Subject: Data Summary Report for Groundwater Monitoring Activities for the Period from July 1, 2014 through December 31, 2014, Sherwin-Williams Site, 1450 Sherwin Avenue, Emeryville, California, DTSC Docket No. HSA-O&MEA 11/12-096

Dear Ms. Bacey:

The Sherwin-Williams Company is pleased to present the enclosed data summary report for groundwater monitoring activities conducted during the period from July 1, 2014 through December 31, 2014 ("the reporting period"), prepared by ARCADIS U.S., Inc. (ARCADIS) for the Sherwin-Williams Company facility in Emeryville, California ("the Site").

This data summary report is submitted pursuant to the requirements of the Operations and Maintenance Agreement (O&M Agreement) between the Sherwin-Williams Company and the Department of Toxic Substances Control (DTSC) executed on January 23, 2013. The O&M Plan considered that reporting would be conducted on an annual basis after the July 2014 Data Summary Report submission. However, per DTSC's request in communication dated July 1, 2014, this additional Data Summary Report summarizes third and fourth quarter 2014 groundwater monitoring results to continue to evaluate groundwater arsenic trends at the Site. This report presents data collected as part of the established groundwater monitoring program, in accordance with the Operations and Maintenance Plan (O&M Plan), prepared by CDM Smith, dated December 11, 2012 and approved by DTSC in a letter dated December 17, 2012.

The O&M Plan established the groundwater monitoring program for the Site. During the reporting period, groundwater self-monitoring activities were performed by ARCADIS in accordance with the O&M Plan and subsequent DTSC direction. This summary report presents groundwater monitoring data collected during the reporting period.

In accordance with the O&M Plan, and as discussed in the Data Summary Report, groundwater monitoring wells CDM-110 and CDM-111 transitioned from semiannual sampling to annual sampling because criteria were met for reducing the monitoring schedule.

Groundwater samples were collected from 20 monitoring wells during the October 2014 semiannual monitoring event for analysis of dissolved arsenic, and from four wells for analysis of volatile organic compounds, as part of the groundwater sampling event outlined in the O&M Plan. Additionally, contingency quarterly monitoring was conducted at monitoring location CDM-108 in July 2014 in accordance with the Contingency Monitoring letter submitted on July 29, 2014 to reevaluate the statistically increasing groundwater arsenic concentration trend. Data from the current reporting period and historical groundwater monitoring data are presented in the enclosed report.

Although the dissolved arsenic concentration was lower than the previous quarter at well CDM-108, a statistically increasing trend was still observed, and LF-41 and RP-2 had arsenic detections above historical maximums in October 2014, groundwater elevation and sampling data collected post remedy implementation from April 2012 through October 2014 at all other groundwater monitoring locations demonstrate that the remedy at the Site is consistent with the remedy effectiveness criteria, and that contingency actions (other than presented in the Contingency Monitoring letter) are currently not necessary. Site construction and/or operations have not impacted the effectiveness of the remedy components.

If you have any questions, please call Lucas Goldstein of ARCADIS at 510-652-4500 or me at 216-566-1768.

Sincerely,

Larry R. Mencin
Sr. Environmental Project Manager

Dear Mr. Mencin:

On behalf of The Sherwin-Williams Company, ARCADIS U.S., Inc. (ARCADIS) has prepared this report summarizing the groundwater monitoring data collected by ARCADIS at 1450 Sherwin Avenue in Emeryville, California ("the Site"; Figure 1). This report presents data collected as part of the established groundwater monitoring program, in accordance with the Operations and Maintenance Plan (O&M Plan), dated December 11, 2012 (CDM Smith 2012), and under the oversight of the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC). The data were collected between July 1, 2014 and December 31, 2014 ("the reporting period"). Site construction and/or operations have not impacted the effectiveness of the remedy components.

The O&M Plan establishes the groundwater monitoring program for the Site. The O&M Plan was approved by DTSC in a letter dated December 17, 2012 (DTSC 2012).

In agreement with DTSC's letter dated August 22, 2006 (DTSC 2006), this report includes a summary of analytical results from groundwater samples collected during the October 2014 monitoring event conducted to support the South Bayfront Project Area (SBPA), located directly west of the Site (Figure 1). The SBPA site is under a separate agreement between the City of Emeryville and DTSC to conduct its own post remedy implementation groundwater monitoring; monitoring at the SBPA site is conducted by others. These SBPA results are presented in this report per agreement with DTSC primarily as additional information and are not specifically evaluated in conjunction with the results of groundwater monitoring conducted at the Site during the reporting period.

