Materials Facility decertified. A recent investigation on the property by PG&E discovered elevated levels of contaminants in soil. DTSC will negotiate a VCA with PG&E to investigate and remediate the property.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Land Use Restriction - Site Inspection/Visit	12/8/2008	The Restricted Excavation Area appeared to be in good condition, with no visible signs of significant cracking or damage.
	Chiron/Novartis	Ramp	5 Year Review		

[VIEW DOCS]	Property	Area	Reports	11/30/2007	Finalized five year review.

[VIEW DOCS]	Chiron/Novartis Property		Notification of Change of Ownership	5/17/2006	Letter notified DTSC that the company had changed ownership and was now known as Novartis Vaccines and Diagnostics.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	5 Year Review Reports	4/5/2002	
[VIEW DOCS]	Materials Facility		Tank Removal Report	1/1/2001	Report submitted to Alameda County for review and approval from PG&E. However, this report was never officially approved by the County.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Certification	11/14/1998	Certified Site.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Land Use Restriction	8/26/1998	Recorded Deed Restriction.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Removal Action Completion Report	11/6/1996	Removal Action completed. Chiron excavated over 7100 cubic yards of soils containing PCBs which were hauled offsite for disposal.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	CEQA - Responsible Agency Review	7/31/1996	
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Removal Action Workplan	7/31/1996	Removal Action Workplan (RAW) approved for excavation of contaminated soils. A Deed Restriction was also required.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Community Profile	7/1/1996	Community Profile Approved
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Public Notice	6/26/1996	Public Notice placed in Oakland Tribune
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Fact Sheets	6/25/1996	Fact Sheet for proposed excavation of PCB contaminated soils
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Voluntary Cleanup Agreement	4/1/1996	Voluntary Cleanup Agreement with Chiron Corporation (property owner) for characterization and cleanup.
[VIEW DOCS]	Chiron/Novartis Property	Ramp Area	Health & Safety Plan	3/27/1996	HASP
	Chiron/Novartis Property		De-Certification	1/1/1995	Decertified Site. In 1994, while constructing a temporary parking lot, an additional area of soil with PCB contamination was discovered.
[VIEW DOCS]	Chiron/Novartis Property	Southern Pacific Right-Of-Way	Site Screening	10/15/1989	Site screening performed.
[VIEW DOCS]	PROJECT WIDE		Certification	6/30/1989	Certified Site. Between July 1987 and June 1989, approximately 400 cubic yards of PCB contaminated soils were removed.
	PROJECT WIDE		Site Screening	3/24/1987	Site Screening completed. Sampling conducted in 1983 and 1984 showed elevated levels of polychlorinated biphenyls (PCBs). These soils were excavated and disposed offsite in 1986. Confirmation sampling showed these areas had been cleaned. Additional sampling in 1986 showed elevated levels of PCBs in one area, but since it was capped, no further action was recommended. In 1987, an oil-stained area was found to contain elevated levels of PCBs. Additional samples to determine the extent of the contamination were taken.

PAST USE(S) THAT CAUSED CONTAMINATION
HAZARDOUS WASTE STORAGE - TANKS/CONTAINERS, HAZARDOUS WASTE TREATMENT, WASTE - INDUSTRIAL TREATMENT FACILITY

POTENTIAL CONTAMINANTS OF CONCERN
TETRACHLOROETHYLENE (PCE)
TRICHLOROETHYLENE (TCE)
VINYL CHLORIDE

POTENTIAL MEDIA AFFECTED
INDOOR AIR, OTHER GROUNDWATER AFFECTED (USES OTHER THAN DRINKING WATER), SOIL, SOIL VAPOR

Site History

STATE RESPONSE BACKGROUND: In 1987, Technichem, Incorporated (Technichem) leased and moved into a potion of the 4245 Halleck Street building. The DTSC issued a Resource Recovery Facility Permit to Technichem on January 22, 1987 for their new PCE recycling process. Technichem removed residual perchloroethylene (PCE) from spent dry cleaning filter cartridges, degreasing processes, still oil, and wastewater. Their process provided a way to recycle the PCE so that the filters could be disposed of or recycled and the reclaimed PCE - resold. Technichem operated at the Site until December 2003. The Technichem portion of the building is vacant. Soil, soil vapor, and groundwater sampling at the Site indicates that the Site has been impacted by PCE from the Technichem operation.

CORRECTIVE ACTION BACKGROUND: In 1993, the Department of Toxic Substances Control (DTSC) performed a RCRA Facility Assessment (RFA) at the Technichem facility. In 2003, the City of Emeryville performed soil sampling in the Technichem facility, which was followed up by a Facility Closure Passive Soil Gas Investigation Workplan performed by PES Environmental in May, 2005. This workplan broke down the area of the Facility into six Solid Waste Management Units (SWMUs) and two Areas of Concern (AOC) that either released or may have released hazardous waste or hazardous waste constituents into the environment. Based on the reports submitted to date, DTSC concludes that further investigation is needed to determine the nature and extent of any release of hazardous waste or hazardous waste constituents in all six SWMUs and both AOCs. The SWMUs and AOCs include the Process Room (SWMU 1), the Tank Storage Area (SWMU 2), the Wastewater Treatment Area (SWMU 3), the Hazardous Waste Drum Storage Area (SWMU 4), the Distillation Unit (SWMU 5), the Outside Storage Area (SWMU 6), the Recycled PCE Storage Areas (AOC 1), and the Laboratory (AOC 2). The hazardous waste and hazardous waste constituents of concern at the facility are numerous, but the concentrations of perchloroethylene are the driving force behind Corrective Action and future remediation. DTSC issued a I/SE consent order on August 11, 2008.

To Potential Recipients of Electronic Files:

Erler & Kalinowski, Inc. ("EKI") has provided our CLIENT, City of Emeryville Redevelopment Agency with paper copies of the Site Cleanup Plan for UPRR Parcel D in Emeryville, California, dated FINAL March 2008, prepared by EKI. An electronic copy of this report, including the text, tables, figures, and appendices, is provided per the request of the Department of Toxic Substances Control the San Francisco Bay Regional Water Quality Control Board in *.pdf (i.e., Adobe Acrobat) format.

These electronic files are being provided at the request of our CLIENT to fulfill requirements of the Department of Toxic Substances Control and the San Francisco Bay Regional Water Quality Control Board for electronic submittal of information, and for the convenience of our CLIENT. The delivery of electronic media by EKI does not constitute the delivery of our professional work product to others or provide rights of reliance by third parties. Only the original paper prints provided to, and for the sole benefit of, our CLIENT constitute EKI's professional work product. Because the electronic media may be damaged during transfer or altered, the paper prints shall control where there are any differences between the paper prints and the electronic media. EKI makes no warranties, either express or implied, of the merchantability, applicability, compatibility with the recipients' computer equipment or software; of the fitness for any particular purpose for the documents and electronic media; or that the electronic media contain no defects or are virus free.

Under no circumstances shall delivery or access to these electronic files be deemed a sale by EKI. This document and recipient's access to, or receipt of, EKI's work product or electronic files shall not create or imply any contractual relationship between EKI and recipient.

Reuse of EKI's work products by others or modification and use by others of any documents or electronic media prepared by EKI shall be at that party's sole risk. In no event shall EKI be liable for direct or consequential damages as a result of recipient's use, reuse, or modification of these electronic files. No third party reliance is intended or provided by submittal of electronic files by EKI in response to governmental agency requirements.

Sincerely,

ERLER & KALINOWSKI, INC.

Earl D. James, P.G.
Vice President

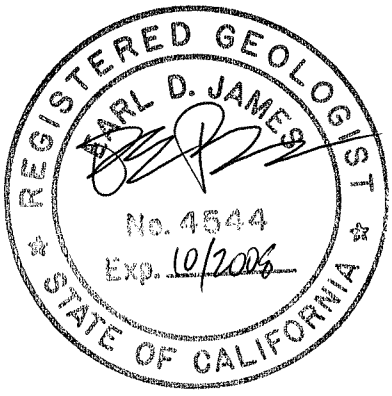
Subject: Final Site Cleanup Plan
UPRR Parcel D
Emeryville, California
(EKI A60021.00)

Dear Mr. Biddle:

Erler & Kalinowski, Inc. ("EKI") is pleased to present this final *Site Cleanup Plan* ("SCP") for the UPRR Parcel D site ("Site"), located at the intersection of Sherwin Street and Halleck Street in Emeryville, California. This work has been conducted in accordance with our agreement dated 12 September 2006 and our proposal dated 4 April 2007. EKI previously prepared the *Analysis of Brownfields Cleanup Alternatives* ("ABCA"), dated 27 November 2007 that described the nature and extent of contamination at the Site, remedial action objectives ("RAOs") and proposed preliminary Site cleanup goals, description of alternatives for Site cleanup, comparison of cleanup alternatives, and recommended a cleanup alternative.

This SCP includes the selected Site cleanup goals to meet RAOs defined in the ABCA, a description of procedures required in order to implement the selected cleanup, and plans to provide guidance for health and safety measures to be employed during cleanup activities. This SCP outlines the process by which the selected cleanup contractor will implement the cleanup alternative for the Site. The following is a list of the plans included in this SCP:



- EKI Site-Specific Health and Safety Plan ("HSP");
- Traffic Control and Waste Transportation Plan;
- Decontamination Plan;
- Dust Control Plan;
- Perimeter Air Monitoring Plan;
- Storm Water Pollution Prevention Plan;
- Soil Cleanup Sampling and Analysis Plan ("SAP"); and
- Quality Assurance Project Plan ("QAPP").

It is understood that the selected cleanup contractor will be required per the Emeryville bidding documents to provide their own HSP and plan addendums, if necessary, as specified in the plans.

We are pleased to have the opportunity to work with you on this project. Please call if you have any questions or wish to discuss these matters in greater detail (650-292-9100).

Very truly yours,

ERLER & KALINOWSKI, INC.

1.0 INTRODUCTION

Erler & Kalinowski, Inc. ("EKI") is pleased to present this Draft Site Cleanup Plan ("SCP") for the Union Pacific Railroad ("UPRR") Parcel D property (the "Site"), located in Emeryville, California. The Site is owned by our client, the City of Emeryville Redevelopment Agency ("City"). This report has been prepared by EKI on behalf of the City in accordance with our agreement dated 12 September 2006. The City is considering potential redevelopment options that include a park or mixed use development. As part of the redevelopment process, the City is planning to conduct cleanup of contaminated soil at the Site. The Site was historically used as a rail spur and nearby sites were generally used for industrial or manufacturing purposes.

This non-time critical removal action will be funded partially under a United States Environmental Protection Agency ("U.S. EPA") Brownfields cleanup grant and the City. The City is acting as the Lead Agency under a Memorandum of Understanding with the California Department of Toxic Substances Control ("DTSC") and the San Francisco Bay Regional Water Quality Control Board ("SFRWQCB"). Ms. Susan G. Colman is acting as Brownfields Site Manager ("Site Manager") who will provide regulatory and technical support to the City; and the City will administer the cleanup grant. The Site Manager will confer with the DTSC and SFRWQCB for review and approval of plans to be submitted with the Final SCP.

This SCP also meets the corrective action and closure requirements for the Technichem facility's Solid Waste Management Unit ("SWMU") #6 (Health and Safety Code 25187 and California Code of Regulations ("CCR"), Title 22, Division 4.5, section 66264.110 et seq. or 66264.111). The cleanup alternatives and the basis for selection of the recommended cleanup alternative for the Technichem SWMU #6 were presented in the *Analysis of Brownfield Cleanup Alternatives,* dated 27 November 2007 ("ABCA"; EKI, 2007).

1.1 Site Description and History

The Site is approximately 2 acres and is located to the north of the intersection of Sherwin Avenue and Halleck Street in Emeryville, California (Figure 1-1). The Site is bounded by the UPRR tracks on the west, the Sherwin-Williams property on the east and north, and the southern edge of Sherwin Avenue on the south (Figure 1-2). The Site was used historically as a railroad spur, and surrounding sites were generally used for industrial and manufacturing purposes. The Site is currently undeveloped with the exception of access roads along the eastern and southern boundaries of the Site.

The Technichem facility's SWMU #6 is located at the southwest corner of the Site, adjacent to the building that formerly housed Technichem. According to DTSC's Hazardous Waste Management Program staff, the Technichem facility's SWMU #6 was not regularly used for storage of hazardous wastes. All equipment except for one were non-regulated units since they did not handle hazardous waste. Air Adsorber C-1 was considered a regulated unit since it processed tetrachloroethene (PCE) vapors generated from treatment of cartridge filters

(hazardous waste) in the Process Room. Also, the potential for future releases to air, soil, groundwater, and surface water was considered low since air emissions were controlled, the area is paved and was not normally used for storage of hazardous waste. The potential for release to air was considered low from the drums of activated carbon because 1) they contained only trace amounts of PCE; 2) all containers were kept closed; 3) the drums were protected from the weather using tarp; and 4) the drums were normally not stored in this area..

Current uses of properties surrounding the Site include: a) the mixed-use Emeryville Warehouse Lofts, the Golden Gate Badminton Club facility, the 45th Street Artists' Cooperative, and the Pelco Distributors facility to the south-southeast, b) the Horton Street Lofts to the east, and c) the Bay Street Mall and IKEA across the UPRR tracks to the west.

The Sherwin-Williams property, located to the north and east of the Site, is vacant, but groundwater extraction and treatment activities are currently being conducted.

1.2 Site Background

The City is preparing the Site for redevelopment. As part of the process, EKI identified past uses of the Site and adjacent properties that may have resulted in releases of chemicals to soil and groundwater in the *Phase I Environmental Site Assessment Report,* dated 2 October 2006 ("Phase I Report"; EKI, 2006a). EKI conducted a soil and groundwater investigation in October 2006, and concentrations of chemicals detected in soil and groundwater were compared with applicable screening criteria to identify chemicals of concern ("COCs"). The results and conclusions of October 2006 soil and groundwater investigation were described in the *Soil and Groundwater Investigation Data Report,* dated 14 November 2006 ("Phase II Report"; EKI, 2006b) and were also summarized in the ABCA (EKI, 2007).

The ABCA was prepared to develop remedial action objections, to evaluate cleanup alternatives for the Site, and to recommend a cleanup alternative for the Site. The ABCA conforms to 40 CFR 300.415 of the National Oil and Hazardous Substances Pollution Contingency Plan and the regulatory processes cited above for the Technichem SWMU #6.

1.3 Site Cleanup Plan Organization

The SCP is organized into six sections as follows:

- Section 1.0 – Introduction
- Section 2.0 – Site Cleanup Description
- Section 3.0 – Site Cleanup Plan
- Section 4.0 – Project Schedule and Budget Oversight
- Section 5.0 – Site Management and Cleanup Operations
- Section 6.0 – References

2.0 SITE CLEANUP DESCRIPTION

This section describes the Site cleanup approach for soil and groundwater contamination issues related to the presence of hazardous substances or petroleum hydrocarbons in soil and groundwater that may affect potential future use and redevelopment of the Site. The cleanup actions described in this SCP will provide human health and environmental protection for potential future land uses described below.

2.1 Planned Future Site Use

Potential future Site uses include a park or a mixed use development. Both of these potential future uses are described below.

The park would likely be developed by the City. Proposed park amenities might include multi-use lawn areas, a basketball court, an amphitheater, and a children's play area. Potential exposure pathways for receptors (park patrons and construction workers using and working in the multi-use lawn area) include inhalation of vapors and/or fugitive dust. A basketball court or amphitheatre would most likely be capped with asphalt and/or concrete, so exposures to vapors and/or fugitive dust will be limited to construction workers developing the area. Any children's play area would warrant the most conservative cleanup approach.

A mixed use development on the Site might include ground floor residential or commercial/retail uses. Any residential use would be "urban" residential, meaning there would be no direct contact with Site soils. Potential exposure pathways for receptors (residents, commercial workers, and construction workers) include inhalation of vapors and/or fugitive dust.

2.2 Cleanup Goals

2.2.1 Identified Primary Chemicals of Concern

As presented in the Phase II report (EKI, 2006a) and the ABCA (EKI, 2007), the primary COCs in soil at the Site are arsenic, cadmium, cobalt, lead, zinc, total petroleum hydrocarbons ("TPH") as diesel ("TPH-d"), and TPH as motor oil ("TPH-mo"), and the primary COC in groundwater is arsenic.

Additional evaluation of analytical results for cobalt in soil indicated that cobalt was not a primary COC in soil (see Section 2.3). Detected concentrations of cobalt in soil were less than the SFRWQCB Environmental Screening Level ("ESL") for residential shallow soil (<3 meters) where potentially impacted groundwater is not a current or potential drinking water resource for cobalt in soil of 40 mg/kg (SFRWQCB, 2007). The EPA Region 9 Preliminary Remediation Goal ("PRG") (EPA, 2004) and the California Human Health Screening Level ("CHHSL") (CAL/EPA, 2005) for residential exposure for cobalt in soil are 900 mg/kg and 660 mg/kg,

respectively. Therefore, cobalt is not retained as a primary COC in soil, and a soil cleanup goal will not be developed for cobalt.

Preliminary soil cleanup goals were selected for all TPH constituents (TPH-g, TPH-d, and TPH-mo) during analysis of cleanup alternatives in the ABCA (EKI, 2007). However, further evaluation indicates that a cleanup goal is not necessary for TPH-g because: 1) TPH-g exceeded the residential ESL of 100 mg/kg in only 1 of 44 soil samples (UPD-5A-4-4.5 at a concentration of 240 mg/kg TPH-g), and 2) this location with TPH-g impacted soil will be addressed because TPH-d and TPH-mo concentrations at UPD-5A-4-4.5 exceed soil cleanup goals.

Although zinc was identified as a primary COC in the Phase II report (EKI, 2006a) and the ABCA (EKI, 2007), detected concentrations of zinc in soil were less than the ESL for direct exposure of 4,600 mg/kg and were also less than the PRG and CHSSL for residential exposure of 23,000 mg/kg. Therefore, zinc is not retained as a primary COC in soil, and a soil cleanup goal will not be developed for zinc.

Chemicals of concern detected in soil at the Technichem SWMU #6 are the same as those detected for the remainder of the Site.

2.2.2 Selected Cleanup Goals

Cleanup goals were selected to allow for any development use of the Site, with the exception of single-family residential (e.g., multi-family residential, park, etc.), that may be contemplated and are also generally consistent with cleanup goals at neighboring sites in the vicinity. No specific development scenario was considered.

Site-specific cleanup goals for groundwater have not been proposed because: 1) groundwater is not a source of drinking water on Site and was not encountered within 10 feet bgs during groundwater collection activities and 2) no source of contamination to groundwater has been defined at the Site. COCs detected in groundwater are likely the result of releases from upgradient and/or adjacent sites. Future cleanup goals for groundwater may have to be established if a parking structure is planned for the Site that requires excavation to depths where groundwater may be encountered.

Soil cleanup goals ("cleanup goals") proposed for primary COCs in soil (TPH-d, TPH-mo, arsenic, cadmium, lead, and zinc) are similar to previously established cleanup goals used for other projects in the City of Emeryville, including the following:

- Pinnacle property located on 64th Street and Christie Avenue;
- Former UPPR Parcels 1, 2, 3, 4, 4A, 6, and 7; and
- Former Dutro site located on 62nd Street and Hollis Street.

Soil cleanup goals for primary COCs in soil are summarized in Table 2-1. Because the cleanup goals for TPH and metal COCs in soil at the Site were established for a residential land use and

address potential exposure concerns, they provide a conservative estimate for park use by recreational visitors with much more limited Site exposures.

2.2.2.1 Cleanup Goals for TPH-d and TPH-mo in Soil

The cleanup goal for TPH-d in soil is 400 mg/kg. The cleanup goal for TPH-mo is 1,000 mg/kg. These cleanup goals are the same cleanup goals used for the former Dutro property that is currently being developed for use as a park. These cleanup goals are based upon the 2005 ESLs for direct exposure. The cleanup goal of 400 mg/kg for TPH-d is lower than the current direct exposure ESL (SFRWQCB, 2007) of 540 mg/kg (using a target hazard quotient ["HQ"] of 1), which is consistent with the HQ used by DTSC and USEPA. The cleanup goal of 1,000 mg/kg for TPH-mo is lower than the current direct exposure ESL (SFRWQCB, 2007) of 2,100 mg/kg (using a target HQ of 1), which is consistent with the HQ used by DTSC and USEPA.

The cleanup goal for TPH-d and TPH-mo combined is 1,000 mg/kg, which is the same cleanup goal used for the former Dutro property.

2.2.2.2 Cleanup Goal for Arsenic in Soil

The cleanup goal for arsenic in soil is 24 mg/kg, which is based upon the same information used to develop the arsenic cleanup goals at several other sites throughout Emeryville, including former UPRR Parcels 1, 2, 3, 4, 4A, 6, and 7 that are being developed as parks.

2.2.2.3 Cleanup Goal for Cadmium in Soil

The cleanup goal for cadmium in soil is 5.6 mg/kg, which is based upon the same information used to develop the arsenic cleanup goals at several other sites throughout Emeryville, including former UPRR Parcels 1, 2, 3, 4, 4A, 6, and 7 that are being developed as parks.

2.2.2.4 Cleanup Goal for Lead in Soil

The cleanup goal for lead in soil is 150 mg/kg, which is based on the PRG (EPA, 2004) and the CHHSL (CAL/EPA, 2005) for residential exposure.

2.3 Delineation of COC-Impacted Soil Based on Cleanup Goals

The conceptual model presented in the Phase II report (EKI, 2006a) and the ABCA (EKI, 2007) indicated that COC-impacted soil was primarily located within the artificial fill layer that ranges in depth from ground surface to a maximum of 3.5 feet below ground surface ("bgs"). A

comparison of COC concentrations in soil to cleanup goals in relation to lithologic cross-sections is presented in Figures 2-1 to 2-5 and confirms the conceptual model conclusion that COC-impacted soils are primarily located within the artificial fill layer.[2,3] The topography of the bottom of the artificial fill layer is presented in Figure 2-6.

[2] Analytical results of three replicate samples of UPD-2-5-5.5 indicate that the initial reported laboratory analytical results of 35.9 mg/kg of arsenic and 44.4 mg/kg cobalt for UPD-2-5-5.5 were spurious results and are rejected (Table 2-2 and Appendix J). The maximum reported concentrations of arsenic and cobalt in the three replicate samples were 17.1 mg/kg and 12.4 mg/kg, respectively, and are below cleanup goals.

[3] COC-impacted soil extends into the upper member of the Young Bay Mud at UPD-4 and UPD-5.

3.0 SITE CLEANUP PLAN

Cleanup alternatives were evaluated in the ABCA in accordance with the NCP. Based on this evaluation, a recommendation was made for the cleanup alternative for the Site. The recommended and selected Site cleanup alternative entails excavation and off-Site disposal of COC-impacted soils that exceed cleanup goals and transportation of those soils to off-site permitted disposal facilities. Prior to soil excavation, permits will be obtained and existing asphalt and concrete slabs, roadways, debris, and any encountered below-grade structures will be demolished. Additional delineation soil sampling will be conducted to refine the soil excavation extents and to collect pre-confirmation samples to verify that COC concentrations are below cleanup goals at the proposed vertical extents of excavation. Soil samples also will be collected for waste characterization purposes. Pending pre-approval of waste profiles from the City-approved disposal facilities selected by the remedial contractor ("Contractor"), excavated soil will be directly loaded into trucks and transported to the appropriate disposal facilities (most likely Class I and/or Class II). Additional soil sampling will be conducted after the conclusion of the excavation activities as described in Section 3.2.

3.1 Preparatory Activities

Tasks to be performed prior to commencement of Site cleanup activities are summarized below.

- Preparation of a Site Cleanup Plan (SCP – this document) that describes the details of work to be implemented and the sequence of cleanup actions. The Site Manager will submit a conditional approval of the SCP to DTSC and SFRWQCB for concurrence. The Site Manager will confer with the DTSC and SFRWQCB for review and approval of plans to be submitted with the Final SCP.
- Completion of a geotechnical evaluation to evaluate required structural support criteria to excavate alongside the Southern Pacific Railroad tracks to the west and the Sherwin-Williams Property to the east.
- Completion of contract documents for procurement of a Contractor to perform the cleanup action.
- City preparation of a fact sheet and notice to be posted in the newspaper regarding the 30-day public comment period, and facilitation of a public meeting prior to initiating the cleanup action.
- Selection of a Contractor and completion of contract negotiation and award. The selected Contractor will need to possess a Hazardous Substance Removal Certification from the Contractors State License Board.
- Contractor procurement of necessary permits, and utility clearances prior to the commencement of excavation activities at the Site.
- Collection and analysis of additional soil samples for verification of excavation delineation/pre-confirmation and waste disposal characterization purposes.
- Coordination of pre-approval for waste disposal classifications with potential off-Site permitted disposal facilities.

- Abandonment of three Sherwin Williams groundwater monitoring wells (LF-21, SA-AW-02, and SA-AW-03) that are located within proposed excavation areas at the Site.

3.1.1 Site Specific Plans to be Submitted Prior to Site Cleanup Activities

The following plans are included in this SCP:

- An EKI Site-Specific Health and Safety Plan ("HSP");
- A Traffic Control and Waste Transportation Plan;
- A Decontamination Plan;
- A Dust Control Plan;
- A Perimeter Air Monitoring Plan;
- A Storm Water Pollution Prevention Plan ("SWPPP");
- A Soil Cleanup Sampling and Analysis Plan ("SAP"); and
- A Quality Assurance Project Plan ("QAPP").

The following subsections summarize the contents of each plan and describe requirements for the selected Contractor to prepare a Contractor Site-specific HSP, to prepare a Contractor addendum to the Traffic Control and Waste Transportation Plan and SWPPP, and to prepare a Contractor addendum to the Decontamination Plan and Dust Control Plan, if necessary. Copies of these plans will be retained on the Site during Site cleanup activities. The plans will assist in the management of the construction activities for Site cleanup by identifying techniques the Contractor is to use to implement Site cleanup. The final plans and the Contractor plan addendums will be submitted to the Site Manager, who will confer with DTSC and SFRWQCB separately, as an amendment or addendum to the Final SCP.

The presence of archaeological artifacts was not observed by the overseeing archaeologist during remedial investigations conducted in 2006 at the Site. Therefore, it is assumed that the uncovering of archaeological artifacts is not likely. However, EKI will brief the Contractor to the possibility of uncovering archaeological artifacts. A procedure will be established should such artifacts be found over the course of excavation.

3.1.1.1 Summary of the EKI Site-Specific Health and Safety Plan

A Site-specific HSP will specify, among other things, employee training and personal protective equipment, training and medical surveillance requirements, standard operating procedures, and a contingency plan that conforms to the requirements of 29 Code of Federal Regulations ("CFR") 1910.120 et seq. and other applicable Federal and State laws and regulations, including Title 8, CCR Section 5192.

EKI's Site-specific HSP, presented in Appendix A, was prepared in accordance with Federal and California Occupational Safety and Health Administration ("OSHA") standards for hazardous waste operations (29 CFR 1910.120) and Title 8, CCR Section 5192). EKI's corporate HSP and

this Site-specific HSP have been reviewed and signed by a Certified Industrial Hygienist ("CIH").

EKI's Site-specific HSP includes the following:

- Description of activities and potential hazards;
- Level of personal protection that will be used during sampling activities;
- Definition of exclusion, contaminant reduction, and support zones;
- Required personal protective measures, including work zone air monitoring;
- Key health and safety personnel;
- Training;
- Medical monitoring; and
- Emergency response plan.

The selected Contractor will prepare its own HSP in accordance with the Contract Documents. The Contractor will be responsible for health and safety of their employees and workers sub-contracted to them at the Site. The Contractor's HSP must be reviewed and signed by a CIH. The Contractor's HSP is to address Site-specific issues, Site chemicals of concern, hazard communication, notification of workers, and other topics required by applicable laws and regulations.

3.1.1.2 Summary of Traffic Control and Waste Transportation Plan

EKI has prepared a Traffic Control and Waste Transportation Plan, which is included in Appendix B. The Traffic Control and Waste Transportation Plan specifies procedures for general and unique handling, transportation, and disposal of excavated soil and traffic control issues at the Site during Site cleanup activities. The Traffic Control and Waste Transportation Plan has been prepared following the DTSC guidance *Transportation Plan – Guidance for Developing Transportation Plans for Removal or Remedial Actions* (DTSC, 2001a), and the City's requirements.

The selected Contractor will be required to prepare an addendum to the Traffic Control and Waste Transportation Plan that specifies: (1) the actual off-site disposal facilities and the transportation routes if actual disposal facilities vary from facilities listed in this Traffic Control and Waste Transportation Plan, (2) the Contractor's selected transportation company, and (3) any proposed deviations from procedures specified in the Traffic Control and Waste Transportation Plan.

3.1.1.3 Summary of Decontamination Plan

EKI has prepared a Decontamination Plan, which is included in Appendix C. The Decontamination Plan specifies procedures for removal, collection, and containment of soil and other potentially contaminated material from equipment and transportation vehicles, decontamination of personnel and tools, and methods for temporary storage, characterization,

treatment, and off-Site disposal of decontamination wastes generated during decontamination activities. The selected Contractor will be required to prepare an addendum to the Decontamination Plan if there are any proposed deviations from procedures specified in the Decontamination Plan.

3.1.1.4 Summary of Dust Control Plan

EKI has prepared a Dust Control Plan, which is included in Appendix D. The Dust Control Plan specifies measures to be undertaken to limit generation of dust, measures to be taken if dust is present on adjacent on- and off-site public streets, and measures to control such emissions following identification of problems as defined by airborne Action Levels specified in the Perimeter Air Monitoring Plan. The selected Contractor will be required to prepare an addendum to the Dust Control Plan if there are any proposed deviations from procedures specified in the Dust Control Plan.

3.1.1.5 Summary of Perimeter Air Monitoring Plan

To monitor the effectiveness of the Contractor's dust control practices, perimeter air monitoring will be conducted as described in the Perimeter Air Monitoring Plan ("AMP"), prepared by EKI and included in Appendix E. The AMP develops airborne Action Levels for identified airborne COCs and dust, describes air monitoring procedures, methods, and sampling frequencies, and specifies measures to be undertaken by the Contractor if airborne Action Levels are exceeded.

3.1.1.6 Summary of Storm Water Pollution Prevention Plan

EKI has prepared a SWPPP, which is included in Appendix F, in accordance with the regulatory requirements for construction storm water pollution management and best management practices ("BMP") that will be implemented, such as those identified by the Storm Water Quality Task Force (SWQTF, 1993). The SWPPP specifies measures to be undertaken to limit storm water impacts from the Site such as reducing the sediment load to the storm water runoff from the Site during Site cleanup activities and preventing accidental spills from impacting storm water. The selected Contractor will be required to file a Notice of Intent ("NOI") with the State Water Resources Control Board ("SWRCB") prior to cleanup activities.

The selected Contractor will be required to prepare an addendum to this SWPPP that includes: (1) a copy of the NOI and receipt letter, (2) material safety data sheets for chemicals used or stored on the site during construction, (3) an example BMP inspection form, (4) emergency contact information, and (5) any proposed deviations from procedures specified in the SWPPP.

3.1.1.7 Summary of Soil Cleanup Sampling and Analysis Plan

EKI has prepared a Soil Cleanup SAP included in Appendix G. Prior to soil cleanup activities, soil samples will be collected at the Site to 1) delineate/confirm the final extents of excavation areas, 2) verify that soil analytical data for COCs at excavation extents are below Site cleanup

goals, and 3) obtain waste characterization analytical data for soil disposal pre-approval purposes. The SAP describes methods and procedures for soil sample collection prior to or after excavation, if needed, sample analysis, and quality control. As part of the proposed soil cleanup, the final delineation of the excavation areas will be conducted based upon the results of the additional delineation soil sampling.

3.1.1.8 Summary of Quality Assurance Project Plan

A QAPP, included as Appendix H, has been prepared by EKI and provides a description of field and laboratory procedures to be followed to ensure that samples collected from the Site yield representative data.

3.1.2 Additional Delineation Soil Sampling

Soil samples from an additional 12 sampling locations will be collected within the proposed excavation area to further verify the conceptual model that the vertical extent of COC-impacted soil is delineated by the bottom of the artificial fill layer (Figure 3-1). Soil samples will be collected in accordance with methods outlined in the SAP (Appendix G) and submitted to Calscience Environmental Laboratories Inc. of Garden Grove, California, a California state certified analytical laboratory, for chemical analysis of primary COCs. Based on analytical results and modifications to the conceptual model, the final perimeter and vertical extents of the excavation may be modified.

3.1.3 Pre-Approval of Waste Disposal Classifications

Waste characterization soil sampling was performed in 2006 as part of Phase II investigations. Analytical results as presented in the *Summary of Additional Chemical and Geotechnical Soil Data* (EKI, 2006c) are presented in Table 3-1. Total metal soil concentrations exceeding 20 times the RCRA regulatory criterion were subjected to the TCLP with the leachate being analyzed for that metal. Based on review of the available waste characterization analytical data, soil proposed for excavation was preliminarily classified as either non-hazardous (Class II) or non-RCRA hazardous (Class I). It is estimated that approximately 95-percent of the soil will be disposed of at a non-RCRA hazardous (Class I) facility and that approximately 5-percent of the soil will be disposed of at a non-hazardous (Class II) facility. The preliminary waste disposal classifications and soil quantities for excavation were presented in the ABCA (EKI, 2007).

Additional waste characterization analytical data obtained after additional delineation soil sampling performed in January 2008 will be used to refine the preliminary waste disposal classifications and facilitate pre-approval for disposal from the City-approved, Contractor-selected disposal facilities. Additional waste characterization may include analyzing leachate from the Waste Extraction Test ("WET") method and Toxicity Characteristic Leaching Procedure ("TCLP") and performing a fish bioassay (CCR Title 26 Section 66261.24(6)). The WET and TCLP leachate will be analyzed for selected metals that were determined to be potential hazardous wastes based on the 10 times the soluble threshold limit concentration

("STLC") criterion and the 20 times the Resource Conservation and Recovery Act ("RCRA") regulatory criterion.

3.1.4 Permits

The Contractor will be required to procure necessary permits prior to beginning cleanup activities on the Site. Permits required could include an OSHA excavation permit and Bay Area Air Quality Management District ("BAAQMD") excavation permit. The City has indicated that grading/excavation or encroachment permits will not be required, as this work is being conducted on behalf of the City.

To comply with the Construction Activities Storm Water General Permit (State Water Resources Control Board ["SWRCB"] Order No. 99-08-DWQ), the Contractor shall prepare and submit a Notice of Intent to the SWRCB.

Well installation permits, obtained from ACPWA, will be necessary in order to properly install new groundwater monitoring wells at the Site (see Appendix I).

Well destruction permits for the proper abandonment of three Sherwin Williams groundwater monitoring wells at the Site will be the responsibility of Sherwin Williams.

3.1.5 Bidding

EKI will assist the City with the preparation of the contract documents to be used for bidding purposes by remedial contractors. The bidding documents will incorporate the plans or plan requirements outlined in this SCP that describe the procedures required to implement Site cleanup. It is understood that the selected Contractor will be required per the City bidding documents to provide the following plans or plan addendums in accordance with requirements outlined in this SCP.

- a Contractor Site-specific Health and Safety Plan;
- a Contractor addendum to the Traffic Control and Waste Transportation Plan;
- a Contractor addendum to the Decontamination Plan, if deemed necessary by the Contractor;
- a Contractor addendum to the Dust Control Plan, if deemed necessary by the Contractor; and
- a Contractor addendum to the SWPP.

3.1.6 Utility Clearance

Prior to initiating excavation activities, USA will be notified by the Contractor and EKI at least two working days in advance of initiating cleanup activities to clear excavation areas of utilities. In addition, the planned excavation area will be surveyed for the presence of existing utilities by a private utility locating service.

3.1.7 Pre-Excavation Geotechnical Evaluation

A geotechnical evaluation will be conducted by the City's geotechnical consultant to develop structural support and/or excavation proximity criteria to excavate alongside the Southern Pacific Railroad tracks to the west, the former Technichem facility to the southwest, and the Sherwin-Williams property to the east. The recommendations of this geotechnical evaluation will delineate excavation limits up to these boundaries where excavation can no longer extend. The results of the geotechnical evaluation will be submitted to the Site Manager for review.

3.1.8 Initial Site Preparation

Prior to cleanup activities on the Site, the selected Contractor's field crew will be conducting initial mobilization activities that are non-invasive and will not include the handling of soil that could potentially be hazardous. The allowable activities include setting up field offices (if necessary), constructing a decontamination pad, underground utility line location, preparing dust control measures, and other pre-excavation activities.

3.1.9 Site Security

Prior to cleanup activities on the Site, the selected Contractor shall construct perimeter fencing and lockable gates to restrict access to the Site. Contractor will be responsible for maintaining Site security and will promptly repair, maintain, or install new fencing, as needed, to maintain Site security at all times.
Full-scale cleanup work described in the next section can begin when the preparatory activities described in this section are complete.

3.2 Site Cleanup Activities

3.2.1 Extent of Excavation

The anticipated lateral and vertical extents of excavation at UPRR Parcel D are shown on Figure 3-2 and was delineated based on the rationale summarized in Table 3-2. The approximate thickness of excavation is shown on Figure 3-3 and is summarized in Table 3-2. The vertical extent of excavation will generally be the bottom of the artificial fill layer based on the conceptual model conclusion that COC-impacted soil at concentrations greater than the cleanup goals are primarily located within the artificial fill with the exception of a few sampling locations as indicated on Figure 3-2 and Table 3-2. The lateral extent of excavation was based on areal distribution of sampling locations with COC-impacted soil at concentrations greater than the cleanup goals. It is estimated that approximately 12,000 tons of soil will be excavated and disposed of at off-site permitted disposal facilities.

The October 2006 soil analytical data will serve as pre-confirmation samples, and therefore, the vertical extent of excavation as outlined in Figure 3-2 is proposed to be the final vertical extent of excavation. The vertical extent of excavation will be subject to modification if additional soil

delineation sampling in January 2008 indicate that the conceptual model needs to be re-evaluated in consultation with the Site Manager and based on observed field conditions during excavation.

The proposed lateral extent of excavation is outlined on Figure 3-2. Due to access limitations and concerns to protect adjacent above-grade neighboring structures and use of street and rail corridors, lateral extents of the excavations will not proceed beyond the property lines or excavation support structures or buffer zones, as deemed necessary by the railroad, the City, or results of the pending geotechnical evaluation. Confirmation soil samples will be collected from sidewalls of the excavation where the proposed lateral extent of excavation is not delineated by a property line. If sidewall confirmation soil samples exceed cleanup goals, additional excavation may be necessary unless further excavation is not possible beyond excavation support structures or buffer zones to maintain integrity of above-ground structures, railroad tracks, sidewalks, etc. If further excavation is not possible due to structural or access issues, orange plastic safety fence will be placed along these excavation perimeter sidewalls. Final limits of excavation will be surveyed by a licensed surveyor and the survey information and any applicable confirmation sampling analytical results will be added to the City's OSIRIS Mapped Real Estate Parcel Database. The City's OSIRIS database is a notification and warning system for City personnel prior to issuing excavation permits. The OSIRIS system is being used as an institutional control throughout the City where soil cannot be excavated due to structural limitations (e.g., near sidewalks, adjacent buildings, etc.).

Confirmation soil samples will be collected from bottoms of the excavation, as necessary, if the distribution of existing and additional delineation pre-confirmation soil data are not sufficient at depth intervals that are directly below the excavation elevations as shown on Figure 3-2. Prior to backfill, the Site Manager will review pre-confirmation and confirmation soil sampling distribution and data. Confirmation soil samples will be collected and analyzed for primary COCs in accordance with methods outlined in the SAP (Appendix G). The final extent of excavation will be surveyed by a licensed surveyor.

The extent of excavation extends across a majority of the Site. Therefore, the overall excavation area may be staged by the Contractor into smaller areas that will be excavated and backfilled according to procedures listed above and below to maintain access for excavation activities and to maintain access to Sherwin Street as long as possible until progression of excavation activities warrants closure of Sherwin Street.

3.2.2 Excavation Equipment and Methods

The specific equipment and means that will be utilized to implement this work will be at the discretion of the selected Contractor. It is anticipated that this soil cleanup project can be accomplished with standard excavation and backfill equipment. Some of the equipment expected to be used at the Site includes track-mounted hydraulic excavators, backhoes, water trucks, intermodal bins, end dump trucks, bulldozers, and compactors.

To the extent possible, excavated soils will be directly loaded into trucks for off-Site disposal to reduce handling and potential dust emissions. Trucks will then be covered and transported to

designated disposal facilities permitted for the waste. To accomplish direct loading of trucks for soil disposal, the majority of identified soil for excavation will be pre-characterized and designated as acceptable to the selected, permitted disposal facilities prior to the start of soil cleanup activities. Refer to the Traffic Control and Waste Transportation Plan in Appendix B for more specific details.

Per Emeryville's noise ordinance, work hours are limited to weekdays between 7 am and 6 pm. However, it is anticipated that actual work hours for this project will be limited to between 7 am and 4 pm. The Contractor shall comply with all local sound control and voice level rules, regulations and ordinances which apply to any work performed.

Excavated soils that may potentially require waste characterization during soil cleanup activities and prior to off-Site disposal, assumed to be limited in volume, will be stockpiled or loaded directly into lined intermodal bins. Stockpiled soil or soil placed in intermodal bins will be handled as potential hazardous waste until proven otherwise. Soil stockpiles will be managed in accordance with procedures outlined in the Dust Control Plan and the SWPPP (Appendix D and F). Stockpiled soil will be placed on plastic sheeting (minimum 10-mil thickness) and securely covered with plastic sheeting (minimum 10-mil thickness). The intermodal bins can be stored on-Site, allowing the soil within the bin to be sampled, covered, and stored until characterization for disposal is completed. The intermodal bins can be transported by truck. All stockpiles or bins will be covered at the end of each work day and when not being actively handled. After classifying the soil stockpiles or individual bins of soil for the appropriate disposal facilities, the soil will be trucked to permitted off-site disposal facilities.

Dewatering is not anticipated to be conducted during cleanup activities. If necessary, water removed from the excavation will be stored on Site and will be transported and disposed at an appropriately permitted off-Site facility or facilities in accordance with methods and procedures described in the Traffic Control and Waste Transportation Plan (Appendix B).

3.2.3 Air Monitoring

Control of dust and airborne COCs is a significant concern for this project. During active Site cleanup activities, air monitoring will be performed at the Site perimeter in accordance with the Perimeter Air Monitoring Plan (Appendix E) to evaluate if dust control methods applied by the Contractor are adequate to protect the surrounding community from exposure to dust and airborne COCs. Specific dust control techniques that the Contractor will implement during Site cleanup activities are described in the Dust Control Plan (Appendix D).

In addition to perimeter air monitoring, personal air monitoring will be performed by the Contractor to assess potential health and safety impacts to on-Site workers. A plan for personal air monitoring will be included in the Contractor's HSP. A plan for personal air monitoring of EKI field representatives is included in the Site-specific HSP included in Appendix A.

In accordance with the Site-specific HSP, included in Appendix A, field personnel will perform air monitoring with a direct reading OVM in the breathing zone at each EKI work area during

remediation activities to evaluate the work environment and be protective of EKI field representatives. This includes the area in the vicinity of borehole UPD-5, where strong chemical odor was noted while drilling. Air monitoring to evaluate the work environment and be protective of the Contractor's field personnel will be described in the Contractor's Site-specific HSP.

3.2.4 Transportation and Off-Site Disposal of Excavated Soils

Soil identified as exceeding cleanup goals will be excavated and direct loaded, to the extent possible, into trucks for transportation to off-site disposal facilities that are permitted to accept specific classifications of wastes. Soil and debris from the Site will be transported and disposed in accordance with the Traffic Control and Waste Transportation Plan (Appendix B). Permitted disposal facilities for the various waste classifications will be identified by the Contractor in the Contractor's addendum to the Traffic Control and Waste Transportation Plan.

3.2.5 Backfill and Site Restoration

After excavation activities are completed, the excavation area will be surveyed, then backfilled and compacted. The excavations will be backfilled with clean import fill and compacted to specifications to be provided by City of Emeryville in the bid documents. Final grading of the backfill will be accomplished in accordance with specifications provided by the City in the bid documents.

Import fill, for backfilling of excavations, may be obtained from a variety of as yet unidentified sources. The screening of these fill soils for environmental concerns will be undertaken following the DTSC guidance *Information Advisory – Clean Imported Fill Material* (DTSC, 2001b). The basic elements of this guidance are:

1. Determining the site use history of the soil source;
2. Identifying the potential COCs associated with the historical uses or natural characteristics of the soil source; and
3. Performing testing of representative soil samples.

The results of the characterization activities regarding fill material will be provided to Site Manager for review prior to the importation of the soils. The information will also be documented in the closure report to be prepared at the completion of the remediation activities (see Section 3.3). The subsections below provide procedures for collecting and analyzing import fill samples and for evaluating analytical data to determine if import fill quality is suitable for use as backfill material at the Site.

Geotechnical analysis will also be performed to generate compaction curves for in-place compaction testing that will be performed during backfill operations. Backfill requirements will be consistent with potential future development plans for the Site.

3.2.5.1 Fill Sampling Specifications

Fill material to be used at the Site will include import fill. Before import fill may be brought on-Site by the Contractor, the Contractor will collect samples of the import fill material at its source for both chemical and geotechnical testing purposes. Import fill sampling frequencies will be consistent with DTSC guidance (DTSC, 2001b). The volume of import fill likely to be required is greater than 5,000 cubic yards. Therefore, import fill samples would be collected at a frequency of twelve samples for the first 5,000 cubic yards of fill and one sample per additional 1,000 cubic yards of fill (DTSC, 2001b), given that the fill originates from the same source.

Fill samples will be analyzed for TPH, volatile organic compounds ("VOCs"), semi-volatile organic compounds ("SVOCs"), Title 22 metals, hexavalent chromium, percent moisture, organochlorine pesticides, and polychlorinated biphenyls ("PCBs"). Additional analyses may be deemed necessary depending on soil sources and associated site history for import fill. Analytical data for backfill will be reviewed by the City and the Client Representative in consultation with the Site Manager prior to being transported to the Site. If samples from the potential fill source(s) have detections of analytes above the expected reporting limits listed in the QAPP (Appendix H), the fill material may be accepted if Site-specific primary COCs were detected below cleanup goals and if other analytes were detected below applicable cleanup goals for other sites throughout Emeryville with similar future land use or below residential screening criteria such as ESLs, CHHSLs, or PRGs, as determined by the City and the Client Representative in consultation with the Site Manager. Geotechnical testing will be conducted to verify the backfill is placed in accordance with the Contract Documents.

3.2.5.2 Fill Sampling Procedures

Fill soil samples requiring chemical analysis will be collected in pre-cleaned brass or stainless steel liners or glass jars. Brass or stainless steel liners or glass jar will be driven directly into the pile of fill soil. If liners are used, both ends of the brass or stainless steel liner will be covered with Teflon sheets and capped with plastic end caps. Samples to be analyzed for TPH-g and VOCs will be collected in 5-gram EnCore samplers. A sample label will be attached to each sample container. Samples for chemical analysis will be packaged in zip-closure plastic bags and then placed on ice in a cooler for storage and transport to the analytical laboratory under chain-of-custody procedures. Sample naming, labeling, handling, transport, and chain-of-custody procedures are described in the SAP (see Appendix G).

3.3 Site Cleanup Completion Report

At the completion of Site cleanup, EKI will prepare a completion report on behalf of the City that describes implementation of the Site cleanup activities. The report will contain the following items:

- Summary of Site cleanup field activities and observations;
- Documentation of implementation of and conformance with the Plans specified as Appendix A to H;

- Documentation of laboratory analytical results for import fill, additional delineation soil sampling, waste characterization, or other sampling needs as deemed necessary based on field observations and conditions;
- Documentation that cleanup goals were met; and
- Documentation of final extent of excavation.

4.0 PROJECT SCHEDULE AND BUDGET OVERSIGHT

There is no regulatory-imposed schedule with deadlines for Site cleanup. Site cleanup activities are planned for the first half of 2008.

The total cost range for Site cleanup is $2,300,000 to $4,900,000.[4]

The project will be funded in part under: 1) a cleanup grant to the City of Emeryville Redevelopment Agency from the U.S. EPA, 2) a loan to the Redevelopment Agency from the City of Emeryville's Capital Incentives for Emeryville Remediation and Redevelopment ("CIERRA", which is funded by the U.S. EPA Revolving Loan Fund), and 3) Redevelopment Agency funds. The cleanup grant is administered by the Redevelopment Agency and CIERRA is administered by the City of Emeryville.

[4] The total cost range for Site cleanup is based on the estimated cost range for Alternative 2 in the ABCA but does not include groundwater monitoring costs.

5.0 SITE MANAGEMENT AND POST-SITE CLEANUP OPERATIONS

Procedures for Site management, security, and safety are provided in the plans and requirements for plan preparation included as appendices to this SCP.

For the soil cleanup, no ongoing operations or maintenance will be required, as no equipment will be installed as part of the soil cleanup activities. As described above, if further excavation is not possible due to structural or access issues, orange plastic safety fence will be placed along these excavation perimeter sidewalls. Final limits of excavation will be surveyed by a licensed surveyor and the survey information and any applicable confirmation sampling analytical results will be added to the City's OSIRIS Mapped Real Estate Parcel Database, the City's web application that provides on-line access to environmental status for parcels and is used by City personnel as a notification and warning system prior to issuing excavation permits.

It is anticipated that after Site cleanup, Sherwin Williams will re-install the three groundwater monitoring wells (LF-21, SA-AW-02, and SA-AW-03) that will be destroyed to facilitate Site cleanup. These wells are currently located along the upgradient or eastern boundary of the Site. Subsequent monitoring of Sherwin Williams wells for arsenic in groundwater will be sufficient to provide an approximation of groundwater quality at Parcel D.

TABLE 2-1
SOIL CLEANUP GOALS
UPRR Parcel D
Emeryville, California

Primary COCs (a)	Detected Concentration Range (mg/kg in dry weight)	Soil Cleanup Goal (mg/kg in dry weight)
TPH-d	< 5.8 to 5,400	400
TPH-mo	< 29 to 19,000	1,000
TPH-d and TPH-mo combined	--	1,000
Arsenic	1.99 to 145	24
Cadmium	<0.114 to 10	5.6
Lead	5.88 to 684	150

Abbreviations
COCs = chemicals of concern
ft bgs = feet below ground surface
TPH = total petroleum hydrocarbons
TPH-d = TPH as diesel
TPH-mo = TPH as motor oil
mg/kg = milligrams per kilogram

References/Notes

TABLE 2-2
SUMMARY OF SOIL ANALYTICAL RESULTS FOR REPLICATE SAMPLES OF UPD-2-5-5.5
UPRR Parcel D
Emeryville, California

Sample Location	Sample ID	Sample Date	Sample Depth (ft bgs)	Sample Elevation (ft msl)	Lithologic Unit	Analytical Results (mg/kg in dry weight)	
						Arsenic	Cobalt
UPD-2	UPD-2-5-5.5	10/16/2006	5 - 5.5	3.66 to 3.16	YBM - lower	35.9 R	44.4 R
	UPD-2-5-5.5 R1	10/16/2006	5 - 5.5	3.66 to 3.16	YBM - lower	16.6	12.4
	UPD-2-5-5.5 R2	10/16/2006	5 - 5.5	3.66 to 3.16	YBM - lower	16.1	6.29
	UPD-2-5-5.5 R3	10/16/2006	5 - 5.5	3.66 to 3.16	YBM - lower	17.1	6.07

Abbreviations:
ft bgs = feet below ground surface
ft msl = feet mean sea level
mg/kg = Milligrams per kilogram
R = Data for this sample is deemed not usuable (a).
YBM = Young Bay Mud

Notes:
(a) Analytical results of three replicate samples of UPD-2-5-5.5 (UPD-2-5-5.5 R1, UPD-2-5-5.5 R2, and UPD-2-5-5.5 R3) indicate that the initial reported laboratory analytical results of 35.9 mg/kg of arsenic and 44.4 mg/kg cobalt for UPD-2-5-5.5 were spurious results and are rejected. The maximum reported concentrations of arsenic and cobalt in the three replicate samples were 17.1 mg/kg and 12.4 mg/kg, respectively.

Abbreviations:
<0.50 = Compound not detected at or above indicated laboratory reporting limit
CHHSL = California Human Health Screening Level (California EPA, dated January 2005, Table 1--California Human Health Screening Levels for Soil and Comparison to Other Potential Environmental Concerns)
COCs = Chemicals of Concern
ESLs = Regional Water Quality Control Board - San Francisco Bay Region, Environmental Screening Levels, Residential shallow soil less than 3 meters and groundwater as a non-drinking water resource (November 2007)
ft bgs = feet below ground surface
ft msl = feet mean seal level
mg/kg = Milligrams per kilogram
na = not applicable or not available
ND = not detected
NU = not usable (see Table 2-2)
PRG = US EPA Region IX Preliminary Remediation Goals for Soil at Residential Sites, December 2004
LBNL = Lawrence Berkeley National Laboratory
YBM = Young Bay Mud

Notes:
(a) Sampling depths at each borehole location do not include the thickness of overlying asphalt or concrete layers that range from approximately 0.5 to 1-foot in thickness
(b) Concentrations of primary COCs which equal or exceed UPRR Parcel D Site-specific Soil Cleanup Goals are shown in **bold** and are shaded in gray.
(c) Concentrations of other COCs which equal or exceed the CHHSLs, PRGs, or ESLs are shown in **bold**.
(d) Concentrations of other metal COCs which equal or exceed LBNL background metal concentrations (LBNL et al, 2002) are underlined.
(e) LBNL and Parsons Engineering Science, Inc. Analysis of Background Distributions of Metals in Soil at Lawrence Berkeley National Laboratory, June 2002.
(f) Proposed excavation elevation at UPD-2 is 7.7 ft msl and the excavation thickness is 1 ft, which is equivalent to the fill thickness. Soil samples at UPD-2 were only collected from the YBM.
(g) Excavation at UPD-15 is not proposed because concentrations of zinc is soil at UPD-15 of 173 mg/kg only slightly exceeded the soil cleanup goal for zinc of 140 mg/kg and zinc was the only COC in soil to exceed soil cleanup goals at that location.

Notes:

1. All locations are approximate.

CHAPTER 5.
CITYWIDE USE AND DEVELOPMENT REGULATIONS

Sections:

Article 1. General Provisions

9-5.101 Purpose and Applicability

Article 2. Miscellaneous Use Regulations

9-5.201 Purpose
9-5.202 Animal Care and Sales, Kennel/Animal Care
9-5.203 Condominium Conversions
9-5.204 Drive-In and Drive-Through Facilities
9-5.205 Factory-Built Housing (Manufactured Homes)
9-5.206 Lodging, Bed and Breakfast.
9-5.207 Medical Marijuana Dispensaries
9-5.208 Mobile Food Vendors
9-5.209 Mobile Homes on Individual Lots
9-5.210 Recreation, Gaming.
9-5.211 Residential Care Facility, Limited
9-5.212 Residential Care Facilities for the Elderly
9-5.213 Retail
9-5.214 Supportive Housing and Transitional Housing.

Article 3. Adult Oriented Businesses

9-5.301 Purpose
9-5.302 Effect
9-5.303 Home Occupations
9-5.304 Districts Where Allowed
9-5.305 Location Requirements
9-5.306 Conditional Use Permit Required
9-5.307 Conditions of Approval
9-5.308 Public Display of Certain Matter Prohibited
9-5.309 Definitions

Article 4. Affordable Housing Program

9-5.401 Created
9-5.402 General Requirements for New Ownership Residential Projects of Ten (10) or More Dwelling Units
9-5.403 Affordable Unit Requirements for Ownership Residential Projects
9-5.404 Household Eligibility Requirements for Affordable Units
9-5.405 Control of Resale of Ownership Affordable Units
9-5.406 New Rental Residential Projects – Affordable Housing Impact Fees
9-5.407 Rental Affordable Units Permitted if Consistent with Costa-Hawkins Act
9-5.408 Requirements for Rental Affordable Units
9-5.409 New Nonresidential Projects – Affordable Housing Impact Fees
9-5.410 Housing Fund
9-5.411 Availability of Government Subsidies
9-5.412 Density Bonus
9-5.413 Reduction of Amenity and Square Footage
9-5.414 Fees
9-5.415 Technical Assistance
9-5.416 Enforcement
9-5.417 Waiver
9-5.418 Annual Report
9-5.419 Definitions

Article 5. Density Bonus for Affordable Housing

9-5.501 Purpose
9-5.502 Applicability
9-5.503 Projects Eligible for Density Bonus
9-5.504 Application Requirements
9-5.505 Amount of Density Bonus
9-5.506 Concessions and Incentives
9-5.507 Waiver or Reduction of Development Standards
9-5.508 Vehicular Parking Ratio
9-5.509 Requirements for Participation
9-5.510 Definitions

Article 6. Firearms and Ammunition Sales

9-5.601 Purpose
9-5.602 Home Occupations
9-5.603 Districts Where Allowed
9-5.604 Location Requirements
9-5.605 Conditional Use Permit Required
9-5.606 Conditions of Approval
9-5.607 Definitions

Article 7. Hazardous Waste Facilities

9-5.701 Purpose
9-5.702 Applicability
9-5.703 Conditional Use Permit Required
9-5.704 Location
9-5.705 Application Requirements
9-5.706 Noticing Requirements
9-5.707 Local Assessment Committee
9-5.708 Conditions of Approval
9-5.709 Appeals

Article 8. Home Occupations

9-5.801 Purpose
9-5.802 Business License and Zoning Compliance Review Required
9-5.803 Uses Permitted
9-5.804 Uses Excluded
9-5.805 Regulations.

Article 9. Live/Work

9-5.901 Purpose
9-5.902 Applicability
9-5.903 Conditional Use Permit Required
9-5.904 Occupancy of Live/Work Unit
9-5.905 Location and Activity Requirements
9-5.906 Incompatible Use Types
9-5.907 Live/Work Standards
9-5.908 Residential Zones
9-5.909 Existing Live/Work Buildings
9-5.910 Waiver or Reduction of Standards
9-5.911 Review Criteria
9-5.912 Conditions of Approval
9-5.913 Conversion of Live/Work Buildings

Article 10. Nonconforming Uses and Structures

9-5.1001 Purpose
9-5.1002 Applicability
9-5.1003 Exceptions
9-5.1004 Nonconforming Uses as Distinguished from Illegal Uses
9-5.1005 Effect of Conditional Use Permit on Nonconforming Uses
9-5.1006 Determination of Legal Nonconforming Uses
9-5.1007 Incompatible Uses
9-5.1008 Nonconforming Lots
9-5.1009 Continuation and Maintenance of Nonconforming Uses and Structures
9-5.1010 Changes and Substitutions of Nonconforming Uses
9-5.1011 Expansion of Nonconforming Structures and/or Uses
9-5.1012 Restoration of Damaged Nonconforming Structures and/or Uses.
9-5.1013 Reestablishment of Abandoned Nonconforming Uses
9-5.1014 Abatement

Article 1. General Provisions

9-5.101 Purpose and Applicability.
The purpose of this chapter is to set forth development regulations that apply throughout the City.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 2. Miscellaneous Use Regulations

9-5.201 Purpose.
The purpose of this article is to consolidate in one (1) location miscellaneous Citywide use and development regulations that pertain to the various use classifications in Chapter 2 and to other uses and situations, and that are so brief as not to warrant separate articles.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.202 Animal Care and Sales, Kennel/Animal Care.
Screening for any outdoor activities shall be provided in conformance with the requirements of Article 5 of Chapter 4.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.203 Condominium Conversions.
See Article 7 of Chapter 6 for regulations pertaining to the conversion of rental housing to condominiums.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.204 Drive-In and Drive-Through Facilities.
Drive-In and Drive-Through Facilities are prohibited. This prohibition does not apply to drive-in movies, which may be approved as temporary uses only, pursuant to the temporary use permit procedure in Article 6 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.205 Factory-Built Housing (Manufactured Homes).
Factory-built housing shall be treated the same as conventional site-built housing.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.206 Lodging, Bed and Breakfast.

(a) Separate Entry Required. The residential unit containing the Bed and Breakfast establishment must have a separate private entry that is not shared with any other dwelling unit; shared entry, such as through a common lobby, hallway, pathway, or elevator, is not allowed.

(b) Owner Occupancy Required. The owner must reside in the residential unit containing the Bed and Breakfast establishment.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.207 Medical Marijuana Dispensaries.

Medical marijuana dispensaries are prohibited pursuant to Section 5-28.04.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.208 Mobile Food Vendors.

(a) On the Public Right-of-Way. Mobile Food Vendors to be located on the public right-of-way are not subject to these planning regulations, but are regulated pursuant Chapter 27 of Title 5 and Chapter 3 of Title 6.

(b) On Private Property. Mobile Food Vendors to be located on private property or elsewhere not on the public right-of-way are subject to these planning regulations, a are eligible only for temporary use permits pursuant to Article 6 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.209 Mobile Homes on Individual Lots.

Mobile homes on individual lots shall be treated the same as Single Unit residential uses.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.210 Recreation, Gaming.

Pursuant to Section 5-5.14, card rooms are only allowed on San Pablo Avenue south of Park Avenue.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.211 Residential Care Facility, Limited.

Limited Residential Care Facilities, including group homes and Residential Care Facilities for the Elderly, which provide care for six (6) or fewer persons shall be treated same as Single Unit residential uses.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.212 Residential Care Facilities for the Elderly.

(a) Defined. A Residential Care Facility for the Elderly is a Residential Care Facility, as defined in Section 9-2.215, that serves persons sixty (60) years of age and olde

(b) Building Intensity Bonus. A Residential Care Facility for the Elderly shall receive a bonus of one percent (1%) of building intensity (floor area ratio or FAR) for each percent (1%) of beds provided to persons eligible for Supplemental Security Income (SSI) as defined by the U.S. Social Security Administration, up to a maximum of twer five percent (25%). This bonus is in addition to any bonuses available pursuant to Section 9-4.204.

(c) Guarantee Required. To be eligible for the bonus provided in subsection (b) of this section, the owner of the Residential Care Facility for the Elderly shall enter into agreement with the City, in a form acceptable to the City Attorney, to guarantee the availability of such beds for persons eligible for SSI for a minimum of fifty-five (55) ye

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.213 Retail.

(a) Outdoor Sales. Screening for any outdoor sales shall be provided in conformance with the requirements of Article 5 of Chapter 4.

(b) Tobacco Shops. Pursuant to Section 5-29.10, Tobacco Shops are prohibited from being located within one thousand feet (1,000') of public or private schools and p greenways and playgrounds.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.214 Supportive Housing and Transitional Housing.

A Supportive Housing or Transitional Housing development shall be considered a residential use of property subject only to those same restrictions that apply to other residential uses of the same type (e.g., One (1) Unit, Two (2) Unit, or Multi-Unit) in the same zoning district.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 3. Adult Oriented Businesses

9-5.301 Purpose.

This article establishes the adult entertainment regulations. The purpose of these regulations is to implement policies contained in the General Plan, particularly those re to the conservation of existing neighborhoods and the compatibility of uses. In adopting this article, it is recognized that certain types of adult entertainment businesses possess certain objectionable operational characteristics which, if such

uses are allowed to concentrate, will have adverse effects upon the character of the areas in which they concentrate and adjacent neighborhoods. Special regulation of entertainment uses is therefore necessary to ensure that these adverse effects of adult entertainment uses will not contribute to the blighting or downgrading of zoning districts in which they are permitted or of surrounding neighborhoods.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.302 Effect.

This article shall not be interpreted as legalizing or condoning the production, presentation, sale, advertisement, dissemination, or distribution of matter which is obscene defined and regulated by applicable State and local laws; nor shall this article be interpreted as legalizing or condoning participation in management, production, presentation, or exhibition of obscene live conduct in any public place or any place exposed to the public view as defined and regulated by applicable State and local law shall this article be interpreted as legalizing or condoning any other activity which is otherwise prohibited by State or local law.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.303 Home Occupations.
It is unlawful to establish any adult entertainment business as defined in this article as a Home Occupation as defined in Article 8 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.304 Districts Where Allowed.
It is unlawful to establish any adult entertainment business as defined in this article in any district other than the INH Heavy Industrial zone.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.305 Location Requirements.
Within the INH Heavy Industrial zone, no adult entertainment business shall be established in the following locations:

(a) Within two hundred feet (200') of any area zoned for residential use;

(b) Within five hundred feet (500') of any other adult entertainment business;

(c) Within one thousand feet (1,000') of any public park, religious institution or elementary or secondary school.

The distance between any two (2) adult entertainment businesses shall be measured in a straight line, without regard to intervening structures, from the closest exterior structural wall of each business. The distance between any adult entertainment business and any residential district, religious institution, school, or public park shall be measured in a straight line, without regard to intervening structures, from the closest property line of the residential zone, religious institution, school, or public park to th closest exterior structural wall of such adult entertainment business.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.306 Conditional Use Permit Required.
It is unlawful to establish an adult entertainment business without first obtaining a conditional use permit as provided in this article. No other use permit shall be required operate an adult entertainment business. No final action may be taken by the Planning Commission until the Emeryville Police Department has issued an operating perm the use or a statement that such permit is not required. To grant a conditional use permit for an adult entertainment business, the following findings must be made in add to the findings required by Article 5 of Chapter 7:

(a) That the proposed adult entertainment business meets all of the location requirements of Section 9-5.305.

(b) That the proposed adult entertainment business will not be open between 2:00 a.m. and 6:00 a.m. daily.

(c) That the proposed adult entertainment business will not use electronic amplification between midnight and 6:00 a.m. daily.

(d) That the proposed adult entertainment business will be adequately soundproofed or insulated for noise and operated so that incidental noise shall not be audible beyond the premises.

(e) That the proposed adult entertainment business will comply with all applicable performance standards in Article 11 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.307 Conditions of Approval.
In approving a conditional use permit for an adult entertainment business, the Planning Commission may designate such conditions as it deems necessary in order to ful the purposes of this article, and may require reasonable guarantees and evidence that such conditions are being, or will be, complied with. Such conditions shall not be restrictive than the conditions attached to any operating permit issued by the Emeryville Police Department, and may include, but are not limited to, designating hours of operation more restrictive than those listed in Section 9-5.306(b).

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.308 Public Display of Certain Matter Prohibited.
All building openings, entries, and windows of adult entertainment businesses shall be located, covered, or screened in such a manner as to prevent a view into the inter from any public or semipublic area, including public sidewalks, streets, arcades, hallways, or passageways of any material which has as its primary or dominant theme m depicting, illustrating, describing, or relating to “specified sexual activities” or “specified anatomical areas” as defined in this article. Furthermore, such businesses may n have signs, graphics, or window displays which in any way present, depict, illustrate, or describe such material when such material has as its purpose or effect sexual arousal, gratification, or affront.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.309 Definitions.
(a) For the purpose of this article “adult entertainment businesses” includes all Adult Oriented Businesses as defined in Section 9-2.303, and more specifically refers to following establishments:

(1) “Adult arcade” shall mean an establishment where, for any form of consideration, one (1) or more motion picture projectors, slide projectors, or similar machine for viewing by five (5) or fewer persons each, are used to show films, motion pictures, video cassettes, slides, or other photographic reproductions which are characterized by an emphasis upon the depiction or description of “specified sexual activities” or “specified anatomical areas.”

(2) “Adult bookstore” shall mean an establishment in which at least thirty percent (30%) of the business involves the sale, for any form of consideration, of any one or more of the following:

a. Books, magazines, periodicals or other printed matter, or photographs, films, motion pictures, video cassettes, slides, or other visual representations which characterized by an emphasis upon the depiction or description of “specified sexual activities” or “specified anatomical areas,” or

b. Instruments, devices, or paraphernalia which are designed for use in connection with “specified sexual activities.” This definition does not include a bona fi pharmacy.

c. For purposes of this definition, “at least thirty percent (30%) of the business” means at least thirty percent (30%) of the stock-in-trade, or at least thirty perc

(30%) of the floor area of that portion of its total premises devoted to the display of its stock-in-trade, or the derivation of at least thirty percent (30%) of the gro income of the establishment.

(3) "Adult motion picture theater" shall mean an establishment where, for any form of consideration, films, motion pictures, video cassettes, slides, or similar photographic reproductions are shown to an audience of six (6) or more persons, and in which a substantial portion of the total presentation time is devoted to the showing of material which is characterized by an emphasis upon the depiction or description of "specified sexual activities" or "specified anatomical areas."

(4) "Adult theater" shall mean a theater, concert hall, auditorium, or similar establishment which, for any form of consideration, regularly features live performance which are characterized by the exposure of "specified anatomical areas" or by "specified sexual activities."

(5) "Bathhouse" shall mean an establishment which provides the services of baths of all kinds, including all forms and methods of hydrotherapy, during which "specified anatomical areas" are displayed or "specified sexual activities" occur. This section shall not apply to hydrotherapy practiced by, or under the supervision medical practitioner, chiropractor, acupuncturist, or physical therapist, or a similar establishment where baths or hydrotherapy are offered as incidental or accessory services.

(b) For the purposes of this article, "specified sexual activities" shall include the following:

(1) Human genitals in a state of sexual stimulation or arousal;

(2) Acts of human masturbation, sexual intercourse, or sodomy; or

(3) Fondling or other erotic touching of human genitals, pubic region, buttock, or female breast.

(c) For the purposes of this article, "specified anatomical areas" shall include less than completely and opaquely covered: human genitals or pubic region; buttock; or female breast below a point immediately above the top of the areola.

(d) For the purposes of this article, certain terms and words are defined as follows:

(1) "Establishment" shall mean the "establishment" of an adult entertainment business and shall mean and include any of the following:

a. The opening or commencement of any such business as a new business;

b. The conversion of an existing business, whether or not an adult entertainment business, or any of the adult entertainment businesses defined herein;

c. The addition of any of the adult entertainment businesses defined herein to any other existing adult entertainment business; or

d. The relocation of any such business.

(2) "Person" shall mean any person, firm, partnership, association, corporation, company, or organization of any kind.

(3) "Public park" shall mean a park, playground, swimming pool, beach, pier, or athletic field within the City which is under the control, operation, or management City.

(4) "Religious institution" shall mean a building which is used primarily for religious worship and related religious activities.

(5) "School" shall mean an institution of learning for minors, whether public or private, which offers instruction in those courses of study required by the California Education Code or which is maintained pursuant to standards set by the State Board of Education. This definition includes a nursery school, kindergarten, elementa school, junior high school, senior high school, or a special institution of learning under the jurisdiction of the State Department of Education, but it does not include vocational or professional institution or any institution of higher education, such as a community or junior college, college or university.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 4. Affordable Housing Program

9-5.401 Created.

To lessen the shortage of housing affordable to moderate, median, low, and very low income households in the City of Emeryville as partial compliance with California Government Code Section 65583(c), there is hereby created an affordable housing program.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.402 General Requirements for New Ownership Residential Projects of Ten (10) or More Dwelling Units.

(a) Developers of new ownership residential projects (both new construction and conversion of nonresidential space to a residential use) of ten (10) or more dwelling un lots, including but not limited to, single-family dwellings, or condominium developments, either partially or completely in Emeryville, shall be conditioned to provide a designated percentage of the dwelling units in the project as units affordable to moderate income households for a minimum period of forty-five (45) years from date of availability as more fully described below, unless the developer, in agreement with the City Council, elects to commit to a fixed percentage of the affordable units as bein affordable to median income households in return for a reduction of the affordability percentage.

(b) Any development permit for new ownership residential projects (both new construction and conversion) of ten (10) or more dwelling units or parcels that provide affordable units pursuant to subsection (a) of this section shall have conditions attached which will assure compliance with the provisions of this article. The conditions sh require a written agreement to indicate the number, type, location, approximate size, and construction scheduling of all dwelling units, the appropriate price levels, provis for income certification and screening of potential occupants of affordable units, a resale control mechanism, a density bonus, if applicable, and such reasonable informa as shall be required by the City for the purpose of determining the applicant's compliance with this article.

(c) All affordable units in a project and phases of a project should be constructed concurrently with or prior to the construction of non-affordable units, unless the City determines that extenuating circumstances exist.

(d) All affordable units shall be occupied by moderate or median income households as certified by the City or its operating agent.

(e) Unless the City finds compelling reasons to the contrary, the affordable units shall be dispersed throughout the development, the mix and type of affordable units sha proportionate to those of the project as a whole, and the affordable units shall be comparable with the design of the base level market rate units prior to purchaser-funde upgrades in terms of appearance, materials, and quality of finishes. Parking designated for the affordable units shall be provided in an equitable manner as that provide the market rate units. The written agreement referred to in subsection (b) of this section shall include a breakdown of the types of units provided as affordable, which sha

directly proportionate to the types of units in the project as a whole under the provisions of this subsection (e) of this section.

(f) The applicant shall have the option, with the approval of the City, to transfer credit for affordable units constructed at one (1) location within the City to satisfy the requirements of this article. The affordability requirement may be satisfied with construction of dwelling units up to twelve (12) months prior to the approval of the project.

(g) Upon a finding by the City that the construction of the required affordable units is not feasible or appropriate as part of a larger development project, the applicant sh have the option to construct the affordable units on a site or sites not contiguous with the development, but within the Emeryville City limits.

(h) The applicant shall have the option, with the concurrence of the City, in a home ownership project, of constructing rental affordable units in a number sufficient to me the requirements of this article if the provision of the affordable units is consistent with Section 9-5.407.

(i) Where the applicant elects to initially rent all of the units in an ownership residential project, the applicant shall have the option of providing rental affordable units if th provision of the units is consistent with Section 9-5.407.

(j) Where units at a separate location are used to meet the affordability requirements under subsections (f), (g), and (h) of this section, the affordability percentage shall applied to the number of units at the two (2) or more locations combined.

(k) Where the applicant is willing to commit to making a portion of the affordable units affordable to median income households for forty-five (45) years:

(1) The applicant can seek approval by the City under subsection (a) of this section to reduce the number of units required; and

(2) The City may subsidize the cost of traffic impact fees, if any, building permit fees, and other fees and exactions that may be required of some or all of the project units.

(l) Prior to City approval of a lesser percentage of affordable units in return for targeting to median income under subsections (a) and (k) of this section, the City must fin that the request provides at least an equivalent contribution toward City goals.

(m) Notwithstanding the other provisions of this section, the owner of any rental residential project or the owner of any ownership residential project that is initially rented whether constructed prior to or after the original adoption of Article 7 of Chapter 6 of this title, and that contains ten (10) or more dwelling units on lots, shall be required notify the City at least one hundred twenty (120) days prior to a proposed change to the tenure of the residential project from rental units to for-sale, ownership units, as as at least one hundred twenty (120) days prior to any proposed transfer or assignment of project, such that the requirements of this chapter that are effective as of the of said notification to the City will be imposed on the ownership residential project through execution of a written agreement as referred to in Section 9-5.402(b) and any other agreements as required by the City (such as an assignment and assumption agreement).

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.403 Affordable Unit Requirements for Ownership Residential Projects.

(a) In new ownership residential projects, twenty percent (20%) of the dwelling units shall be affordable to moderate income households as provided above. The housing sales prices corresponding to these income ranges shall be established by the City or its designee. In ownership residential projects located partially in Emeryville, twent percent (20%) of the units in Emeryville shall be affordable units or ten percent (10%) of all of the units in the project shall be affordable units with all of the affordable un located in Emeryville, whichever is greater. In applying these percentages, any decimal fraction less than or equal to one-half (0.50) may be disregarded and any decima fraction greater than one-half (0.50) shall be construed as requiring one dwelling unit.

(b) The developer shall offer to sell the affordable units required by this article to eligible purchasers for a period of not less than one hundred twenty (120) days from th date of the City's issuance of the certificate of occupancy for each particular affordable unit, with the sale being completed within ninety (90) days thereafter. At the end the one hundred twenty (120) day marketing period, the City, in its sole discretion, may require the developer to extend its sales efforts for an additional sixty (60) day pe The developer shall actively market the units during this period and implement any suggestions provided by the City. Furthermore, if negotiating the agreement with the developer, the City may require that the marketing periods be extended depending on the number of units to be constructed and marketed at that same time.

(c) If the developer is unable to sell some or all of the affordable units at the end of the marketing period described in subsection (b) of this section, the City shall be offe the opportunity to sell the units for a period of no less than sixty (60) days, with sales being completed within ninety (90) days thereafter. During this period, the City or it designee may purchase the units.

(d) If the developer, City, or the City's operating agent are unable to sell some or all of the affordable units at the end of the marketing periods described in subsections and (c) of this section, and the City or its designee does not purchase the units, then the developer may sell the affordable units at an unrestricted price to a bona fide purchaser for value and pay the City an amount equal to the difference between the sales price and the affordable cost established by the City. After payment of the req amount to the City, all sale and resale restrictions shall be removed from the affordable unit.

(e) The developer shall advertise the initial availability of all affordable units in a project to the Emeryville general public through a marketing program approved by the Ci The developer shall seek qualified purchasers through a process involving community outreach and broad marketing efforts, informational workshops, an application, a lottery, and application review and processing. The City or its operating agent shall review the assets and income of prospective purchasers of the ownership affordable on a project-by-project basis and shall make the final decision about income eligibility. Unless otherwise prohibited by law, preference will be given first to residents of Emeryville and second to people employed in Emeryville, or to other preferences as adopted by the City for a particular ownership residential project subject to this articl part of its review of the eligibility of prospective purchasers, the City or its operating agent shall advise all prospective purchasers of the resale restrictions applicable to ownership affordable units as specified in this article and shall require all purchasers to participate in City-approved homebuyer education prior to the close on escrow o purchaser's affordable unit.

(f) The City shall enter into recorded agreements with developers, and take other appropriate steps necessary to assure that the required moderate and median income ownership units are provided and that the units remain affordable to moderate or median income households for a period of at least forty-five (45) years from the record of the purchase agreement.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.404 Household Eligibility Requirements for Affordable Units.

(a) In establishing moderate, median, low or very low household income, the City or its designee shall consider, among other things, the median household income data provided periodically by the California Department of Housing and Community Development, household size and number of dependents, and all sources of household income and assets.

(b) Every purchaser of an affordable unit shall certify by a form acceptable to the City that the dwelling unit is being purchased for the purchaser's primary place of resid

The City or its operating agent shall verify this certification. Failure, by the purchaser, to maintain eligibility for homeowners' property tax exemption shall be construed to mean that the affordable unit is not the primary place of residence of the purchaser. Should the purchaser fail to make the unit his/her principal place of residence within (6) months following notice by the City of the failure to comply with this provision, such failure shall authorize the City to send a subsequent notice that it treats the failure sale which triggers a preemptive option for the City to purchase such unit consistent with the procedures set out in Section 9-5.405(b); provided, that no sale is deemed occur, no option periods are triggered, and no rights of the City are extinguished if it does not send the second written notice deeming the failure of the owner to comply sale.

(c) The policies governing the selection of home buyers for certification by the City or its operating agent under the provisions of this article shall be established by the C These shall include, but not be limited to, maximum income and asset limits, order of preference, and policy on first-time home buyers. The most recently established crite shall be used by the City or its operating agent in selecting home buyers and in structuring any lottery.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.405 Control of Resale of Ownership Affordable Units.

(a) In order to maintain the availability of the affordable units as may be constructed pursuant to the requirements of this article, the City shall impose the following resale conditions for a minimum period of forty-five (45) years from the recordation of each grant deed, which forty-five (45) year period shall start over with each resale. The pr received by the seller of an affordable unit shall be limited to the lesser of a bona fide offer to purchase or the price affordable to a moderate income household. If the affordable unit has been established for a median income household through an agreement with the developer as provided in Section 9-5.402(k), then the price of the u shall be the lesser of the bona fide offer to purchase or the price affordable to a median income household, as applicable.

(b) Home ownership affordable units shall be sold and resold from the date of the original sale only to moderate and median income households as determined to be elig for affordable units by the City or its operating agent according to the requirements of this article. When an owner of an affordable unit desires to sell the unit, the owner notify the City. The owner shall market the unit to eligible purchasers for a period of not less than ninety (90) days from the date of notification to the City of the desire to and of initiation of marketing (unit is available for viewing and designated contact person available to respond to inquiries), with the sale being completed within ninety (9 days thereafter. If the owner is unable to sell the unit to an eligible purchaser, then the City shall be offered the opportunity to sell the unit for a period of no less than six (60) days, with sale being completed within ninety (90) days thereafter. During this period, the City or its designee may purchase the units. The seller shall not levy or ch any additional fees nor shall any finder's fee or other monetary consideration be allowed other than customary real estate commissions and closing costs.

(c) If the owner, City, or the City's operating agent are unable to sell the unit at the end of the marketing periods described in subsection (b) of this section, and the City designee does not purchase the units, then the owner may sell the affordable unit at an unrestricted price to a bona fide purchaser for value and pay the City an amount equal to the difference between the sales price and the affordable cost established by the City. After payment of the required amount to the City, all sale and resale restrictions shall be removed from the affordable unit.

(d) The owners of any affordable unit shall attach and legally reference in the grant deed conveying title of any such affordable ownership unit a declaration of restriction provided by the City or its operating agent stating the restrictions imposed pursuant to this article. The grant deed shall afford the grantor and the City the right to enforc attached declaration of restrictions. The declaration of restrictions shall include all applicable resale controls, occupancy restrictions, and prohibitions as required by this article. Should the City provide subsidies or financing for any affordable unit, including down payment assistance loans, it will require the filing of a deferred payment subordinate deed of trust in favor of the City, having such terms as the City shall from time to time require, and that subordinate deed of trust shall incorporate and make further enforceable the declaration of restrictions referred to in this subsection.

(e) The City or its operating agent shall be given the responsibility of monitoring the resale of ownership affordable units. Any violation of the resale provisions shall be referred to the City for appropriate action.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.406 New Rental Residential Projects – Affordable Housing Impact Fees.

(a) Rental residential projects shall pay affordable housing impact fees as prescribed by this section to mitigate the project's impact on the need for affordable housing in City, unless the applicant elects to provide on-site rental affordable units consistent with Section 9-5.407.

(b) Affordable housing impact fees for rental residential projects shall be established by resolution of the City Council and may be amended from time to time as required Such fees shall not exceed the cost of mitigating the impact of market rate residential projects on the need for affordable housing in the City.

(c) The affordable housing impact fee shall be paid upon issuance of a building permit for each dwelling unit in the rental residential project. The amount of any affordabl housing impact fee payable under this section shall be based upon the fee schedule in effect at the time of issuance of the building permit for the dwelling unit to which tl fee relates.

(Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.407 Rental Affordable Units Permitted if Consistent with Costa-Hawkins Act.

(a) As an alternative to paying the affordable housing impact fees as required by Section 9-5.406, or where an applicant elects to initially rent all of the units in an owner residential project, an applicant may propose to provide six and nine-tenths percent (6.9%) of the dwelling units in the residential project as rental units affordable to low income households. In calculating the number of required rental affordable units, any decimal fraction less than or equal to one-half (0.50) may be disregarded and any decimal fraction greater than one-half (0.50) shall be construed as requiring one dwelling unit.

(b) To ensure compliance with the Costa-Hawkins Act (Chapter 2.7 of Title 5 of Part 4 of Division 3 of the Civil Code), the City may only approve a proposal to provide re affordable units if the applicant agrees in a recorded agreement with the City to limit rents in consideration for a direct financial contribution or a form of assistance speci in Chapter 4.3 (commencing with Section 65915) of Division 1 of Title 7 of the Government Code.

(c) Any development permit for a new residential project (both new construction and conversion) that provides rental affordable units pursuant to subsection (a) of this section shall have conditions attached which will assure compliance with the provisions of this article. The conditions shall require an agreement to be recorded prior to occupancy that indicates the number, type, location, approximate size, and construction scheduling of all dwelling units, the appropriate rent levels, provision for income certification and screening of potential occupants of affordable units, a density bonus, if applicable, compliance with the Costa-Hawkins Act, and such reasonable informa as shall be required by the City for the purpose of determining the applicant's compliance with this article. The agreement shall require that the rental affordable units be rented to low income households for a period of at least fifty-five (55) years from the date of recordation of the agreement, unless all of the units in the residential project offered to the public for purchase. In that event, the applicant shall provide twenty percent (20%) of the dwelling units as ownership affordable units complying with Secti 9-5.402 through 9-5.405. The recorded agreement shall provide relocation benefits for tenants of the rental affordable units in the event of sale.

(Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.408 Requirements for Rental Affordable Units.
(a) All rental affordable units in a project and phases of a project should be constructed concurrently with or prior to the construction of nonaffordable units, unless the C determines that extenuating circumstances exist.

(b) All rental affordable units shall be occupied by low or very low income households.

(c) Unless the City finds compelling reasons to the contrary, the rental affordable units shall be dispersed throughout the development, the mix and type of rental afforda units shall be proportionate to those of the project as a whole, and shall be comparable with the design of the base level market rate units prior to purchaser-funded upgrades in terms of appearance, materials, and quality of finishes. Parking designated for the rental affordable units shall be provided in an equitable manner as that provided for the market rate units. The written agreement referred to in Section 9-5.407(c) shall include a breakdown of the rental affordable units, which shall be directly proportionate to the types of units in the project as a whole under the provisions of this subsection (c).

(d) The developer shall market the rental affordable units as required by this article to eligible renters throughout the duration of the written agreement referred to in Sec 9-5.407(c). No less than one hundred twenty (120) days prior to the initial lease up of the affordable units, the developer shall provide the City, for its review and approv marketing program for the affordable units, which program shall be in conformance with the City's affordable unit marketing program procedures promulgated by the City may be amended from time to time. During the initial lease up of the affordable units, the developer shall market the affordable units commencing upon approval of the marketing program by the City for a period of time no less than one hundred twenty (120) days after the date of the City's issuance of the certificate of occupancy for the project. At the end of the one hundred twenty (120) day marketing period, the City, in its sole discretion, may require the developer to extend its marketing efforts for an additional sixty (60) day period increment. The developer shall actively market the units during this period and implement any suggestions provided by the City. Furtherm in negotiating the written agreement with the developer, the City may require that the marketing periods be extended depending on the number of units to be constructe and marketed at that same time. On an annual basis, in coordination with its obligations to income certify occupants of affordable units, the developer shall review and re as necessary and as approved by the City, its marketing program in order to maintain conformance with the City's procedures or otherwise respond to market conditions

(e) The developer shall advertise the initial availability of affordable units to the Emeryville general public through a marketing program approved by the City. Upon notification of the availability of rental dwelling units by the developer, the developer shall seek qualified renters through a process involving community outreach and bro marketing efforts, informational workshops, an application submittal, a lottery, and application review and processing.