Although the O&M Plan considered that reporting would be conducted on an annual basis after submission of the July 2014 Data Summary Report, per DTSC's request in its comments to the July 2014 Data Summary Report in email dated July 1, 2014, this Data Summary Report summarizes third and fourth quarter 2014 groundwater monitoring results to continue to evaluate groundwater arsenic trends at the Site.

Summary

Groundwater monitoring data were evaluated to determine the effectiveness of the remedy and to determine if contingency actions are needed to achieve cleanup goals. Remedy effectiveness criteria for the Site are provided in Table C-2 of the O&M Plan and in Table 7 of this report[1]. The groundwater monitoring data collected post remedy implementation from April 2012 through October 2014 demonstrated that the remedy is meeting the established effectiveness criteria for the Site, with the exception of an increasing concentration trend that was determined for arsenic in groundwater from well CDM-108. This well first showed an increasing concentration following the October 2013 monitoring event (CDM Smith 2014a). Monitoring well CDM-108 is located along the western property line of the Site, immediately west of the middle slurry wall breach (Figure 1).

As specified in the O&M Plan, if a statistically increasing contaminant of concern (COC) concentration trend is observed, the frequency of monitoring for that well will increase to monthly for 3 months, and the Mann-Kendall trend will be reevaluated using the concentrations from the most recent four monitoring events. Monthly monitoring was initiated at well CDM-108 in early December 2013 and continued through February 2014. Concentrations of arsenic in these three monthly groundwater samples and subsequent sample results from this reporting period continue to show this trend for CDM-108. Proposed contingency action for CDM-108 was presented within the Proposed Contingency Action for Monitoring Well CDM-108 letter submitted to DTSC on July 29, 2014 (CDM Smith 2014c). The proposed contingency action includes quarterly groundwater monitoring for dissolved arsenic at CDM-108 from

[1] Effectiveness criteria for CDM-101 and CDM-102: COC concentrations are less than site cleanup goals or their trends are statistically stable to decreasing for 4 years after remedy implementation, and arsenic is less than 5 milligrams per liter (mg/L) 4 years after remedy implementation.
Effectiveness criteria for CDM-103, CDM-104, CDM-107, CDM-108, CDM-109, CDM-112, RP-1, RP-2, RP-4, RP-5, LF-18, LF-24, LF-25, LF-36, and LF-41: COC concentrations are less than site cleanup goals or their trends are statistically stable to decreasing.

July 2014 through April 2016, and reevaluation of the trend following the July 2015 monitoring event. Contingency monitoring on a quarterly frequency at CDM-108 in accordance with the aforementioned letter began in July 2014.

As presented previously to DTSC, arsenic concentrations reported from well CDM-108 since its installation in April 2012 are consistent with pre remedy implementation observations from a former nearby well (LF-21, abandoned in 2007; see Figure 1), and the increasing arsenic trend from well CDM-108 may not indicate spreading of arsenic in groundwater in the vicinity of CDM-108. The range of arsenic concentrations from CDM-108 (0.032 milligram per liter [mg/L] to 0.23 mg/L) is similar to the range of concentrations observed between 2005 and 2007 from LF-21 (0.011 mg/L to 0.15 mg/L). These concentrations of arsenic in groundwater in this portion of the site groundwater plume, coupled with arsenic present upgradient and downgradient from this area, are considered to be representative of an overall stable to decreasing groundwater plume.

Two monitoring wells (LF-41 and RP-2) had detections of arsenic in groundwater in October 2014 higher than their historically reported values prior to remedy implementation. Although arsenic concentrations in October 2014 were measured above historical maximum concentrations at LF-41 and RP-2, statistical trends post remedy implementation still indicate no trend and are below contingency criteria for implementing active groundwater extraction (Table C-3 of the O&M Plan [CDM Smith 2012]).

Groundwater elevation and sampling data collected post remedy implementation from April 2012 through October 2014 at all other groundwater monitoring locations demonstrate that the remedy at the Site is consistent with the remedy effectiveness criteria, and that contingency actions (other than presented in the Proposed Contingency Action for Monitoring Well CDM-108 letter [Contingency Monitoring letter; CDM Smith 2014c]) are currently not necessary. Site construction and/or operations have not impacted the effectiveness of the remedy components.