(f) Unless otherwise prohibited by law, preference will be given first to residents of Emeryville and second to people employed in Emeryville, or to other preferences as adopted by the City for a particular rental residential project subject to this article.

(g) The City or its operating agent shall monitor the affordable rental units. The developer or owner shall retain final discretion in the selection of the eligible households; provided, that the same rental terms and conditions (except rent levels and income) are applied to tenants of affordable units as are applied to all other tenants, except a required to comply with government subsidy programs.

(Formerly 9-5.406. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.409 New Nonresidential Projects – Affordable Housing Impact Fees.
(a) Nonresidential projects shall pay affordable housing impact fees to mitigate the project's impact on the need for affordable housing in the City.

(b) Affordable housing impact fees for nonresidential projects shall be established by resolution of the City Council and may be amended from time to time as required. S fees shall not exceed the cost of mitigating the impact of nonresidential projects on the need for affordable housing in the City. The City Council may from time to time ad housing impact fees for different categories of nonresidential projects, specify the specific uses within each nonresidential land use category, and establish a list of nonresidential uses exempt from the payment of affordable housing impact fees.

(c) The affordable housing impact fee shall be paid upon issuance of a building permit for any nonresidential project for which the fee is due. The amount of any affordab housing impact fee payable under this section shall be based upon the fee schedule in effect at the time of issuance of the building permit for the nonresidential project t which the fee relates.

(d) As an alternative to payment of the affordable housing impact fee set forth in this section, an applicant for a nonresidential project may submit a request to mitigate th affordable housing impacts of such development through the construction of affordable units, either on site or off site, through the dedication of land, or through other m The City Council may approve or conditionally approve such an alternative if the City Council determines, based on substantial evidence, that such alternative complianc provide as much or more affordable housing at the same or lower income levels as will payment of the affordable housing impact fee, is consistent with the General Plan Housing Element, and will otherwise provide as great a public benefit as would payment of the affordable housing impact fee. Any affordable units constructed on site or site shall comply with the provisions contained in Sections 9-5.402 through 9-5.408, as applicable.

(Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.410 Housing Fund.
(a) There is established in the City an affordable housing fund for the purpose of receiving and disbursing certain monies to address the housing needs of extremely low very low, low, median and moderate income households. Separate accounts within such housing fund may be created from time to time to avoid commingling if required law or as deemed appropriate to further the purposes of the housing fund.

(b) All affordable housing impact fees shall be deposited into the affordable housing fund.

(c) The fees collected under this article and all earnings from investment of the fees shall be expended exclusively to provide or assure continued provision of affordable housing in the City to meet the housing needs of the City's workforce through acquisition, construction, development assistance, substantial rehabilitation, financing, rent other subsidies, or other methods, and for costs of administering programs which serve those ends. The housing shall be of a type, or made affordable at a cost or rent, which there is a need in the City and which is not adequately supplied in the City by private housing development in the absence of public assistance and to the extent feasible shall be utilized to provide for moderate, median, low, very low, and extremely low income housing.

(Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.411 Availability of Government Subsidies.
It is the intent of this article that the requirements for units affordable by moderate, median, low, and/or very low income families shall not be determined by the availabilit government subsidies. This is not to preclude the use of such programs or subsidies.

This article is also not intended to be an undue burden on the developers of residential projects. Therefore, as detailed in succeeding sections of this article, incentives a given to provide affordable units.

(Formerly 9-5.407. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.412 Density Bonus.
To avoid any undue economic burden or cost to the applicant providing affordable units required by the provisions of this article, developers of affordable housing may a for a density bonus and other incentives, if eligible, pursuant to Article 5 of this chapter. Any such density bonus shall be in addition to any development bonuses grante pursuant to Section 9-4.204.

(Formerly 9-5.408. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.413 Reduction of Amenity and Square Footage.
Upon a showing of economic hardship and necessity by the applicant:

(a) With City approval, the applicant may reduce the interior amenity level of the affordable units below that of the market-rate units, provided such dwelling units conforr the requirements of applicable building and housing codes; and

(b) With City approval, the applicant may reduce the square footage of the affordable units below that of the market-rate units, provided all dwelling units conform to the requirements of applicable building and housing codes.

(Formerly 9-5.409. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.414 Fees.
In the attempt to avoid any undue burden on developers who are required to provide affordable units under the provisions of this article, the City may subsidize the cost traffic impact fees, if any, building fees and other City fees applicable to the affordable units of a proposed housing development.

(Formerly 9-5.410. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.415 Technical Assistance.
In order to emphasize the importance of securing moderate, median, low and very low income housing as a part of this program, the City and/or designated consultants provide assistance on financial subsidy programs to applicants. During individual project review, consideration shall be given to an economic analysis which will indicate most suitable methods for the terms of this article to be implemented. This is to be done for the purpose of increasing the feasibility and lowering the cost of dwelling unit affordable to moderate, median, low and very low income households.

(Formerly 9-5.411. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.416 Enforcement.
(a) The provisions of this article shall apply to all agents, successors, and assignees of an applicant for development of the site. No building permit or occupancy permit s be issued, nor any development approval granted, which does not meet the requirements of this article.

(b) In addition to, or in lieu of, the provisions of subsection (a) of this section, the City shall institute injunction, mandamus, or any other appropriate legal actions or proceedings for the enforcement of this article.

(c) Any person, firm, or corporation, whether as principal, agent, employee or otherwise, violating or causing the violation of any of the provisions of this article, shall be of a misdemeanor, and upon conviction thereof shall be punishable for each offense by a fine of not more than five hundred dollars ($500.00), or by imprisonment in the County Jail for a term not exceeding six (6) months, or by both fine and imprisonment. Such person, firm, or corporation shall be deemed to be guilty of a separate offen for each and every day during any portion of which any violation of this article is commenced, continued, or permitted by such person, firm, or corporation, and shall be punishable as provided herein.

(Formerly 9-5.412. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.417 Waiver.
(a) As part of an application for the first approval of a residential project or nonresidential project, an applicant may apply for a reduction, adjustment, or waiver of the requirements of this article based upon a showing that applying the requirements of this article would result in an unconstitutional taking of property or would result in an other unconstitutional result. The applicant shall set forth in detail the factual and legal basis for the claim, including all supporting technical documentation, and shall bea burden of presenting the requisite evidence to demonstrate the alleged unconstitutional result. The City may assume each of the following when applicable:

(1) The applicant will benefit from the incentives set forth in the City Code; and

(2) The applicant will provide the most economical affordable units feasible in terms of financing, construction, design, location and tenure.

(b) The City Council, based upon legal advice provided by or at the behest of the City Attorney, may approve a reduction, adjustment, or waiver if the approval authority determines that applying the requirements of this article would effectuate an unconstitutional taking of property or otherwise have an unconstitutional application to the property. The reduction, adjustment, or waiver shall be approved only to the extent necessary to avoid an unconstitutional result, after adoption of written findings, and b on legal analysis and the evidence. If a reduction, adjustment, or waiver is granted, any change in the residential or nonresidential project shall invalidate the reduction, adjustment, or waiver, and a new application shall be required for a reduction, adjustment, or waiver pursuant to this section.

(Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.418 Annual Report.
The City shall prepare, or cause to be prepared, an annual report to the City Council on the status of the affordable units constructed under the provisions of this article. report shall include the number, size, type, tenure, and general location of the affordable units as well as the number of resales and rental vacancy rate. This report shal provide a basis for an evaluation of the overall effectiveness of this article.

(Formerly 9-5.414. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

9-5.419 Definitions.
As used in this article:

(a) “Affordable” shall be defined in accordance with California Health and Safety Code Section 50052.5, and in accordance with the following table, for moderate income median income, low income, and very low income households in accordance with the following table, and in accordance with the project’s being owner occupied or rente occupied:

Income Level	Owner-Occupied Project	Renter-Occupied Project
Moderate Income	35% of 110% of the Area Median Income	30% of 110% of the Area Median Income
Median Income	30% of 90% of the Area Median Income	30% of 80% of the Area Median Income
Low Income	30% of 70% of the Area Median Income	30% of 60% of the Area Median Income
Very Low Income	30% of 50% of the Area Median Income	30% of 50% of the Area Median Income

The City shall publish the annual home-sale price and rents allowable under this program on an annual basis.

(b) “Affordable unit” shall mean an ownership or rental housing unit, as required by this article, which is affordable to a household with moderate, median, low or very lov income.

(c) “Applicant” shall mean any person, firm partnership, association, joint venture, corporation, or any entity or combination of entities which seeks City permits and approvals.

(d) “Area median income” or “median income” shall mean the area median income published annually by the California Department of Housing and Community Developn for the County of Alameda.

(e) “At one (1) location” shall mean all adjacent land owned or controlled by the applicant, the property lines of which are contiguous at any point, or the property lines of which are separated only by a public or private street, road or other public or private right-of-way, or separated only by other land of the applicant.

(f) “Bedroom(s)” shall mean the number of rooms available predominantly as sleeping quarters. The City has a history of providing live/work space and other unusually structured living arrangements. For that reason, the City retains discretion in determining how many bedrooms a particular dwelling unit will contain so as to determine w price or rent will be required for eligibility as an affordable unit.

(g) “Dwelling unit” shall mean a dwelling designed for occupancy by one (1) household.

(h) “Housing costs” shall be defined in accordance with California Health and Safety Code Section 50052.5 and implementing regulations and shall generally mean the monthly mortgage principal and interest, property taxes and assessments, homeowners insurance, homeowner association fees where applicable, an allowance for utiliti and property maintenance and repairs, for ownership dwelling units; and the monthly rent, and allowance for utilities, fees or service charges charged to all tenants, for r dwelling units.

(i) “Income eligibility” shall mean the gross annual household income, considering the household size and number of dependents, income of all wage earners, elderly or disabled family members and all other sources of household income. For self-employed households, net annual household income shall be used in determining income eligibility.

(j) “Market-rate unit” shall mean an ownership or rental housing dwelling unit which is not an affordable unit.

(k) “Moderate, median, low and very low income households” means those households whose maximum income does not exceed levels published annually by the Califor Department of Housing and Community Development for the County of Alameda. Generally, “moderate income” is defined as one hundred one percent (101%) to one hundred twenty percent (120%) of median income, “median income” is defined as eighty-one percent (81%) to one hundred percent (100%) of median income, “low inco is defined as fifty-one percent (51%) to eighty percent (80%) of median income and “very low income” is defined as up to fifty percent (50%) of median income.

(l) “Nonresidential project” means any development of nonresidential uses in the City for which a discretionary permit or building permit is required, including an addition existing use, the new construction of gross square feet of nonresidential space, the conversion of residential use to a nonresidential use, or the conversion of one nonresidential use to another nonresidential use for which an affordable housing impact fee or larger affordable housing impact fee is required.

(m) “Operating agent of the City” shall mean a nonprofit organization, for-profit corporation, county or City agency chosen by the City to carry out some or all of the administrative provisions of this article.

(n) “Ownership residential project” means any residential project that includes the creation of one (1) or more residential dwelling units that may be sold individually. A residential ownership project includes the conversion of apartments to condominiums and residential rental projects having a recorded condominium plan.

(o) “Project” shall mean a housing development at one (1) location including all dwelling units for which permits have been applied for or approved within a twelve (12) m period.

(p) “Resale controls” shall mean legal restrictions by which the price of affordable units will be controlled to insure that the dwelling unit is affordable to moderate, low, ar very low income households over time.

(q) “Rental residential project” means any residential project that creates residential dwelling units that cannot be sold individually.

(r) “Residential project” means any development for which a discretionary permit or building permit is required and that includes the creation of one (1) or more additiona dwelling units, conversion of nonresidential uses to dwelling units, or a condominium conversion.

(s) “Substantial rehabilitation” means rehabilitation, the value of which constitutes twenty-five percent (25%) of the after rehabilitation value of the dwelling, inclusive of th land value.

(Formerly 9-5.415. Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-009, eff. Aug. 14, 2014)

Article 5. Density Bonus for Affordable Housing

9-5.501 Purpose.
The purpose of this article is to establish procedures for implementing State density bonus requirements, as set forth in California Government Code Sections 65915 thro 65918, and to increase the production of affordable housing, consistent with City policies. The bonuses for affordable housing in this article are distinguished from, and a addition to, other development bonuses available to projects that provide other public benefits, as provided by Section 9-4.204.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.502 Applicability.
The provisions of this article shall apply to the following development categories:

(a) New residential development projects of five (5) or more dwelling units, regardless of the type of dwelling units proposed. Applicant shall demonstrate that at least f (5) residential units can be developed on the project site in compliance with all zoning and development regulations.

(b) Where permitted or conditionally permitted by the underlying zoning designation of a site, mixed use developments that include at least five (5) dwelling units.

(c) Rehabilitation of one (1) or more multiple unit residential structures containing at least five (5) units that results in a net increase in the available residential units.

(d) Development that will change the use of an existing building from nonresidential to residential and that will provide at least five (5) residential units.

(e) Development that includes the conversion of at least five (5) residential units to ownership housing.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.503 Projects Eligible for Density Bonus.
(a) The City shall grant one (1) density bonus as described in Section 9-5.505, and incentives or concessions as described in Section 9-5.506, when an applicant for a residential development project agrees to construct at least any one (1) of the following:

(1) At least ten percent (10%) of the total dwelling units of a residential development project for low income households.

(2) At least five percent (5%) of the total dwelling units of a residential development project for very low income households.

(3) A senior citizen housing development or a mobile home park that limits residency based on age requirements for housing older persons pursuant to California Code Section 798.76 or 799.5.

(4) Ten percent (10%) of the total dwelling units in a common interest development as defined in California Civil Code Section 1351, for persons and families of moderate income;

provided, that all units in the development are offered to the public for purchase.

The applicant shall elect whether the density bonus shall be awarded on the basis of subsection (a)(1), (2), (3), or (4) of this section. A density bonus awarded under thi section allows a residential development to exceed the maximum residential density as provided by Section 9-4.203. The maximum residential density shall be the base density established in Table 9-4.203(a) and Figure 9-4.203(a). The granting of a density bonus, concession or incentive shall not be interpreted, in and of itself, to requir General Plan amendment, zoning change, or other discretionary approval. The density bonus shall not be included when determining the number of dwelling units that is equal to five (5%) or ten percent (10%) of the total dwelling units.

For those projects that are subject to the provisions of the Affordable Housing Set-Aside Program (Article 4 of this chapter) set-aside units may be counted toward the requirements of this section. To the extent that the provisions of this section and the affordable housing set-aside provisions are in conflict, the provisions of the Affordab Housing Set-Aside Program prevail.

(b) In addition, the following projects are eligible for a density bonus as provided in Section 9-5.505:

(1) Residential developments that include the donation of land.

(2) Residential developments that include child care facilities.

(3) Condominium conversions.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.504 Application Requirements.
An applicant shall file a written application in accord with the application procedures under Article 2 of Chapter 7 and any specific application requirements established b Director for this use.

(a) Application for density bonus shall be made concurrent with submittals required for the processing of associated discretionary permits. The request for density bonu shall be articulated as part of the description and justification for the development project. The request for the density bonus shall specify the percentage of density bonu sought, per Section 9-5.503, and indicate how the affordable housing obligations will be met.

(b) The review process for a density bonus project shall be the same as that required for associated discretionary permits. Discretionary actions on density bonus proje shall be subject to the same appeal process applied to associated discretionary permits.

(c) The application and approval of a density bonus and any associated incentives or concessions shall not require a separate permit or approval process from that otherwise required for the same project without a density bonus request.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.505 Amount of Density Bonus.
The amount of density bonus granted to a qualifying project shall be based on the category and percentage of affordable units proposed, as reflected in the following tab The maximum bonus shall be thirty-five percent (35%). The applicant may elect to accept a lesser percentage of density bonus. All density calculations resulting in fractio units shall be rounded up to the next whole number. The calculations are in accordance with California Government Code Section 65915 and are subject to any subsequ amendments or revisions thereto.

(a) Low Income Households. For residential development projects providing at least ten percent (10%) of the total dwelling units for low income households the density

bonus shall be calculated as follows:

Table 9-5.505(a)

Density Bonus for Low Income Units

Percentage Low Income Units	Percentage Density Bonus
10	20
11	21.5
12	23
13	24.5
14	26
15	27.5
16	29
17	30.5
18	32
19	33.5
20	35

(b) Very Low Income Households. For residential development projects providing at least five percent (5%) of the total dwelling units for very low income households th density bonus shall be calculated as follows:

Table 9-5.505(b)

Density Bonus for Very Low Income Units

Percentage Very Low Income Units	Percentage Density Bonus
5	20
6	22.5
7	25
8	27.5
9	30
10	32.5
11	35

(c) Senior Citizen Housing. For a senior citizen housing development or a mobile home park that limits residency based on age requirements for housing older persons pursuant to California Civil Code Section 798.76 or 799.5, the density bonus shall be twenty percent (20%) of the number of senior housing units.

(d) Moderate Income Common Interest Development. For a residential development that provides at least ten percent (10%) of the total dwelling units in a common inte development as defined in California Civil Code Section 1351, for persons and families of moderate income; provided, that all units in the development are offered to the public for purchase, the density bonus shall be calculated as follows:

Table 9-5.505(d)

Density Bonus for Moderate Income Common Interest Development

(e) Donation of Land.

(1) When an applicant for a residential development that provides at least ten percent (10%) of the total dwelling units for very low income households donates la the City in accordance with this section, the applicant shall be entitled to a minimum fifteen percent (15%) increase above the otherwise maximum allowable residen density for the entire development as follows:

Table 9-5.505(e)

Density Bonus for Donation of Land

Percentage Very Low Income Units	Percentage Density Bonus

30	35

(2) The density bonus for land dedication shall be in addition to any density bonus allowed under Section 9-5.503(a), up to a maximum combined increase of thirty percent (35%) if the applicant seeks an increase under this section. Nothing in this section shall be construed to enlarge or diminish the City's authority to require a developer to donate land as a condition of development.

(3) An applicant shall be eligible for the increased density bonus described in this section if all the following criteria are met:

a. The applicant donates and transfers the land to the City no later than the date of the approval by the City of the final subdivision map, parcel map, or reside development application.

b. The developable land and zoning classification of the land being transferred are sufficient to permit construction of units affordable to very low income households in an amount not less than ten percent (10%) of the residential units of the proposed development.

c. The transferred land is at least one (1) acre in size or of sufficient size to permit development of at least forty (40) units, has the appropriate General Plan designation, is appropriately zoned with appropriate development standards for development at the density described in California Government Code Section 65583.2, subdivision (c), paragraph 3, and is or will be served by adequate public facilities and infrastructure.

d. The transferred land shall have all of the permits and approvals, other than building permits, necessary for the development of the very low income housing units on the transferred land, not later than the date of approval of the final subdivision map, parcel map, or residential development application, except that the may subject the proposed development to subsequent design review to the extent authorized by California Government Code Section 65583.2(i), if the design i reviewed by the City prior to the transfer.

e. The transferred land and the affordable units shall be subject to a deed restriction, which shall be recorded on the property upon dedication, ensuring continued affordability of the units for at least thirty (30) years.

f. The land is transferred to the City or to a housing developer approved by the City.

g. The transferred land is within the proposed development or, if the City agrees, within one-quarter (1/4) mile of the boundary of the proposed development.

h. A proposed source of funding for the development of very low income units shall be identified not later than the date of approval of the final subdivision ma parcel map, or residential development application.

(f) Child Care Facility.

(1) When an applicant proposes to construct a residential development that conforms to the requirement of Section 9-5.503(a) and includes a child care facility th will be located on the premises of, as part of, or adjacent to the development, the City shall grant either of the following:

a. An additional density bonus that is in an amount of square feet of residential space that is equal to or greater than the amount of square feet in the child ca facility.

b. An additional concession or incentive designated by the City that contributes significantly to the economic feasibility of the construction of the child care fac

(2) In order to qualify for a density bonus as provided in this subsection the applicant shall submit for review and approval by the Director a financial report (pro fo for the proposed child care facility that includes sources of operating revenue to ensure that the center remains open and provides the promised services for the life the project.

(3) The City shall require, as a condition of approving the development, that:

a. The child care facility shall remain in operation as long as or longer than that time during which the affordable housing units are required to remain affordat pursuant to this section; and

b. Of the children who attend the child care facility, the children of very low income households, low income households, or families of moderate income households shall equal a percentage that is equal to or greater than the percentage of dwelling units that are made affordable to very low income households, income households, or moderate income households.

(4) Notwithstanding any requirement of this section, the City need not provide a density bonus or concession for a child care facility if it finds, based upon substan evidence, that Emeryville has adequate child care facilities.

(g) Condominium Conversion Developments.

(1) When a development is the conversion of an existing apartment complex to a condominium complex and the applicant agrees to make at least thirty-three per (33%) of the total units of the development affordable to moderate income households for thirty (30) years, or fifteen percent (15%) of the total units of the propose development affordable to low income households for thirty (30) years, and agrees to pay for the administrative costs incurred by the City to process the application to monitor the continued affordability and habitability of the affordable housing units, the City shall either:

a. Grant a density bonus of twenty-five percent (25%); or

b. Provide other incentives of equivalent financial value as determined by the City.

(2) Nothing in this section shall be construed to require the City to approve a proposal to convert apartments to condominiums.

(3) An applicant shall be ineligible for a density bonus or other incentives under this section if the apartments proposed for conversion are in a development for wh a density bonus or other incentives were previously provided under Section 9-5.503 or 9-5.506.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.506 Concessions and Incentives.

(a) An applicant for a density bonus provided by this article may request specific incentives or concessions and may request a meeting with the City.

(1) In addition to the applicable density bonus, qualifying projects shall receive the following number of incentives or concessions:

a. One (1) incentive or concession for projects that propose at least ten percent (10%) of the total units for lower income households, at least five percent (5% very low income households, or at least ten percent (10%) for persons and families of moderate income in a common interest development.

b. Two (2) incentives or concessions for projects that propose at least twenty percent (20%) of the total units for lower income households, at least ten percer (10%) for very low income households, or at least twenty percent (20%) for persons and families of moderate income in a common interest development.

c. Three (3) incentives or concessions for projects that propose at least thirty percent (30%) of the total units for lower income households, at least fifteen per (15%) for very low income households, or at least thirty percent (30%) for persons and families of moderate income in a common interest development.

(2) Proposals seeking concessions or incentives deemed necessary to exceed the base density allowance would not be subject to the otherwise required conditio use permit.

(3) For purposes of this section, concessions or incentives shall include, without limitation:

a. A reduction in site development standards or a modification of zoning code requirements or architectural design requirements that exceed the minimum bui standards approved by the California Building Standards Commission as provided in California Health and Safety Code Division 13, Part 2.5 (commencing with Section 18901), including, but not limited to, a reduction in setback and square footage requirements and in the ratio of vehicular parking spaces that would otherwise be required that results in identifiable, financially sufficient, and actual cost reductions.

b. Approval of mixed use zoning in conjunction with the housing project if commercial, office, industrial, or other land uses will reduce the cost of the housing development and if the commercial, office, industrial, or other land uses are compatible with the housing project and the existing or planned development in the areas where the proposed housing project will be located.

c. A reduction in the ratio of vehicular parking spaces and/or configurations as set forth in California Government Code Section 65915(p).

d. Other regulatory incentives or concessions proposed by the developer or the City that result in identifiable, financially sufficient, and actual cost reductions

(4) This section does not limit or require the City to provide direct financial incentives, including the provision of publicly owned land, or the waiver of fees or dedic requirements. However, the City will consider deferral of application processing fees on a case-by-case basis.

(5) The City shall grant the concession or incentive requested by the applicant unless the City makes a written finding, based upon substantial evidence, of any of following:

a. The concession or incentive is not required in order to provide for affordable housing costs as defined in California Health and Safety Code Section 50052. for rents for targeted units to be set as specified.

b. The concession or incentive would have a specific adverse impact, as defined in California Government Code Section 65589.5, subdivision (d), paragraph upon public health and safety or the physical environment or on any real property that is listed in the California Register of Historical Resources and for which t is no feasible method to satisfactorily mitigate or avoid the specific adverse impact, without rendering the development unaffordable to low or moderate income households.

c. The concession or incentive would be contrary to State or Federal law.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.507 Waiver or Reduction of Development Standards.

(a) An applicant may submit to the City a proposal for the waiver or reduction of development standards that will have the effect of physically precluding the constructio a development at the densities or with the concessions or incentives permitted under this section, and may request a meeting with the City. Nothing in this section shall b interpreted to require the City to waive or reduce development standards if the waiver or reduction would have a specific, adverse impact, as defined in California Government Code Section 65589.5, subdivision (d), paragraph (2), upon health, safety, or the physical environment, and for which there is no feasible method to satisfactorily mitigate or avoid the specific adverse impact. Nothing in this section shall be interpreted to require a local government to waive or reduce development standards that would have an adverse impact on any real property that is listed in the California Register of Historic Resources, or to grant any waiver or reduction that v be contrary to State or Federal law.

(b) A proposal for the waiver or reduction of development standards pursuant to this section shall neither reduce nor increase the number of incentives or concessions which the applicant is entitled pursuant to Section 9-5.506.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.508 Vehicular Parking Ratio.

(a) Upon request of the developer, the following maximum parking ratio, inclusive of handicapped and guest parking, shall apply, pursuant to California Government C Section 65915:

(1) Zero (0) to one (1) bedroom: one (1) on-site parking space.

(2) Two (2) to three (3) bedrooms: two (2) on-site parking spaces.

(3) Four (4) or more bedrooms: two and one-half (2-1/2) parking spaces.

(b) If the total number of parking spaces required for a development is other than a whole number, the number shall be rounded up to the next whole number. A development may provide on-site parking through tandem parking or uncovered parking, but not through on-street parking. The applicant may also request a concessior an incentive pursuant to Section 9-5.506 to further lower the vehicle parking ratios from those described herein.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.509 Requirements for Participation.

In order for a developer or property owner to be eligible for density bonus the following requirements must be met:

(a) Any development permit that receives density bonus under this article shall have conditions attached which will assure compliance with the provisions of this article. conditions shall require a written agreement to indicate the number, type, location, approximate size, and construction scheduling of all dwelling units, the appropriate pr levels, provision for income certification and screening of potential purchasers and/or renters of affordable units and senior units, a resale control mechanism, if applicab and such reasonable information as shall be required by the City for the purpose of determining the applicant's compliance with this article.

(b) All affordable units and senior units in a project shall be constructed concurrently with or prior to the construction of any market-rate and nonsenior housing units.

(c) Unless the City finds compelling reasons to the contrary, the affordable units or senior units shall be dispersed throughout the development and shall be proportion to the mix and type of units in the project as a whole (with the exception that premium units such as penthouses and top floor view units shall not be required to be availe as affordable or senior housing units). Furthermore, the affordable units or senior units shall be comparable with the design of the base level market-rate units prior to purchaser-funded upgrades in terms of appearance, materials, and finished quality.

(d) The time period of availability as affordable or senior housing shall be for at least thirty (30) years. A longer period may be required for affordable housing set-aside units pursuant to Article 4 of this chapter, or as required by the construction or mortgage financing assistance program, mortgage insurance program, or rental subsidy program.

(e) The maximum allowable rents for affordable units shall be as defined in California Health and Safety Code Section 50053.

(f) Owner-occupied units shall be available at affordable housing costs, as defined in California Health and Safety Code Section 50052.5.

(g) For-sale affordable units may be subject to an equity sharing agreement, in the event that public subsidies are involved in the construction and/or purchase of said units.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.510 Definitions.
As used in this article:

(a) "Affordable" shall be as defined in Section 9-5.415.

(b) "Child care facility" means a facility installed, operated, and maintained for the nonresidential care of children as defined under applicable State licensing requireme for the facility.

(c) "Common interest development" as currently defined in California Civil Code Section 1351 and any subsequent amendments or revisions.

(d) "Concession" or "incentive" shall have the meaning set forth in California Government Code Section 65915(k).

(e) "Equivalent financial value" concerns a condominium conversion project and refers to the cost to the developer/property owner based on the land cost per dwelling The land cost per dwelling unit is determined by the difference in the value of the land with and without the density bonus.

(f) "Senior citizen housing development" as currently defined by California Civil Code Sections 51.3 and 51.12 and any subsequent amendments or revisions.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 6. Firearms and Ammunition Sales

9-5.601 Purpose.
This article establishes regulations governing sales of firearms and ammunition. The purpose of these regulations is to provide criteria for the consideration and approva businesses engaged in the sale of firearms and ammunition. The City finds it necessary to establish such requirements and criteria to regulate the sale of firearms and ammunition in the interest of the public health, safety and welfare.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.602 Home Occupations.
It is unlawful to engage in the business of selling, leasing, or otherwise transferring any firearm or ammunition as defined in this article as a Home Occupation as such te defined in Article 8 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.603 Districts Where Allowed.
It is unlawful to engage in the business of selling, leasing, or otherwise transferring any firearm or ammunition as defined in this article in any district other than the INH Heavy Industrial zone.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.604 Location Requirements.
It is unlawful to engage in the business of selling, leasing, or otherwise transferring any firearm or ammunition in the following locations:

(a) Within two hundred feet (200') of any area zoned for residential use;

(b) Within five hundred feet (500') of any other business engaged in sale of firearms and ammunition;

(c) Within one thousand feet (1,000') of any public park, religious institution or elementary or secondary school.

The distance between any two (2) businesses engaged in the business of selling, leasing or otherwise transferring any firearm or ammunition shall be measured in a stra line, without regard to intervening structures, from the closest exterior structural wall of each business. The distance between any business engaged in the business of selling, leasing or otherwise transferring any firearm or ammunition and any residential district, religious institution, school, or public park shall be measured in a straight without regard to intervening structures, from the closest property line of the residential zone, religious institution, school, or public park to the closest exterior structural of the business engaged in the business of selling, leasing or otherwise transferring any firearm or ammunition.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.605 Conditional Use Permit Required.
It is unlawful to engage in the business of selling, leasing, or otherwise transferring any firearm or ammunition without first obtaining a conditional use permit as provided this article. No final action may be taken by the Planning Commission until the Emeryville Police Department has issued a law enforcement permit as required by Chapter of Title 5. To grant a conditional use permit for the business of selling, leasing, or otherwise transferring any firearm or ammunition, the following findings must be made i addition to the findings required by Article 5 of Chapter 7:

(a) That the proposed business meets all of the location requirements of Section 9-5.604.

(b) That the proposed business will not be open between 5:00 p.m. and 9:00 a.m. daily.

(c) That the proposed business will comply with all applicable performance standards in Article 11 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.606 Conditions of Approval.
In approving a conditional use permit for a business engaged in the business of selling, leasing or otherwise transferring any firearm or ammunition, the Planning Commi may designate such conditions as it deems necessary in order to fulfill the purposes of this article, and may require reasonable guarantees and evidence that such cond

are being, or will be, complied with. Such conditions shall not be less restrictive than the conditions attached to the law enforcement permit issued by the Emeryville Polic Department, and may include, but are not limited to, designating hours of operation more restrictive than those listed in Section 9-5.605(b).

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.607 Definitions.

(a) "Ammunition" shall mean ammunition or cartridge cases, primers, bullets, or propellant powders designed for use in any firearm, and any component thereof, but sh not include blank cartridges or ammunition that can be used solely in an "antique firearm" as defined in Section 921(a)(16) of Title 18 of the United States Code.

(b) "To engage in the business of selling, leasing or otherwise transferring any firearm or ammunition" means to conduct a business by the selling, leasing or transferri any firearm or ammunition, or to hold one's self out as engaged in the business of selling, leasing or otherwise transferring any firearm or ammunition, or to sell, lease or transfer firearms or ammunition in quantity, in series, or in individual transactions, or in any other manner indicative of trade.

(c) "Firearm" shall mean any device, designed to be used as a weapon or modified to be used as a weapon, from which is expelled through a barrel a projectile by the of explosion or other means of combustion; provided, that the term "firearm" shall not include an "antique firearm" as defined in Section 921(a)(16) of Title 18 of the Unite States Code.

(d) "Public park" shall mean a park, playground, swimming pool, beach, pier, or athletic field within the City which is under the control, operation, or management of the City.

(e) "Religious institution" shall mean a building which is used primarily for religious worship and related religious activities.

(f) "School" shall mean an institution of learning for minors, whether public or private, which offers instruction in those courses of study required by the California Educa Code or which is maintained pursuant to standards set by the State Board of Education. This definition includes a nursery school, kindergarten, elementary school, junio high school, senior high school, or a special institution of learning under the jurisdiction of the State Department of Education, but it does not include a vocational or professional institution or any institution of higher education, including a community or junior college, college or university.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 7. Hazardous Waste Facilities

9-5.701 Purpose.

This article establishes regulations governing off-site Hazardous Waste Facilities. The purpose of these regulations is to provide criteria and procedures for the consider and approval of off-site Hazardous Waste Facilities which collect, store, transfer, treat or dispose of hazardous wastes and to be consistent with California Health and Sa Code Sections 25199 through 25199.14, applicable portions of the Alameda County Hazardous Waste Management Plan and the City of Emeryville General Plan. The C finds it necessary to establish such requirements and criteria to regulate Hazardous Waste Facilities in the interest of the public health, safety and welfare.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.702 Applicability.

(a) The requirements of this article are applicable to the siting and development of off-site hazardous waste treatment, storage, and transfer facilities. "Off-site Hazardo Waste Facilities" means those facilities which treat, store, recycle, incinerate or transfer hazardous wastes from at least two (2) producers of hazardous wastes which ar located on the same property of the Hazardous Waste Facility. Consistent with the Alameda County Hazardous Waste Management Plan, off-site Hazardous Waste Faci only include those facility types as defined by the plan for Small-Scale Transfer and Storage Facilities including hazardous waste collection facilities, and Industrial Trans Storage and Treatment Facilities.

(b) The off-site facility definition does not apply to:

(1) Transportable treatment units (TTU) which are designed to be moved either intact or in modules and which are intended to be operated at a given location for limited period of time; or

(2) Permanent on-site Hazardous Waste Facilities at locations where hazardous waste is produced, and which are owned by, leased to, or under the control of th producer of the waste.

(c) Facilities for the land disposal of hazardous wastes or treatment residues are prohibited in the City of Emeryville.

(d) All such facilities (i.e., off-site, on-site, household hazardous waste collection, and TTUs) shall obtain all necessary State licensing to install and operate.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.703 Conditional Use Permit Required.

It is unlawful to establish a Hazardous Waste Facility without first obtaining a conditional use permit as provided in this article pursuant to the procedures and required findings in Article 5 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.704 Location.

Hazardous Waste Facilities shall not be located within the following areas. All distances shall be measured from lot line to lot line.

(a) All Hazardous Waste Facilities.

(1) Two hundred feet (200') of an active or recently active seismic fault.

(2) Three hundred feet (300') of the San Francisco Bay shoreline or a critical habitat unless the applicant has demonstrated by risk assessment that a small buffe zone provides adequate protection for the environment and the public in the event of an accident.

(3) An area with twenty-five percent (25%) or greater slope or areas subject to liquefaction or subsidence unless the facility incorporates adequate engineered designed features which assure structural stability.

(4) An area of highly permeable soils or sediment, as defined in Title 23, California Code of Regulations, Chapter 15.

(b) Small-Scale Hazardous Waste Transfer and Storage Facilities.

(1) Five hundred feet (500') of any dwelling unit unless the applicant has demonstrated by risk assessment that a smaller buffer zone provides adequate protectio the public in the event of an accident.

(2) Five hundred feet (500') of an immobile population.

(3) A one hundred (100) year floodplain or an area subject to flooding by dam failure or tsunami, unless the project is protected by adequate engineered solutions designed to preclude flood failure.

(4) Recreational or scenic areas unless necessary to handle hazardous wastes generated by visitors, workers, or residents in the area.

(c) Industrial Hazardous Waste Transfer/Storage/Treatment Facilities.

(1) A one hundred (100) year floodplain or an area subject to flooding by dam failure or tsunami, unless the project is protected by adequate engineered solutions designed to preclude flood failure.

(2) Unless the applicant has demonstrated by risk assessment that a smaller buffer zone provides adequate protection for the public in the event of an accident:

a. Five hundred feet (500') of any dwelling unit or any area designated for residential use in this title; or

b. Two thousand feet (2,000') of any dwelling unit or any area designated for residential use in this title for facilities that will handle ignitable, explosive, or rea hazardous wastes.

(3) Unless the applicant has demonstrated by risk assessment that a smaller buffer zone provides adequate protection for the public in the event of an accident:

a. Five hundred feet (500') of any immobile population; or

b. Five thousand feet (5,000') of any immobile population for facilities that will handle ignitable, explosive, or reactive hazardous wastes.

(4) A recreational or scenic area.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.705 Application Requirements.
In addition to the documents required for a conditional use permit application pursuant to Article 5 of Chapter 7, an application for a conditional use permit for a Hazardo Waste Facility shall be accompanied by the following documents:

(a) A letter of justification describing the proposed Hazardous Waste Facility and explaining how it will satisfy the findings in Article 5 of Chapter 7.

(b) A preliminary geological study of the property and surrounding area which includes as deep a soils analysis as there are known aquifers, regardless of the potabilit those aquifers.

(c) Identification of the amounts (tonnage) and types of hazardous wastes to be managed at the Hazardous Waste Facility, the sources of these wastes, the ultimate disposition of the wastes, and the anticipated life of the project. Information shall be provided on the amount, sources, and types of hazardous wastes to be treated base an actual survey of the businesses to be served.

(d) Identification of travel routes to be used by generators and the owner/operator of the Hazardous Waste Facility for the transportation of hazardous wastes.

(e) A plan for public involvement with the proposed project prior to any Planning Commission public hearings. This plan will provide for adequate public testimony on th project in an effort to mitigate all public concerns prior to the Planning Commission's review and determination.

(f) A plan that identifies an ongoing monitoring program to ensure no release of any hazardous substance from the project site into the environment. This shall include ongoing monitoring required by other permitting agencies such as the State Department of Toxic Substances Control, the San Francisco Bay Regional Water Quality Cor Board, the Bay Area Air Quality Management District, the Federal Environmental Protection Agency, etc.

(g) A risk assessment which, at a minimum, studies the potential risks to public health, safety and the environment with attention to the proximity of the proposed site to residential uses, civil uses, environmentally sensitive areas, and groundwater.

(h) Evidence that all other necessary permits from regional, State and Federal agencies have been applied for or received.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.706 Noticing Requirements.
In addition to the noticing requirements set forth in Chapter 7, hearings and public notices shall be consistent with the applicable requirements of California Health and S Code Sections 25199 through 25199.14.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.707 Local Assessment Committee.
No later than thirty (30) days after an application for a Hazardous Waste Facility is accepted as complete, the City Council shall appoint a seven (7) member Local Assessment Committee (LAC) for each Hazardous Waste Facility application.

(a) Pursuant to California Health and Safety Code Section 25199.7(d), the City Council shall appoint a seven (7) member Local Assessment Committee (LAC). The City Council has discretion to appoint additional members to this committee as they deem appropriate. The membership, responsibilities and duties shall be consistent with th provisions of California Health and Safety Code Section 25199.7. The LAC shall cease to exist after the final administrative action has been taken by the State and local agencies on the permit applications for the project for which the LAC was formed.

(b) The City shall provide staff resources to assist the LAC in performing its duties as required by California Health and Safety Code Section 25199.7(d)(3).

(c) If the LAC and the applicant cannot resolve any differences through the meetings specified by State law, the State Office of Permit Assistance may assist in this resolution pursuant to California Health and Safety Code Section 25199.4, as required by California Health and Safety Code Section 25199.7(h).

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.708 Conditions of Approval.
In approving a conditional use permit for a Hazardous Waste Facility, the Planning Commission may designate such conditions as it deems necessary in order to fulfill the purposes of this article, and may require reasonable guarantees and evidence that such conditions are being, or will be, complied with. Such conditions may include, but not limited to, the following:

(a) An increase in the amount of liability insurance required under State law for such facilities whether or not a Hazardous Waste Facility is required to comply with such State law.

(b) An agreement to indemnify the City of Emeryville in the event of a spill or release of hazardous wastes or any constituents thereof into the environment.

(c) Installation of containment structures for hazardous waste releases capable of withstanding failure due to geologic, soil or other failures.

(d) Compliance with all applicable laws, regulations, ordinances and orders of any governmental agency. The owner/operator of the Hazardous Waste Facility shall provide the City with notice within three (3) days of any violation or noncompliance with any applicable law, regulation, ordinance or order.

(e) Plans and procedures for notifying property owners and occupants within a five-hundred-foot (500') radius of the facility of any accidental releases of hazardous substances into the environment.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.709 Appeals.
The Planning Commission's decision on a conditional use permit for a Hazardous Waste Facility may be appealed to City Council in accordance with the appeal procedure Article 14 of Chapter 7. A final decision of the City Council regarding a conditional use permit for a Hazardous Waste Facility may be further appealed to the Governor of State of California or the Governor's designee pursuant to California Health and Safety Code Section 25199.9.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 8. Home Occupations

9-5.801 Purpose.
This article establishes regulations governing Home Occupations. The purpose of the regulations contained in this article is to provide criteria and procedures for the consideration and approval of Home Occupations. The City finds it necessary to establish such requirements and criteria to regulate Home Occupations in the interest of public health, safety and welfare.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.802 Business License and Zoning Compliance Review Required.
A Home Occupation shall require a business license pursuant to Chapter 1 of Title 3 and a zoning compliance review pursuant to Article 3 of Chapter 7. In approving a zoning compliance review for a Home Occupation, the Director may designate reasonable conditions deemed necessary to comply with the regulations in Section 9-5.80

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.803 Uses Permitted.
Any use, except those listed in Section 9-5.804, may be a Home Occupation if the Director determines that it will comply with all of the regulations set forth in Section 9-5

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-001, eff. Mar. 6, 2014)

9-5.804 Uses Excluded.
None of the following uses or activities shall be a Home Occupation:

(a) Uses of Special Concern. Any use of special concern, as listed in Section 9-2.701, shall not be a Home Occupation.

(b) Commercial Hauling. A commercial hauling business shall not be a Home Occupation.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.805 Regulations.
A Home Occupation shall comply with all of the following regulations:

(a) A Home Occupation shall not change the residential character of the dwelling unit or adversely affect other uses.

(b) A Home Occupation shall take place within the dwelling unit or garage, or accessory building that is incidental to the principal residential use.

(c) Outdoor storage associated with a Home Occupation is prohibited.

(d) A Home Occupation shall not exceed forty percent (40%) of the dwelling unit's square footage and shall not exceed a maximum of four hundred (400) square feet of indoor space.

(e) Plants and animals may be grown or kept in outdoor areas of the subject premises as part of the Home Occupation.

(f) Displays and signage advertising the Home Occupation are prohibited.

(g) A Home Occupation shall not have more than one (1) associated vehicle that shall not exceed twenty feet (20') in length. The associated vehicle shall not have more than four (4) square feet of signage related to the Home Occupation.

(h) Employees must be residents of the dwelling unit in which the Home Occupation is located, with the exception of one (1) nonresident, full-time equivalent employee

(i) A Home Occupation shall not have more than five (5) clients on the premises at any given time, and shall not have more than ten (10) clients at the premises in any given business day.

(j) Nonresident employees and clients shall only be at the premises between 8:00 a.m. and 9:00 p.m.

(k) On-site sales shall be limited to those items physically produced or manufactured within the dwelling unit, garage, or accessory buildings that are part of the Home

Occupation, except for plants and animals, which may be grown or kept in outdoor areas of the subject premises.

(l) A Home Occupation that involves hazardous materials or processes shall require Fire Department approval. A Home Occupation shall not create offensive or objectionable noise, vibration, odors, smoke, fumes, heat, dust, dirt, glare or electrical disturbance perceptible by the average person beyond the lot line or party walls o multi-unit buildings of the subject premises.

(m) A Home Occupation shall comply with all other applicable provisions of these planning regulations, including but not limited to the performance standards in Article this chapter; all other applicable provisions of the Emeryville Municipal Code; and all other applicable local, State, and Federal laws and regulations.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 9. Live/Work

9-5.901 Purpose.
This article establishes regulations governing Live/Work Units. The purpose of these regulations is to provide space that allows for a flexible combination of residential ar nonresidential uses to meet the changing needs of the Emeryville community. The intent is to encourage small, independent, and creative businesses and artistic endeav throughout the City.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.902 Applicability.
The provisions of this article apply to any new or existing Live/Work Unit or Live/Work building, including conversions of existing residential and nonresidential buildings t Live/Work buildings, conversions of Live/Work buildings to wholly residential or nonresidential uses, and any change of use or occupancy in a Live/Work building.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.903 Conditional Use Permit Required.
Occupancy of a Live/Work building shall require approval of a conditional use permit pursuant to the procedures and required findings in Article 5 of Chapter 7.

(a) Eligible Applicants. The following persons shall be eligible to apply for a conditional use permit for a Live/Work building:

(1) The owner of the Live/Work building or Live/Work Unit.

(2) An authorized agent of the owner of the Live/Work building or Live/Work Unit.

(3) The occupant of the Live/Work Unit with the express written permission of the building owner.

(b) To Whom Granted. The conditional use permit for occupancy of a Live/Work building shall be granted to the owner of the building or Live/Work Unit.

(c) Notification of Occupants. A copy of the conditional use permit, showing the conditions of approval, shall be provided to all occupants of Live/Work Units in the build prior to their execution of a lease or purchase agreement for such Live/Work Unit.

(d) Exception: Existing Live/Work Building. If a valid conditional use permit exists for a Live/Work building on the effective date of the adoption of this article, no additior conditional use permit shall be required for that building in order to meet the requirements of this section.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.904 Occupancy of Live/Work Unit.
The owner or occupant of a Live/Work Unit shall receive zoning compliance approval pursuant to Article 3 of Chapter 7. The zoning compliance approval shall identify th occupant(s) and use(s) of the Live/Work Unit and demonstrate compliance with the conditional use permit which was issued for the building.

(a) Exception: Existing Live/Work Units. If the owner or occupant has received zoning compliance approval for a Live/Work Unit on the effective date of the adoption of article, no additional zoning compliance approval is required for that unit in order to meet the requirements of this section unless the use or occupancy is subsequently changed.

(b) Posting of Zoning Compliance Approval. The zoning compliance approval for a Live/Work Unit shall be posted in the work portion of the Live/Work Unit.

(c) Change of Use or Occupancy. The owner or occupant of a Live/Work Unit shall notify the City of any proposed change in use or occupancy. Any change of use or occupancy shall require a new zoning compliance approval pursuant to Article 3 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.905 Location and Activity Requirements.
(a) Location.

(1) Heavy Live/Work Units, as defined in Section 9-2.331(a), are permitted in the INH zone, subject to a conditional use permit pursuant to Article 5 of Chapter 7.

(2) Light Live/Work Units, as defined in Section 9-2.331(b), are permitted in the RM, RMH, RH, MUR, MURS, MUN, OT, and INL zones, subject to a conditional us permit pursuant to Article 5 of Chapter 7.

(b) Activity. The work activity associated with a Live/Work Unit must be permitted or conditionally permitted in the zoning district where it will be located as indicated in Chapter 3; provided, however, that if the unit is in a residential zone, the work activity must be allowed by the regulations for the MUR Mixed Use with Residential zone.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.906 Incompatible Use Types.
The following use types are deemed incompatible with Live/Work Units, and shall not be permitted in any Live/Work building; nor shall Live/Work Units be permitted in an building which contains the following use types:

(a) Uses of Special Concern. Any use of special concern, as listed in Section 9-2.701.

(b) Commercial and Institutional Use Types.

Animal Care and Sales (all)

Motor Vehicle Sales and Services (all)

Eating and Drinking Establishments

Bars/Nightclubs/Lounges

Emergency Shelters

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.907 Live/Work Standards.

Live/Work buildings shall comply with the following standards, unless specifically waived in accordance with Section 9-5.910. The Planning Commission may increase any requirement, up to what normally would be required for the business activities which may be associated with the proposed Live/Work Units, if determined to be necessary protect the public health, safety and welfare.

(a) Building Size. A Live/Work building shall not exceed the floor area ratio as specified in Article 2 of Chapter 4.

(b) Unit Size and Living Area.

(1) The floor area of each Live/Work Unit shall be no less than seven hundred fifty (750) square feet and no more than two thousand (2,000) square feet, unless applicant demonstrates that less or more space is appropriate to the proposed use.

(2) Not more than fifty percent (50%) of the floor area of each Live/Work Unit shall be devoted to living area except that in residential zones not more than eighty percent (80%) of each Live/Work Unit shall be devoted to living area.

(c) Parking and Loading. Off-street parking and loading shall be provided as required by Article 4 of Chapter 4.

(d) Open Space. Open space shall be provided as required by Article 3 of Chapter 4.

(e) Performance Standards. All Live/Work Units and Live/Work buildings shall comply with the applicable performance standards in Article 11 of this chapter.

(f) Ventilation. All Live/Work Units shall be provided with at least one (1) operable window. A ventilation system shall be installed subject to the approval of the Chief Building Official and Fire Marshal for any Live/Work activity which requires additional ventilation or which generates hazardous fumes or dust.

(g) Mixed Occupancies. If a building contains mixed occupancies of Live/Work Units and other uses, occupancies other than Live/Work shall meet all applicable requirements for those uses, and proper occupancy separations shall be provided between the Live/Work Units and other occupancies, as determined by the Chief Build Official.

(h) Additional Requirements. Live/Work Units and buildings must comply with any additional requirements imposed by the Planning and Building, Fire, Police and Public Works Departments as necessary to protect the public health, safety and welfare.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.908 Residential Zones.

Live/Work Units and buildings located in residential zones are subject to the following additional standards:

(a) On-Premises Sales. On-premises sales of goods not produced within the Live/Work building by an occupant of a Live/Work Unit are not permitted.

(b) Work Restricted to Occupants. Work on the premises of a Live/Work Unit shall be limited to persons who live in the Live/Work Unit with the exception of one (1) nonresident, full-time equivalent employee.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.909 Existing Live/Work Buildings.

Any building which contains one (1) or more Live/Work Units on the effective date of the adoption of this article, and has valid permits for such Live/Work Units, need not meet the parking, loading, and open space requirements of Section 9-5.907. The parking, loading, and open space which existed on the effective date of the ordinance codified in this article shall not be reduced to levels below those required by this article.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.910 Waiver or Reduction of Standards.

In approving a conditional use permit for Live/Work Units, the Director or Planning Commission, as the case may be, may waive or reduce any requirement or portion of a requirement identified in Section 9-5.907 if all of the following findings are made in addition to the findings required by Article 5 of Chapter 7:

(a) That the Live/Work Units are provided within a building which was in existence on the effective date of the initial adoption of this article.

(b) That the Live/Work Units are provided within a building which is structurally sound or improved so that it is structurally sound.

(c) That the Live/Work Units are provided within a building which is consistent with the architectural character of neighboring buildings or which is improved in order to consistent.

(d) That the requirements of Section 9-5.907 cannot be met due to site or building constraints.

(e) That human health, safety and welfare will not be adversely affected due to such waiver.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-001, eff. Mar. 6, 2014)

9-5.911 Review Criteria.

In reviewing an application for a conditional use permit for Live/Work Units, the Planning Commission shall consider and give preference for projects which incorporate th following:

(a) Compatibility of the Live/Work building with neighboring uses.

(b) Activities involving artistic endeavors.

(c) Low-income housing.

(d) Separation of work activities from living areas, where work activities could present threats to human health and safety.

(e) Ground floor commercial activity.

(f) Adequate traffic circulation.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.912 Conditions of Approval.
In approving a conditional use permit for Live/Work Units, the Planning Commission may designate such conditions as it deems necessary to protect the public health, sa and welfare, and may require reasonable guarantees and evidence that such conditions are being, or will be, complied with. Such conditions may include, but are not lim to, the following:

(a) Building Management. A building manager shall be designated for the Live/Work building to serve as a liaison between City personnel and Live/Work occupants, ar between Live/Work occupants and commercial or industrial occupants. The building manager shall be provided with a copy of all occupancy permits, and shall notify the of any changes in use or occupancy. The building manager shall report any infringements of permit conditions. The owner of the Live/Work building shall inform the Direc of the name and telephone number of the building manager, and shall notify the Director of any changes thereto.

(b) Inspections. Live/Work Units shall be subject to periodic inspections by the City's fire, building, health and safety personnel from 9:00 a.m. to 5:00 p.m. on all days except Saturdays, Sundays, and City holidays.

(c) Written Notice. For Live/Work buildings located in industrial zones, the owner of the Live/Work building shall provide written notice to all Live/Work Unit occupants th the surrounding area may be subject to levels of noise, dust, fumes or other nuisances at higher levels than would be expected in residential areas. Specific sources of t nuisances may be identified if appropriate and if possible.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.913 Conversion of Live/Work Buildings.
(a) Nonresidential Zone. In a nonresidential zone, any Live/Work building may be converted to wholly nonresidential uses which are permitted in that zone.

(b) Residential Zone. In a residential zone, no Live/Work building may be converted to wholly nonresidential uses; however, it may be converted to wholly residential us

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 10. Nonconforming Uses and Structures

9-5.1001 Purpose.
This article establishes regulations for nonconforming uses and structures. The purpose of these provisions is to regulate uses of land and structures that were legal bef the adoption or amendment of these planning regulations, but which no longer comply. The intent of this article is to permit nonconforming uses to continue until they are removed or required to be terminated, but not to encourage their survival. More specifically, it is the intent of this article to distinguish between incompatible nonconformi uses that are detrimental to public health, safety, and general welfare, and nonconforming uses that are economically productive and compatible with surrounding development despite being inconsistent with the use regulations of these planning regulations.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1002 Applicability.
The provisions of this article apply to uses that have become nonconforming by adoption of these planning regulations, uses that were previously nonconforming and rer nonconforming under these planning regulations, and uses that become nonconforming due to subsequent amendments to these planning regulations, except as provid Section 9-5.1003.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1003 Exceptions.
The provisions of this article do not apply in the following situations:

(a) Signs. Nonconforming signs shall be subject to the provisions of Section 9-5.1614.

(b) Residential Uses. Any residential use, lot, or structure that was legally established prior to the adoption of these planning regulations and that has been continuous maintained in residential use in compliance with the requirements of all applicable codes is deemed to be a conforming use, lot, or structure. However, any enlargement replacement of such use shall conform to these planning regulations.

(c) General Manufacturing Uses. Any General Manufacturing use, lot, or structure in the INL Light Industrial zone that was legally established prior to the adoption of th planning regulations and that has been continuously maintained in compliance with the requirements of all applicable codes is deemed to be a conforming use, lot, or structure. However, any enlargement or total replacement of such use shall conform to these planning regulations.

(d) Public Uses. Provided that there is no change of use, nothing in this article shall require the termination, discontinuance, or removal of a public use or a public utility to prevent the expansion, modernization, replacement, repair, maintenance, alteration, reconstruction, or rebuilding and continuation of public use or utility buildings, structures, equipment, and facilities.

(e) Planned Unit Developments. Planned unit developments approved prior to the adoption of these planning regulations, as listed in Section 9-3.310, are subject to th use and development regulations stipulated in the various ordinances establishing the PUDs. If the ordinance for a PUD does not address a particular issue, these planr regulations shall apply to that issue. Any modifications to such PUDs shall be subject to the provisions of these planning regulations.

(f) Other Planning Entitlements. Any use allowed under a planning entitlement, including but not limited to a conditional use permit, design review permit, or variance, th was approved prior to the adoption of these planning regulations and that has not expired, is deemed to be a conforming use and is subject to any conditions included ir approval. If such a use is not permitted by these planning regulations, it may be expanded pursuant to Section 9-5.1011, except those uses that are deemed incompatib pursuant to Section 9-5.1007. Other modifications to such a use beyond what was originally approved shall be subject to the provisions of these planning regulations.

(g) Structures under Construction. Nothing contained in this article shall be deemed to require any change in the plans, construction, or designated use of any building structure for which a building permit has properly been issued prior to the adoption of these planning regulations.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1004 Nonconforming Uses as Distinguished from Illegal Uses.

(a) Nonconforming Use. A nonconforming use is any use of land, use of structure, lot, or structure that was legally established prior to the adoption of these planning regulations, but which does not conform to the provisions of these planning regulations. Nonconforming uses may be continued, maintained, repaired, altered, substituted another nonconforming use, expanded, restored or reestablished only in conformance with the requirements of this article.

(1) Nonconforming uses include:

a. Uses made nonconforming by the addition of a standard or requirement in these planning regulations that was not previously required for such use; and

b. Uses that were previously permitted by right and are subject to a discretionary permit under the requirements of these planning regulations.

(2) A nonconformity may result from any inconsistency with the requirements of these planning regulations, including but not limited to location, density, floor area (FAR), height, setback, usable open space, parking, or performance standards or the lack of a conditional use permit, variance, or other required planning entitleme

(3) A use or structure shall not be deemed nonconforming solely because it does not conform with the applicable design standards for parking lots and structures pursuant to Section 9-4.406, allowed projections above the top of buildings pursuant to Section 9-4.202(c), or restrictions on features allowed in required yards pursuant to Section 9-4.301(e), or because of other minor deviations from the requirements of these planning regulations.

(b) Illegal Use. An illegal use is a use of land, use of structure, lot, or structure that was not legally established under the regulations that were applicable at the time it established, whether before or after the adoption of these planning regulations. Any such illegal use is hereby declared to be a public nuisance and shall be discontinue legalized immediately.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1005 Effect of Conditional Use Permit on Nonconforming Uses.

(a) Use Remains Nonconforming. Any nonconforming use that is substituted, expanded, restored or reestablished pursuant to a conditional use permit as provided in t article shall still be considered a nonconforming use in its entirety and shall be subject to all applicable provisions of this article.

(b) Conditions of Approval. In approving a conditional use permit to substitute, expand, restore, or reestablish a nonconforming use, conditions of approval may be imp as deemed necessary to fulfill the purposes of this article, and reasonable guarantees and evidence may be required that such conditions are being, or will be, complied Such conditions may include, but are not limited to, requiring additional landscaping, screening, and other site improvements; and establishing a time limit and terminatio date for the nonconforming use.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1006 Determination of Legal Nonconforming Uses.

The Director shall determine whether a use is nonconforming and whether it was legally established. The Director's determination may be appealed to the Planning Commission in accordance with the appeal procedures in Article 14 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1007 Incompatible Uses.

Uses of special concern, as listed in Section 9-2.701, that are prohibited in the zoning district in which they are located, as indicated in Article 2 of Chapter 3, are hereby declared to be incompatible uses and may be continued but shall not be expanded, substituted for another nonconforming use, or reestablished if abandoned for more t ninety (90) days. An incompatible use may be substituted with a nonconforming use that is not an incompatible use pursuant to the requirements of Section 9-5.1010(d).

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1008 Nonconforming Lots.

Any lot that is smaller than the minimum size or width required by Article 7 of Chapter 4 may be developed subject to all other requirements of these planning regulations is described in the official records on file in the office of the Alameda County Recorder as a lot of record.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-001, eff. Mar. 6, 2014)

9-5.1009 Continuation and Maintenance of Nonconforming Uses and Structures.

(a) Right to Continue. Any nonconforming use or structure may be continued and maintained indefinitely if it has remained in continuous existence since the adoption o these planning regulations. The right to continue a nonconforming use or structure shall run with the land. Any substitution, expansion, restoration or reestablishment of nonconforming use or structure shall be subject to the requirements of this article.

(b) Maintenance and Repairs. Maintenance, repairs, and structural interior alterations to a nonconforming structure are permitted if the changes and improvements do expand the structure, except as provided in Section 9-5.1011.

(c) Additions and Alterations to Nonconforming Public Uses. Additions, extensions, and alterations may be made to any nonconforming public use, including but not lim to schools, parks, recreation facilities, police stations, and fire stations, if the addition, extension, or alteration:

(1) Does not extend beyond the boundaries of the site in existence when the use became nonconforming;

(2) Does not reduce any off-street parking required by Article 4 of Chapter 4; and

(3) Complies with the applicable performance standards in Article 11 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1010 Changes and Substitutions of Nonconforming Uses.

A nonconforming use may be changed to a conforming use or substituted with another nonconforming use subject to the requirements of this section. These requiremen shall not apply to a change of ownership, tenancy, or management where there is no change in use type and the use is not expanded.

(a) Change from Nonconforming to Permitted Use. Any nonconforming use may be changed to a use that is permitted by right in the zoning district in which it is locatec that complies with all applicable standards for such use. Any such change in use terminates the right of the previous nonconforming use to continue to exist, and it may r be reestablished.

(b) Change from Nonconforming to Conditionally Permitted Use. Any nonconforming use may be changed to a use that is conditionally permitted in the zoning district ir which it is located, subject to the approval of a conditional use permit pursuant to Article 5 of Chapter 7 and any other applicable findings and standards for the new use. such change in use terminates the right of the previous nonconforming use to continue to exist, and it may not be reestablished.

(c) Absence of Permit. Any use that is nonconforming solely by reason of the absence of a conditional use permit may be changed to a conforming use by obtaining a r conditional use permit, subject to all applicable findings and requirements for the use.

(d) Substitution. A nonconforming use may be substituted with another nonconforming use that is not an incompatible use as defined in Section 9-5.1007 upon the app of a minor conditional use permit. To grant such a conditional use permit the following findings must be made in addition to the findings required by Article 5 of Chapter 7

(1) The proposed new use will not be detrimental to the public health, safety, or welfare.

(2) The proposed new use will not impede the redevelopment or use of nearby properties in compliance with the General Plan.

(3) The proposed new use will be no less compatible with the purposes of the zoning district where it is located than the nonconforming use it replaces.

(4) The proposed new use will not increase the nonconformity with respect to density, floor area ratio (FAR), height, setback, usable open space, or parking.

(5) The proposed new use will comply with the applicable performance standards in Article 11 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1011 Expansion of Nonconforming Structures and/or Uses.

A nonconforming structure and/or use that is not an incompatible use as defined in Section 9-5.1007 may be expanded upon the approval of a minor conditional use per Any increase in bonus density, floor area ratio, or height shall require a conditional use permit pursuant to Section 9-4.204. To grant a conditional use permit for the expansion of a nonconforming structure and/or use, the following findings must be made in addition to the findings required by Article 5 of Chapter 7:

(1) The proposed expansion will not be detrimental to the public health, safety, or welfare.

(2) The proposed expansion will not impede the redevelopment or use of nearby properties in compliance with the General Plan.

(3) The proposed expansion will not increase the nonconformity with respect to density, floor area ratio (FAR), height, setback, usable open space, or parking.

(4) Any proposed expansion of the structure's floor area shall comply with the parking and loading requirements of Article 4 of Chapter 4 for the new floor area.

(5) The proposed expansion will comply with the applicable performance standards in Article 11 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1012 Restoration of Damaged Nonconforming Structures and/or Uses.

A nonconforming structure and/or use that is damaged or partially destroyed by fire, explosion, earthquake or other unintentional act may be restored or rebuilt, subject the following provisions:

(a) Damage Not More Than Seventy-Five Percent (75%). If the damage does not exceed seventy-five percent (75%) of its replacement cost, not including the foundati immediately prior to the date that the damage occurred, the structure may be restored and the nonconforming use may be resumed; provided, that an application for a building permit for the restoration work is submitted within six (6) months of the date that the damage occurred and that the restoration work is diligently pursued so that building permit does not expire. If an application for a building permit is not submitted within six (6) months, or if the building permit expires, the right of the previous nonconforming structure and/or use to continue to exist shall terminate, and they may not be reestablished.

(b) Damage More Than Seventy-Five Percent (75%). If the damage exceeds seventy-five percent (75%) of its replacement cost, not including the foundation, immediat prior to the date that the damage occurred, the structure may be restored and the nonconforming use may be resumed, except an incompatible use as defined in Sectio 5.1007, upon the approval of a minor conditional use permit. If an application for a conditional use permit is not submitted within six (6) months of the date that the dama occurred, or if an application for a building permit is not submitted within six (6) months of approval of the conditional use permit, or if the building permit expires, the righ the previous nonconforming structure and/or use to continue to exist shall terminate, and they may not be reestablished. To grant a conditional use permit for the restora of a nonconforming structure and/or use, the following findings must be made in addition to the findings required by Article 5 of Chapter 7:

(1) The proposed restoration will not be detrimental to the public health, safety, or welfare.

(2) The proposed restoration will not impede the redevelopment or use of nearby properties in compliance with the General Plan.

(3) The proposed restoration will not increase the nonconformity with respect to density, floor area ratio (FAR), height, setback, usable open space, or parking.

(4) The proposed restoration will comply with the applicable performance standards in Article 11 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1013 Reestablishment of Abandoned Nonconforming Uses.

An abandoned nonconforming use may be reestablished subject to the requirements of this section. A nonconforming use shall be deemed to be abandoned when the s vacated, the business license lapses, utilities are terminated, or the lease is terminated.

(a) Replacement by a Conforming Use. If an abandoned nonconforming use is replaced by a conforming use, the right of the previous nonconforming use to continue t exist shall terminate and it may not be reestablished.

(b) Nonconforming Use Abandoned for Ninety (90) Days or Less. A nonconforming use that is abandoned for ninety (90) days or less, including an incompatible use as defined in Section 9-5.1007, may be reestablished, or may be substituted with another nonconforming use pursuant to the requirements of Section 9-5.1010(d).

(c) Nonconforming Use Abandoned for More Than Ninety (90) Days but Less Than One (1) Year. A nonconforming use that is abandoned for more than ninety (90) da but less than one (1) year, and that is not an incompatible use as defined in Section 9-5.1007, may be reestablished upon the approval of a minor conditional use permit

may be substituted with another nonconforming use pursuant to the requirements of Section 9-5.1010(d). To grant a conditional use permit for the reestablishment of an abandoned nonconforming use the following findings must be made in addition to the findings required by Article 5 of Chapter 7:

(1) The reestablished use will not be detrimental to the public health, safety, or welfare.

(2) The reestablished use will not impede the redevelopment or use of nearby properties in compliance with the General Plan.

(3) The reestablished use will not increase the nonconformity with respect to density, floor area ratio (FAR), height, setback, usable open space, or parking.

(4) The reestablished use will comply with the applicable performance standards in Article 11 of this chapter.

(d) Nonconforming Use Abandoned for One (1) Year or More. If a nonconforming use is abandoned for one (1) year or more, its right to continue to exist shall terminat and it may not be reestablished or substituted with another nonconforming use.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-001, eff. Mar. 6, 2014)

9-5.1014 Abatement.

The provisions of this article shall not apply to a nonconforming use or structure which is, or which becomes, a public nuisance. If a nonconforming structure or use is fou to constitute a public nuisance, appropriate abatement action may be taken by the City in compliance with Article 15 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 11. Performance Standards

9-5.1101 Purpose.

The purpose of these performance standards is to control and limit dangerous or objectionable environmental effects generated by, or inherent to, the use of land or buildings.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1102 Applicability.

(a) New Uses. These performance standards shall apply to the operation of all new uses established after the effective date of the ordinance codified in these regulatio

(b) Existing Uses. These performance standards shall generally not apply to the ongoing operations of uses in existence on the effective date of the ordinance codifiec these regulations or of a subsequent rezoning or other amendment applying more restrictive performance standards to such uses, with the following stipulations:

(1) Existing uses shall be subject to any applicable performance standards that were in effect prior to the effective date of the ordinance codified in these regulatio

(2) The operations of existing uses shall not be so changed as to result in a greater degree of nonconformity with respect to these performance standards.

(3) Any expansion of an existing use shall be required to conform to these performance standards.

(4) The establishment of a new use in proximity to an existing use shall not require the existing use to change its operations to comply with these performance standards.

(5) Any existing use that is a legal conforming use with respect to these regulations, and that ceases operations for a period of one (1) year or more, shall comply these performance standards upon resuming operations. Any existing use that is nonconforming with respect to these regulations shall be subject to the applicable provisions for nonconforming uses in Article 10 of this chapter and, if allowed to resume operations, shall comply with these performance standards.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1103 Proof of Compliance.

The Director may require the applicant for a building permit or business license to submit such information with respect to proposed equipment, machinery, processes, products, or environmental effects as may be necessary to demonstrate the ability of the proposed use to comply with these performance standards. Such required information may include reports by expert consultants. Any such requirement, and any determination by the Director as to sufficiency of proof, may be appealed to the Planning Commission in accordance with the appeal procedures in Article 14 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1104 Measurements.

When measurements are necessary in the enforcement of these performance standards, they shall be made by competent professionals in the applicable field, in accordance with accepted professional practice.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1105 Air Quality: Noxious Materials.

All existing or proposed uses producing dust, dirt, ash, charred paper, soot, grime, carbon or other noxious material which can or may cause damage to the health of an individual, animal or vegetation, damage to property, or the physical soiling or discoloring of the surfaces of any structure or materials located outside the property lines the parcel of land from which such emission emanates shall have the source of the contaminant muffled or controlled in a manner that will prevent the issuance, continua or recurrence of any emission that is, or may be, detectable beyond the property line of the premises. All uses shall comply with the requirements of the Bay Area Quality Management District.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1106 Air Quality: Noncontaminated Emissions.

All existing or proposed uses shall have all intakes and exhausts on all air-handling equipment designed, installed, and operated in such a manner so as to prevent any perceptible acceleration of air movement across property lines. Cooling towers and condensers shall be designed, installed, and operated in a manner which will preven water spray from being carried across property lines.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1107 Light and Glare.

All lighting, reflective surfaces, or any other sources of illumination shall be utilized in a manner which produces no glare on public streets or on any other parcel. Lights

be shielded so as not to be directly visible from an adjoining residential property, except for low level lighting such as interior lights and porch lights.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1108 Liquid or Solid Waste.

The use, handling, storage and transportation of waste materials, including hazardous wastes, shall comply with Chapter 8 of Title 7, Wastewater Collection System; California Health and Safety Code Section 25100 et seq., Hazardous Waste Control; and any other applicable laws. See also Article 7 of Chapter 5, Hazardous Waste Facilities.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1109 Noise.

(a) Noise Ordinance. All uses and activities shall be subject to the applicable provisions of the noise regulations in Chapter 13 of Title 5.

(b) Siting of New Uses. The community noise compatibility standards in Figure 6-11 of the General Plan shall be used as review criteria for new uses. These standards indicate the level of existing ambient noise to which such new uses may be exposed. Noise generated by such uses shall be regulated by subsection (c) of this section.

Table 9-5.1109

Maximum Permitted Noise Level (dBA)

Zone		Daytime Weekdays 7 a.m. to 9 p.m. Weekends 8 a.m. to 9 p.m.	Nighttime Weekdays 9 p.m. to 7 a.m. Weekends 9 p.m. to 8 a.m.
RM Medium Density Residential Zone		65	55
All Other Zones	Abutting a Lot in the RM Medium Density Residential Zone	65	55
	Not Abutting a Lot in the RM Medium Density Residential Zone	70	60

(c) Noise Generation. Noise generated by uses shall not exceed the maximum permitted noise level as set forth in Table 9-5.1109 at the property lines of the receiving use, except that:

(1) The noise levels set forth in Table 9-5.1109 may be exceeded by no more than five (5) dBA for a cumulate period of no more than fifteen (15) minutes per hou

(2) The noise levels set forth in Table 9-5.1109 may be exceeded by no more than ten (10) dBA for a cumulate period of no more than five (5) minutes per hour.

(3) The noise levels set forth in Table 9-5.1109 may be exceeded by no more than fifteen (15) dBA for a cumulate period of no more than one (1) minute per hour

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1110 Odor.

All uses shall be so operated as not to permit matter causing offensive odors which are perceptible to the average person at or beyond any lot line of the lot containing s uses. Adequate buffer distances shall be provided between offensive odor sources and sensitive receptors including schools, hospitals, and community centers. Cooking odors and smoke shall be controlled and prevented from becoming a nuisance to neighboring properties. An odor detected no more than fifteen (15) minutes in any one day is acceptable.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1111 Vibration.

There shall be no activity on any site that causes ground vibration that is perceptible without instruments at the property line of the site. This shall not apply to operations involved in the demolition of structures or caused by motor vehicles or trains.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 12. Preservation of Structures

9-5.1201 Purpose.

This article establishes regulations for the preservation of significant and residential structures. The purpose of these regulations is to encourage the preservation and re of such structures. Significant structures reflect the City's heritage, contribute positively to the City's aesthetic character, and provide opportunities for reinvestment. The City's existing housing stock is an important community resource on which the supply and affordability of shelter and maintenance of the community's character depend.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1202 Applicability.

This article applies to any project that involves the demolition of a significant or residential structure, the substantial alteration of the exterior appearance of a significant structure, or a change in the number of dwelling units and/or Live/Work Units in a residential structure.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1203 Conditional Use Permit Required.

(a) Preservation and Reuse. Preservation and reuse of a significant or residential structure shall require approval of a minor conditional use permit pursuant to Article Chapter 7 and the additional findings specified in Section 9-5.1206(a). This shall be in addition to whatever planning permits are otherwise required for the proposed pro (e.g., conditional use permit, design review), which shall be processed concurrently with the conditional use permit for preservation and reuse. Development bonuses ar available for the preservation and reuse of significant structures pursuant to Section 9-4.204.

(b) Demolition. Demolition of a significant or residential structure shall require approval of a conditional use permit by the City Council, upon a recommendation of the Planning Commission, pursuant to Article 5 of Chapter 7 and the additional findings specified in Section 9-5.1206(b). This shall be in addition to whatever planning permi are otherwise required for the proposed project (e.g., conditional use permit, design review, planned unit development), which shall also require City Council approval ar

shall be processed concurrently with the conditional use permit for demolition.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1204 Application.

In addition to the documents required for a conditional use permit application pursuant to Article 5 of Chapter 7, an application for a conditional use permit for the preservation and reuse or the demolition of a significant or residential structure shall be accompanied by the following documents:

(a) Existing Structure. A location map, the address and Assessor's parcel number of the property, a plan showing the footprint of the structure, and photographs of all s of the structure.

(b) Justification. A letter stating why the preservation and reuse or the demolition is needed and how the findings set forth in Section 9-5.1206 could be made.

(c) Proposed Structure. A description of the proposed preservation and reuse of the existing structure or of any proposed replacement structure, a description of propo uses, plans, elevations and color and materials board.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1205 Approval Procedure for Demolition.

(a) Planning Commission Recommendation. After holding a public hearing, noticed as required by Chapter 7, the Planning Commission shall recommend a course of a on the application for a conditional use permit to demolish a significant or residential structure and on any application for a replacement project, including any required approvals such as design review, use permit, variance, rezoning and/or planned unit development. At the conclusion of the public hearing, the Planning Commission, aft making the required findings, shall recommend approval, conditional approval, or denial of the conditional use permit for demolition and any replacement project. The Planning Commission shall forward to the City Council the application, the appropriate environmental documents and the Commission's written report recommending approval, conditional approval, or denial of the conditional use permit for demolition and any replacement project.

(b) City Council Action. The City Council shall take final action on the application for a conditional use permit to demolish a significant or residential structure and on an application for a replacement project, including any required approvals such as design review, use permit, variance, rezoning and/or planned unit development. Within th (30) days following receipt by the City Clerk of the reports forwarded by the Planning Commission, a public hearing, noticed as required by Chapter 7, shall be held by th City Council for action on the conditional use permit for demolition and required approvals for any replacement project. At the conclusion of the public hearing, the City Council, after making the required findings, shall approve, conditionally approve, or deny the conditional use permit for demolition and any replacement project.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1206 Findings.

(a) Preservation and Reuse. To approve a proposal for the preservation or reuse of a significant or residential structure, one (1) of the following findings must be made applicable:

(1) Significant Structure. That the proposed project will retain and enhance all or most of the features of the structure that make it significant.

(2) Residential Structure. That the applicant will retain and incorporate the existing residential units or will provide at least the same number of residential units as existing structure, either on site or elsewhere within the City of Emeryville.

(b) Demolition. The City Council may authorize demolition of a significant or residential structure only if one (1) or more of the following occurs:

(1) Replacement of Significant Structure. The City Council approves a replacement structure based on all of the following findings:

a. The elimination of the significant structure would not be materially detrimental to the public interest of the affected neighborhood of the City; and

b. The replacement structure would feature design quality that is as high as or higher than the structure to be demolished and that it is compatible with the character of the neighborhood; and

c. The replacement structure will promote a pedestrian orientation of the neighborhood in which it is located; and

d. The proposed use would be unable to occupy the existing structure, or would be cost prohibitive as an adaptive reuse of the existing structure due to requi seismic retrofit or other factors.

(2) Replacement of Residential Structure. The City Council approves a replacement structure based on all of the following findings:

a. The applicant will provide at least the same number of dwelling units as the demolished structure, either on site or elsewhere within the City of Emeryville; a

b. The replacement structure would feature design quality that is as high as or higher than the structure to be demolished and that it is compatible with the character of the neighborhood; and

c. The elimination of the residential structure would not be materially detrimental to the housing needs or the public interest of the affected neighborhood or th City.

(3) Significant or Residential Structure, Whether or Not a Replacement Structure is Proposed. The City Council makes one (1) or more of the following findings:

a. The structure is irrecoverably damaged due to natural disaster; or

b. The structure or lot is irrecoverably contaminated with one (1) or more toxins, such that the appropriate regulatory agency requires demolition or partial demolition of the structure before soil remediation or renovation and reuse of the structure can occur; or

c. The structure will be replaced by publicly accessible landscaped open space; or

d. Demolition of the structure is in the best interest of the public health, welfare, or safety.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1207 Conditions of Approval.

The City Council may apply such conditions in connection with approval of the demolition of a significant or residential structure as it deems necessary in order to fulfill th purposes of this article, and may require reasonable guarantees and evidence that such conditions are being, or will be, complied with. Such conditions shall be impleme

prior to the Building Official's issuance of a building permit for the demolition of the structure, and may include but are not limited to the following:

(a) A good faith effort to relocate the structure to an appropriate site within the City of Emeryville.

(b) Documentation of the existing structure to Historic American Buildings Survey standards or to standards established by the Director.

(c) Preserving any significant elements of the structure and/or the structure's facade, and reusing them in any replacement structure.

(d) Salvaging of fixtures and architectural features from the existing building and reusing them in any replacement structure or elsewhere within the City of Emeryville.

(e) Use of building materials in any proposed replacement structure similar to the original structure or those in the immediate area.

(f) Design modifications to any proposed replacement structure to better fulfill the purposes of this article.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1208 Appeals.
A decision on a conditional use permit for the preservation and reuse of a significant or residential structure pursuant to Section 9-5.1203(a) may be appealed as provid Article 14 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1209 Effect on Building Permits.
(a) Replacement Structure. If the City Council approves a replacement structure based upon the findings specified in Section 9-5.1206(b)(1) or (2), and except as spe in subsection (b) of this section, the Building Official shall not issue a building permit to demolish a significant or residential structure unless:

(1) The Building Official is in a position to concurrently issue a building permit for the replacement structure to be constructed on the site of the structure to be demolished; and

(2) The Building Official has been provided a fully executed copy of a contract for the construction of the replacement structure.

(b) Contaminated Site. If the City Council approves a replacement structure based upon the findings specified in Section 9-5.1206(b)(1) or (2), and the site of the replacement structure requires remediation of contaminated soil and/or groundwater, the Building Official may issue a building permit to demolish a significant or residen structure upon submittal of an application for a building permit for the replacement structure, including payment of all required plan review fees.

(c) Other Circumstances. If the City Council makes any of the findings contained in Section 9-5.1206(b)(3), the Building Official may issue a building permit to demolish significant or residential structure upon the effective date of the City Council's action.

(d) Accessory Buildings. "Accessory buildings," as defined in Chapter 8, shall be excluded from the provisions of this section.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1210 Designation of Significant Structures.
(a) Park Avenue District. The structures in the Park Avenue District indicated as "Tier 1, High architectural significance" and "Tier 2, Moderate architectural significance Figure 9-5.1210 are hereby designated as significant structures.

(b) Outside Park Avenue District. All structures located outside the Park Avenue District that meet the definition of "significant structure" in Section 9-5.1211(a) are her designated as significant structures.

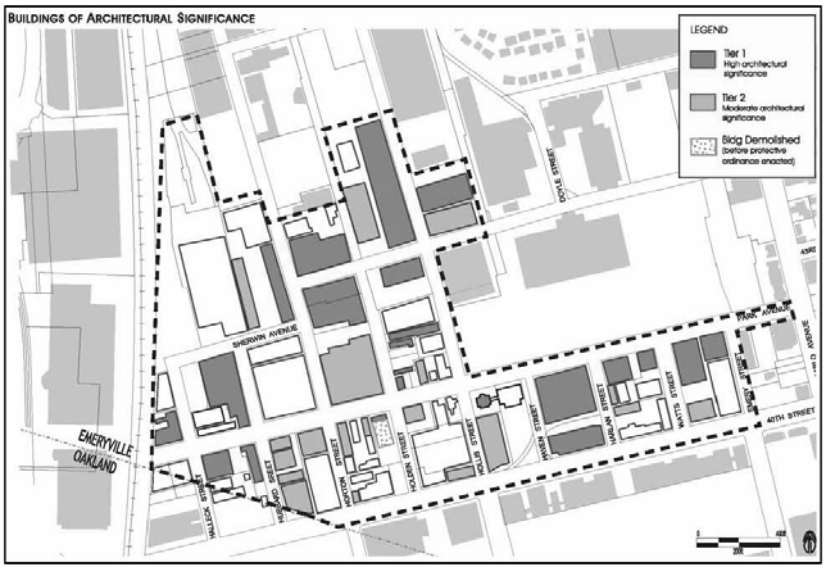

Figure 9-5.1210: Significant Structures in the Park Avenue District

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1211 Definitions.
As used in this article:

(a) "Significant structure" means a structure that is at least fifty (50) years old and meets one (1) of the following criteria:

(1) A prominent structure that is emblematic of Emeryville and important to the history of Emeryville; or

(2) A structure that has at least five (5) of the following features in its street facade(s):

a. Predominantly brick, excepting windows and doors.

b. Windows and doors, including roll-up doors, covering at least thirty percent (30%) of a street facade and covering at least thirty percent (30%) of the grour floor street facade.

c. Symmetry or repetitive rhythm as defined by window and door openings on most of a street facade.

d. Multi-paned windows (at least half of the area of the windows having panes measuring no more than one and one-half feet (1-1/2') by three feet (3')).

e. Window sills protruding from walls at least two inches (2").

f. Roofline with varied heights or angled or curved shapes at street front.

g. Decorative bas relief, concrete inlays, ironwork, stained glass, tiles or other decorative features.

h. Walls with columns or curves.

i. Walls with complex cornices six inches (6") wide or wider.

j. Varied artistic patterns in the predominant cladding material.

k. Arch or angle over the major entrance.

(b) "Demolish" means to remove or destroy all or part of any structure to an extent of more than seventy-five percent (75%) of the replacement cost of the structure, nc including the foundation, immediately prior to destruction, or to remove or destroy features of a significant structure such that it would no longer qualify as a significant structure.

(c) "Preserve and reuse" means retention of all or part of any structure, involving demolition to an extent of no more than seventy-five percent (75%) of its replacement cost, not including the foundation, immediately prior to commencing work on the structure, and to renovate the structure for a subsequent use that is the same as or diffe than its previous use.