As part of the Data Summary Report for the previous period, ARCADIS requested that the monitoring schedule be modified from semiannually to annually for monitoring wells CDM-110 and CDM-111 based on results of the Mann-Kendall trend analyses post remedy implementation. The Data Summary Report for the previous period was approved in the letter from DTSC dated August 11, 2014. Wells CDM-110 and CDM-111 will be monitored as part of the next annual monitoring event to be conducted in April 2015.

Groundwater Monitoring Program

This report presents groundwater monitoring data collected during the July 1, 2014 to December 31, 2014 reporting period. During the reporting period, quarterly groundwater elevations were measured in July and October, a contingency quarterly monitoring event was conducted at monitoring location CDM-108 in July, and a semiannual groundwater quality sampling event was conducted in October.

Work during the reporting period was conducted in accordance with the O&M Plan (CDM Smith 2012), the Quality Assurance Project Plan (QAPP; LFR 2006), the Health and Safety Plan for the Site (ARCADIS 2012), the current Standard Operating Procedure for Groundwater Sample Collection (SOP; CDM Smith 2014b), and the Contingency Monitoring letter (CDM Smith 2014c).

Groundwater Elevation Measurements

ARCADIS conducted two separate quarterly water-level measurement events during the reporting period. Groundwater elevation data obtained during the reporting period are presented in Table 1. For reference, well construction details are also included in Table 1. Groundwater elevations and interpreted contour intervals for the two quarterly water-level measurement events are presented on Figures 2 and 3. Current and historical groundwater elevation data are provided in Table D-1 of Appendix D.

Groundwater elevations were measured on a quarterly basis from July to December 2014 as specified in the O&M Plan (CDM Smith 2012). In accordance with the O&M Plan, and because groundwater movement patterns have been consistent with the projected groundwater model design conditions, water-level measurement events were transitioned from monthly to quarterly starting with the July 2013 water-level measurement event. If groundwater flow conditions become inconsistent with projected design conditions, monthly collection events will be initiated, per the O&M Plan.

Supplemental to the schedule presented in the O&M Plan, ARCADIS measured groundwater elevations at additional monitoring wells during the monitoring events to further monitor water-level trends at the Site. Details for each event are provided below:

- On July 8, 2014 and October 27, 2014, depth-to-water measurements were collected at 35 monitoring wells and two piezometers. All wells required to be monitored in accordance with the O&M Plan were measured during the quarterly

water-level events. Supplemental to the monitoring schedule presented in the O&M Plan, the following wells were also gauged for depth to groundwater during the quarterly water-level events: upgradient wells LF-13, LF-27, and LF-29, and downgradient off-site well MD-5 (located on the SBPA site, directly west of the Site [Figure 1]).

- During the October 27, 2014 water-level monitoring event, the water-level sounders used to measure the depth to groundwater at the Site and the SBPA site were calibrated to each other. The water-level sounder calibration was conducted by field personnel teams for each site at well MD-5, located on the SBPA site, before the event began. Based on the results of the calibration, the other field personnel teams adjusted their depth-to-water measurements to match the ARCADIS depth-to-water measurements.

Groundwater Quality Sampling

ARCADIS performed groundwater quality sampling on July 8, 2014 (quarterly event) and October 27 through October 31, 2014 (semiannual event). In accordance with the Contingency Monitoring letter, ARCADIS performed groundwater quality sampling at CDM-108 on July 8, 2014.

In accordance with the O&M Plan, groundwater samples collected during the sampling events were analyzed for dissolved arsenic using United States Environmental Protection Agency (EPA) Method 6010B. Groundwater samples (CDM-101, CDM-102, CDM-107, and CDM-108) collected during the October 2014 semiannual monitoring event were also analyzed for volatile organic compounds (VOCs) using EPA Method 8260B. Analytical results are presented in Table 2 for VOCs and Table 3 for laboratory-filtered dissolved arsenic concentrations. Figure 4 presents the arsenic concentrations detected in groundwater samples collected from the monitoring wells sampled during the July and October 2014 events. Complete analytical results for the reporting period are presented in Appendix C. Field parameters collected during groundwater sampling (temperature, pH, and specific conductance, dissolved oxygen, oxidation-reduction potential, and turbidity) are presented in Table B-1 of Appendix B. Appendix D Tables D-2 through D-4 present current and historical analytical data collected at the Site.

Groundwater Sampling Methods

In accordance with the QAPP (LFR 2006) and the current SOP (CDM Smith 2014b) approved by DTSC (DTSC 2014a), monitoring wells were purged using a submersible

pump and sampled using HydraSleeves™ during the July and October 2014 monitoring events.

A minimum of three well-casing volumes of water was purged from each monitoring well before sampling. Field parameters were also recorded during purging. Wells were sampled once stabilization of temperature, pH, and specific conductance parameters was achieved and the initial well volume recovered to a minimum of 80% (or for a minimum of 2 hours and a maximum of 24 hours [LFR 2006]). All wells recovered to a minimum 80% of the initial well volume within 2 hours of purging.

The samples designated for chemical analysis were analyzed according to EPA method protocol by Curtis & Tompkins, Ltd., a state-certified analytical laboratory located in Berkeley, California. Appendix A includes a quality assurance/quality control (QA/QC) review of groundwater sampling and analytical results. Analytical laboratory reports and chain-of-custody forms for field and QA/QC samples are presented in Appendix F. Field data sheets and other QA/QC data are kept on file and available upon request.

Quality Assurance/Quality Control

In accordance with the QAPP (LFR 2006), QA/QC measures were implemented to maintain data quality and minimize the potential for field and laboratory cross contamination of samples. QA/QC procedures include collecting duplicate samples, HydraSleeve™ and submersible pump rinsate samples, trip blanks, and a water blank sample; controlling sampling order; and using single-use disposable sampling equipment (i.e., HydraSleeves™). Tables A-1 and A-2 provide user data typically included in laboratory reports and were prepared for the reporting period (Appendix A).

No QA/QC issues were encountered during the July 2014 quarterly event. The QA/QC issues encountered during the October 2014 semiannual event are summarized in Appendix A Tables A-1b and A-2b. Aside from the analytes mentioned in Appendix A Table A-2b, no other analytes were detected above laboratory reporting limits in any of the QA/QC samples, and the relative percent differences in concentrations of analytes between the primary and duplicate groundwater samples collected during the sampling events were below 30%.

Groundwater Results from the South Bayfront Project Area

The SBPA is the property located nearby to the west of the Site. The southern portion of the SBPA is bounded to the north by Temescal Creek and a portion may be

considered hydraulically related to the Site. Five groundwater monitoring wells are located within the southern portion of the SBPA; a figure from the Annual 2013 Groundwater Monitoring Report (Erler & Kalinowski, Inc. [EKI] 2013) showing the monitoring network associated with the SBPA site is provided in Appendix G. Selected analytical results from the most recent groundwater monitoring event conducted at the SBPA in October 2014 are summarized in the following table.

Well ID	Date Measured or Sampled	Groundwater Elevation (ft NAVD 88)	Arsenic (mg/L)	Total VOCs (mg/L)	TPHd (mg/L)
MD1 (SLR)	10/27/14	7.80	0.049	0.510[a]	2.5
MD2 (SLR)	10/27/14	4.52	0.019/ 0.02 [DUP]	ND/ ND [DUP]	2.7 Y/ 2.9 Y [DUP]
MD3 (SLR)	10/27/14	5.08	0.26	0.05[b]	1.6 Y
MD4 (SLR)	10/27/14	7.81	<0.005	ND	0.14 Y
MD5 (EKI)	10/27/13	5.48	0.00977/ 0.00971 [DUP]	ND/ ND [DUP]	--

Notes:

ft NAVD 88 = feet relative to North American Vertical Datum of 1988

mg/L = milligrams per liter

[a] Methyl tertiary-butyl ether detected at 0.0018 mg/L, benzene detected at 0.2 mg/L, toluene detected at 0.002 mg/L, chlorobenzene detected at 0.27 mg/L, isopropylbenzene detected at 0.017 mg/L, propylbenzene detected at 0.017 mg/L, and sec-butylbenzene detected at 0.0019 mg/L

[b] Acetone detected at 0.05 mg/L.

DUP = duplicate

ND = not detected; reporting limit not provided

< = less than reporting limit provided

-- = sample not analyzed for given compound

Y = sample exhibits chromatographic pattern that does not resemble standard

SLR = monitoring results were provided by SLR Consulting.

EKI = monitoring results were provided by Erler & Kalinowski, Inc.

Groundwater Remedy Effectiveness

Groundwater monitoring data were evaluated to determine the effectiveness of the remedy and to determine if contingency actions are needed to achieve cleanup goals; these data are presented in Table 7 and summarized below.

Although the dissolved arsenic concentration was lower than the previous quarter at well CDM-108, a statistically increasing trend was still observed. The groundwater

elevation and sampling data collected post remedy implementation at all other groundwater monitoring locations from April 2012 through October 2014 demonstrate that the remedy at the Site is consistent with the remedy effectiveness criteria. CDM-108 is currently being monitored quarterly in accordance with the Contingency Monitoring letter (CDM Smith 2014c) approved by DTSC in July 2014 (DTSC 2014b).