(d) "Residential structure" means a structure that is used for any use classified as a Residential use type at Section 9-2.203, 9-2.205, 9-2.207, 9-2.211 or 9-2.213, or defined as a "Live/Work Unit" at Section 9-2.331. A vacant structure shall be considered a residential structure if its most recent use was any such Residential or live/wor use type.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 13. Private Property Access from City Parks, Greenways, and Other City Property

9-5.1301 Purpose.
This article establishes regulations for accessing private property from City parks, greenways, and other City property. Such access can help to enliven parks and green and may provide the only feasible means of access in some situations.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1302 Applicability.
The provisions of this article shall apply whenever a private property owner seeks to gain access to the private property from a City park, greenway, or other City-owned property. Such access may include the entire property or individual dwelling units, Live/Work Units, commercial tenant spaces, or other individual units of the property. Nothing in this article shall restrict access to private property from any public right-of-way, which shall be subject to all other applicable laws and regulations.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1303 Conditional Use Permit Required.
No private property shall be accessed from a City park, greenway, or other City property by pedestrians, bicycles, motor vehicles, or any other means except upon the granting of a minor conditional use permit pursuant to the requirements of this article. Such a conditional use permit approves access from the City park, greenway, or ot City property and includes approval of any and all access improvements on the private property, but does not constitute an entitlement for use of the City park, greenwa other City property in perpetuity.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1304 Allowable Uses.
Except for Eating and Drinking Establishments, no use of special concern, as listed in Section 9-2.701, shall gain access from a City park, greenway, or other City proper unless it is the only feasible means of access.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1305 Alternate Access.
To the extent feasible, a second means of access to the private property shall be provided so that access from a City park, greenway, or other City property is not the so means of access to the private property or any of its individual spaces or units. If access from a City park, greenway, or other City property is the only feasible means of access to the private property, the owner of the private property shall be responsible, in cooperation with the City, for facilitating access to the private property in the eve that the City needs to close or restrict access to the park, greenway, or other City property for maintenance, repairs, or other reasons. The owner of the private property bear all costs associated with facilitating such access during closure or restriction of the park, greenway, or other City property.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1306 Limitations.
Access to private property from a City park, greenway, or other City property shall be limited to pedestrian and bicycle access, unless it provides the only feasible means access for motor vehicles.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1307 Landscaping and Maintenance of Property Gaining Access.
Private property gaining access from a City park, greenway, or other City property shall be attractively landscaped in conformance with all requirements of this Code, the Emeryville Design Guidelines, and all other applicable design guidelines such as the North Hollis Urban Design Plan or the Park Avenue District Plan. Such landscaping be maintained in a healthy growing condition at all times, and the overall property shall be maintained free of trash, litter, graffiti, weeds, peeling paint, and any other blig conditions, in conformance with the requirements of Chapters 2 and 11 of Title 6 and all other applicable laws and regulations.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1308 Access Facilities.
The private property owner shall be responsible for providing a suitable all weather pedestrian and/or bicycle path from the pedestrian and/or bicycle path on the City property to the pedestrian and/or bicycle access point on the private property. If motor vehicle access is to be provided, a driveway conforming to the requirements of Ar 4 of Chapter 4 shall be provided. The private property owner shall be responsible for bearing all costs of design, construction, operation and ongoing maintenance of su access facilities both on the City property and on the private property. If a door into a building is provided on the private property, it shall not swing over the property line the City property; if necessary to prevent this, the door shall be inset into the wall of the private building.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1309 Financial Contribution to Citywide Parks Fund.
As a condition of gaining access from a City park, greenway, or other City property, the owner of the private property shall make a one (1) time lump sum contribution to Citywide Parks Fund in an amount equal to the value of the access as determined by an appraisal prepared at the applicant's expense under the direction of the City. Th shall be in addition to the application fee and any other fees prescribed by the Master Fee Schedule. This condition may be waived, or the amount of the contribution reduced, if the property owner is required to construct or make improvements to the park, greenway, or City property, other than the proposed access facilities, or if the Council determines that the benefit of the access to the City outweighs the benefit of the access to the applicant.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1310 Application.
An application for access to private property from a City park, greenway, or other City property shall be submitted to the Planning and Building Department on a form provided by the Director, accompanied by the fee as set forth in the Master Fee Schedule and application materials as determined necessary by the Director, including b not limited to the following:

(a) A site plan, dimensioned, clearly labeled, and drawn to a standard architectural or engineering scale, showing the entire area where the private property interfaces the park, greenway, or other City property, including other properties and public rights-of-way within ten feet (10') in all directions. The site plan shall clearly indicate:

(1) The location of any and all features on the private property and in the park, greenway, or other City property, including but not limited to pedestrian and bicycl paths, trees, tree wells and grates, lights, signs, utility poles, trash containers, kiosks, planters, benches, play equipment, driveways, parking and loading areas, buildings, doorways, and disabled access ramps.

(2) The proposed access pathways and/or driveways from the park, greenway, or other City property onto the private property, indicating dimensions and materia

(3) The relationship of the proposed access pathways and/or driveways to other adjacent properties and public rights-of-way, including any doors and windows.

(4) The pedestrian, bicycle, and/or motor vehicle circulation routes and disabled access paths of travel if applicable.

(b) A landscape and grading plan clearly indicating and identifying by species all proposed new trees, shrubs, ground cover, and other plant material, and all trees, shr ground cover, and other plant material proposed to be removed.

(c) Color photographs showing the existing conditions of all areas of the park, greenway, or other City property and the private property affected by the proposed acce

(d) A statement in a form acceptable to the City Attorney that the permittee shall defend, indemnify, and hold harmless the City of Emeryville, its agents, officers, and employees from any claim, action, or proceeding (including legal costs and attorney's fees) against the City of Emeryville, its agents, officers or employees from any loss, liability, damage, or cost sustained by any person or property, arising from the operation, use, or maintenance of the proposed access facilities as provided by this article

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1311 Findings.
To grant a conditional use permit for access to private property from a City park, greenway, or other City property, the following findings must be made in addition to the findings required by Article 5 of Chapter 7:

(a) The location, size, and design of the proposed access facilities will be compatible with and will not adversely affect or be materially detrimental to operation and maintenance of the park, greenway, or other City property through which access is to be gained.

(b) The proposed access facilities conform to the applicable provisions of the Emeryville Design Guidelines, including but not limited to the Area Specific Guidelines pertaining to the area in which the proposed access facilities are to be located, and to all other applicable design guidelines such as the North Hollis Urban Design Plan the Park Avenue District Plan.

(c) The proposed access facilities comply with all applicable standards and requirements of this title, the Emeryville Municipal Code, and local, State, and Federal regulations.

(d) The proposed access facilities conform with the requirements of all applicable City departments, including but not limited to Planning and Building, Public Works, Fir and Police.

(e) If motor vehicle access is proposed, there is no other feasible way to provide motor vehicle access to the private property.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1312 Conditions of Approval.
In approving a conditional use permit for access to private property from a City park, greenway, or other City property, such conditions may be designated as deemed necessary to protect the public health, safety and welfare, and reasonable guarantees and evidence may be required that such conditions are being, or will be, compliec with. Such conditions may include, but are not limited to, the following:

(a) Recording of an access easement with the Alameda County Recorder.

(b) Providing for the ongoing maintenance and repair of the access facilities and landscaping constructed on the City's property, and their future replacement if necess

(c) Restricting access to certain hours for pedestrians, bicycles, and/or motor vehicles, or allowing access during hours when City parks and greenways are otherwise closed to the public.

(d) Restricting the uses that may gain access from the City park, greenway, or other City property.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 14. Secondary Residential Units

9-5.1401 Purpose.
This article establishes regulations for Secondary Residential Units. Secondary Residential Units provide a valuable housing resource and help to achieve the goals, objectives, and policies of the Housing Element of the General Plan to promote a range of affordability levels. The purpose of these regulations is to encourage the establishment of Secondary Residential Units as accessory uses in conjunction with principal Single Unit residential uses, and to provide for their ministerial approval in conformance with State law.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1402 Applicability.
The provisions of this article apply to any proposal to establish a Secondary Residential Unit, as defined in Section 9-2.702(b), as an accessory use in conjunction with a principal Single Unit residential use.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1403 Approval Procedure.
A proposal for a Secondary Residential Unit shall be reviewed by the Director, in consultation with the Chief Building Official and Fire Marshal, for conformance with the provisions of this article pursuant to the zoning compliance review procedures in Article 3 of Chapter 7. If the Director determines that the proposal conforms to the requirements of this article, a zoning compliance approval shall be issued. If the Director determines that the proposal does not conform to the requirements of this articl zoning compliance approval shall not be issued, and the applicant shall be advised as to how the proposal could be brought into compliance. The Director's determinatio compliance or noncompliance may be appealed to the Planning Commission pursuant to Article 14 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1404 Where Allowed.
(a) Districts. Secondary Residential Units are permitted only in the residential zones, and in the MUR Mixed Use with Residential and MURS Mixed Use with Residentia South zones.

(b) Other Uses. Secondary Residential Units are permitted only on lots containing a legal, conforming Single Unit residential use and no other principal use. (A Single U residential use outside the RM Medium Density Residential zone may be deemed conforming pursuant to Section 9-5.1003(b).) A Secondary Residential Unit may be established in conjunction with the establishment of a new principal Single Unit residential use; provided, that no other principal use exists, or will exist, on the same lot.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1405 Building Intensity and Residential Density.
Secondary Residential Units are exempt from the building intensity (floor area ratio or FAR) and residential density regulations in Article 2 of Chapter 4.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1406 Size of Unit.
(a) Floor Area. A Secondary Residential Unit may not have a greater floor area than the principal Single Unit with which it is associated. In addition, the floor area of th Secondary Residential Unit shall be limited as follows:

(1) If the principal Single Unit is less than one thousand (1,000) square feet, the Secondary Residential Unit shall not exceed five hundred (500) square feet.

(2) If the principal Single Unit is at least one thousand (1,000) square feet but less than one thousand eight hundred (1,800) square feet, the Secondary Resident Unit shall not exceed fifty percent (50%) of the floor area of the principal Single Unit.

(3) If the principal Single Unit is one thousand eight hundred (1,800) square feet or more, the Secondary Residential Unit shall not exceed nine hundred (900) sq feet.

(b) Bedrooms. The Secondary Residential Unit may not have more bedrooms than the principal Single Unit with which it is associated.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1407 Parking.
A Secondary Residential Unit may only be established if off-street parking is provided for the principal Single Unit as required by Article 4 of Chapter 4. Parking shall be provided for the Secondary Residential Unit as follows:

(a) If the Secondary Residential Unit contains no bedrooms or one (1) bedroom, no parking spaces are required.

(b) If the Secondary Residential Unit contains two (2) or more bedrooms, one (1) parking space is required.

Parking for the Secondary Residential Unit shall comply with the design standards for parking lots and structures in Section 9-4.406, except that parking spaces for the principal Single Unit and Secondary Residential Unit may be in tandem.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1408 Dimensional Requirements.
(a) Lot. The lot on which a Secondary Residential Unit is to be located must comply with the minimum lot size and width requirements of Section 9-4.701.

(b) Setback. A Secondary Residential Unit shall be subject to the same setback requirements as the principal Single Unit, as set forth in Section 9-4.301, except that th minimum rear setback shall be five feet (5').

(c) Height. The maximum height limit of a Secondary Residential Unit shall be thirty feet (30'), except that it shall step down at an angle from a maximum height of thirty (30') at fifteen feet (15') from the rear lot line to a maximum height of fifteen feet (15') at five feet (5') from the rear lot line.

(d) Separation. A Secondary Residential Unit may be either attached to or detached from the principal Single Unit with which it is associated. If detached, the Seconda Residential Unit shall be separated from the principal Single Unit by no less than six feet (6').

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1409 Design.

Any proposal for a Secondary Residential Unit shall be subject to the applicable provisions of the Emeryville Design Guidelines, including but not limited to those pertaini the area of the City in which the proposed Secondary Residential Unit is to be located, and to any other applicable design guidelines. A Secondary Residential Unit shall compatible with the principal Single Unit with which it is associated in terms of form, materials, style, and other relevant design factors. No formal design review approval be required, but the design shall be evaluated as part of the zoning compliance review for conformance to the requirements of this section.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1410 Other Requirements.

(a) Owner Occupancy Required. The owner of the property must occupy either the principal Single Unit or the Secondary Residential Unit.

(b) One (1) Secondary Residential Unit per Lot. No more than one (1) Secondary Residential Unit is permitted on a lot.

(c) Units May Not Be Sold Separately. A Secondary Residential Unit and its associated principal Single Unit may not be sold separately either by conversion to condominiums, division of the lot on which they are located, or by other means.

(d) Sewer Lateral. A proposal to establish a Secondary Residential Unit shall comply with the provisions of Chapter 8 of Title 7 concerning sewer laterals, including replacement or upgrading of the sewer lateral if required.

(e) Other Code Requirements. A Secondary Dwelling Unit shall comply with all other applicable provisions of the Emeryville Municipal Code and State and Federal law, including, but not limited to, building and fire code requirements.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 15. Sidewalk Cafes

9-5.1501 Purpose.

This article establishes the sidewalk cafe regulations. The purpose of these provisions is:

(a) To encourage and promote the establishment of sidewalk cafes as visual amenities which in turn intensify pedestrian activity and make the street life more attractive while protecting the public health, safety, and general welfare;

(b) To ensure that all persons, including those with disabilities, may reasonably use the public streets, sidewalks, rights-of-way, and other public property without interference or hazard;

(c) To avoid obstruction of views of traffic signs and pedestrians;

(d) To ensure that damage to sidewalks is minimized and repaired;

(e) To maintain the good appearance of public streets, sidewalks, and adjacent private property;

(f) To allow the healthy growth of street trees and other landscaping;

(g) To maintain access by emergency vehicles and personnel; and

(h) To protect ingress and egress to properties adjoining the public right-of-way.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1502 Permit Required.

No person shall establish, operate, or maintain a sidewalk cafe without first obtaining a valid sidewalk cafe permit pursuant to this article.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1503 Where Permitted.

Sidewalk cafes shall be permitted in any zoning district in which Restaurants are permitted or conditionally permitted. Parklets shall be permitted in any zoning district.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1504 Standards.

All sidewalk cafes shall conform to the following standards:

(a) The sidewalk cafe shall adjoin and be operated in conjunction with a Restaurant licensed to sell food and beverages for consumption on the premises.

(b) The permittee shall at all times comply with all Federal, State, and local laws regarding the operation of the sidewalk cafe and the associated Restaurant.

(c) The sidewalk cafe permit shall be posted in plain view within the Restaurant for which the permit has been issued.

(d) The hours of operation of the sidewalk cafe shall not exceed the hours of operation of the associated Restaurant.

(e) There shall be no food preparation or storage in the sidewalk cafe area.

(f) All furniture and equipment associated with the sidewalk cafe shall be confined at all times to the sidewalk cafe area as shown on the approved site plan, and shall b

removed from the sidewalk cafe area at the end of each business day, except for semi-permanent barriers such as railings, fences, or planters, which are not required to removed.

(g) At least four feet (4') of clear sidewalk width, or a greater width if deemed appropriate by the City, shall be maintained adjacent to the sidewalk cafe at all times. Such clear sidewalk width shall be free of any and all obstructions, including but not limited to street trees, tree wells and grates, street lights, signs, utility poles, fire hydrants, trash containers, kiosks, planters, benches, and news racks, and shall comply with any and all requirements for disabled access.

(h) The sidewalk cafe shall be maintained in a clean, sanitary, and attractive condition at all times, free of dirt, grease, trash, and litter. Tables shall be bussed regularly disposable plates, cups, and utensils are used, a trash container shall be provided for the use of patrons. A final cleanup shall be conducted at the end of each business day, including litter removal from the sidewalk cafe area, adjacent sidewalk, and roadway gutter within one hundred feet (100') in each direction on the same side of the street. The sidewalk cafe area and adjacent sidewalk shall be swept clean at least daily, and shall be steam cleaned annually if required by the Public Works Director.

(i) Amplified sound shall be prohibited in the sidewalk cafe.

(j) Smoking shall be prohibited in the sidewalk cafe and within twenty-five feet (25') of all entrances, windows, and vents of the associated Restaurant.

(k) No changes to the layout, design, or operation of the sidewalk cafe shall be allowed without prior approval of the Planning Director.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-001, eff. Mar. 6, 2014)

9-5.1505 Alcoholic Beverages.

Alcoholic beverages may be served and consumed in a sidewalk cafe; provided, that:

(a) A valid license from the California Department of Alcoholic Beverage Control has been obtained and all requirements imposed by said Department have been met.

(b) The permittee shall at all times comply with all Federal, State, and local laws regarding the sale, service, and consumption of alcohol.

(c) The sidewalk cafe shall be separated from the adjacent sidewalk by a substantial physical barrier, such as a railing, fence, or planter, that is at least thirty inches (3 high and with openings no more than four feet (4') wide.

(d) Alcoholic beverages shall be consumed only within the sidewalk cafe area and associated Restaurant. The permittee shall not allow patrons to leave the confines o sidewalk cafe with any alcoholic beverage and shall not allow patrons to give or sell alcoholic beverages to any person outside the sidewalk cafe.

(e) The sidewalk cafe shall maintain full food service and shall operate as a bona fide eating place at all times that it is in operation. No sidewalk cafe may function as a tavern, or cocktail lounge, and no sidewalk cafe shall be associated with a Bar/Nightclub/Lounge, as defined in Section 9-2.319(a).

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1506 Application.

Application for a sidewalk cafe permit shall be submitted to the Planning and Building Department on a form provided by the Director, accompanied by the fee as set forth the Master Fee Schedule and application materials as determined necessary by the Director, including but not limited to the following:

(a) A site plan, dimensioned, clearly labeled, and drawn to a standard architectural or engineering scale, showing the entire area between the curb and the building containing the Restaurant, and adjacent properties, sidewalk areas, and public right-of-way within ten feet (10') in all directions. The site plan shall clearly indicate:

(1) The proposed sidewalk cafe area, including its length, width, and square footage, and the adjacent sidewalk including the curb;

(2) The number and arrangement of tables and chairs, and any other proposed features including but not limited to umbrellas, heaters, trash containers, railings, planters and fencing;

(3) The relationship of the proposed sidewalk cafe to the Restaurant and adjacent businesses, including doors and windows;

(4) The location of any and all other features in the public right-of-way, including but not limited to street trees, tree wells and grates, street lights, signs, utility pole fire hydrants, trash containers, kiosks, planters, benches, news racks, driveways, disabled access ramps, crosswalks, bus stops and shelters, loading zones, and o street parking spaces, and indicating the clear sidewalk width required by Section 9-5.1504(g);

(5) The pedestrian circulation and disabled access path of travel through the proposed sidewalk cafe between the public sidewalk and the Restaurant.

(b) Specifications for the design of all tables and chairs, and any other proposed features including but not limited to umbrellas, heaters, trash containers, railings, plan and fencing. Such specifications shall provide sufficient information for the Director to be able to ascertain the color, material, design, and general quality of these feature and may include actual color and material samples, manufacturer's specification sheets, color photographs, catalog entries, or other information as deemed appropriate the Director.

(c) Color photographs of the Restaurant, sidewalk area, and adjacent businesses and public right-of-way sufficient to illustrate conditions prior to establishment of the sidewalk cafe.

(d) Proof of comprehensive liability insurance covering the sidewalk cafe area and the adjacent property on which the Restaurant is located in an amount of not less th one million dollars ($1,000,000.00) as a combined single limit for personal injury (including death) and property damage; an endorsement naming the City of Emeryville a additional insured; a copy of the declarations or information page(s) for the policy; and a statement by the insurance carrier that thirty (30) days' notice will be given to th City before any cancellation. The policy of liability insurance shall be kept in force during such time as the sidewalk cafe is maintained under the terms of this article.

(e) A statement in a form acceptable to the City Attorney that the permittee shall defend, indemnify, and hold harmless the City of Emeryville, its agents, officers, and employees from any claim, action, or proceeding (including legal costs and attorney's fees) against the City of Emeryville, its agents, officers or employees from any loss, liability, damage, or cost sustained by any person or property, arising from the operation, use, or maintenance of the sidewalk cafe as provided by this article.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1507 Approval Procedure.

Applications for sidewalk cafe permits shall be considered by the Planning and Building Director, in consultation with the Public Works Director, Chief Building Official, Fir Marshal, and Police Chief. The Director, at his/her discretion, may give such notice as is deemed appropriate to adjacent property owners or other interested parties. However, the Director may, instead, refer any application to the Planning Commission for consideration. If considered by the Commission, the application shall be heard

public hearing noticed by types C, D, and E and optionally by types A and F, as these notice types are defined in Section 9-7.208(b). The Director or Commission, as the case may be, may approve or disapprove an application or require changes or conditions of approval which, in his/her/its judgment, are necessary to ensure conformity the provisions of this article. The Director's decision may be appealed to the Planning Commission pursuant to Article 14 of Chapter 7. If the Director refers the applicatio the Planning Commission for consideration, the Commission's decision may be appealed to the City Council pursuant to Article 14 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1508 Required Findings.

In order to approve a sidewalk cafe permit, all of the following findings shall be made:

(a) The location, size, design and operating characteristics of the proposed sidewalk cafe will be compatible with and will not adversely affect or be materially detrimen neighborhood character, with consideration given to the convenience and safety of pedestrians, property owners, occupants, customers, residents, and tenants of office stores, shops, and dwellings in the vicinity; harmony in design with nearby uses, buildings and structures; and the capacity and physical character of surrounding streets sidewalks.

(b) The proposed sidewalk cafe conforms to the standards in Section 9-5.1504.

(c) If alcoholic beverages are to be served, the proposed sidewalk cafe conforms to the provisions of Section 9-5.1505.

(d) The proposed sidewalk cafe conforms to the applicable provisions of the Emeryville Design Guidelines, including but not limited to the General Guidelines pertainin sidewalks and landscaping, and the Area Specific Guidelines pertaining to the area in which the proposed sidewalk cafe is to be located; and to all other design guidelin applicable to the area in which the proposed sidewalk cafe is to be located.

(e) The proposed sidewalk cafe is consistent with the General Plan.

(f) The proposed sidewalk cafe complies with all applicable standards and requirements of this title, the Emeryville Municipal Code, and local, State, and Federal regulations.

(g) The proposed sidewalk cafe conforms with the requirements of all applicable City departments, including but not limited to Planning and Building, Public Works, Fire and Police.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1509 Renewal.

A sidewalk cafe permit shall expire on December 31 of the calendar year in which it was issued or renewed. A valid permit which has not been surrendered, suspended revoked may be renewed for respective periods of not longer than one (1) year upon the following terms and conditions:

(a) All annual sidewalk cafe permits issued under this article, except the first permit issued for a newly established sidewalk cafe, shall be considered to be issued on January 1 of each year and shall expire on December 31 of the same year.

(b) The annual renewal application for an existing sidewalk cafe is hereby declared delinquent if not filed on or before March 1 of each year.

(c) The City is not required to send a renewal, delinquency or other notice to any person subject to the provisions of this article.

(d) Every person subject to a sidewalk cafe permit shall, before the renewal application becomes delinquent, file with the Director a renewal application except as prov in subsection (h) of this section.

(e) Application for renewal of a sidewalk cafe permit shall be submitted to the Planning and Building Department on a form provided by the Director, accompanied by a statement indicating whether any information required by Section 9-5.1506 has changed; and proof of comprehensive liability insurance, as detailed in Section 9-5.1506 for the renewal period.

(f) The Director shall review the renewal application in consultation with the Public Works Director, Chief Building Official, Fire Marshal, and Police Chief, to ensure the sidewalk cafe's continued compliance with the provisions of this article and any conditions of approval, and to assess any outstanding violations or complaints. The Direc may request additional information in order to complete his/her review.

(g) Upon completion of the review, the Director shall make a determination whether to renew the application, and shall promptly inform the permittee of his/her decisior the permit is renewed, the Planning Director shall provide the permittee with a new permit for the renewal period, to be posted in the Restaurant as required by Section 9 5.1504(c). In renewing the sidewalk cafe permit, the Director may modify or delete any existing conditions of approval, and impose any new conditions of approval, as he deems appropriate. If the permit is not renewed, the Director shall provide a written explanation to the permittee detailing the reasons for the nonrenewal. If the permit is renewed, the sidewalk cafe shall be removed, and the sidewalk shall be restored as required by Section 9-5.1512, within thirty (30) days of the Director's decision, unles appealed pursuant to Section 9-5.1511(c).

(h) In the absence of any action by the City or the permittee to renew a sidewalk cafe permit prior to the delinquency date specified in subsection (b) of this section, the permit shall be deemed to be renewed for one (1) year.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1510 Revocation.

A permit issued pursuant to this article shall be subject to suspension, revocation, or modification for the violation of any provisions of this Code or for any grounds which would warrant the denial of the issuance of such original permit. The Director may issue a notice of violation for any failure to comply with any requirement of this article any condition of the permit. Such notice shall set forth the action necessary to come into compliance and a time frame for compliance. If the noncompliance is not abated corrected, or rectified within the time specified by the Director in said notice, the Director may revoke, suspend, or modify the permit, upon thirty (30) days' notice. If the Director decides to revoke or suspend the permit, the sidewalk cafe shall be removed, and the sidewalk shall be restored as required by Section 9-5.1512, within thirty (3 days of the Director's decision unless appealed pursuant to Section 9-5.1511(d).

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1511 Appeals.

(a) A decision of the Director on a new sidewalk cafe permit pursuant to Section 9-5.1507 may be appealed to the Planning Commission as provided in Article 14 of Chapter 7. The decision of the Planning Commission shall be final.

(b) If the Director refers a new sidewalk cafe permit application to the Planning Commission for consideration pursuant to Section 9-5.1507, the decision of the Plannin Commission may be appealed to the City Council as provided in Article 14 of Chapter 7.

(c) A decision of the Director on the renewal of a sidewalk cafe permit pursuant to Section 9-5.1509 may be appealed to the Planning Commission as provided in Articl of Chapter 7. The decision of the Planning Commission shall be final. If the Commission decides not to renew the permit, the sidewalk cafe shall be removed, and the sidewalk shall be restored as required by Section 9-5.1512, within thirty (30) days of the Commission's decision.

(d) A decision of the Director to revoke, suspend, or modify a sidewalk cafe permit pursuant to Section 9-5.1510 may be appealed to the Planning Commission as prov in Article 14 of Chapter 7. The decision of the Planning Commission shall be final. If the Commission decides to revoke or suspend the permit, the sidewalk cafe shall be removed, and the sidewalk shall be restored as required by Section 9-5.1512, within thirty (30) days of the Commission's decision.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1512 Restoration of Sidewalk.
Upon cessation of the operations of a sidewalk cafe, the permittee shall restore the sidewalk to its original condition, including but not limited to the refilling of any holes drilled into the sidewalk. Any damage or alteration to the sidewalk caused by the use of the sidewalk cafe shall be repaired to the satisfaction of the Director of Public Wo by the permittee at the permittee's sole expense.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1513 Amortization.
Any existing sidewalk cafe which does not comply with the provisions of this article shall be removed or otherwise brought into conformance within six (6) months of the effective date of the ordinance codified in this article.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1514 Parklets.
Parklets shall require a sidewalk cafe permit and shall be subject to all of the regulations and procedures set forth in this article for sidewalk cafes except that they are n required to be built and operated in conjunction with a Restaurant. In addition, parklets shall be subject to the following regulations:

(a) A parklet shall require the approval of the City Council, upon the recommendation of the Transportation Committee, prior to the approval of a sidewalk cafe permit. conditions and requirements designated by the City Council in its approval shall become conditions of approval of the sidewalk cafe permit.

(b) A parklet shall be available for use by the general public and shall not be reserved for the exclusive use of an adjacent Restaurant or other use, even if built and operated in conjunction with that Restaurant or other use, nor for the exclusive use of any other private enterprise.

(c) Table service shall not be permitted in a parklet.

(d) Commercial signage and advertising shall not be permitted in a parklet.

(e) Service and consumption of alcoholic beverages shall not be permitted in a parklet.

(f) Design criteria for parklets may be issued administratively by the Director.

(g) A building permit shall not be required for a parklet, but its design and construction shall comply with all applicable building regulations, including but not limited to disabled access, and any design criteria issued by the Director.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1515 Definitions.
As used in this article:

(a) "Parklet" shall mean the temporary use of space in the roadway, adjacent to the curb and typically located in a parking space, unused bus stop, or other vehicular with or without a platform to extend the grade of the sidewalk into the roadway. A parklet may feature tables and chairs for public use, benches, planters and landscapin features, bicycle parking, and other public amenities, and may be built and operated in conjunction with an adjacent street-level Restaurant or other use. A parklet may function as a "bicycle corral" with bicycle racks in the roadway for the on-street parking of bicycles.

(b) "Person" shall mean and include individual, firm, association, partnership, joint venture or corporation (whether for-profit or nonprofit).

(c) "Public right-of-way" shall mean the area dedicated to public use for public street purposes including but not limited to roadways, parkways, alleys and sidewalks.

(d) "Restaurant" shall mean the use type defined in Section 9-2.319(b).

(e) "Roadway" shall mean that portion of a public right-of-way improved, designed and ordinarily used for vehicular traffic and/or parking, including drainage gutters an curbs.

(f) "Sidewalk" shall mean either:

(1) That portion of a public right-of-way provided for the exclusive use of pedestrians, including planting areas or parkways, between the roadway and adjacent property lines; or

(2) Any other publicly accessible pedestrian area owned or controlled by the City of Emeryville including, but not limited to, greenways and parks.

(g) "Sidewalk cafe" shall mean an area of the sidewalk used exclusively for eating, drinking, and related pedestrian circulation and located adjacent to, and operated ir conjunction with, a street-level Restaurant.

(h) "Sidewalk cafe permit" shall mean a permit to establish, operate, and maintain a sidewalk cafe or parklet issued pursuant to this article. A sidewalk cafe permit may be transferred or assigned, does not constitute a deed or grant of an easement by the City, shall be valid for one (1) calendar year, and is revocable at any time.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 16. Signs

9-5.1601 Purpose.
The purpose of this article is to regulate signs as an information system that expresses the character and environment of Emeryville while recognizing the importance of business activity to the City. Specifically, these regulations are intended to:

(a) Encourage communications which aid orientation and promote economic vitality.

(b) Enhance and preserve the aesthetic character of the City.

(c) Apply basic principles of good design and sensitivity to community appearance.

(d) Restrict signs that may create a nuisance to nearby properties, violate privacy, or create hazards or unreasonable distractions for pedestrians or drivers.

(e) Ensure that the constitutionally guaranteed right of free speech is protected.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1602 Applicability.
This article establishes the sign regulations. These regulations shall apply to all signs in the City, except signs on the public sidewalk, which are regulated by Chapter 34 Title 5; signs for certified farmers' markets, which are regulated by Section 5-35.06; and signs adjacent to landscaped freeways, which are regulated by Chapter 12 of Ti Nothing in this article shall be construed to allow any signs for a Home Occupation except as allowed by Article 8 of this chapter.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1603 Procedure.
(a) Review by Director. All sign proposals shall be subject to review by the Director to determine whether they are prohibited, exempt, or require approval of a minor de review permit, major design review permit, or Master Sign Program.

(b) Prohibited Signs. A prohibited sign, as listed in Section 9-5.1604, is not allowed. Any such sign, other than a nonconforming sign pursuant to Section 9-5.1614, is hereby declared to be a public nuisance and shall be removed immediately.

(c) Exempt Signs. An exempt sign, as listed in Section 9-5.1605, does not require design review approval and may be installed without further planning review if the Director determines that it meets all the requirements for an exempt sign. Note, however, that such a sign may still require a building permit pursuant to the building regulations in Title 8.

(d) Individual Establishment Signs. Individual establishment signs that are neither prohibited nor exempt shall require a design review permit from either the Director or Planning Commission and shall be processed pursuant to Section 9-5.1612.

(e) Master Sign Programs. A proposal for a Master Sign Program shall require approval by the Planning Commission pursuant to Section 9-5.1613.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1604 Prohibited Signs.
The following types of signs, materials, designs, messages, and locations are prohibited:

(a) Cabinet Signs. One (1) or two (2) sided internally illuminated signs consisting of a translucent message panel or panels, usually rectangular, mounted on a frame enclosing the illumination fixtures; also known as "panel," "can," or "box" signs.

(b) Electronic Signs. Electronic signs with changeable copy and/or animation; also known as "reader boards." This prohibition does not include small signs oriented to pedestrians and providing public transportation and other noncommercial information.

(c) Mobile Billboards. Any sign carried or conveyed by a vehicle for the primary purpose of advertising excluding signs on taxis and buses.

(d) Outdoor Advertising Signs. Billboards and any other off-premises outdoor advertising signs which convey a commercial message as their primary purpose.

(e) Signs Creating Traffic Hazards.

(1) Signs located in such a manner as to constitute a traffic hazard or obstruct the view of traffic, any unauthorized traffic sign or signal device, or any sign that ma confused with any authorized traffic sign, signal, or device; or that makes use of the words "stop," "look," "danger," or any other word, phrase, symbol, or character interferes with, misleads, or confuses vehicular drivers in their use of roads.

(2) Signs which may pose a traffic hazard due to glaring or varying illumination.

(3) Signs within five feet (5') of a fire hydrant, street sign, or traffic signal if such placement could create a safety hazard.

(f) Signs for Vacated Uses. Signs for activities which have vacated a site or premises for ninety (90) days or more.

(g) Signs on Public Property. Signs on public property unless posted by public personnel in the performance of their duties.

(h) Signs That Produce Noise or Emissions. Signs that produce noise or sounds that can be heard at the lot line and signs that emit visible smoke, vapor, particles, or

(i) Streamers, Pennants or Inflatable Signs. Streamers, pennants, and other signs made of lightweight fabric or similar material, designed to rotate or move with the wir inflatable signs or displays.

(j) Vehicle-Mounted Signs. Vehicle-mounted signs of a commercial nature, except when attached to vehicles being used for bona fide delivery and other vehicular purp away from a fixed place of business.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1605 Exempt Signs.
The following signs or modifications to signs do not require design review, and, except for business signs, the area of such signs shall not be included in the maximum allowable sign area measurement for the purposes of this article. The owner of an exempt sign is responsible for its safe and attractive erection and maintenance, for obtaining a building permit where applicable, and for complying with applicable provisions of this article or any other requirements of this title.

(a) A-Frame Signs. Portable freestanding signs in the shape of the letter "A" as viewed from the side, typically with two (2) sides facing opposite directions. Under this exemption, such signs may only be displayed on private property. No more than one (1) sign is permitted per individual establishment. Such sign may not exceed three f (3') in height with no more than six (6) square feet of sign area on each side. See Chapter 34 of Title 5 for regulations pertaining to the display of such signs on the publi sidewalk.

(b) Address Signs. Address identification signs of no more than two (2) square feet per address.

(c) Apartment and Condominium Identification Signs. Nonilluminated identification signs on apartment and residential condominium buildings of no more than six (6) sq feet per address.

(d) Business Signs. Business establishment identification signs, restricted to one (1) sign not exceeding six (6) square feet in area for each establishment. Such signs s be included in the aggregate sign area as specified in Section 9-5-1609(b)(1).

(e) Business Information Signs. Signs not exceeding six (6) square feet in aggregate area per business establishment containing such information as "open/closed," "c cards accepted" or items such as directories and menus.

(f) Change of Business Signs. A temporary attachment or covering of wood, plastic, or canvas over a permanent sign indicating a change of ownership or activity may displayed for no longer than forty-five (45) days following the change of ownership or activity for which the sign is intended. The sign shall be no larger than the previous permitted permanent sign.

(g) Commemorative Signs. Commemorative plaques, memorial signs or tablets, or signs indicating names of buildings and dates of building erection, either attached to cut into the surfaces of buildings; provided, that no such sign exceeds four (4) square feet in area.

(h) Construction Signs. A temporary construction sign may be erected on a construction site for the duration of construction activities; provided, that it is immediately removed after issuance of a certificate of occupancy for the project, or abandonment of work. A temporary construction sign may not exceed eight (8) square feet in area five feet (5') above finished grade to the top of the sign in the RM Medium Density Residential zone or eighteen (18) square feet in area and six feet (6') above finished g to the top of the sign in other zones.

(i) Decorative Holiday Displays. Noncommercial decorative holiday displays; provided, that such displays are removed within forty-five (45) days of their installation.

(j) Directional Signs. Signs to direct on-site traffic circulation, not exceeding six (6) square feet in area, and with an aggregate area not exceeding one-fifth (1/5) of a square foot per linear foot of site frontage, and publicly installed off-site directional signs to facilitate traffic flow to and from high-volume private facilities.

(k) Flags. Noncommercial flags flown from flagpoles or otherwise displayed. Flagpoles shall be subject to the applicable height limits in Section 9-4.202.

(l) Information Signs. Noncommercial informational signs not exceeding four (4) square feet in area erected for the safety and convenience of the public, such as signs identifying restrooms or telephones, "no parking" and "no trespassing" signs.

(m) Interior Signs. Signs located in interior areas of a building or site that are not intended to be visible from public streets, public open space, or adjacent properties.

(n) Kiosk and Mobile Vendor Signs. Signs fixed to mobile vending carts that identify or advertise the name, product, or service provided by the vendor. Each mobile ver cart is limited to a maximum sign area of eight (8) square feet.

(o) Official Government Signs. Official notices issued by a court, public body or office; official notices posted by a utility or public agency; signs erected by a governmer body to direct or regulate pedestrian or vehicular traffic; public hearing or meeting notices; or other signs required or authorized by law.

(p) Public Service and Civic Identity Signs. Signs erected on public or private property to promote City-sponsored activities or other community events. Signs may inclu district identification banners; temporary signs or banners erected above streets or attached to lamp posts or utility poles; or temporary banners posted to fences at publ schools.

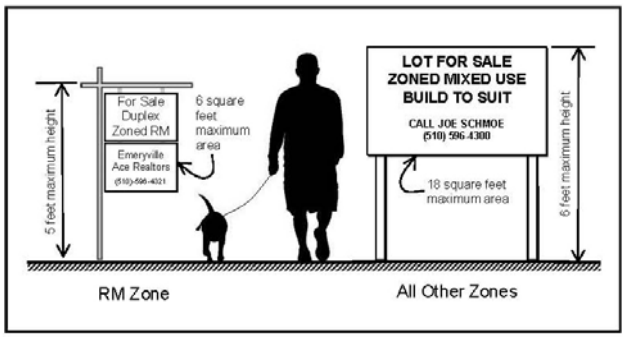

Figure 9-5.1605(q)(1): On-Site Real Estate Signs

(q) Real Estate Signs.

(1) On-Site Real Estate Signs. On-premises signs conveying information about the sale, rental, or lease of the appurtenant lot, premises, dwelling, or structure; provided, that they comply with the following standards:

a. No more than one (1) real estate sign per lot in the RM Medium Density Residential zone, or one (1) real estate sign per public street frontage per lot in oth zones, may be displayed at any one (1) time.

b. The sign or signs shall not exceed an aggregate area of six (6) square feet in the RM Medium Density Residential zone or eighteen (18) square feet in all o zones. See Figure 9-5.1605(q)(1).

c. Wall signs shall not be higher than seven feet (7') above finished grade to the top of the sign in the RM Medium Density Residential zone or fifteen feet (15 all other zones. Ground signs shall not exceed five feet (5') in height to the top of the sign in the RM Medium Density Residential zone or six feet (6') in height in other zones. See Figure 9-5.1605(q)(1).

d. Signs shall not be illuminated.

e. Signs shall not be placed on rooftops or above parapet or eave lines.

f. All signs shall be removed within seven (7) days after the sale, lease, or rental of the property has been completed.

(2) Directional Signs for Open Houses. Off-site signs located on the public sidewalk and directing the public to “open house” events for the viewing of lots, premis dwellings or structures that are for sale, lease, or rent shall be regulated by the applicable provisions of Chapter 34 of Title 5.

(r) Small Noncommercial Signs. Noncommercial signs, each no larger than six (6) square feet in area, attached to a freestanding sign structure, a window, or a buildin wall. All businesses and residences may display up to two (2) such signs, which may include, but are not limited to, freedom of speech signs, political signs, and organiza identification signs. Such signs may be located on the ground floor or upper floors of buildings and shall not be located in the public right-of-way.

(s) Temporary Window Signs. Window signs, subject to the following provisions:

(1) Temporary window signs not exceeding ten percent (10%) of the area of window and transparent door frontage on any ground floor or second floor building facade in nonresidential use are permitted.

(2) Temporary window signs may be displayed for no more than ninety (90) consecutive days with at least ninety (90) consecutive days between display periods.

(3) Temporary window signs shall not be included in the aggregate sign area as specified in Section 9-5-1609(b)(1).

(4) Any interior sign either hung within two feet (2') of a window or attached to a display located within two feet (2') of a window, and which faces outward, is considered a window sign.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1606 General Provisions for All Sign Types.

(a) Calculation of Sign Area. The area of an individual sign shall be calculated as follows:

(1) Single-Faced Signs. Sign area shall include the entire area within a single continuous perimeter composed of squares or rectangles that enclose the extreme l of all sign elements, including, but not limited to, sign structures or borders, written copy, logos, symbols, illustrations, and color. Supporting structures such as sign bases and columns are not included in sign area; provided, that they contain no lettering or graphics except for addresses. The calculation of sign area for various t of single-faced signs is illustrated in Figure 9-5.1606(a)(1).

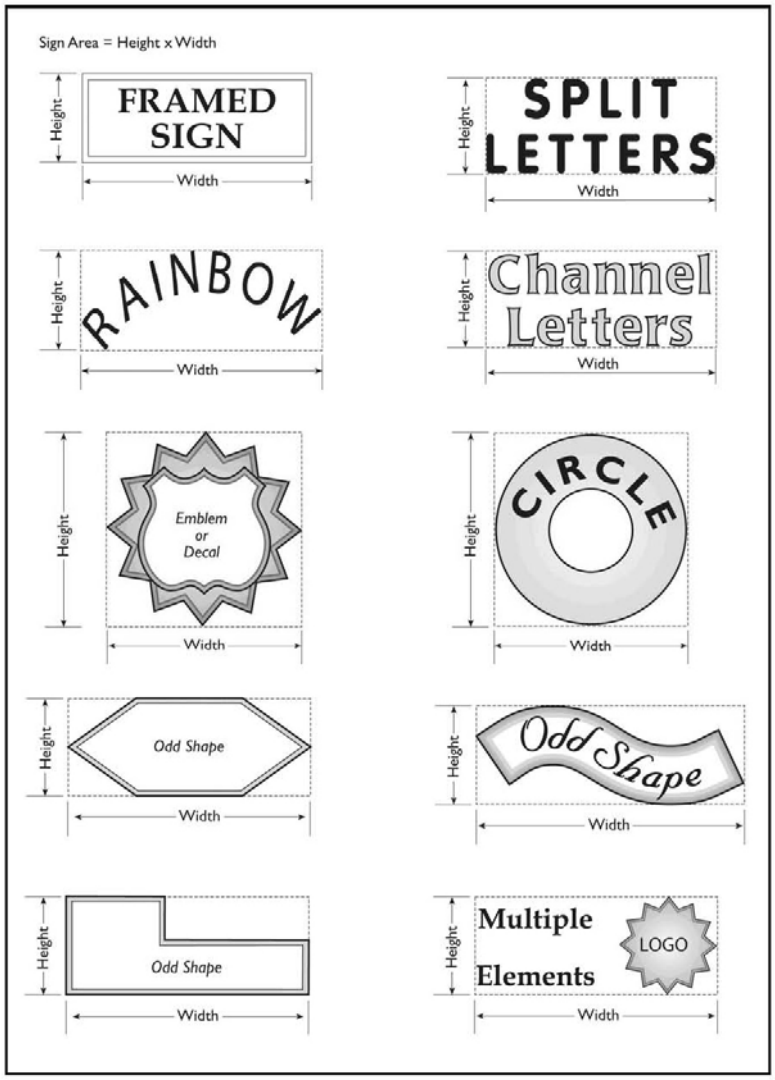

Figure 9-5.1606(a)(1): Area of Single-Faced Signs

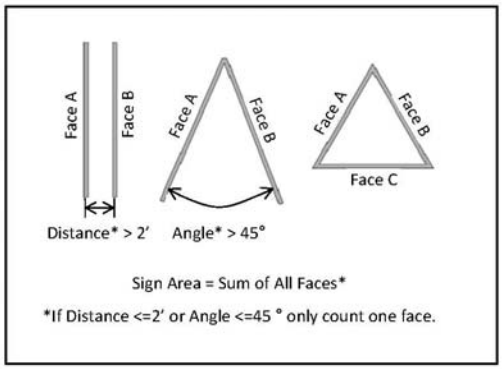

Figure 9-5.1606(a)(2-3): Area of Double-Faced and Multi-Faced Signs

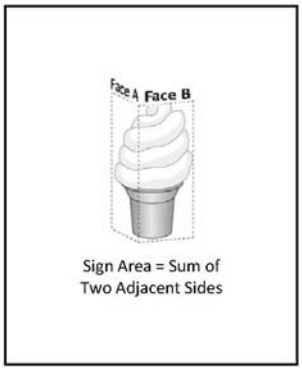

Figure 9-5.1606(a)(4): Area of Three (3) Dimensional Signs

(2) Double-Faced Signs. Where two (2) faces of a double-faced sign are located two feet (2') or less from one another at all points, or located at an interior angle forty-five (45) degrees or less from one another, the sign area shall be computed as the area of one (1) face. Where the two (2) faces are not equal in size, the larg sign face shall be used. Where two (2) faces of a double-faced sign are located more than two feet (2') or forty-five (45) degrees from one another, both sign faces be counted toward sign area. See Figure 9-5.1606(a)(2-3).