Groundwater Quality Effectiveness Criteria

Groundwater quality effectiveness criteria are summarized in Table C-2 of the O&M Plan (CDM Smith 2012). With the exception of trend analyses criteria identified for monitoring location CDM-108, all wells with effectiveness criteria indicated that COC concentrations are below cleanup goals and/or COC concentration trends are statistically stable to decreasing.

Table 7 provides a summary of evaluation criteria wells and their status with respect to the October 2014 semiannual event results. Effectiveness criteria wells with arsenic concentrations above their cleanup goals are CDM-101, CDM-108, CDM-109, RP-1, RP-2, LF-36, and LF-41. Monitoring wells CDM-101, CDM-109, RP-1, RP-2, LF-36, and LF-41 indicated no trend (i.e., statistically stable) for arsenic concentrations post remedy implementation. These findings indicate that stabilizing conditions exist at the majority of the Site.

Laboratory results for arsenic from samples collected during the reporting period from groundwater wells that existed prior to remedy implementation were within historical arsenic concentration ranges with the exception of the concentrations of arsenic at wells LF-41 and RP-2. Arsenic concentrations at monitoring wells that were installed during remedy implementation (CDM-101 through CDM-114) are less than historically reported concentrations for monitoring wells that previously existed within the vicinity of these wells.

As shown in Table 4, arsenic concentration trends calculated using the Mann-Kendall trend evaluation method (Gilbert 1987) performed for arsenic concentrations over the entire period at wells existing pre remedy implementation indicate statistically stable or decreasing arsenic concentration trends for all wells (that have sufficient data to establish a trend) except MW-3, RP-2, and RP-4. As shown in Table 5, the results of the Mann-Kendall trend analyses post remedy implementation indicate no trend for monitoring wells MW-3 and RP-2 and a decreasing concentration trend for monitoring well RP-4. These findings are indicative of stabilizing conditions at wells MW-3 and RP-4, as arsenic concentrations post remedy implementation are not detected above historical maximum concentrations. Although arsenic concentrations in October 2014

were measured above historical maximum concentrations at LF-41 and RP-2, statistical trends post remedy implementation still indicate no trend and are still below contingency criteria for implementing active groundwater extraction (Table C-3 of the O&M Plan [CDM Smith 2012]).

Results of the Mann-Kendall trend analysis continue to indicate a statistically increasing concentration trend for arsenic in groundwater at CDM-108, based on groundwater data collected post remedy implementation (Table 5). Concentrations of arsenic at monitoring well CDM-108 have ranged from 0.032 mg/L in April 2012 to 0.22 mg/L (0.23 mg/L in duplicate sample) in July 2014; the most recent detection was 0.17 mg/L in October 2014. Arsenic concentration trend plots for CDM-108 are provided in Appendix E. Concentrations of arsenic in groundwater at CDM-108 are well below contingency criteria for implementing active groundwater extraction (0.50 mg/L).

VOC concentrations detected in samples collected from evaluation criteria wells at or above their cleanup goals during the October 2014 semiannual monitoring event were 1,2-dichloroethane at CDM-101 (0.0008 mg/L) and CDM-102 (0.0011 mg/L); these concentrations are above the cleanup goal of 0.0005 mg/L. Consistent with historical observation, VOC concentrations attenuate across the Site and continue to be below the cleanup goals near the downgradient site boundary.

Groundwater Movement Effectiveness Criteria

Groundwater movement effectiveness criteria, as summarized in Table C-2 of the O&M Plan, are being met at the Site. Based on groundwater elevations collected at the Site from April 2012 through October 2014, groundwater movement patterns are consistent with the projected design conditions (CDM Smith 2012). Data collected post remedy implementation demonstrate the effectiveness of the slurry wall segments to divert groundwater, the effectiveness of the slurry wall breaches to facilitate groundwater movement without mounding, and the effectiveness of high-permeability backfill placement to control groundwater movement westward at the Rifkin/Sherwin-Williams property line between CDM-101/CDM-102 and PZ-101/CDM-104. In addition, depths to groundwater at monitored site wells have been consistently greater than 3 feet below ground surface post remedy implementation.