(3) Multi-Faced Signs. On a three (3) faced sign, where at least one (1) interior angle is forty-five (45) degrees or less, the area of two (2) faces (the largest and smallest face) shall be summed to determine sign area. In all other situations involving a sign with three (3) or more sides, sign area shall be calculated as the sum faces. See Figure 9-5.1606(a)(2-3).

(4) Three (3) Dimensional Signs. Signs that consist of, or have attached to them, one (1) or more three (3) dimensional objects (i.e., balls, cubes, clusters of objec sculpture, or statue-like trademarks), shall have a sign area of the sum of all areas using the four (4) vertical sides of the smallest cube that will encompass the sign See Figure 9-5.1606(a)(4).

(b) Materials. Signs shall be constructed of durable and attractive materials. Paper, cardboard, or other material subject to rapid deterioration shall be limited to tempor interior window signs. Fabric and vinyl signs shall be restricted to public service and civic identity signs, awning signs, banner signs, and temporary signs permitted pursu to Section 9-5.1610.

(c) Construction and Maintenance.

(1) All signs and supporting structures shall be installed in accordance with applicable provisions of the building regulations in Title 8.

(2) All signs, together with all supporting structures, shall be maintained in the following manner:

a. Signs shall be kept free of rust, dirt and chipped, cracked or peeling paint.

b. All hanging, dangling, torn or frayed parts of signs shall be promptly repaired, and graffiti and unauthorized attachments shall be removed.

c. Burned-out illumination shall be promptly replaced.

d. Sign areas shall be kept free and clear of all noxious substances, rubbish and weeds.

(3) If a sign is removed from its supporting structure for longer than ninety (90) days, the supporting structure shall be removed.

(d) Illumination. The illumination of signs, from either an internal or external source, shall be designed to avoid negative impacts on neighboring rights-of-way and properties. The following standards apply to all illuminated signs:

(1) Sign lighting shall not be of an intensity or brightness, or generate glare, that will create a public or private nuisance.

(2) External light sources shall be directed, shielded, and filtered to limit direct illumination of any object other than the sign.

(3) Illuminated roof signs and high-rise identification signs shall be dimmable, and shall be dimmed if necessary to address complaints of glare from occupants of buildings in a direct line of sight to the sign. Other sign types may also be required to be dimmable as a condition of approval.

(4) Exterior LED signs shall be subject to major design review pursuant to Section 9-5.1612(c), and shall be evaluated for conformance with the "Recommended M Time Brightness Levels for On-Premise Electronic Message Centers (EMC's)" dated April 2011 prepared by the International Sign Association.

(e) Changeable Copy Other Than Permitted Marquee Signs. Nonelectronic changeable copy shall cover no more than twenty percent (20%) of an establishment's tota allowed aggregate sign area, except for the following uses which are allowed up to seventy-five percent (75%) of sign area to be changeable copy: all public and civic us indoor theaters, other public assembly uses, and fuel price signs.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1607 Standards for Specific Sign Types.

Except as otherwise specified, all permanent signs shall comply with the standards in Table 9-5.1607. Signs erected on a site may be any combination of permitted sign types, subject to the limitations for individual sign types listed in this section, and any other applicable provisions of this article including, but not limited to, aggregate sign area. See Figure 9-5.1607 for illustrations of projecting, shingle, monument, and awning signs.

Table 9-5.1607: Standards for Specific Sign Types

Sign Type	Maximum Number Permitted	Maximum Area per Individual Sign	Maximum Height to Top of Sign	Location Requirements	Additional Regulations
(a) Individual Establishment Signs Allowed with Minor Design Review					
(1) Awning Sign	3 per nonresidential tenant or use	10 sq. ft. or 25% of surface area of awning, whichever is less	25' or top of second floor of building, whichever is less	Lowest point must be at least 9' above public sidewalk. Awnings permitted only on first and second floors of building.	May project no more than 4' from building wall and no more than 1/3 width of public sidewalk
(2) Banner Sign	3 per nonresidential tenant or use per street frontage	15 sq. ft.	25'	No portion may extend above highest point of parapet wall or eave line. Lowest point must be at least 9' above public sidewalk.	May project no more than 4' from building wall and no more than 1/3 width of public sidewalk
(3) Monument Sign	1 per nonresidential lot per street frontage	60 sq. ft. per face; no more than 2 faces	6'	N/A	Larger sign may be approved as part of Master Sign Program for overall site signage only
(4) Projecting Sign	1 per nonresidential tenant or use per street frontage	15 sq. ft.	25'	No portion may extend above highest point of parapet wall or eave line. Lowest point must be at least 9' above public sidewalk.	May project no more than 4' from building wall and no more than 1/3 width of public sidewalk
(5) Shingle Sign	1 per nonresidential tenant or use	4 sq. ft.	N/A	Lowest point must be at least 9' above public sidewalk	Illumination not permitted
(6) Wall Sign	1 per nonresidential tenant or use per street frontage	50 sq. ft. or 15% of tenant facade area, whichever is less	25'	Width may not exceed 75% of tenant facade width, or 25', whichever is less	Larger signs may be approved as part of Master Sign Program for overall site signage only
(7) Window Sign	1 per window or transparent door per nonresidential tenant or use	No more than 10% of area of window or transparent door	N/A	Ground floor or second floor only	N/A
(b) Individual Establishment Signs Allowed with Major Design Review					
(1) Entry Gateway	1 per nonresidential lot per street frontage	To be determined by Planning Commission			N/A
(2) High-Rise Identification Sign	2 per nonresidential building; 1 on any facade	1% of area of building facade on which sign is located	No portion of sign above top of parapet	Top story of building	Only permitted on buildings over 75' high. Changeable copy not permitted.
(3) Marquee Sign	1 per nonresidential building	To be determined by Planning Commission			May only contain changeable copy and images related to on-premises events

(4)	Roof Sign	1 per nonresidential building	To be determined by Planning Commission	N/A
(c)	**Signs Allowed Only as Part of a ~~Master Sign Program as Part of Overall Site Sig~~hage**			
(1)	Ground Sign	1 per nonresidential lot per street frontage	To be determined by Planning Commission	N/A
(2)	Tower Sign	1 per nonresidential lot per street frontage	To be determined by Planning Commission	N/A
(3)	Wall Sign exceeding maximum dimensions specified in (a) (6) of this table	To be determined by Planning Commission		N/A
(4)	Monument Sign over 6' in height and/or 60 sq. ft. in area	1 per nonresidential lot per street frontage	To be determined by Planning Commission	N/A

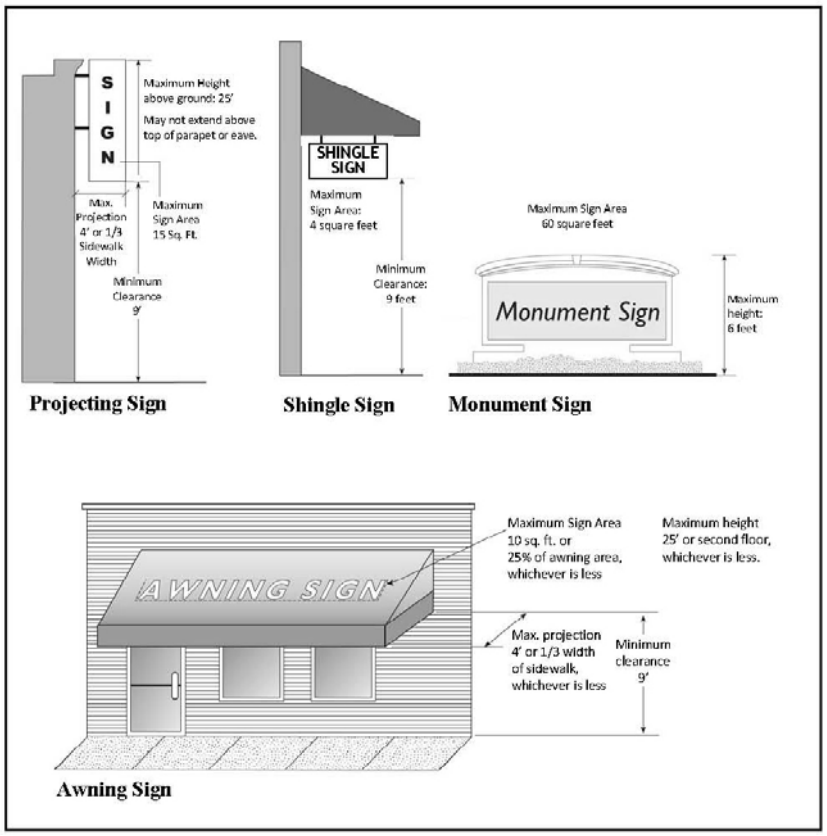

Figure 9-5.1607: Illustration of Projecting, Shingle, Monument, and Awning Signs

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-001, eff. Mar. 6, 2014)

9-5.1608 Sign Regulations in the RM Medium Density Residential Zone.

(a) Permitted Signs. In addition to the exempt signs listed in Section 9-5.1605, commercial establishments are allowed one (1) sign of up to ten (10) square feet per establishment, subject to minor design review approval pursuant to Section 9-5.1612.

(b) Standards for Specific Sign Types. Signs shall conform to the standards listed in Table 9-5.1607 except as modified by subsection (a) of this section.

(c) Illumination. No sign illumination is permitted except downward facing indirect illumination. No sign shall be internally illuminated.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1609 Sign Regulations in All Other Zones.

(a) Permitted Signs. In addition to the exempt signs listed in Section 9-5.1605, all sign types listed in Table 9-5.1607 are permitted, subject to the standards in the table Sign types not listed in Table 9-5.1607, or signs not in conformance with the standards in Table 9-5.1607, may be considered on a case-by-case basis. If the applicant proposes that such signs be included in the aggregate sign area allowed by subsection (b) of this section, they may be considered by the Director under the minor desig review procedure at Section 9-5.1612(b). If the applicant proposes that such signs not be included in the aggregate sign area allowed by subsection (b) of this section, t

shall be considered by the Planning Commission under the major design review procedure at Section 9-5.1612(c).

(b) Aggregate Sign Area.

(1) Individual Establishments.

a. The maximum aggregate sign area for individual establishments is one (1) square foot of sign area per linear foot of public frontage. "Public frontage" refer either building frontage on a public street or, if the establishment does not front on a public street, the building facade of the establishment accessible to the pu on which the main entrance to the establishment is located. In a multi-tenant property, the frontage is typically measured from lease-line to lease-line.

b. If an establishment has frontage on more than one (1) public street or more than one (1) publicly accessible facade, all such frontages may be included in t calculation of aggregate sign area, except service roads, alleys, and similar accessways intended primarily for service vehicles.

c. The following shall not be included in aggregate sign area:

i. Exempt signs other than business signs.

ii. Roof signs, high-rise identification signs, marquee signs, and entry gateway signs approved by the Planning Commission pursuant to Section 9-5.1612

iii. Signs that identify individual establishments but are part of the overall site signage of a Master Sign Program approved pursuant to Section 9-5.1613.

d. For any individual establishment, the total area of all signs, including exempt business signs but excluding all other signs listed in subsection (b)(1)(c) of thi section, shall not exceed the aggregate sign area calculated pursuant to this section.

(2) Site Signage. The aggregate sign area allowance for sites with multiple individual establishments shall be determined on a case-by-case basis by the Planning Commission as part of the approval of a Master Sign Program. The aggregate sign area for overall site signage shall be no more than is necessary to adequately identify the site and its major tenants, and shall not include the aggregate sign area of individual establishments, as determined pursuant to subsection (b)(1) of this section.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-001, eff. Mar. 6, 2014)

9-5.1610 Temporary Commercial Signs.

Temporary commercial signs meeting the requirements of this section may be permitted in all zones other than the RM Medium Density Residential zone upon the approv a minor design review permit pursuant to Section 9-5.1612(b). This section does not apply to temporary change of business signs, which are exempt from design review pursuant to Section 9-5.1605(f).

(a) Number. A maximum of two (2) temporary commercial signs may be displayed by any individual establishment at the same time.

(b) Area. The total area of all such temporary commercial signs shall not exceed thirty-two (32) square feet per individual establishment. This sign area shall not be included in the calculation of aggregate permanent sign area pursuant to Section 9-5.1609(b).

(c) Materials. Temporary commercial signs shall be constructed of durable and attractive materials. Paper, cardboard, or other material subject to rapid deterioration sh not be used. Fabric and vinyl signs are permitted.

(d) Location. Temporary commercial signs may be located anywhere on the site of the individual establishment, subject to minor design review approval. If located in windows or transparent doors, no more than twenty percent (20%) of the total area of any window or transparent door shall be covered by any combination of temporary commercial signs, exempt temporary window signs pursuant to Section 9-5.1605(s), and permanent window signs pursuant to (a)(7) in Table 9-5.1607.

(e) Duration. The time limit for display of a temporary commercial sign shall be forty-five (45) days, which may be renewed for one (1) additional period of forty-five (45) days upon payment of a second application fee. Two (2) consecutive forty-five (45) day periods may be approved at one (1) time upon the payment of two (2) fees, but n not be further extended.

(f) Illumination. Temporary signs shall not be illuminated.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013; Sec. 3 (part), Ord. 14-001, eff. Mar. 6, 2014)

9-5.1611 Design Principles.

The following design principles shall be used as criteria for review and approval of design review for individual signs and Master Sign Programs.

(a) Architectural Compatibility. A sign (including its supporting structure, if any) shall be designed as an integral design element of a building's architecture and shall be architecturally compatible, including color and scale, with any building to which the sign is to be attached and with surrounding structures. A sign that covers a window or spills over "natural" boundaries or architectural features and obliterates parts of upper floors of buildings is detrimental to visual order and generally is not permitted.

(b) Legibility. The size and proportion of the elements of the sign's message, including logos, letters, icons and other graphic images, shall be selected based on the average distance and average travel speed of the viewer. Sign messages oriented towards pedestrians may be smaller than those oriented towards automobile drivers. Colors chosen for the sign text and/or graphics shall have sufficient contrast with the sign background in order to be easily read during both day and night hours.

(c) Design Guidelines. All signs shall be subject to the applicable provisions of the Emeryville Design Guidelines, including but not limited to those pertaining to signs ar the area of the City in which a proposed sign is to be located, and to any other applicable design guidelines.

(d) Animated and Moving Signs. Animated, flashing, blinking, reflecting, revolving, or other similar signs, or signs with visibly moving or rotating parts or visible mechani movement of any kind, are generally discouraged unless they add appropriate visual interest compatible with their surroundings.

(e) Deviations from Design Principles. The Director may approve signs that do not adhere to the principles established in this section if he or she finds that the sign exh exceptional design quality or is of significance to the area where it will be displayed.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1612 Procedures for Individual Establishment Signs.

(a) Application. Application for a design review permit for individual establishment signs shall be submitted to the Planning and Building Department on a form provided the Director, accompanied by the fee as set forth in the Master Fee Schedule and application materials as determined necessary by the Director, including but not limited the following:

(1) A site plan that is fully dimensioned and drawn to scale showing all sign locations and elevations of buildings and signs.

(2) A fully dimensioned color drawing of each proposed sign indicating construction details and sign copy.

(3) Proposed colors, materials and methods of illumination.

(b) Minor Design Review.

(1) Types of Signs Eligible. The following types of signs shall be reviewed by the Director pursuant to the minor design review procedures in Article 4 of Chapter 7 the applicable provisions of this article:

Wall signs.

Projecting signs.

Banner signs.

Shingle signs.

Awning signs.

Window signs.

Monument signs no more than six feet (6') tall and sixty (60) square feet in area.

Temporary commercial signs.

(2) Findings. To approve a minor design review permit for individual establishment signs as listed in subsection (b)(1) of this section, all of the following findings m be made in addition to the findings required by Article 4 of Chapter 7:

a. The proposed signs will comply with all the applicable provisions of this article, including but not limited to aggregate sign area, standards for specific sign t and design principles.

b. The size, materials, colors, graphic style, illumination and other features of the proposed signs are in keeping with the visual character of the area.

c. The signs will be readable, taking into account the proportion between different parts of the sign, its visibility from important vantage points, and other relev design features.

d. The signs will relate well to the design of the building and be compatible with its architectural features, colors and textures.

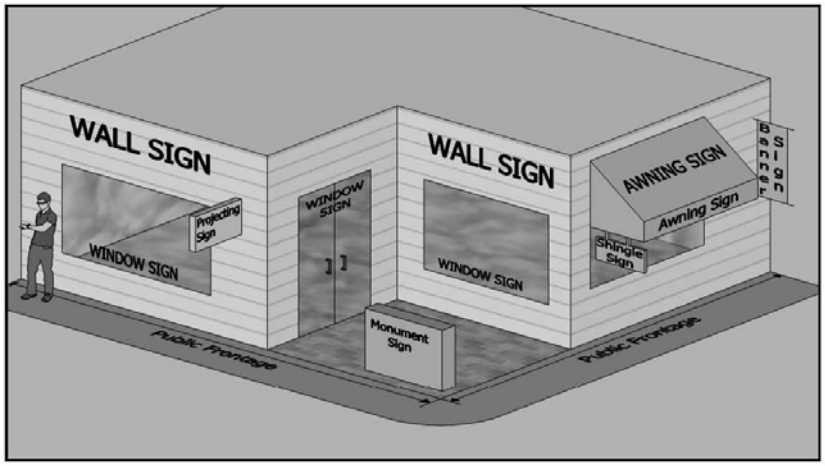

Figure 9-5.1612(b): Examples of Individual Establishment Signs Allowed with Minor Design Review.*

*** Note: This drawing is for illustrative purposes only; a typical establishment will not have all signs illustrated here. Total area of all signs may not exceed aggre sign area pursuant to Section 9-5.1609(b).**

(c) Major Design Review.

(1) Types of Signs Eligible. The following types of signs shall be reviewed by the Planning Commission pursuant to the major design review procedures in Article 4 Chapter 7 and the applicable provisions of this article:

Roof signs.

High-rise identification signs.

Marquee signs.

Entry gateways.

Exterior LED signs.

(2) Findings. To approve a major design review permit for individual establishment signs as listed in subsection (c)(1) of this section, all of the following findings m be made in addition to the findings required by Article 4 of Chapter 7:

a. The proposed sign is necessary because of the nature of the establishment and its location.

b. The proposed sign is no larger than is necessary to adequately identify the establishment, or the sign is of extraordinary design significance justifying its si

c. The proposed sign will comply with all the applicable provisions of this article, including but not limited to design principles.

d. The size, materials, colors, graphic style, illumination and other features of the proposed sign are in keeping with the visual character of the area.

e. The sign will be readable, taking into account the proportion between different parts of the sign, its visibility from important vantage points, and other relevant design features.

f. The sign will relate well to the design of the building and be compatible with its architectural features, colors and textures.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1613 Master Sign Programs.

(a) General.

(1) When Required. A Master Sign Program is required for all developments including five (5) or more retail tenant spaces, and is optional for any other multi-tenant nonresidential or mixed use development.

(2) Types of Signs Eligible. A Master Sign Program may include any type of sign eligible for individual establishment signs as indicated in Section 9-5.1612. In addition the following types of signs may only be allowed as part of a Master Sign Program, and only as overall site signage for the development:

Ground signs.

Tower signs.

Wall signs exceeding maximum dimensions at (a)(6) in Table 9-5.1607.

Monument signs exceeding six feet (6') in height and/or sixty (60) square feet in area.

(b) Application. Application for a Master Sign Program shall be submitted to the Planning and Building Department on a form provided by the Director, accompanied by fee as set forth in the Master Fee Schedule and application materials as determined necessary by the Director, including but not limited to the following:

(1) Text and drawings, including plans drawn to scale, which identify all signs proposed for the development, establishing their location, size, function and other characteristics needed to evaluate the extent of the signage proposed. Plans and drawings shall include a site plan, typical building elevations, and drawings of proposed overall site signage and generic sign types for individual establishments. Any anticipated recurring temporary signs shall be included.

(2) Computation of allowable area for all signs for each individual establishment, and of total area of all proposed signage. Maximum allowable aggregate area for individual establishments shall be no more than allowed by Section 9-5.1609(b)(1). Maximum allowable aggregate area for overall site signage shall be in addition to and shall be shown separately. The maximum area of such overall site signage shall be no more than is necessary to adequately identify the development and its major tenants.

(3) Design criteria for individual establishment signs dealing with colors, materials, illumination, graphic styles, placement, size, and other pertinent sign features.

(4) A written program of standards for individual establishment signs to be distributed to future tenants, including color, size, illumination, construction details, sign placement and size.

(c) Findings. In order to approve a Master Sign Program, the Planning Commission must make all of the following findings in addition to the findings required by Article Chapter 7:

(1) The proposed Master Sign Program will promote visual harmony and a cohesive appearance for the development while allowing an appropriate level of individ for each establishment.

(2) The proposed Master Sign Program will promote signs that relate well to the design of the buildings in the development in terms of compatibility with architectu features, colors and textures.

(3) The proposed Master Sign Program will promote signage that is in keeping with the visual character of the surrounding area.

(4) The total aggregate sign area allowed under the proposed Master Sign Program for each individual establishment does not exceed that allowed by Section 9-5.1609(b)(1).

(5) The height, size, and total aggregate area of overall site signage allowed under the proposed Master Sign Program is no more than is necessary to adequatel identify the development and its major tenants.

(6) The proposed Master Sign Program will comply with all the applicable provisions of this article, including but not limited to standards for specific sign types and design principles.

(d) Review of Individual Signs under a Master Sign Program. A proposal for individual signs under a Master Sign Program shall be reviewed by the Director for conformance with the requirements of the Master Sign Program and this article pursuant to the zoning compliance review procedures in Article 3 of Chapter 7. If the Dire determines that the proposal conforms to the requirements of the Master Sign Program and this article, a zoning compliance approval shall be issued. If the Director determines that the proposal does not conform to the requirements of the Master Sign Program and this article, a zoning compliance approval shall not be issued, and th applicant shall be advised as to how the proposal could be brought into compliance. The Director's determination of compliance or noncompliance may be appealed to th Planning Commission pursuant to Article 14 of Chapter 7.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1614 Nonconforming Signs.

(a) Continuance and Maintenance. Nonconforming signs that were legal when first installed, and which have not been modified so as to become illegal, may be continu and routine maintenance and repairs may be performed.

(b) Alterations and Additions to Nonconforming Signs. No nonconforming sign shall be moved, altered, or enlarged unless required by law or unless the moving, alterat or enlargement will result in the elimination of the nonconformity.

(c) Abandonment of Nonconforming Sign. Whenever a nonconforming sign has been abandoned, or the use of the property has been discontinued for a continuous pe of ninety (90) days, the nonconforming sign shall be removed.

(d) Restoration of a Damaged Sign.

(1) Whenever a nonconforming sign is destroyed by fire or other calamity to the extent of fifty percent (50%) or less of the sign's replacement value, the sign may restored and the nonconforming use of the sign may be resumed; provided, that restoration is started within six (6) months of the damage and diligently pursued to completion.

(2) Whenever a nonconforming sign is destroyed by fire or other calamity to a greater extent than fifty percent (50%) of the sign's replacement value, or is volunta removed or is required by law to be removed, the sign shall not be restored except in full conformity with the requirements of this article.

(e) Illegal Signs. A sign that was not legally established under the regulations that were applicable at the time it was established, whether before or after the adoption o these planning regulations, is an illegal sign. Any such illegal sign is hereby declared to be a public nuisance and shall be removed or legalized immediately.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1615 Definitions.

(a) Signs Generally. "Sign" means a structure, fixture, device, or material containing any combination of written copy, graphics, or symbols intended to promote a busin product, commodity, service, idea, or person, or to provide direction, identification, or information. "Sign" may include flags, streamers, pennants, banners, and balloons their intent is as stated above. Noncommercial works of art, including but not limited to murals, are not signs.

(b) Sign Types. The following definitions shall apply throughout this article, in addition to definitions contained elsewhere in this article, including, but not limited to, the prohibited signs listed in Section 9-5.1604 and the exempt signs listed in Section 9-5.1605.

(1) "Animated sign" means a sign which, by method or manner of illumination, flashes on or off, or blinks with varying light intensity, shows motion or creates the illusion of motion, or revolves to create the illusion of being on or off.

(2) "Awning sign" means a sign affixed permanently to the outside surface of an awning.

(3) "Banner sign" means a sign made of fabric or any nonrigid material with no enclosing framework, usually supported by horizontal poles protruding from a build wall.

(4) "Blade sign" means a projecting sign.

(5) "Business sign" means a sign that directs attention to the principal business, profession or industry located on the premises where the sign is displayed, to products sold, manufactured or assembled, or to services or entertainment offered on such premises.

(6) "Changeable copy sign" means a sign whose informational content can be changed or altered manually.

(7) "Channel letters" means three (3) dimensional individual letters or figures, with an open back or front, illuminated or nonilluminated, that are affixed to a buildin to a freestanding sign structure.

(8) "Construction sign" means a temporary sign that describes in words and/or drawings a planned future development project on a property.

(9) "Entry gateway sign" means a sign permanently affixed to an arch or other structure spanning over an entrance to a property.

(10) "Freedom of speech sign" means a noncommercial sign expressing an idea.

(11) "Freeway-oriented sign" means a sign that is oriented primarily to the traveling public using a freeway, and installed for the sole purpose of identifying major business locations in close proximity to the freeway.

(12) "Ground sign" means a sign that is permanently supported upon the ground by poles or braces and is not attached to any building or other structure. These include freestanding pole signs.

(13) "High-rise identification sign" means a sign located on the top story of a building that is over seventy-five feet (75') tall and identifying the name of the building owner, a tenant of the building, or any entity associated with the building.

(14) "Marquee sign" means a sign with a changeable message that advertises events, performances, or services, and that is displayed on a permanent structure made of rigid materials supported by and extending from the facade of a building.

(15) "Monument sign" means a low-profile freestanding sign erected upon or supported solely by a planter, pedestal base, or similar ground structure approximate the same width as the sign.

(16) "Moving sign" means a sign or any portion thereof that rotates, moves, or appears to move in some manner by mechanical, electrical, natural, or other means

(17) "Noncommercial sign" means a sign that does not promote a business, commodity, service, entertainment, product, or other attraction.

(18) "Organization sign" means a sign that identifies a nonprofit or other noncommercial organization.

(19) "Permanent sign" means a sign made of durable materials and intended to be displayed for an indefinite time period.

(20) "Political sign" means a sign that promotes a political candidate, party, or issue.

(21) "Projecting sign" means a sign, the surface of which is not parallel to the face of the supporting wall and which is supported wholly by the wall. This definition includes V- or wing-type signs. Also known as a "blade sign."

(22) "Roof sign" means a sign located above any portion of any roof of a building, including a canopy or other overhang.

(23) "Shingle sign" means a sign that hangs from a canopy or awning or from the ceiling of an arcade or passageway.

(24) "Temporary sign" means a sign that is intended to be displayed for a limited time period.

(25) "Tower sign" means a sign that is supported by a tall framework or structure, whether or not attached to a building, typically intended to identify a multi-tenan commercial complex and its major tenants.

(26) "Wall sign" means a sign painted on or affixed to, and wholly supported by, a building or other wall in such a manner that its exposed face is approximately parallel to the plane of such building or wall.

(27) "Window sign" means a sign painted or installed on a glass window or door and intended to be seen from the exterior of the structure in which the window or is located, or an interior sign located within two feet (2') of the inside of a window or door in a manner that it can be viewed from the exterior of the structure.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 17. Telecommunications Facilities

9-5.1701 Purpose.
This article provides standards and procedures to regulate the development, siting, installation, and operation of Wireless Communications Facilities, consistent with the applicable requirements of State and Federal law. The regulations are intended to provide for the appropriate development of Wireless Communications Facilities within t City to meet the needs of residents, business owners, and visitors, while protecting public health and safety and preventing visual blight and degradation of the communi aesthetic character, consistent with the General Plan.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1702 Applicability and Exemptions.
The requirements of this article apply to all Wireless Communications Facilities as defined in Section 9-5.1708.

(a) Principal Use. A Wireless Communications Facility that includes a transmission tower shall be considered a principal use and is subject to the provisions of Section 3.202.

(b) Accessory Use. A Wireless Communications Facility that includes Wireless Communications Antennas and related equipment shall be considered an accessory use is subject to the development requirements and standards in Section 9-5.1705.

(c) Exemptions. The following accessory facilities are exempt from this article:

(1) Licensed amateur (ham) radio, citizen band operations and emergency services radio.

(2) Hand-held, mobile, marine, and portable radio transmitters and/or receivers.

(3) Radio and television mobile broadcast facilities.

(4) Communication equipment and storage devices, such as computer servers, in cabinets or rooms completely located inside of permitted structures.

(5) A single ground or building-mounted receive-only radio, television or wireless cable antenna not exceeding the maximum height permitted by Article 2 of Chap including any mast, or a receive-only radio or television satellite dish antenna, subject to the following restrictions in residential districts:

a. Satellite Dish One (1) Meter or Less. A satellite dish that does not exceed one (1) meter in diameter and is for the sole use of a resident is permitted anywh on a lot in a residential district so long as it does not exceed the height of the ridgeline of the primary structure on the lot.

b. Antennas. An antenna that is mounted on any existing building or other structure that does not exceed twenty-five feet (25') in height is permitted. The ante must be for the sole use of a resident living on the lot on which the antenna is located.

(6) Any Wireless Communications Facility that is exempt from local regulation pursuant to the rules and regulations of the Federal Communications Commission (F or a permit issued by the California Public Utilities Commission (CPUC).

The owner or operator of such facility shall provide the Director with a copy of a current FCC or CPUC permit or a copy of applicable FCC regulations prior to its installation.

(7) Minor modifications to existing Wireless Communications Facility, including replacement in-kind or with smaller or less visible equipment, that meet the standard set forth in this article and will have little or no change in the visual appearance of the facility.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1703 Application Requirements.
An applicant shall file a written application pursuant to the application procedures in Article 2 of Chapter 7 and any specific application requirements established by the Director for this use.

(a) Co-Location. The applicant and owner of any site on which a Wireless Communications Facility is located shall cooperate and exercise good faith in co-locating oth Wireless Communications Facilities on the same support structures. Good faith shall include sharing technical information to evaluate the feasibility of co-location, and negotiations for erection of a replacement support structure to accommodate co-location. A competitive conflict to co-location or financial burden caused by sharing information normally will not be considered as an excuse to the duty of good faith. In the event a dispute arises as to whether a permittee has exercised good faith in accommodating other users, the City may require the applicant to obtain a third-party technical study at applicant's expense.

(1) All Wireless Communications Facilities shall make available unused space for co-location of other Wireless Communications Facilities, including space for these entities providing similar, competing services.

(2) All co-located and multiple-user Wireless Communications Facilities shall be designed to promote facility and site sharing. Telecommunications towers and necessary appurtenances, including but not limited to parking areas, access roads, utilities and equipment buildings, shall be shared by site users whenever possib

(3) No co-location is required where it can be shown that the shared use would or does result in significant interference in the broadcast or reception capabilities the existing Wireless Communications Facilities or failure of the existing facilities to meet Federal standards for emissions or cause the host to go offline for a signific period of time.

(4) Failure to comply with co-location requirements when feasible or cooperate in good faith as provided for in this subsection is grounds for denial of a permit req or revocation of an existing permit.

(b) If an applicant proposes a Wireless Communications Facility which is not co-located with an existing Wireless Communications Facility, the applicant shall provide a inventory of existing facilities within one-quarter (1/4) mile of the proposed site, including area which falls in a neighboring jurisdiction, and the applicant shall also provid explanation as to why the proposed facility cannot be co-located with an existing facility.

(c) In addition to any other requirements, all Wireless Communications Facilities applications shall, at a minimum, include the following information:

(1) Report on Alternatives. A report explaining why the Wireless Communications Facility is needed at the requested location. Any applicant seeking to construct a transmission tower shall explain why co-location or location on another kind of support structure is not feasible, including efforts made to develop such an alternativ the City has requested that the applicant co-locate its Wireless Telecommunications Facility on a site, the applicant shall explain why co-location is not feasible.

(2) Wireless Communications Facility Plans. Plans shall include a fully dimensioned diagram of the proposed Wireless Communications Facility, including height, shape, size and type of construction. Plans for a transmission tower must include information demonstrating that the structure will be able to accommodate at least (1) other similar telecommunication provider. A diagram showing the separation between the proposed facility and any existing facility or facilities on the same supp structure or site is required if co-location is planned.

(3) Site Plans. A fully dimensioned site/landscaping plan that includes: specific placement of the proposed tower, equipment shelters, and any other Wireless Telecommunications Facility on the site; elevation drawings; setbacks from lot lines; the location of existing structures, trees, and other significant site features; nota of those features proposed to be removed; the type and locations of plant materials proposed to screen the facility; and the proposed materials and colors for the facility.

(4) Visual Analysis. Photo-simulations showing views of the proposed facility from surrounding residential properties and public rights-of-way at varying distances a map indicating the locations used for the analysis and their distances from the site.

(5) Documentation of Compliance. Copies of all applicable licenses or other approvals required by the FCC and any other agency with authority to regulate Wirele Communications Facilities, including documentation of compliance with all conditions imposed in conjunction with such licenses or approvals, shall be provided. If th do not include an estimate of the anticipated radio frequency emissions, the applicant shall provide this separately.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1704 Review of Telecommunications Facilities.

A nonexempt Wireless Communications Facility shall not be established, expanded, or otherwise modified except in conformance with this article. Nonexempt facilities ar subject to design review and/or conditional use permit, pursuant to the procedures in Chapter 7, as follows:

(a) Wireless Communications Antennas in the RM Medium Density Residential zone may only be approved with a conditional use permit and are subject to design revie To grant such a conditional use permit, the following finding must be made in addition to the findings required by Article 5 of Chapter 7:

(1) That the antenna is necessary to fill a gap in coverage.

(b) Wireless Communications Antennas not in the RM Medium Density Residential zone are subject to major design review unless the antennas and all associated equipment are completely hidden from public view.

(c) Wireless Communications Antennas in the public right-of-way may only be approved with a conditional use permit, design review, and an encroachment agreement pursuant to Chapter 2 of Title 7.

(d) Wireless Communications Facilities which include a freestanding pole or transmission tower may only be approved with a conditional use permit and design review, only in the INL Light Industrial, INH Heavy Industrial, and P Public zoning districts.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1705 Development Requirements and Standards.

All Wireless Communications Facilities shall be located, developed, and operated in compliance with all of the following standards and with applicable standards of the zo district in which they are located.

(a) Location and Siting.

(1) No new transmission tower shall be located within one thousand feet (1,000') of an existing transmission tower, including existing transmission towers which a other jurisdictions.

(2) Pursuant to Section 6409 of the Federal Middle Class Tax Relief and Job Creation Act of 2012, any modification of a transmission tower which does not "substantially change" the tower is permitted.

(3) All Wireless Communications Facilities shall meet the building setback standards of the district in which they are proposed to be located.

(4) Facilities and equipment located in the public right-of-way shall be located, constructed, installed, and maintained in compliance with the applicable requiremer Title 7 and the following standards:

a. Facilities shall only be installed where they will not interfere with existing or future City uses of the right-of-way, the rights of private property owners, other fixtures and services, water hydrants or mains, wastewater stations, traffic control systems, or any other service or facility that benefits the City or its residents.

b. Facilities shall be installed within existing underground ducts or conduits whenever such ducts, conduits, manholes or other facilities have volume or capac that is available or will be available for third-party facilities. Utility boxes, power units, and similar fixtures shall be installed completely underground, unless the P Works Director finds that undergrounding would result in maintenance and operation problems that would interfere with service.

c. Overhead facilities may be installed on existing utility poles or replacement poles if the new pole has the same or better appearance than the existing pole.

d. Overhead facilities shall not be installed where a project has been implemented to remove existing overhead facilities.

e. Pedestals, amplifier units, equipment cabinets, and similar above-ground installations shall, where feasible, be located at least six inches (6") from any side and two feet (2') from driveway and curb edges. They shall not be placed in front of the primary entrance to a residence or retail business or at any other locati where they would unduly interfere with the operation of a business, including blocking views of the entrance or display windows.

(b) Height Requirements.

(1) Wireless Communications Antennas on Buildings. See Article 2 of Chapter 4 for requirements regulating building height and projections above the top of buildi

(2) Other Wireless Communications Facilities. A freestanding Wireless Communications Facility shall not exceed the height limit of the district in which it is located. When a Wireless Communications Antenna is mounted on a structure which is not a building it shall not exceed the height of the structure unless camouflaged as p the structure design, nor shall it exceed the height limit of the district in which the structure is located.

(c) Design and Screening. Wireless Communications Facilities shall be located, designed and screened to blend with the existing natural or built surroundings, as well any existing support structures, so as to reduce visual impacts to the extent feasible. All facilities, except for equipment within existing buildings, are subject to design rev Equipment cabinets shall be located within the building upon which antennas are placed, if technically feasible. Otherwise, equipment cabinets, and associated equipmer such as air conditioning units and emergency generators, shall be screened from view by a wall or landscaping, as approved by the Director.

(d) Performance Standards. Wireless Communications Facilities shall comply with the performance standards listed in Article 11 of this chapter, including but not limitec noise standards.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1706 Post-Installation Verification and Monitoring.
Post-installation verification and monitoring by qualified and objective third-party experts shall be required as follows:

(a) Validation of Proper Operation. Within forty-five (45) days of commencement of operations, the permittee shall provide verification that the radio frequency levels cc with FCC regulation and that all equipment complies with City noise regulations.

(b) Review Following One (1) Year. The permittee shall report to the City a measurement of radio frequency emissions one (1) year from the date of commencement of operation. Thereafter, such a report shall be available upon request by the City.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1707 Discontinuance of Use.
(a) As a condition of approval, an applicant for a building permit to erect or install a Wireless Communications Facility shall be required to post a cash or surety bond in form and amount acceptable to the Director to cover removal costs of the Wireless Communications Facility in the event that its use is abandoned or the approval is otherwise terminated.

(b) The service provider shall notify the Director of the intent to vacate a site at least thirty (30) days prior to the vacation. The permit for any Wireless Communications Facility that is not operated for a continuous period of twelve (12) months shall be deemed lapsed and the site will be considered abandoned unless:

(1) The Director has determined that the same operator resumed operation within six (6) months of the notice; or

(2) The City has received an application to transfer the permit to another service provider.

(c) No later than ninety (90) days from the date the use is discontinued or the provider has notified the Director of the intent to vacate the site, the owner of the abandc Wireless Communications Facility or the owner of the property on which the facility is sited shall remove all equipment and improvements associated with the use and sha restore the site to its original condition. The owner may use any bond or other assurances provided by the operator to do so. The owner or his agent shall provide writter verification of the removal of the facility within thirty (30) days of the date the removal is completed.

(d) If the Wireless Communications Facility is not removed within thirty (30) days after the permit has lapsed, the site shall be deemed to be a nuisance, and the Directc may cause the facility to be removed at the owner's expense or by calling any bond or other financial assurance to pay for removal. If there are two (2) or more users of single transmission tower, then this provision shall apply to the abandoned facility but not become effective for the tower until all users cease using the tower.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

9-5.1708 Definitions.
As used in this article:

(a) "Co-location" means the location of two (2) or more Wireless Communications Facilities on a single support structure or otherwise sharing a common location. For tl purposes of this article, co-location shall also include the location of Wireless Communications Facilities with other facilities such as water tanks, light standards, and othe utility facilities and structures.

(b) "Wireless Communications Antenna" means the physical device through which electromagnetic, wireless telecommunications signals authorized by the Federal Communications Commission are transmitted or received. It includes antennas and related equipment which may include cable, conduit and connectors, equipment pads shelters and cabinets, and access ladders. Antennas used by amateur radio operators are excluded from this definition.

(c) "Wireless Communications Facility" is a facility containing equipment for the transmitting or receiving of electromagnetic radio frequency waves. It may include Wirel Communications Antennas as define above and may also include the pole or tower on which equipment is mounted.

(Sec. 2 (Exh. A) (part), Ord. 13-001, eff. Mar. 7, 2013)

Article 18. Emergency Shelters

9-5.1801 Purpose.
This article establishes regulations governing emergency shelters. The City finds it necessary to establish such requirements and criteria in the interest of the public heal safety and welfare.

(Sec. 2 (part), Ord. 14-003, eff. Apr. 17, 2014)

9-5.1802 Applicability.
This article shall apply to the establishment of all emergency shelters.

(Sec. 2 (part), Ord. 14-003, eff. Apr. 17, 2014)

9-5.1803 Approval Procedure.

(a) Where Permitted by Right. In zoning districts in which emergency shelters are permitted by right, as indicated in Table 9-3.202, a proposal for an emergency shelte shall be reviewed by the Director, in consultation with the Chief Building Official and Fire Marshal, for conformance with the provisions of this article pursuant to the zonin compliance review procedures in Article 3 of Chapter 7. If the Director determines that the proposal conforms to the requirements of this article, a zoning compliance approval shall be issued. If the Director determines that the proposal does not conform to the requirements of this article, a zoning compliance approval shall not be issu and the applicant shall be advised as to how the proposal could be brought into compliance. The Director's determination of compliance or noncompliance may be appea to the Planning Commission pursuant to Article 14 of Chapter 7.

(b) Where Conditionally Permitted. In zoning districts in which emergency shelters require a conditional use permit, as indicated in Table 9-3.202, a proposal for an emergency shelter shall be considered by the Planning Commission pursuant to the major conditional use permit procedures in Article 5 of Chapter 7. In approving a conditional use permit for an emergency shelter, the Commission may designate reasonable conditions including, but not limited to, those deemed necessary to comply v the standards in Section 9-5.1804. The Commission's decision may be appealed to the City Council pursuant to Article 14 of Chapter 7.

(Sec. 2 (part), Ord. 14-003, eff. Apr. 17, 2014)

9-5.1804 Standards.
Emergency shelters shall comply with all of the following standards:

(a) Number of Beds. An emergency shelter may have up to sixty (60) beds.

(b) Waiting Area. A waiting and intake area containing a minimum of ten (10) square feet per bed shall be provided.

(c) Outdoor Activities: Outdoor activities, including but not limited to on-site waiting, client intake areas, and charitable food distribution, may only be conducted betwee hours of 8:00 a.m. to 6:00 p.m. and shall be screened from public view to the extent feasible.

(d) Location Requirement. No emergency shelter shall be established within three hundred feet (300') of any other emergency shelter. The distance between any two emergency shelters shall be measured in a straight line, without regard to intervening structures, from the closest property line of each shelter.

(e) Lighting. Adequate external lighting for security shall be provided.

(f) Security. Parking and outdoor facilities shall be designed for security for residents, visitors and employees.

(g) Management Plan. The shelter operator shall have a written management plan including provisions for staff training, neighbor relations, security, screening of resid to ensure compatibility with services provided at the facility, and programs for residents.

(h) On-Site Staffing. A minimum of one (1) staff member per twenty (20) beds shall be on duty and awake when the facility is in operation.

(i) Compliance with Federal, State, and Local Regulations. Emergency shelters shall comply with all Federal, State, and local licensing requirements.

(j) Compliance with Life Safety Regulations. Emergency shelters shall comply with all applicable building, fire, and health and safety codes, including maximum occupar restrictions.

(Sec. 2 (part), Ord. 14-003, eff. Apr. 17, 2014)

Article 19. Development Impact Fees

9-5.1901 Authority and Reference to This Article.
This article may be referred to as the "Impact Fee Ordinance," and is adopted pursuant to the authority of Article XI, Section 7 of the California Constitution, California Government Code Section 66000 et seq. (hereinafter "Mitigation Fee Act"), California Government Code Section 65000 et seq. (the planning and zoning law of the State California), and in accordance with the findings set forth in the ordinance codified in this article.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1902 Purpose of Fees.
Pursuant to this article, the City has established fees which will be imposed upon projects for the purpose of mitigating the impacts that the projects have upon the City's ability to provide public facilities.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1903 Use of Fees.
(a) The fees imposed by the City pursuant to this article, including any interest earning thereon, shall be used to pay, in whole or in part, the estimated reasonable cost c providing specified public facilities, as described in implementing resolutions; to reimburse the City for the cost of specified public facilities constructed by the City with fur from other sources; and to make reimbursement payments in accordance with Section 9-5.1915.

(b) As described in each implementing resolution, the specified public facilities will be categorized into separate and distinct sets of public facilities based upon the type c public facility to be provided, or other identifying features. Each separate set of specified public facilities described in an implementing resolution shall be referred to in th chapter as a "public facility category." Public facility categories include, but are not limited to: transportation and park and recreation facilities.

(c) For each separate public facility category, a separate fee shall be calculated and imposed, and each separately imposed fee shall be collected by the City and depos in a separate and distinct "fee fund," subject to the accounting requirements of the Mitigation Fee Act.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1904 Calculation of Fees by Implementing Resolutions.
Pursuant to the Mitigation Fee Act, in any action establishing, increasing, or imposing a fee as a condition of approval of a project, a technical report shall be prepared fc each public facility category, subject to City Council approval by implementing resolution.

Each implementing resolution shall include the following:

(a) Identify the purpose of the fee by identifying the estimated types and quantities of projects subject to the fee, and the public facility category to be funded by the fees

(b) Identify the use of the fee by identifying the specified public facilities to be funded by the fees.

(c) Determine how there is a reasonable relationship between the City's use of the fee and the types of projects on which the fee is to be imposed by demonstrating how project will benefit from the specified public facilities to be funded by the fees.

(d) Determine how there is a reasonable relationship between the need for the specified public facilities and the types of projects on which the fee is to be imposed, be demonstrating how the project creates a demand for the construction of the specified public facilities to be funded by the fees.

(e) Determine how there is a reasonable relationship between the amount of the fee and the cost of the specified public facility attributable to the project on which the fe to be imposed. This shall include two (2) elements: (1) a quantification of the estimated reasonable cost of providing the specified public facility, which may include the estimated costs of land acquisition, design, construction, construction administration, general administration (including establishment and enforcement) of the fee progra and contingencies; and (2) an identification of the method by which the City quantified the proportionate responsibility of each project for the cost of the specified public facilities, which may be satisfied by establishing a formula which reasonably quantifies the proportionate responsibility of various types of projects using standardized uni measurement.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1905 Obligation to Pay Fees.

(a) Each applicant for City approval of a project (including applications for a change of use and remodels) shall pay impact fees to the City, in accordance with the amou set forth in implementing resolutions, unless the applicant establishes, to the satisfaction of the Director, entitlement to a fee adjustment pursuant to Section 9-5.1908, a exemption pursuant to Section 9-5.1909, or approval of a fee credit pursuant to Section 9-5.1913.

(b) The obligation to pay impact fees pursuant to this article shall not replace an applicant's obligation to mitigate development project impacts in accordance with other requirements of State or local law, or to otherwise comply with applicable City site development standards (Chapter 4 of Title 9 of the Planning Regulations), Citywide us and development regulations (Chapter 5 of Title 9 of the Planning Regulations), or subdivision requirements (Chapter 6 of Title 9 of the Planning Regulations).

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1906 Timing of Payment.

(a) At Permit Issuance. Except as otherwise provided in this section, the fees for each project shall be paid in full prior to the issuance of the permit required for that proj

(b) After Permit Issuance. Upon application by an applicant, and approval by the Director, the fees for a project may be paid as follows:

(1) For projects that include residential dwelling units, if application of this subsection (b)(1) is specifically requested by the applicant, fees shall be paid before: (a) f inspection, or (b) issuance of a certificate of occupancy, whichever occurs first. The amount of the fee to be paid shall be the amount of the fee in effect on the date permit issuance. Notwithstanding the foregoing, the Director may deny the application to defer payment of fees for a residential project that does not meet the criter set forth in California Government Code Section 66007(b)(2)(A) pertaining to lower income affordable housing, and thus require the earlier payment of fees only if t criteria set forth in California Government Code Section 66007(b)(1) is satisfied.

(2) For any nonresidential project, fees shall be paid in their entirety on a date before the project receives (a) its final inspection, or (b) its certificate of occupancy, whichever occurs first. However, the amount of the fee to be paid for a project shall be the amount of the fee in effect, pursuant to implementing resolution, at the ti that full payment is made to the City.

(c) Implementation. The Director shall develop an application form for applicants to request payment of fees after permit issuance pursuant to subsection (b) of this secti and shall establish departmental guidelines for approval or denial of such applications.

The Director is authorized to execute and approve an application under this subsection (c).

(d) Compliance. No City official may issue a permit with respect to a project unless the fees required by this article have been paid as required by subsection (a) of this section or an application meeting the criteria set forth in subsection (c) of this section has been approved by the Director in connection with the project. No City official m certify final inspection or issue a certificate of occupancy for a project, or otherwise allow occupancy of a project, until the fees required by this article with respect to suc project are paid in accordance with this section.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1907 Amount of Payment.

(a) The amount of any fee to be paid for a project shall be the amount of the fee in effect, pursuant to implementing resolution, on the date of permit issuance. However, any project besides one covered by Section 9-5.1906(b)(1), if any fee is paid after the date of permit issuance in accordance with an application approved by the Directo pursuant to Section 9-5.1906(c), then the amount of the fee shall be the amount in effect, pursuant to implementing resolution, at the time that full payment is made to th City.

(b) The amount of any fee to be paid in connection with a change of use shall be: (1) the amount of the fee required pursuant to subsection (a) of this section for the proposed use, (2) minus the amount of the fee paid for the last legal use of the existing structure.

(c) The amount of any fee to be paid in connection with a remodel shall be the amount of the fee required pursuant to subsection (a) of this section for that portion of the remodel which generates impacts greater than the last legal use of the existing structure.

(d) In the event that the land use of a project is not included in the implementing resolution for determination of the amount of the fee, the Director shall determine their f set forth in the implementing resolution.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1908 Fee Adjustments by the City.

The City reserves the right to update and adjust each fee from time to time, in accordance with the Mitigation Fee Act. The fee in effect at the time any applicant has obta a vested development right shall be subject to adjustment by the City, as incorporated in updated implementing resolutions in effect at the time that full payment of the fe made, based upon any or all of the following criteria:

(a) Adjustments in the amount of the estimated construction costs of providing the specified public facilities based upon adjustments in accordance with the inflation inde

(b) Adjustments to replace estimated costs with actual costs (including carrying costs) of providing the specified public facilities.

(c) Adjustments to reflect more accurate cost estimates of providing the specified public facilities based upon more detailed analysis or design of the previously identified specified public facilities.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1909 Exemptions.
(a) Residential projects are exempt from impact fees for any remodel, as long as it does not result in a change of use.

(b) A project shall be exempt from the requirements of this impact fee ordinance if the applicant provides documentation, to the satisfaction of the Director, of Federal, St or local law (including a duly adopted resolution of the City Council) which established entitlement to the exemption.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1910 Request for Refund.
An applicant may request a refund of a fee previously paid in accordance with this article, and the Director may approve said refund, only if the applicant provides writter documentation to the satisfaction of the Director that: (a) the permit (including and planning permit or City approval on which the fee was imposed) is canceled or voided (b) work has not progressed on the permit which would allow commencement of a new use or change of use, and (c) the City has not already committed the fees to the construction of public facilities. Any refund made pursuant to this subsection shall include a deduction to cover the City's administrative costs of processing the refund.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1911 Application for Potential Credit.
An applicant may be eligible for a credit against impact fees otherwise owed, in return for providing a specified public facility to the City, only if the applicant submits a wr application to the Director which establishes compliance with all of the following requirements to the satisfaction of the City Council:

(a) Describe the specified public facilities (or portion thereof) proposed to be provided by the applicant, with a cross-reference to the description of the specified public facilities in the relevant implementing resolution.

(b) Identify the estimated cost of providing the specified public facilities (including construction, design, and/or land acquisition) for which the applicant is requesting cred

(c) Describe the project or projects to which the fee credit is requested to apply. The description shall be limited to all or a portion of the project for which specified public facilities are a condition of approval.

(d) Document that either: (1) the applicant is required, as a condition of approval for the project, to construct the specified public facilities; or (2) the applicant requests tc build one or more specified public facilities which benefit the project, and the City Council determines by resolution prior to the commencement of construction that it is in City's best interests for the specified public facilities to be built by the applicant.

(e) To the extent that credit for land acquisition costs are requested, document that: (1) the location of the land is advantageous to the public facility needs of the City; ar (2) the amount of credit for the land acquisition is equal to a reasonable estimate of the fair market value of the land based upon either: (a) documentation provided by th applicant to the City, or (b) in the event that the City determines that the documentation provided by the applicant does not provide a reasonable basis for determining th fair market value of the land, the applicant shall pay for the costs of a property appraisal by an expert selected by the City which is qualified to express an opinion as to t value of the property (pursuant to California Civil Procedure Code Section 1255.010).

(f) Notwithstanding the foregoing, no credit shall be provided against impact fees otherwise owed if an applicant has received a development bonus in accordance with Section 9-4.204 of these planning regulations for providing the specified public facility.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1912 Timing of Application for Potential Credit.
The application for credit shall be submitted by the applicant to the Director in accordance with the following timing requirements: (a) to the extent that the applicant requ credit for design or construction, the application shall be submitted concurrently with the submittal of improvement plans; (b) to the extent that the applicant requests cre for land dedication, the application shall be submitted prior to the recordation of a final map or parcel map for the project. The applicant may submit a late application onl the applicant establishes, to the satisfaction of the City, that, in light of new or changed circumstances, it is in the City's best interests to allow the late application.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1913 Amount of Potential Credit.
In the event that the City determines that the applicant has submitted a timely application in compliance with Section 9-5.1912, and it is in the City's best interest to allow applicant to provide the proposed specified public facility, the applicant shall be entitled to credit against fees otherwise owed in accordance with this article; provided, th the applicant enters into a public improvement agreement with the City approved by resolution of the City Council which includes the following essential terms:

(a) The design of the specified public facility is approved by the City.

(b) The applicant agrees to provide the specified public facilities in return for the credit to be allocated in accordance with the terms of the public improvement agreemen this article.

(c) The amount of credit available to the applicant shall not exceed the lesser of: (1) the applicant's actual cost of providing the specified public facility, to be evidenced b submittal of written documentation to the satisfaction of the City, and (2) the estimated cost of providing the specified public facility, as identified in the implementing resolution.

(d) The amount of credit available to the applicant for land dedication shall be equal to the amount identified in Section 9-5.1911(e).

(e) The land to be dedicated to the City shall not contain hazardous substances, waste or materials, as defined by State or Federal law, including petroleum, crude oil or fraction thereof, or shall otherwise be remediated in accordance with a cleanup plat approved by the City and applicable State or Federal regulatory agencies to a level suitable for the intended use. Further, the applicant shall agree to thereafter defend, indemnify, and hold the City harmless from all demands, claims, orders, costs, expenses, fees, penalties, and causes of action related to hazardous substances, waste or materials, as defined by State or Federal law, including petroleum, crude oil c and fraction thereof, located on or emanating from the property.

(f) The applicant provides improvement security in a form and amount acceptable to the City.

(g) The applicant agrees to pay prevailing wages for all public works as defined in the California Labor Code related to the specified public facility. The requirement for payment of prevailing wages shall be limited to the construction of the specified public facility for which a fee credit is granted, unless an exception to prevailing wage requirements applies under the California Labor Code, in which case the requirement for prevailing wages shall not apply.

(h) The applicant identifies the project to which the credit will be applied.

(i) The credit may only be applied to fees which would otherwise be owed for the public facility category relevant to the specified public facility.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1914 Request for Reimbursement.
To the extent that the applicant has a balance of credit available, the applicant may be entitled to potential reimbursement from the City only if the applicant submits a wr request to the Director which establishes the following:

(a) The request shall be made no later than one hundred eighty (180) days after the later to occur of: (1) issuance of the last permit within the project for which the application for credit was made, or (2) the date of the City's acceptance of the specified public facilities as complete.

(b) The request shall identify the specific dollar amount of the credit balance for which the applicant requests reimbursement, along with documentation in support therec This documentation shall include a calculation of the total credit available (pursuant to Section 9-5.1913(c)) less amount of credit previously allocated to offset fees pursu to Section 9-5.1913(h).

(c) The request must include a designation of the name and address of the legal entity to which reimbursement payments are to be made.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1915 Allocation of Reimbursements.
(a) In the event the Director determines that the applicant has properly submitted a request for reimbursement pursuant to Section 9-5.1914, the Director shall prepare a written determination to be approved by resolution of the City Council which will identify the dollar amount of the reimbursement. The dollar amount of the reimbursement shall be based upon the amount specified in the applicant's request, not to exceed the actual credit available to the applicant, less the total of all credit allocations to offs fees pursuant to Section 9-5.1913, as determined by the City.

(b) The City shall make reimbursement payments to the applicant or the entity identified by the applicant pursuant to Section 9-5.1914(c). The right to receive reimburser payments, if any, shall not run with the land.

(c) The City shall make reimbursement payments pursuant to a schedule approved by resolution of the City Council, and consistent with the approved capital improveme program. No interest shall accrue on the amount subject to reimbursement. The City shall not make and shall have no obligation to make reimbursement payments to an applicant from any source other than the relevant fee fund, nor shall any reimbursement be made in excess of the amount of fees deposited in the relevant fee fund.

(d) No reimbursement payment shall be made to an applicant until after the completion of construction by the applicant and acceptance of improvements by the City.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1916 Notice of Protest Rights.
(a) Each applicant is hereby notified that, in order to protest the imposition of any impact fee required by this article, the protest must be filed in accordance with the requirements of this article and the Mitigation Fee Act. Failure of any person to comply with the protest requirements of this article or the Mitigation Fee Act shall bar that person from any action or proceeding or any defense of invalidity or unreasonableness of the imposition. Notwithstanding language to the contrary, the provisions of Arti 14 of Chapter 7 of Title 9 of these Planning Regulations and Chapter 4 of Title 1 of the Emeryville Municipal Code shall not apply to a protest of the imposition of any imp fee required by this article.

(b) On or before the date on which payment of the fee is due, the applicant shall pay the full amount required by the City and serve a written notice to the Director with a the following information: (1) a statement that the required payment is tendered, or will be tendered when due, under protest; and (2) a statement informing the City of th factual elements of the dispute and the legal theory forming the basis for the protest.

(c) After receipt of the notice from the applicant, and prior to the informal hearing to be scheduled in accordance with Section 9-5.1917, the Director shall investigate the factual and legal adequacy of the applicant's protest. At the request of the Director, the applicant shall provide additional information or documentation in substantiation the protest.

(d) The applicant shall bear the burden of proving, to the satisfaction of the Director, entitlement to a fee adjustment. The evidence (information and documentation) to b submitted by the applicant in support of the protest shall include, but not be limited to, an identification of the amount of the fee which the applicant alleges should be imposed upon the project, and all factual and legal bases for the allegation. The applicant shall identify each portion of this impact fee ordinance and any implementing resolution which the applicant claims supports the allegation. The applicant shall identify each portion of this impact fee ordinance (in particular the elements summarizec Section 9-5.1904) and each portion of any implementing resolution (in particular the technical reports incorporated therein) which the applicant claims fails to support the City's imposition of the fee upon the project.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1917 Informal Hearing.
(a) The Director shall schedule an informal hearing regarding the protest, to be held no later than sixty (60) days after the imposition of the impact fees upon the project, with at least ten (10) days' prior notice to the applicant (unless either dates are otherwise agreed by the Director and the applicant).

(b) During the informal hearing, the Director shall consider the applicant's protest, relevant evidence assembled as a result of the protest, and any additional relevant evidence provided during the informal hearing by the applicant and the City. The Director shall provide an opportunity for the applicant to present additional evidence at hearing in support of the protest. However, in weighing relevant evidence, the Director may consider the extent to which the applicant provided requested substantiating evidence prior to the hearing.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1918 Director's determination.
When the Director determines that sufficient evidence has been submitted to decide the protest, the Director shall close the informal hearing and issue a written determination regarding the protest. The Director may continue the informal hearing in order to assemble additional relevant evidence. The Director's determination shall support the fee imposed upon the project unless the applicant establishes, to the satisfaction of the Director, entitlement to an adjustment to the fee.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1919 Appeal of Director's Determination.

Any applicant who desires to appeal a determination issued by the Director pursuant to Section 9-5.1918 shall submit a written appeal to the Director and the City Manag A complete written appeal shall include a complete description of the factual elements of the dispute and the legal theory forming the basis for the appeal of the Director' determination. An appeal received by the City Manager more than ten (10) calendar days after the Director's determination may be rejected as late. Upon receipt of a complete and timely appeal, the City Manager shall appoint an independent hearing officer to consider and rule on the appeal.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1920 Appeal Hearing.

The independent hearing officer shall, in coordination with the applicant and the Director, set the time and place for the appeal hearing, and provide written notice theree The independent hearing officer may issue directives related to the conduct of the hearing in an effort to facilitate resolution of the dispute or narrow the issues in dispute including prehearing or post-hearing briefs pursuant to a briefing schedule, and scheduling presentation of evidence during the hearing. The independent hearing office shall consider relevant evidence, provide an opportunity for the applicant and the City to present additional noncumulative evidence at the hearing, and preserve the complete administrative record of the proceeding.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1921 Decision of Independent Hearing Officer; Judicial Review.

(a) Within thirty (30) days after the independent hearing officer closes the hearing and receives post-hearing briefs (if any), the independent hearing officer shall issue a written decision on the appeal hearing which shall include a statement of findings of fact in support of the decision and notice that the time within which judicial review mu be sought is governed by this section. The written decision shall be mailed by first-class mail, postage prepaid, including a copy of the affidavit or certificate of mailing, to applicant. The independent hearing officer's discretion shall be limited to a determination that either supports the Director's determination or orders the City to refund all portion of the impact fees to the applicant. The applicant shall bear the burden of proving entitlement to a fee adjustment. The decision of the hearing officer is final and conclusive, and is subject to judicial review only in accordance with subsection (b) of this section.

(b) Judicial review of any decision of the hearing officer may be had pursuant to California Civil Procedure Code Section 1094.5 only if the petition for writ of mandate is no later than the ninetieth (90th) calendar day following the date the decision of the hearing office is provided to the applicant as provided in subsection (a) of this sectio

(c) If the applicant files a request for the record, as specified in subsection (d) of this section, within ten (10) calendar days after the date the decision of the hearing offic provided to the applicant as provided in subsection (a) of this section, the time within which a petition pursuant to California Civil Procedure Code Section 1094.5 may be shall be extended to not later than the thirtieth (30th) calendar day following the date on which the record is either personally delivered or mailed to the applicant or his c designee.

(d) The complete record of the proceedings shall be prepared by the City Clerk and shall be delivered to the applicant within ninety (90) calendar days after a written rec therefor has been filed by the applicant with the City Clerk. The City may recover from the applicant its actual costs for transcribing or otherwise preparing the record. Su record shall include the transcript of the proceedings, all pleadings, all notices and orders, any proposed or tentative decision by a hearing officer, the final decision, all admitted exhibits, all rejected exhibits in the possession of the City or hearing officer, all written evidence, and any other papers in the case.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1922 Costs of Protest.

The applicant shall pay all City costs related to any protest or appeal pursuant to this article, in accordance with the fee schedule adopted by the City. At the time of the applicant's protest, and at the time of the applicant's appeal, the applicant shall pay a deposit in an amount established by the City to cover the estimated reasonable cos processing the protest and appeal. If the deposit is not adequate to cover all City costs, the applicant shall pay the difference within twenty (20) days after receipt of writt notice from the Director.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1923 Applicant's Acknowledgment of Adjustment or Waiver.

As a condition of any adjustment or waiver made for a fee imposed upon a particular project, the applicant may be required by the Director or the independent hearing o to provide an acknowledgment and waiver, in a form acceptable to the Director, of any further right to protest or appeal the City's imposition of fees for that project.

(Sec. 3 (part), Ord. 14-008, eff. Aug. 14, 2014)

9-5.1924 Definitions.

As used in this article, all words, phrases, and terms shall be interpreted in accordance with the definitions set forth in the Mitigation Fee Act, unless otherwise defined he

(a) "Applicant" means any person, or other legal entity, which applies to the City for approval of a development project.

(b) "Change of use" means any proposed use of an existing structure (or a previously existing structure) on a parcel which: (1) requires a building permit, planning perm other permit or City approval, and (2) the proposed use is included in a different property use category (as defined in implementing resolutions) than the last legal use of existing structure, and (3) the proposed use results in impacts greater than the last legal use of the existing structure.

(c) "Fee" means, for the purpose of this article, a development impact fee imposed by the City in accordance with this article.

(d) "Fee fund" means each of the separate and distinct funds into which fees for each public facility category are deposited.

(e) "Impact fee ordinance" means this article.

(f) "Implementing resolution" means a resolution of the City Council of the City of Emeryville, including any technical report incorporated by reference, in which the findinç specified in Section 9-5.1904 are made for each public facility category.

(g) "Inflation index" means a recognized standard index (such as the Consumer Price Index), as determined by the City Council to be a reasonable method of calculating impact of inflation upon cost estimates set forth in implementing resolutions.

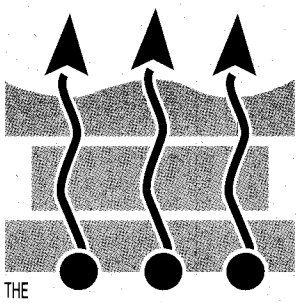
(h) "Mitigation Fee Act" means California Government Code Section 66000 et seq.

(i) "Permit" means the City building permit required for a project, or, if the project consists of a change of use for which no building permit is required, a zoning complianc review or any other permit or City approval required for the change of use.

(j) "Project" means any project as defined in Section 9-8.216(qq), and shall specifically include any building permit, planning permit, or any other permit or City approval required for a change of use. Project shall specifically include any change of use or remodel.

(k) “Public facility” means any public improvements, public services, or community amenities, as defined by the Mitigation Fee Act, including, but not limited to: transportat improvements, park and recreation facility improvements, and any similar public improvement for which the City has adopted an implementing resolution pursuant to this article.

(l) “Public facility category” means a separate and distinct set of public facilities as described in Section 9-5.1903(b).



(m) “Remodel” means any proposed improvement or reconstruction of an existing structure (or a previously existing structure) on a parcel which: (1) requires a building permit, planning permit, or other permit or City approval, and (2) results in impacts greater than the last legal use of the existing structure.

(n) “Specified public facility” means those public facilities described in each implementing resolution, the total program costs of which are used as the basis for the calcul of a fee, as described in Section 9-5.1904.

(o) “Vested development rights” means an applicant’s right to proceed with development of a development project in substantial compliance with the local ordinances, policies, and standards in effect at the time that the rights vest, as the term is defined in the vesting tentative map statutes (California Government Code Sections 66498. through 66498.9), development agreement statutes (California Government Code Sections 65864 through 65869.5), and State law.

1.0 EXECUTIVE SUMMARY

As specified in our Workplan for Groundwater Re-Development and Sampling, The Reynolds Group (TRG) conducted groundwater monitoring well redevelopment and sampling activities on January 8 and 15, 2007, at the property located at 1400 Park Avenue in Emeryville, California (Site). This report documents these activities and presents the results of the groundwater monitoring. Based on the results presented herein, TRG is also requesting closure of the Site on behalf of Emeryville Properties.

Included with this report are descriptions of TRG's groundwater monitoring and sampling procedures, groundwater elevation data and laboratory results (**Table 1**), a Site Location Map (**Figure 1**), Site Plot Plan With Groundwater Monitoring Results (**Figure 2**), and Site Plot Plan With Groundwater Contours measured on January 15, 2006 (**Figure 3**). Analytical results with chain of custody documentation are included as **Appendix A**, Standard Operating Procedures are attached as **Appendix B**, and field data sheets are attached as **Appendix C**, Registered Survey of Groundwater Monitoring Wells are attached in **Appendix D** and a Site Specific Health and Safety Plan in found in **Appendix E**.

On January 15, 2007, a week after re-developing the onsite groundwater monitoring wells, the three wells (MW-1, MW-2, and MW-4) were sampled by TRG. Samples were analyzed for Lead by EPA Method 200, for total petroleum hydrocarbons (TPH) as Diesel and as Gasoline by EPA Method 8015, and by EPA Method 8260B for benzene, toluene, ethylbenzene and xylenes (BTEX) and methyl tertiary butyl ether (MTBE) and other fuel oxygenates. Groundwater samples collected from each of the three wells had no detected levels of petroleum hydrocarbons, BTEX or fuel oxygenates. Trace levels of total lead, were detected ranging from 0.005 to 0.006 milligrams per liter (mg/L, see **Table 1** and **Figure 2**). These lead detections are well below the State of California Maximum Contamination Levels for Drinking Water (MCLs) of 0.015 mg/L as specified in the Lead and Copper Rule. Thus lead is not considered an impact to the groundwater.

TRG requests that this Site be granted regulatory closure. Based on results of the recent testing, there are no contaminants which present any threat to groundwater at the Site or any of the neighboring sites. The data presented herein demonstrates that there has been no release of hydrocarbons from the former USTs and ASTs at the Site.

2.0 BACKGROUND

The Site, located at 1400 Park Avenue in Emeryville, California (see **Figure 1 – Site Location Map**), formerly housed facilities operated by Chromex and The Charles Lowe Company. A former below grade concrete vault associated with Chromex's activities was removed in 1992. In December 1995, a "No Further Action" letter was issued for the Site by the Alameda County Health Care Services (ACHCS) for the former chromium vault at the Site. In 1995, Aqua Science Engineers (ASE) excavated and removed hydrocarbon contaminated soils beneath the vertical honing pit area. A total of 75 yards of soil was removed during these excavation activities. Also in 1995, ASE removed three 550 gallon steel underground storage tanks (USTs), which at one time contained diesel, motor oil and gasoline. In 1997, ASE successfully abandoned a half buried 700 gallon steel Above-Ground Storage Tank (AST). Three monitoring wells (MW-1, MW-2 and MW-4) were installed between 1994 and 1996 and still exist at the Site.

2.10 Involved Parties

The Reynolds Group was retained by the Site owner to perform the work associated with this project. The Alameda County Health Care Services Agency is the lead agency on this case as represented by Mr. Steven Plunkett.

TRG was responsible for managing this project and overseeing the developing, surveying, and sampling the groundwater monitoring wells, and producing this report. Associated Laboratories of

Orange, California, provided laboratory analytical services for groundwater samples. Associated Laboratories is a California State Certified Laboratory. Gregg Drilling helped with the well redevelopment, Blaine Tech Services assisted in the groundwater sampling, and Morrow Surveying of Sacramento, a liscensed surveyor located all three monitoring wells using a NAD 83 coordinate datum.

3.0 FIELDWORK

3.10 Well Redevelopment

On January 8, 2007, three monitoring wells (MW1, MW2, and MW4) at the Site were re-developed to obtain a representative sample of formation groundwater. The specific field procedures used in the groundwater well development and groundwater sampling are attached in **Appendix B – Standard Operating Procedures**.

Before purging any wells, the depth to groundwater was measured in all wells using a sounder. The depth to water and total depth of each well was recorded on a field data sheet to 0.01 feet accuracy. Development included surging the well screen to remove fines from the filter pack. After surging was completed and the sand content of the bailed water decreased, as determined by another well depth measurement, a submersible pump was used to continue well development. The surge block and submersible were decontaminated with Liquinox and deinozed water in between each well development. The three groundwater monitoring wells had a total of 162 gallons purged, with more than three boring volumes removed per well, to remove fines from the filter pack material. At the completion of well development, all physical parameters (temperature, dissolved oxygen, specific conductivity, pH, turbidity, and oxidation reduction potential) had stabilized (see **Appendix C – Field Data Sheets**). All field generated wastes (development water) were containerized on-Site in 55 gallon drums pending profiling for proper off-Site disposal.

3.20 Well Surveying

Since two of the three wells had been previously surveyed, MW-1, MW-3 and MW-4 were surveyed on January 8, 2007, by a California licensed surveyor, Morrow Surveying (see **Appendix D**). The groundwater well location was measured at the top of the casing and referenced to the elevation relative to mean sea level and latitude and longitude using NAD 83. The casing elevations are shown in **Table 1**. The field data sheets are included in **Appendix D**.

3.30 Groundwater Sampling

Prior to gauging and sampling activities on January 15, 2007, an equipment cleaning station was set up that consisted of a wash bucket and two rinse buckets. The wash bucket was filled with tap water and mixed with Liquinox cleaning solution. The first rinse bucket was filled with tap water and the second rinse bucket contained deionized water. The well sounder, pump and discharge hose were all cleaned, flushed and rinsed prior to their initial use on site and between each subsequent use.

Before purging any wells, the depth to groundwater was measured in all wells using a sounder. The depth to water and total depth of each well was recorded on a field data sheet to 0.01 feet accuracy. All wells were sampled using the (low-flow) sampling method shown in Appendix D. A 2" Grundfos Pump with tubing (separate tubing used for each well), attached to a Flow Cell, was used to purge, read, and collect groundwater samples. The pump was placed two feet above the total depth of the wells. The purge rate was one gallon per minute and the total purge volume per well varied from 17 to 27 gallons.

During purging, temperature, pH, conductivity, dissolved oxygen and turbidity were measured and recorded on the field data sheets. Purging continued until the monitored purge water characteristics stabilized. Approximately 68 gallons of purge water was generated during this groundwater

monitoring event. Purge and decontamination water was deposited into 55-gallon drums and stored on site pending profiling for proper offsite disposal.

Groundwater samples were collected directly from the submersible pump's tubing prior to the flow cell. Each water sample was collected into 5 vials (voas) preserved with hydrochloric acid, a 1 Liter Amber bottle (unpreserved), and one 250 mL plastic bottle (unpreserved). The sample containers we filled to avoid headspace and bubbles. The filled sample containers were labeled, placed in an ice-cooled chest, and transported following proper chain-of-custody procedures to Associated Laboratories.

3.40 Groundwater Gradient

Prior to purging and sampling on January 15, 2007, the depth to groundwater in each well was measured from the top of each well casing using an EnviroSupply and Service Inc. Interface Meter Model H. Oil. The groundwater flow direction and slope were calculated by determining the elevation of groundwater in each well relative to surveyed top-of-casing elevations (top of casing minus depth to water). These data are summarized in Table 1. The location and elevation of each well was professionally surveyed by Morrow Surveying Land Surveyors (see Appendix D).

Groundwater gauging during this event was performed in January 15, 2007. The groundwater flow direction was shown to be from the north northeast to the south southwest direction at 0.67 ft. per foot. Groundwater elevation contours for January 2007 are shown on the attached **Figure 3**.

4.0 LABORATORY ANALYSES & RESULTS

All samples were analyzed for TPH as gasoline and diesel by EPA Method 8015, for BTEX, MTBE and other fuel oxygenates by EPA Method 8260B, and for lead by EPA Method 200. The laboratory reports and chain-of-custodies are included as **Appendix A**.

Groundwater samples were collected from a total of three of the monitoring wells (MW1, MW-2, and MW-4). Groundwater samples from each of the three wells had no detected hydrocarbons or VOCs, including gasoline (<50 ug/L), diesel(<0.1 mg/L), benzene (<1 ug/L), toluene (<5 ug/L), ethylbenzene (<5 ug/L), xylenes (<5 ug/L), MTBE (<1 ug/L), di-isopropylether (<1 ug/L), ethyl-tertbutylether (<1 ug/L), tert-amylmethylether (<1 ug/L), and tertiary butyl alcohol (<10 ug/L). Trace concentrations of lead were detected in the three monitoring wells ranging from 0.005 to 0.006 mg/L. When compared to the California State Action Level of 0.015 mg/L, as specified in the Lead and Copper Rule, the concentrations of lead are not considered hazardous.

5.0 CONCLUSIONS

Based on the results of this current investigation, closure should be granted at the Site given that:

(1) No evidence of any release of hydrocarbons to the groundwater from the former on-site USTs and AST was found in this investigation. The data presented herein shows no detections of gasoline, diesel, BTEX, MTBE or other oxygenates in the groundwater samples collected at the Site;

(2) Trace levels of Total Lead were found, ranging from 0.005 to 0.006 mg/L0.006 mg/L. These lead detections are well below the State of California Maximum Contamination Levels for Drinking Water (MCLs) of 0.015 mg/L as specified in the Lead and Copper Rule. Thus lead is not considered an impact to the groundwater.

6.0 RECOMMENDATIONS

TRG recommends that the Alameda County Health Care Agency grant closure to the Site located at 13702 Ventura Boulevard based on the information provided herein.

If you have any questions or concerns pertaining to the Closure Request, I can be reached directly at (949)378-8448.

Thank you for your consideration of this matter.

Sincerely,
THE REYNOLDS GROUP
a California corporation by:

Gwen Tellegen, P.E.
Project Manager

Section 1
Client: The Reynolds Project: _____
Date Received: 1/16/07
Sample(s) received in cooler: (Yes) No (Skip Section 2)

Section 2
Was the cooler packed with: ✓ Ice ___ Ice Packs ___ Bubble Wrap ___ Styrofoam
___ Paper ___ None ___ Other _____
Cooler or box temperature: 3.2°C

(Acceptance range is 2 to 6 Deg. C.)

Section 3	YES	NO	N/A
Was a COC received?			✓
Were custody seals present?	✓		
If Yes – were they intact?	✓		
Were all samples sealed in plastic bags?	✓		
Did all samples arrive intact? If no, indicate below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were correct containers used for the tests required?	✓		
Was a sufficient amount of sample sent for tests indicated?	✓		
No head space in VOA vials?	✓		
Were the correct preservatives used?			✓
Were the samples scanned for presence of radioactivity?			✓
Was total residual chlorine measured (Fish Bioassay samples only)? *			

Not enough for an Effluent ID: FB

*: If the answer is no, please inform Fish Bioassay Dept. immediately.

Section 4
Explanations/Comments

APPENDIX B

Standard Operating Procedures

THE REYNOLDS GROUP -STANDARD OPERATING PROCEDURE

GROUNDWATER WELL DEVELOPMENT

SCOPE OF WORK

Monitoring well development establishes a complete hydraulic connection between the well and the aquifer material surrounding the well screen and filter pack. Monitoring wells will be measured and developed according to the TRG Well Development Standard Operating Procedure described below. The Well Development SOP consists of Field Preparation, Well Development and Decontamination Procedures.

Field Preparations include the following:

1. Review of Health and Safety Plan (HASP), especially required PPE and hospital route map
2. Discuss field procedures and requirements with project team/ development contractor
3. Completion of the Field Prep Checklist (See Attached)
4. Obtain all required development equipment – IF THE DEVELOPMENT EQUIPMENT IS PROVIDED BY THE SUBCONTRATOR BE SURE TO CALIBRATE IT IN THE OFFICE BEFORE FIELD WORK
    - PPE (Tyvec, booties, gloves, hardhat, steel toe boots)
    - Proper instruments to measure specific conductivity, temperature, and pH
    - Turbidimeter
    - PID/ FID
    - Plastic
    - Paper towels
    - Camera
    - Trash bags
    - Surge block
    - Submersible pump

Well Development Procedures include the following:

1. Most wells are developed by using surge block and submersible pumping methods to draw the coarse and/or fine material out of the sand pack.

2. Well development should begin no sooner than 72 hours after well installation. However, if drilling muds are used during well installation, well development should occur approximately 24 hours following well installation so that the drilling mud does not set up in well screen section. A phased process is used to develop wells, starting with a gentle pumping or bailing phase to remove sand, followed by a surging phase, and then a pumping phase after the well begins to clear up. Step by step procedures are described as follows:

a. At the time of installation, immediately after the well completion, gentle pumping is used to remove water and sand from the well. The purpose of this technique is used to settle the sand pack with the borehole.

b. Approximately 72 hours after well installation, bailing or pumping for well development can begin. The initial bailing removes sand and fine material that may have accumulated in the well, and pulls in natural material into the sand pack. To determine the amount of sediment in the well, the total well depth should be measured and compared to the well installation boring log depth. The difference between measured depth and installed depth represents the amount of sediment in the well. Bailing or pumping is conducted until the sand content in the water begins to decrease and the measured depth approaches the total well depth.

c. After the sand content begins to decrease, surging is conducted. A surge block is used to move sediments from the filter pack into the well casing. A surge block consists of a plunger attached to a rod or pipe of sufficient length to reach bottom of the well. All surge blocks are made of inert materials that cannot contaminate the well. Surge blocks should release pressure to prevent casing collapse. Care should be taken to not surge too strongly which could result in casing collapse or deformation. The surge block is moved up and down the well screen interval and then removed, followed by a return to bailing or pumping to remove any sand brought into the well by the surging action.

d. After surging has been completed and the sand content of the bailed water has decreased, as determined by another well depth measurement, a submersible pump is used to continue well development. The pump should be moved up and down the well screen interval until the obtained water is relatively clear. During well development pH, specific conductivity, temperature, and turbidity should be monitored frequently (every 2-5 minutes) to establish natural conditions and evaluate whether the well has been completely developed. The primary criteria used to determine the completion of well development is the clearness of the groundwater (Nephelometric Turbidity Units or NTU). Before ceasing well development activities a turbidity of less than 5 NTU should be attained. Any well with turbidity greater than 5 NTU after development is considered to be suspect in integrity by the State of California.

i. Development will conclude when at least 3 well bore volumes are removed, the water clarifies, and water quality parameters have stabilized within 10% for three successive readings. The final three readings collect should conform to the following readings:
pH +/- 0.1 unit
electrical conductance (EC) +/- 3%

A copy of The Reynolds Group Well Development log form is attached. These parameters as well as time, depth to water, total volume pumped, temperature should be recorded on this form.

The volume of water purged from the well during development will be a minimum of 3 borehole volumes (wells will typically not reach stabilization of water quality parameters before this condition is achieved and may not have reached stability even after this threshold has been achieved). A copy of The Reynolds Group well volume calculation form is attached. Greater volumes may be required if the measured water quality parameters do not stabilize to the stated criteria.

THE REYNOLDS GROUP -STANDARD OPERATING PROCEDURE

LOW FLOW GROUNDWATER MONITORING

SCOPE OF WORK

Monitoring wells will be measured, purged, and sampled according to the TRG Well Monitoring Low Flow Groundwater Monitoring Standard Operating Procedure described below. The Groundwater Monitoring SOP consists of Field Preparation, Sampling Procedures, and Decontamination Procedures sections.

Field Preparations include the following:

1. Review of Health and Safety Plan (HASP), especially required PPE and hospital route map
2. Discuss field procedures and requirements with project team
3. Completion of the Field Prep Checklist (See Attached)
4. Obtain all required sampling equipment – IF THE SAMPLING EQUIPMENT IS RENTED BE SURE TO TRY USE AND CALIBRATION IN THE OFFICE BEFORE FIELD WORK
    - PPE (Tyvec, booties, gloves, hardhat, steel toe boots)
    - Dedicated tubing
    - Low flow pump
    - In-line Flow Cell to measure DO, ORP, Temperature, and pH
    - Turbidimeter
    - PID/ FID
    - Plastic
    - Paper towels
    - Ziplock bags
    - Cooler
    - Ice
    - Disposable bailers
    - Twine
    - Camera
    - Trash bags

5. Review site specific monitoring procedure, which will include the following:
    a. Removal of any dedicated tubing from each well before purging and sampling, safely placing it in a clean area in separate clean trash bags.
    b. Purging water from wells using a low flow pump connected to a Flow Cell (removing at least 3 casing volumes or until all parameters stabilize-see below)
    c. Measuring water quality parameters during purging on attached monitoring form

d. Sampling the well using a disposable bailer or from the low flow pump discharge hose (before the Flow cell)
e. Re-inserting the dedicated tubing after sampling.

6. Obtain sample containers for required analysis
   a. The two wells will be sampled for:
      - Filtered CAM Metals by EPA Method 6010
      - Hex Chromium by EPA Method 7199 (24 hour hold time)
      - Nitrates (48 hour hold time)
      - Sulfates by EPA Method 300
      - The laboratory will filter ONLY the samples for dissolved metals
      - From each well the samples will be collected in two 1 Liter polyethylene bottles with no preservatives

Sampling Procedures include the following:

1. Arrive at Site and conduct tailgate meeting discussing HASP.
2. Don proper PPE, which will consist of a tyvex uniform with booties and gloves for each technician, and carefully open each well and remove the dedicated tubing, placing it in separate clean trash bags.
3. Measure the total depth and depth to water of each well to the nearest one-tenth of a foot using a sounder, properly decontaminating (see Section below) the instrument between each well.
4. Place visqueen around each well while noting and recording the condition of well lids, caps, seals, and casing. IF THE WELLS ARE NOT LABELED, A PERMANENT MARKER OR PAINT PEN SHOULD BE USED TO MARK THE TOPAND UNDERSIDE OF THE WELL CAP, as well as the casing.
5. Properly decontaminate the low flow pump prior to purging of each well (see Decontamination Procedure).
6. Cut appropriate length of tubing for each well (total well depth minus two ft.)
7. Calibrate all instruments (Flow Cell, FID, and Turbidimeter) being used to collect parameters or monitor air quality during the purge and sample process. This must be done before the start of EVERY day, and if readings seem to drift during the monitoring, the instrument should be recalibrated.
8. Calculate three well volumes for each well (see Attached Spreadsheet).

9. **Purging Wells** – minimize spillage during pumping by having extra drums in the well area
   a. Each well will be purged to extract three boring volumes while measuring and recording on to two minute intervals for temperature, conductivity, pH, turbidity, and dissolved oxygen.

b. Purging will conclude after three volumes are removed, or when the water quality parameters have stabilized within 10% for three successive readings.

pH +/- 0.1
specific electrical conductance (SEC) +/- 3%
oxidation-reduction potential (ORP) +/- 10 millivolts
turbidity +/- 10% (when turbidity is greater than 5 NTUs)
dissolved oxygen (DO) +/- 0.3 milligrams per liter

7. Monitor and record water levels during purging. Adjust pump flow levels so that water levels do not fluctuate more than 10% of total water column and do not cause aeration.
8. All purged water will be contained in properly labeled drums for characterization and proper disposal.
9. **Sampling Wells** - will be carried out once water quality parameters have stabilized.
   a. Sampling will be performed either from the discharge line of the low flow pump (before the Flow Cell) or from disposable bailers lowered slowly with twine (new twine will be used for each well) approximately two ft. below the water surface.
   b. Sample bottles, will be labeled with well name, date, time sampled, and constituents to be analyzed.
      i. Each well will be sampled using the required number of bottles
      ii. A field blank sample will be taken by running distilled water through the sampling equipment into sample bottles and will be labeled FB.
      iii. A trip blank sample will be taken using distilled water to fill the bottle set and labeled TB
      iv. A duplicate sample will be taken will be taken by taking separate samples from the same well and labeled MW-X.
   c. Sample bottles will be placed into buckets while sampling to ensure no spillage of water onto the sidewalk or street.
   d. Sample bottles will be rinsed with sample water that is discarded before sampling.
   e. Water retrieved from each well will be deposited into bottles by opening the check valve at the bottom of the disposable bailer allowing water to slowly fill to the top of the rims minimizing spillage, agitation, and aeration.
   f. Bailers will be placed back into the bags in which they came and placed into drums for proper disposal.
   g. The sample bottles from each well will be put into separate ziplock bags to ensure no cross contamination.
   h. Samples will be kept on ice in coolers and chilled to 4 degrees C.
10. Following the collection of each sample, a chain of custody will be properly completed showing sample identification, date, time of sample, matrix, number of containers, and tests required.
11. Any dedicated micro-purge tubing will be carefully re-installed into wells, ensuring no contact with the ground surface.

12. All persons involved in purging and sampling will remove and dispose of PPE in a properly labeled drum.
13. All equipment will be decontaminated and placed in special storage containers.
14. A state certified laboratory will arrive onsite to receive all samples and chain of custody.

Decontamination Procedures include the following:

1. Once removed from the well, the purging and sampling pumps should be decontaminated with a non-phosphate soapy-water wash and scrubbed with a brush, a water rinse, and a distilled-water rinse, to help ensure that there is no cross-contamination between wells.
2. The step-by-step procedure is:
    a. Pull pump out of previously-sampled well (or out of vehicle) and use three sprayers filled with soapy water, tap water and distilled water. Spray outside of tubing and pump until water is flowing off of tubing after each rinse. Use bristle brush to help remove visible dirt, contaminants, etc.
    b. Have three long-PVC tubes with caps or buckets filled with soapy water, tap water and distilled water. Run pump in each until approximately 2 to 3 gallons of each decon solution is pumped through tubing. Pump at low rate to increase contact time between the decon solutions and the tubing.
    c. Prior to lowering the pump down the next well, spray the outside of the pump with distilled water. Use disposable paper towels and dry the pump.
    f. It is especially important to clean thoroughly that portion of the equipment that will be in contact with sample water. In addition, a clean plastic sheet should be placed adjacent to or around the well to prevent surface soils from coming in contact with the purging equipment. The effects of cross-contamination also can be minimized by sampling the least contaminated well first and progressing to the more contaminated ones. The bailer cable/rope (if a bailer is used) and plastic sheet should be properly discarded, as provided in the site health and safety plan, and new materials provided for the next well.
    g. Dedicated tubing will be used and disposed of after each well is sampled.

INTRODUCTION

The Reynolds Group (TRG) was engaged to perform groundwater monitoring at Emeryville Properties located at 1400 Park Avenue in Emeryville, California.

KEY PERSONNEL AND RESPONSIBILITIES

Following are key assignments for this project:

ASSIGNMENT	RESPONSIBLE PARTY
Project Manager:	Gwen Tellegen/Ed Reynolds
Project Site Safety Officer:	Sean Boykin
Office Health and Safety Manager;	Gwen Tellegen

The Project Manager (PM) has overall responsibility for field development and implementation of this Health and Safety Plan (HASP). The PM assigns health and safety related duties and responsibilities only to qualified individuals. Before anyone enters the work area, they must meet the requirements of 29 CFR 110.120 for medical examination and health and safety training.

The Project Site Safety Officer (PSSO), who must be on-site during all work activities, will be responsible for on-site health and safety activities. The PSSO has stop-work authorization that he will exercise when he perceives an imminent safety hazard, an emergency situation, or any other potentially dangerous situations, such as extreme weather conditions. If the PSSO stops work for a safety-related issue, work cannot begin again until approved by the OHSM. In an emergency, the PSSO will arrange for emergency support services when needed.

GENERAL SAFETY REQUIREMENTS

Continuous air monitoring for worker safety and regulatory compliance will be conducted using a photoionization detector (PID) or flame-ionization detector (FID) a minimum of every 15 minutes during the entire operation, unless directed otherwise by the appropriate regulatory agency officer(s) present on site.

Monitoring equipment, including PID/FID and CG/O2 meter, will be calibrated daily and calibration logs will be maintained on-site and made available upon request.

All on-site personnel operating within the work zone will show proof of current 40-hour hazardous waste operations training upon request.

Cellular telephones/radios will be available on-site at all times during work for communication in the event of an emergency.

HAZARD EVALUATION

The following is an evaluation of the hazards which might be associated with this project and the countermeasures which should be taken to remediate these hazards:

Exposure

POTENTIAL CHEMICALS:

The most likely chemical compounds to be encountered during this remediation are elevated petroleum fuel hydrocarbons, found typically in oil field operations.

ASSOCIATED HAZARD:

Gasoline, Diesel, Oil and Grease:	Dermal: can defat and irritate skin Inhalation: TLV's typically 300-600 ppm Acute effects = irritant to skin, eyes, nose, mouth
BTEX:	Dermal: can defat and irritate skin Inhalation: TLV for benzene = 1 ppm Acute effect = irritant Chronic effect: benzene is a human carcinogen.
MTBE:	Dermal: can defat and irritate skin Inhalation: TLV for MTBE = 25 ppm Acute effect = irritant Chronic effects: MTBE is a human carcinogen.

EXPOSURE PROBABILITY AND LIKELY CONSEQUENCE:

A low hazard level exists where there is no contact with the chemicals, when low concentrations are encountered, or when proper protection is worn.

COUNTERMEASURES:

- When OVM reading is less than 50 ppm above background level wear Level D protection;
- When OVM reading is above 100 ppm for greater that 15 minutes wear Level C protection;
- When OVM reading is above 1000 ppm cease work operations until level decreases.

Fire and Explosion

POTENTIAL FOR FIRE OR EXPLOSION:

Workers may encounter fire or explosion hazards on this project. Fire or explosion could occur by rupturing an underground gas line or if digging through soil that contains high concentrations of fuel hydrocarbons.

EXPOSURE PROBABILITY AND LIKELY CONSEQUENCE:

Low probability with moderate consequence.

COUNTERMEASURES:

Seek information about possible underground obstructions from knowledgeable individuals before excavating. Note if Dig Alert has marked the site for underground lines (see Section 3.11).

Oxygen Deficiency

On-site workers are not likely to encounter an oxygen deficiency. Workers will not enter confined spaces on this project.

Ionizing Radiation

On-site workers are not likely to encounter radioisotopes or other hazardous ionizing radiation on this site.

Biologic Hazards

On-site workers are not likely to encounter biologic hazards on this site.

Safety Hazards

On-site workers may encounter physical safety hazards on this site. Work operations include:

- working near moving, powered machinery;
- slips, strains, trips, and falls;
- moving and lifting of heavy objects;
- use of hand tools, and
- use of motor vehicles.

COUNTERMEASURES:

Use experienced on-site persons. Wear hard-toed shoes and approved hard hats. Heighten worker awareness with a tailgate safety session for all on-site workers at the start of work each day. Maintain all equipment (including safety devices) in proper operation condition. Never leave an open excavation unattended.

Electrical

On-site workers could encounter electrical hazards on this site if the front loader contacts overhead power lines, if subsurface work encounters buried live electrical lines, if poor weather conditions exist, or equipment is not properly grounded.

COUNTERMEASURE:

Be sure not to raise the front loader in proximity to overhead power lines. Work shall cease if bad weather conditions exist. Equipment shall be grounded. Seek information about possible underground lines from knowledgeable individuals before excavating. Note if Dig Alert has marked the site for underground lines (see Section 3.11).

Heat Stress

There will be a low likelihood that on-site workers may encounter heat stress on this project. Workers will be wearing Tyvek suits and ambient temperature will likely be in the low-to mid-eighties.

COUNTERMEASURES:

Heighten worker awareness about heat stress at daily tailgate safety session. Monitor heart rate at break time. If heart rate exceeds 110 beats per minute, cut work period by one-third. Provide and encourage drinking of water and juices at the job site.

Cold Exposure

On-site workers are not likely to encounter cold exposure on this project.

Noise

On-site workers will likely encounter excessive noise levels from operation of the heavy equipment.

COUNTERMEASURE:

Workers will wear hearing protection around the backhoe and whenever they have trouble conversing in normal tones at a distance of about five feet.

Underground Lines

Every effort will be made to determine if underground lines exist beneath the site. Dig Alert will be contacted at least two working days prior to the commencement of work.

SITE CONTROL

For control purposes, the work area consists of a 160-foot area around the backhoe. It is open and workers will enter and leave the site with care. Smoking, eating, and drinking are prohibited in the immediate work area. The PSSO will exclude casual observers from the work area and will be on-site during work operations.

EMERGENCY RESPONSE PLAN

Following are emergency names, phone numbers, and contacts:

Police	911
Fire Department	911
Ambulance	911
Emergency Hospital Alta Bates Summit Medical Center 350 Hawthorne Avenue Oakland, California	(510) 655-4000
The Reynolds Group 520 West First Street Tustin, CA 92780	(714) 730-5397
Closest Phone for Emergencies:	Cellular Phones

Medical Emergencies:

For emergencies requiring ambulance service, call 911 for transportation of injured to hospital. Life-flight is available and can be obtained when calling 911.

Nearest Facility:

Alta Bates Summit Medical Center is nearest the Site. The most direct route is shown on the attached map.

Emergency Decontamination:

In a medical emergency, personnel decontamination is of lesser importance than medical attention. Alert paramedics or emergency room attendants about the potential for contamination.

The undersigned have read and will comply with the Health and Safety Plan for the 1400 Park Avenue, Emeryville Groundwater Well Development and Monitoring project.

URS

Date: May 30, 2013

To: Ms. Juanita Bacey, Department of Toxic Substances Control

From: Des Garner, Erik Skov, Peter Healy

Subject: **Technical Memorandum**
Technichem Site Investigation, January and March 2013

1.0 INTRODUCTION

The California Environmental Protection Agency (Cal-EPA) Department of Toxic Substances Control (DTSC) has retained URS Corporation (URS) to conduct a site investigation for the remediation of groundwater at the Technichem, Incorporated Site (the Site), located at 4245 Halleck Street, Emeryville, California (Figure 1).

URS conducted indoor air and ground water monitoring to evaluate the extent of the chlorinated Volatile Organic Compounds (VOCs) plume in groundwater, primarily tetrachloroethene (PCE) and trichloroethene (TCE).

The Groundwater and Indoor Air Monitoring Workplan (Workplan) was submitted to DTSC in December, 2012 (URS, 2012). An addendum to the Workplan was submitted to DTSC in February 2013 (URS, 2013).

This Technical Memorandum summarizes the field activities and analytical results from the field work performed in January and March 2013.

The technical memorandum is organized as follows:

- Section 2: Site Background;
- Section 3: Summary of Field Activities;
- Section 4: Deviations from the Work Plan
- Section 5: Field Parameter and Analytical Results; and
- Section 6: Conclusions.

Supporting data are included in Figures 1 through 7, Tables 1 through 4, and Appendices A

through D.

2.0 SITE BACKGROUND

The Technichem site is located at 4245 Halleck Street, in a mixed residential and commercial area of Emeryville in Alameda County, California. It is an approximately 0.35-acre parcel that supports a 1,600-square-foot concrete building, and is bordered to the north by a vacant industrial property (formerly a Sherwin William's paint manufacturing facility); to the east by Halleck Street; to the south by a commercial/industrial property; and to the west by a Union Pacific Railroad (UPRR) right-of-way. A multi-unit residential development is located across Halleck Street from the site.

The former Technichem facility consists of a one-story concrete tilt-up building with a brick façade. It is trapezoidal in shape, approximately 200 feet in length, and narrowing from 100 feet wide in the south to 60 wide in the north. It is divided into three separate areas. These areas were formerly used as follows: 1) the Technichem offices were located in the southern portion of the building; 2) Technichem processing and storage areas were in the central portion of the building; and 3) a northern area of the building was previously occupied by the San Francisco Newspaper Agency. The southern unit is currently occupied by an Asian imports company while the other two units are currently vacant. Technichem operated a PCE recycling facility, which received a DTSC Resource Recovery Facility Permit on January 22, 1987

In 2006 and 2007, PES Environmental, Inc. (PES) conducted two soil gas investigations at the site that yielded concentrations of VOCs that exceeded DTSC California Human Health Screening Levels (CHHSLs) (PES 2006, 2007). As a result, in 2008 the DTSC issued and Imminent and Substantial Endangerment Determination (ISED) regarding the site. The ISED required a response action to alleviate the hazard (DTSC, 2008).

In October 2010, Engineering/Remediation Resources Group (ERRG) conducted a removal action at the site. The work included removal of interior walls and equipment, removal of sections of concrete floor, excavation of contaminated soil, placement and compaction of backfill, and restoration of the site. The 2010 excavation was extended until contaminated soil was removed, and (1) DTSC-specified action levels (San Francisco Regional Water Quality Control Board (RWQCB) environmental screening levels for shallow soil) were met; (2) soil supporting loadbearing walls or other structures was encountered (within 2 feet from the perimeter walls or within 10 feet from the northern support columns); or (3) groundwater was encountered. Soil with concentrations exceeding the action level for PCE was left in place along the western wall, the northern excavation boundary, the eastern portion of the southern wall, and a small area at the base of the excavation in the center of the site due to engineering constraints. Based on the results of the previous removal action, ERRG recommended removing the remaining contaminated soil from the western wall, northern wall, and southern wall of the site. Excavation to address contamination at the

bottom of the excavation was not recommended because shallow groundwater was present in the excavations at a depth of 3 – 5 feet bgs (ERRG, 2012a).

In 2011 and 2012, ERRG conducted additional delineation sampling followed by an additional removal action at the site. The highest concentration of PCE detected in soil was 260,000 micrograms per kilogram (µg/kg) during delineation sampling. A Membrane Interface Probe (MIP) investigation was conducted at ten locations on and in the vicinity of the site to help delineate the extent of the VOCs in the subsurface. Six of the locations were selected for the installation of groundwater monitoring wells, and an additional six locations were selected for direct-push soil borings for collection of grab groundwater samples. ERRG installed three 1.5 inch pre-packed monitoring wells (GW-5, GW-6 and GW-8) to a total depth of 15 feet bgs, screened from 5 feet to 15 feet bgs to target the shallow water-bearing zone and three monitoring wells to a total depth of 25 feet bgs, and screened from 15 to 25 feet bgs to target the deeper water-bearing zones. The wells were subsequently developed using a surge block technique prior to sampling. PCE, TCE, cis-1,2-DCE, and vinyl chloride were detected in groundwater at concentrations exceeding the MCLs in 5 out of the 12 groundwater samples collected. Benzene was also detected in one groundwater sample at a concentration of 1.6 micrograms per liter (µg/L), above the MCL of 1 µg/L. Due to excessive draw-down in wells GW-4, GW-5, GW-6 and GW-12, field parameters did not fully stabilize during low-flow sampling (ERRG 2012b).

The removal action consisted of installation of shoring, structural engineering support of the building, concrete removal, excavation of soil exceeding the site action levels, and backfill and restoration. Soil was removed from three excavation areas within the building. Soil excavation areas were extended laterally in all directions until contaminated soil was removed, and DTSC-specified action levels were met, until the property boundary was encountered, or until groundwater was encountered. Soil was not excavated below groundwater. Soil with concentrations exceeding the action levels for PCE, trichloroethene (TCE), and cis-1,2-dichloroethene (cis-1,2-DCE) were left in place under the western wall at the western property boundary, because this area could not be excavated due to the limitations of the shoring design and proximity to the property line. The highest detected concentrations of PCE, TCE, and cis-1,2-DCE left in place were 12,000 µg/kg, 3,300 µg/kg, and 5,700 µg/kg, respectively. ERRG identified that vinyl chloride may have also been present in soil in this area, but was not detected above laboratory reporting limits, which were elevated due to high concentrations of the other analytes (ERRG, 2012).

3.0 SUMMARY OF MONITORING ACTIVITIES

3.1 Summary of Indoor Air Sampling

On January 3, 2013, prior to initiation of air sampling, URS evaluated all observed preferential vapor intrusion pathways with a photoionization detector (PID). Areas screened included plumbing penetrations in building bathrooms, existing groundwater

wells, floor drains, and foundation-wall joints. PID readings collected at the locations of observed preferential pathways are recorded on Figure 7. The PID screening yielded no detections in suspected preferential pathways. URS subsequently took PID readings from the head space of monitoring well GW-13 on May 2, after the well had been open to the atmosphere for 45 minutes, and recorded PID readings of up to 220 ppm of total VOCs.

URS also conducted an inventory of chemical products stored in the occupied part of the building (Area 1) and found: paint thinner, paint, insulating foam sealant, adhesive, "Goop-Off", Simple Green, dry wall primer/sealer and floor coating.

After screening preferential pathways, URS personnel collected indoor air samples from two locations in the building. Samples were collected over an 8-hour period in accordance with DTSC's October 2011 vapor intrusion guidance recommendations for non-residential structures. The samples were collected in 6-liter Summa canisters, and analyzed by Eurofins Airtoxics using U.S. EPA Method TO-15 Modified Low Level. This modified low-level TO-15 method ensured that the reporting limits were low enough to compare analytical data to the Cal-EPA CHHSLs for indoor air. Analytical results were validated by a URS senior chemist.

The two indoor samples were collected from the center of each of the two rooms being sampled. The ambient air sample was collected in a secure location on the Sherwin Williams property, immediately adjacent to the northern boundary of the site. All three samplers were elevated approximately 3 feet above ground level. The locations of the samples and analytical results are shown on Figure 6. Table 4 summarizes the analytical results from the January 2013 indoor air monitoring event.

3.2 Summary of Groundwater Monitoring

On January 4th, existing groundwater monitoring wells GW-4, GW-5, GW-6, GW-7, GW-8, and GW-12 were sampled and analyzed for VOCs by US EPA Method 8260B.

Monitoring wells were sampled using low-flow sampling techniques, utilizing a peristaltic pump, dedicated polyethylene tubing, and a multi-parameter flow-through cell. All groundwater sampling was conducted in accordance with the U.S. EPA guidance for low-flow sampling (U.S. EPA, 1996) and the DTSC Representative Sampling of Groundwater for Hazardous Substances, Guidance Manual for Groundwater Investigations (DTSC, 2008).

Groundwater samples were analyzed by Moore Twining Associates, a California Department of Public Health Services-certified laboratory. Analytical results were validated by a URS senior chemist.

Table 3 shows the field parameters from the January and March 2013 groundwater monitoring event. The field parameters and results are discussed in Section 6.0. The groundwater sampling logs are included in Appendix A. The laboratory analytical and data validation reports are provided in Appendix C.

4.0 WORK PLAN ADDENDUM ACTIVITIES

Following the evaluation of the groundwater results from the existing monitoring wells, DTSC determined that an additional monitoring well (GW-13) needed to be installed in the area of the site where the highest ERRG grab groundwater result was found (1,200 µg/L at location GW-2). Consequently, a work plan addendum was prepared for the installation, development and sampling of the new well.

Prior to commencing field activities, URS obtained a Water Resources Well Permit, from the Alameda County Public Works Agency. A copy of this permit is included in Appendix D.

URS obtained utility clearance by notifying Underground Services Alert (USA), and by hiring a specialized subcontractor, Sierra Nevada GSI, to verify the absence of utilities at the proposed monitoring well location. On March 8th, 2013, Penecore Drilling, under the supervision of URS field personnel, installed GW-13 (Figure 2). All drilling activities were performed under the supervision of a California Registered Geologist. A URS geologist continuously logged the boring. The soils were classified according to the Unified Soil Classification System. The boring log and well construction details for monitoring well GW-13 can be found in Appendix B. Well construction followed specifications consistent with DTSC's Monitoring Well Design and Construction for Hydrogeologic Characterization Guidance Manual (July, 1995).

In accordance with the DTSC's guidance manual, the well was developed by Penecore on March 15th, more than 72 hours after completion of the installation. Under URS oversight, Penecore purged and bailed the well until it produced clean, relatively sediment-free water.

On March 18th, URS personnel returned to the site and sampled GW-13 using the low-flow sampling technique, a bladder pump, dedicated polyethylene tubing, and a multi-parameter flow-through cell. Groundwater samples were analyzed for VOCs (U.S. EPA Method 8260B) by Moore Twining Associates. Samples were also analyzed by CENSUS quantitative Polymerase Chain Reaction for quantification of Dehalococcoides by Microbial Insights, Incorporated.

Table 2 includes the field parameters and groundwater elevations from the January 2013 groundwater monitoring event. The field parameters and results are discussed in Section 6.0. The groundwater sampling logs are included in Appendix A. The laboratory analytical and data validation reports are provided in Appendix C.

5.0 DEVIATIONS FROM THE WORK PLAN

The fieldwork was implemented following URS' Groundwater and Indoor Air Monitoring Workplan and its subsequent addendum. One deviation from the proposed procedures in the above documents occurred: due to the small diameter (1.5") of existing wells GW-4, GW-5, GW-6, GW-7, GW-8, and GW-12, URS was unable to use a bladder pump to sample the wells during the January 2013 event. Consequently, these wells were sampled using a peristaltic pump.

6.0 FIELD PARAMETERS AND ANALYTICAL RESULTS

6.1 Groundwater Elevations

Groundwater depths were measured to the nearest 0.01 foot during the groundwater monitoring events. Groundwater elevation measurements collected from six groundwater monitoring wells at the site in March 2013 were used to assess the groundwater flow direction within the uppermost water-bearing zone. The existing wells were screened at two different depth intervals from 5 – 15 feet bgs (GW-4, GW-6 and GW-8) and from 15 – 25 feet bgs (GW-4, GW-7, GW-12). The well installed by URS was screened from 15 – 25 feet bgs. Consequently, there are 4 elevation contour points for the deeper interval and three for the shallow interval. Due to uncertainty in the groundwater flow direction and anomalous water level readings, a second set of groundwater level data was collected on May 2. This data is presented in Table 1, and is the data set used for generating groundwater elevation contour maps.

For the shallow wells, groundwater elevation varied from 7.25 feet to 8.64 feet above mean sea level (msl). For the wells screened at the deeper interval, the groundwater elevations varied from 7.16 feet to 8.52 above msl. Although the elevations for both water-bearing zones are similar, the elevations cannot be contoured unless they are taken as two discrete data sets, thus supporting ERRG's selection of the two screened intervals for monitoring well installation.

The interpreted groundwater flow direction for both shallow and deep groundwater is to the southeast. In both cases the groundwater gradient is 0.008. Figures 2 and 3 show the interpreted groundwater flow directions for the two sets of wells.

6.2 Groundwater Physical Parameters

Groundwater physical parameters including temperature, pH, conductivity, Dissolved Oxygen (DO), and Oxidation Reduction Potential (ORP) were monitored in the field during groundwater collection. DO and ORP provide information on the suitability of groundwater for natural attenuation processes, as well as on any changes in groundwater chemistry during the pilot test. Physical parameters for GW-13 were collected in March 2013, after the newly installed well was developed. Parameters for the other wells were

recorded in January, 2013, during the initial groundwater sampling event. The data is presented in Table 2.

Dissolved Oxygen

DO in groundwater was measured in the field from each of the existing wells during the January sampling event.

Shallow Wells: GW-5, GW-6 and GW-8 [Screened 5 – 15 feet bgs]

Dissolved oxygen (DO) measurements were very consistent between the 3 shallow wells at 0.25 mg/L (GW-8), 0.38 mg/L (GW-6) and 0.45 mg/L (GW-5).

Deep Wells: GW-4, GW-7, GW-12 and GW-13 [Screened 15 – 25 feet bgs]

DO measurements for the deeper water-bearing zone were higher than for the shallow zone. DO ranged from 1.92 mg/L to 4.11 mg/L.

Oxidation-Reduction Potential

ORP was measured as a field parameter since the ORP of a groundwater system depends on and influences rates of degradation. Lower (negative) ORP values indicate more reducing conditions.

Shallow Wells: GW-5, GW-6 and GW-8 [Screened 5 – 15 feet bgs]

Shallow groundwater ORP measurements varied from -22 mV to -56.3 mV, indicating reducing conditions.

Deep Wells: GW-4, GW-7, GW-12 and GW-13 [Screened 15 – 25 feet bgs]

For the deeper wells, with the exception of GW-4, ORP measurements indicated oxidizing conditions, with positive ORP values from 47.4 mV to 157.6 mV. The GW-4 result was anomalous at -1.3 mV.

pH

The pH of groundwater has an effect on the presence and activity of microbial populations, because microbes generally thrive at pH values between 6 and 8.

Shallow Wells: GW-5, GW-6 and GW-8 [Screened 5 – 15 feet bgs]

The pH measured in the 3 shallow wells varied from 7.40 to 7.83.

Deep Wells: GW-4, GW-7, GW-12 and GW-13 [Screened 15 – 25 feet bgs]

For the deeper wells the pH varied from 6.55 to 7.62. The newly installed well, GW-13 had the lowest (most acidic) pH observed in groundwater at the site.

6.3 Groundwater Laboratory Results

During the January 2013 groundwater monitoring event groundwater was collected and analyzed for VOCs. Results from one additional sample collected at GW-13 in March 2013 are discussed together with the January 2013 groundwater monitoring results. The VOC results are summarized in Table 3.

VOCs

PCE concentrations ranged from not detected above the 0.12 µg/L reporting limit in GW-4 through GW-8 to 14 µg/L in GW-12 and 12,000 µg/L in the duplicate sample at monitoring well GW-13. With the exception of the low level (0.98 µg/L) detection of cis-1,2-DCE in GW-8, no VOCs were detected in the shallow groundwater.

The PCE detections in GW-12 and GW-13 exceed the State of California established MCL. The concentration of PCE in MW-12 and MW-13 was 14 µg/L and 12,000 µg/L, respectively.

TCE concentrations ranged from less than the 0.17 µg/L reporting limit in GW-4 through GW-8 to 16 µg/L in GW-12 and 42 µg/L in GW-13. The TCE detections in GW-12 and GW-13 exceed the MCL. The concentration of TCE in MW-12 and MW-13 was 16 µg/L and 42 µg/L, respectively.

The daughter product cis-1,2-DCE ranged from less than the 0.15 µg/L reporting limit in GW-4 through GW-7 to 14 µg/L in GW-12 and 21 µg/L in GW-13. The cis-1,2-DCE detections in GW-12 and GW-13 exceed the MCL.

The daughter product, trans-1,2-DCE, was not detected in most groundwater samples. At GW-13, trans-1,2-DCE was detected at a concentration slightly higher than the reporting limit, 0.17 µg/L. This value is below the MCL.

The daughter product vinyl chloride was not detected in any of the historical wells at the site. However, at GW-13 vinyl chloride was detected at a concentration of 7.2 µg/L, exceeding the MCL. Additionally, vinyl chloride was not detected in GW-12 in January 2013.

Bacteria

The biodegradation of PCE to vinyl chloride is carried out by a variety of bacteria including *dehelococcoides ethanogenes* (DHC) in the presence of appropriate conditions and electron donors. The only known species that can complete the degradation of vinyl chloride to

ethene is DHC. In accordance with the 2013 URS work plan addendum, the sample collected from GW-13 was analyzed for DHC. The results showed a concentration of less than the reporting limit of 2.8 cells/milliliter, indicating that reductive dehalogenation via microbial action does not appear to be actively occurring in this area of the site.

6.4 VOCs in Indoor Air

Indoor air samples were collected from two locations within the site building in addition to one ambient sample collected in a secure location on the property immediately north of the site to provide an indication of vapor intrusion into the site building.

PCE was detected in both sample locations at levels exceeding the CHHSL for indoor air at commercial/industrial properties of 0.693 µg/m^3. Sample A-1, collected in the currently unoccupied portion of the building where the removal action took place in 2012, yielded a result of 3.1 µg/m^3. The duplicate collected at this location had a PCE concentration of 3.2 µg/m^3. Sample A-2, collected in the building currently occupied by an Asian imports company, yielded a result of 1.7 µg/m^3. While TCE was detected in both sampling locations, concentrations were almost a full order of magnitude less than the CHHSL of 2.04 µg/m^3. The ambient air sample, A-3, yielded no detections of the chemicals of concern.

7.0 CONCLUSIONS

- Based on the results of the indoor air sampling, vapor intrusion into the building is occurring. Intrusion is likely taking place through preferential pathways such as plumbing penetrations, floor drains or cracks through the floor slab. The highest indoor air results were in Area 2, the unoccupied part of the building, where the highest PCE groundwater results (12,000 µg/L) were found. The indoor air result for Area 1 is lower than that of Area 2 (1.7 µg/m3 versus 3.2 µg/m^3) but both results exceed the CHHSL for indoor air at commercial/industrial properties. Chemicals, adhesives and paints stored in Area 1 (the occupied part of the building) do not appear to be contributing to the indoor concentrations of PCE.

- The PCE concentration of 12,000 µg/L detected in the new well, screened from 15 – 25 feet bgs is significantly higher (by a factor of 10) than the ERRG grab groundwater result from the same area (groundwater grab location GW-2: Figure 3). This grab groundwater sample was collected at a depth of 20 – 25 feet bgs (ERRG, 2012b).

- Based on groundwater elevation data, there is no downgradient monitoring point for the deeper groundwater-bearing zone (15 – 25 feet bgs). GW-8, although down and cross-gradient from GW-13 is screened in the shallower groundwater-bearing zone (5-15 ft bgs).

8.0 RECOMMENDATIONS

1. Vapor intrusion has resulted in concentrations of PCE in air in the two areas of the building sampled exceeding the PCE CHHSL for indoor air at commercial/industrial properties of 0.693 µg/m^3. The CHHSL corresponds to a lifetime excess cancer risk of 1 in 1,000,000. Although exceeding the CHHSL, the lifetime excess cancer risks for these PCE samples are 4.6 and 2.45 in 1,000,000, respectively, under a commercial/industrial scenario. The values are in the low end of the range for risk management decisions and represent risk based on conservative, health-protective assumptions. However, the building owner may consider sealing floor slab penetrations with epoxy or an equivalent material, to remove these potential migration pathways.

2. Additional delineation in the area of GW-13 is recommended. Based on ERRG's MIP data, indicating the presence of a shallow zone of contamination (ECD detector) between 10 and 15 feet bgs, this interval should be targeted for additional delineation work.

3. Based on groundwater elevation data, there is no down gradient monitoring point for the deeper groundwater-bearing zone (15 – 25 feet bgs). GW-8, although down and cross-gradient from GW-13, is not screened at the same depth. Consequently, URS recommends installing at least one monitoring well screened from 15 – 25 feet bgs in the area of MW-13 to further delineate the deep groundwater.

4. In situ remediation of the groundwater contamination area at GW-13 may be an alternative, once the source is better defined. Any enhanced biodegradation would require bioaugmentation as no DHC were detected in MW-13 during the 2013 sampling.

Please contact the under-signed at 650.391.4046 if you have any questions regarding this Draft Technical Memorandum.

Sincerely,

Des Garner

Project Name: Technichem
Project #: 28068189
Workorder #: 1301126R1

Dear Ms. Kali Futnani

The following report includes the data for the above referenced project for sample(s) received on 1/9/2013 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
Modified TO-15 Full Scan/SIM
URS Corporation
Workorder# 1301126R1

Four 6 Liter Summa Canister (SIM Certified) samples were received on January 09, 2013. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the Full Scan and SIM acquisition modes. The method involves concentrating up to 1.0 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	***TO-15***	***ATL Modifications***
ICAL %RSD acceptance criteria	</=30% RSD with 2 compounds allowed out to < 40% RSD	For Full Scan: 30% RSD with 4 compounds allowed out to < 40% RSD For SIM: Project specific; default criteria is </=30% RSD with 10% of compounds allowed out to < 40% RSD
Daily Calibration	+- 30% Difference	For Full Scan: </= 30% Difference with four allowed out up to </=40%.; flag and narrate outliers For SIM: Project specific; default criteria is </= 30% Difference with 10% of compounds allowed out up to </=40%.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

The results for each sample in this report were acquired from two separate data files originating from the same analytical run. The two data files have the same base file name and are differentiated with a "sim" extension on the SIM data file.

Due to the linear calibration range of the instrument, the reporting limit for Heptane was raised from

0.10 ppbv to 0.50 ppbv.

All Quality Control Limit exceedances and affected sample results are noted by flags. Each flag is defined at the bottom of this Case Narrative and on each Sample Result Summary page. Target compound non-detects in the samples that are associated with high bias in QC analyses have not been flagged.

PER CLIENT REQUEST, THE WORK ORDER WAS RE-ISSUED ON JANUARY 23, 2013 TO CORRECT THE TARGET COMPOUND LIST TO REPORT ONLY SIM COMPOUNDS VINYL CHLORIDE, CIS-1,2-DICHLOROETHENE, TRICHLOROETHENE, AND TETRACHLOROETHENE. CHANGING THE COMPOUND LIST CAUSED SOME PREVIOUSLY REPORTED COMPOUNDS TO BECOME NOT REPORTED.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

RE: Technichem

Enclosed are the analytical results for samples received by our laboratory on 01/08/13 . For your reference, these analyses have been assigned laboratory work order number 3A08014 .

All analyses have been performed according to our laboratory's quality assurance program. All results are intended to be considered in their entirety, Moore Twining Associates, Inc. (MTA) is not responsible for use of less than complete reports. Results apply only to samples analyzed.

If you have any questions, please feel free to contact us at the number listed above.

Sincerely,

Moore Twining Associates, Inc.

Notes and Definitions

ug/L	micrograms per liter (parts per billion concentration units)
mg/kg	milligrams per kilogram (parts per million concentration units)
mg/L	milligrams per Liter (parts per million concentration units)
ND	Analyte NOT DETECTED at or above the reporting limit
RPD	Relative Percent Difference

Analysis of pH, filtration, and residual chlorine is to take place immediately after sampling in the field.
If the test was performed in the laboratory, the hold time was exceeded.

LEVEL III Data Validation Report

PROJECT: Technichem

LABORATORY: Moore Twining Associates, Fresno, CA
Subcontracted to BC Laboratories, Inc., Bakersfield, CA

LAB NUMBER: 3C20029

SAMPLES: MW-13, MW-91, Trip Blank

MATRIX: Water

Analysis	Volatile Organic Compounds 8260B
Holding Time	✓
Surrogate Recovery	Note 1
MS/MSD (MW-13)	Note 2
LCS (Blank Spike)	✓
Method Blanks	✓
Duplicates (MW-13 and MW-91)	✓
Trip Blanks	✓
Reporting Limits	Notes 3, 4

✓ – QC criteria were met.

Notes:

1. In the case of the Trip Blank, the surrogate, 1,2-dichloroethene-d4, was recovered above (133%) the QC acceptance range of 75% to 125%. Since no target compounds were reported in the sample, no action was required.

2. The RPD between the reported concentration of chloroethane in the spiked sample (MW-13) of 41.3% exceeded the QC limit of 20%. Chloroethane was not reported in sample MW-13, and no action was taken.

3. Samples MW-13 and MW-91 were re-analyzed at a dilution by factors of 100 and 250, respectively, in order to quantitate tetrachloroethene. The reporting limits were increased by the same factor as the dilution. The reported concentrations exceeded the elevated reporting limits.

4. Concentrations between the MDL And the PQL were flagged "J," estimated.

Summary:

Based on this Level III validation, these data are usable, as qualified, for their intended purpose. None of these data were rejected.

RE: Technichem

Enclosed are the analytical results for samples received by our laboratory on 3/20/2013. For your reference, these analyses have been assigned laboratory work order number 3C20029.

Please find enclosed the official letter of documentation for the EPA 8260 analysis from the subcontracted laboratory, which was received at our laboratory on 4/25/13.

All analyses have been performed according to our subcontractor laboratory's quality assurance program. All results are intended to be considered in their entirety, Moore Twining Associates, Inc. (MTA) is not responsible for use of less than complete reports. Results only apply to samples analyzed.

If you have any questions, Please feel free to contact us at the number listed above.

Sincerely,

Moore Twining Associates, Inc.

Julio Morales
Client Services Supervisor

Specifications

Permit #	Issued Date	Expire Date	Owner Well Id	Hole Diam.	Casing Diam.	Seal Depth	Max. Depth
W2013-0158	03/05/2013	06/06/2013	GW-13	6.00 in.	2.00 in.	15.00 ft	25.00 ft

Specific Work Permit Conditions

1. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.

2. Permittee, permittee's contractors, consultants or agents shall be responsible to assure that all material or waters generated during drilling, boring destruction, and/or other activities associated with this Permit will be safely handled, properly managed, and disposed of according to all applicable federal, state, and local statutes regulating such. In no case shall these materials and/or waters be allowed to enter, or potentially enter, on or off-site storm sewers, dry wells, or waterways or be allowed to move off the property where work is being completed.

3. Compliance with the well-sealing specifications shall not exempt the well-sealing contractor from complying with appropriate State reporting-requirements related to well construction or destruction (Sections 13750 through 13755 (Division 7, Chapter 10, Article 3) of the California Water Code). Contractor must complete State DWR Form 188 and mail original to the Alameda County Public Works Agency, Water Resources Section, within 60 days. Include permit number and site map.

4. Applicant shall submit the copies of the approved encroachment permit to this office within 60 days.

5. Applicant shall contact Steve Miller for an inspection time at (510) 670-5517 or email to stevem@acpwa.org at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.

6. Minimum seal depth (Neat Cement Seal) is 2 feet below ground surface (BGS).

7. Minimum surface seal thickness is two inches of cement grout placed by tremie.

8. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of $500.00.

9. Prior to any drilling activities onto any public right-of-ways, it shall be the applicants responsibilities to contact and coordinate a Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits required for that City or to the County and follow all City or County Ordinances. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County a Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.

Wastes - Hazardous Waste - Test Methods

Test Methods

This Web site provides resources relating to "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", also known as SW-846. This site contains updates about SW-846 and information about the development and approval process of SW-846 methods.

In support of the Resource Conservation and Recovery Act (RCRA) program, EPA employs analytical chemistry and characteristic testing methodologies, environmental sampling and monitoring, and quality assurance.

- SW-846: EPA Waste's official compendium of analytical and sampling methods that have been evaluated and approved for use in complying with RCRA regulations.
- MICE Service: Answers method-related questions and takes comments on technical issues regarding SW-846 methods.
- The Performance-Based Measurement System (PBMS): Aids in selecting the most effective test method.
- The Implementation of the Performance Approach: The adoption of the Performance Based Measurement System (PBMS) to reduce the cost of monitoring, stimulate the development and use of new, more cost-effective monitoring technologies.
- National Environmental Monitoring Conference (NEMC): The annual conference for RCRA environmental monitoring and waste characterization.
- Methods Development and Approval Process: How to publish a method in SW-846.
- Resources: a number of key publications, links, and answers to frequent questions.

Site History

Chromex ceased operations in January 1991. Facility closure activities started in April 1991, and included the removal of eight ASTs that had been located in either a below-grade concrete vault or an aboveground bermed area. The former below grade concrete vault was removed in April 1992, and 40 tons of soil with elevated metals, including chromium, was also removed. Four soil bores were installed in October 1992 to delineate the extent of chromium impacted soils about the vault and only several of the one foot samples contained metals values over potential regulatory concern. Grab groundwater was successfully collected in three of the four bores, all metals results were acceptable; however, several VOCs were detected and were attributed to offsite sources. In December 1994 six soil bores (SB-1 to SB-6) were installed, and three wells were installed (MW-1 to MW-3). Chromium, hexavalent chrome, and lead were detected in soil or groundwater, but below regulatory concern. HVOCs were also present and were ultimately attributed to offsite sources, with similar concentrations.

As part of the closure activities a vertical honing pit was excavated in July 1995 and 75 cubic yards (112.36 tons) of associated soil were removed. Concentrations up to 870 ppm were left in place due to limitations imposed by the building and the sidewalk. In December 1996 well MW-4 was installed in proximity to the honing pit excavation. Three 550-gallon USTs (two gasoline, one diesel and / or motor oil) were removed in October 1995; existing well MW-1 was also used to monitor groundwater for these USTs. The excavation for these USTs was backfilled with imported soil and contaminated soil disposed of under manifest offsite. In 1997 a half buried AST was abandoned in-place; it may have been utilized for storm water. Well MW-3 was decommissioned under permit in February 1999. The three remaining wells were redeveloped and sampled in January 2007. All hydrocarbon concentrations were non-detectable; however, TPHmo was not analyzed for.

Review of the well network does not appear to support downgradient delineation of a dissolved phase plume, and thus an understanding of the site hydrogeology appears to be inadequate. Wells at the site have not been surveyed to Geotracker standards. Wells MW-1 to MW-3 were originally installed to monitor the toxic portion of this site (Chromium, and other contaminants). Well MW-1 has been located in at least two different locations and is stated to be the well that is used to define the downgradient dissolved phase plume extent.. The most recent depicted position of well MW-1 appears to be west of the former USTs. Depending on the well network available (MW-3 was destroyed under permit) , groundwater is documented to flow to either the northwest or to the south. With either groundwater gradient, the well MW-1 appears to monitor a crossgradient position rather than a downgradient position.

No soil analytical data has been collected for TPH gasoline, BTEX, MTBE, TPH diesel, or TPH motor oil outside the source area, thus a vapor intrusion and direct contact LTCP criterias cannot be evaluated. There are a series of reports that have not been submitted to ACEH or Geotracker. These missing reports are cited in several of the available reports and may be useful to understanding the site.

Not all historic documents for the fuel leak case may be available on GeoTracker. A more complete historic case file for this site is located on the Alameda County Environmental Health website at: http://ehgis.acgov.org/dehpublic/dehpublic.jsp.

Site History

The properties at 1401 and 1421 Park Avenue have been utilized as a metal plating facility since 1952. Electro-Coatings, Inc purchased the business in 1963, including the property at 1401 Park (1421 was a leased portion of the business). Environmental investigations relative to the chromium and nickel plating operations have been on-going since at least August 1977. Volatile Organic Compounds were also utilized at the metals plating facility and are a part of the investigations associated with these operations. An extensive file exists, and active remediation was on-going as of June 2006, and is managed by the RWQCB.

This case is specifically focused on two gasoline USTs that were discovered around February 1995 at the 1421 Park Avenue address. The USTs were abandoned in-place to limit interference to then on-going remedial activities related to the metal plating operations. Four Geoprobe bores were installed in October 1997 to investigate the UST related contamination; however, limited data relative to hydrocarbons has been submitted. No other information related to UST issues has been submitted.