Arsenic mass flux was calculated within the excavated and backfilled area between CDM-101 and CDM-102 using groundwater monitoring data collected at the Site from April 2012 through October 2014 and is presented in Table 6. The net arsenic mass flux evaluation through the CDM-101/CDM-102 area indicates movement of arsenic

away from the former Rifkin property toward the Sherwin-Williams property and a total arsenic mass through the transect of approximately 7.40×10^{-4} pounds per year from April 2012 through October 2014. These results are indicative of remedy effectiveness based on maintaining a net mass flux from the former Rifkin property to the Sherwin-Williams property.

Closing

In accordance with the O&M Plan and subsequent DTSC direction, the following activities will be performed during the next reporting period (January 2015 through April 2015): quarterly groundwater elevation collections are scheduled to be performed in January 2015, and annual groundwater sampling is scheduled to be performed in April 2015. Groundwater monitoring for monitoring well CDM-108 will continue on a quarterly basis and is scheduled to be performed in January and April 2015 within the next reporting period. The next data summary report, for the first half of 2015, will be submitted on July 31, 2015.

If you have any questions or comments regarding the contents of this report, please call Larry Mencin of Sherwin-Williams at 216.566.1768 or Lucas Goldstein of ARCADIS at 510.596.9535.

Sincerely,

Table 2
Volatile Organic Compounds (EPA 8260) in Groundwater Monitoring Wells, Fourth Quarter 2014
The Sherwin-Williams Company
Emeryville, California

Concentrations reported in milligrams per liter (mg/L)

Well Number	Date Sampled	1,1,1-TCA	1,2-DCA	1,2-DCP	2-Hexa-none	Acetone	Benzene	Chloro-benzene	Chloro-form	cis-1,2-DCE	Ethyl-benzene	Methyl Ethyl Ketone	PCE	Toluene	trans-1,2-DCE	TCE	Vinyl Chloride	Xylenes, Total

Data QA/QC performed by OM.

Notes:

< = Analyte was not detected at or greater than the detection limit reported.

DUP = Duplicate sample (field duplicate)

J = Concentration is estimated.

U5 = Quantified as nondetect (U) based on field blank contamination evaluation.

U12 = Quantified as nondetect (U) based on source water contamination evaluation.

Abbreviations for analytes:

1,1,1-TCA = 1,1,1-Trichloroethane
1,1,2-TCA = 1,1,2-Trichloroethane
1,1-DCA = 1,1-Dichloroethane
1,1-DCE = 1,1-Dichloroethene
1,2,4-TMB = 1,2,4-Trimethylbenzene
1,2-DCA = 1,2-Dichloroethane
1,2-DCB = 1,2-Dichlorobenzene
1,2-DCP = 1,2-Dichloropropane
1,3,5-TMB = 1,3,5-Trimethylbenzene
cis-1,2-DCE = cis-1,2-Dichloroethene
PCE = Tetrachloroethene
trans-1,2-DCE = trans-1,2-Dichloroethene
TCE = Trichloroethene
MTBE = Methyl tertiary-butyl ether

Emeryville, California

Concentrations reported in milligrams per liter (mg/L)

DTSC Cleanup Goal (mg/L)			0.036
Well Number	**Notes**	**Date Sampled**	**Arsenic**

Data QA/QC performed by EW.

Notes:

Samples were analyzed using EPA Method 6010B.

< = Analyte was not detected at or greater than the detection limit reported.

DUP = Duplicate sample (field duplicate)

Screening levels shown are the DTSC cleanup goals assigned to the Sherwin-Williams site.

Results shown in bold are above the DTSC cleanup goal for arsenic.

Table 4
Mann-Kendall Trend Test Evaluation for Arsenic in Groundwater
Pre- and Post-Remedy Data through October 2014
The Sherwin-Williams Company
Emeryville, California

Location	Number of Samples	Number of Detections	Sum of Trend	Trend	Date Last Sampled
LF-36	48	43	-154	No Trend	10/31/2014
LF-37	36	20	-56	No Trend	10/28/2014
LF-40	36	24	34	No Trend	10/28/2014
LF-41	36	34	114	No Trend	10/28/2014
LF-42	36	19	-203	Decreasing	10/30/2014
MW-3	63	60	944	Increasing	10/30/2014
RP-1	67	65	-168	No Trend	10/31/2014
RP-2	70	61	842	Increasing	10/30/2014
RP-3	59	27	-429	Decreasing	10/28/2014
RP-4	73	64	1091	Increasing	10/30/2014
RP-5	64	51	88	No Trend	10/30/2014

Notes:

One-half of the detection limit is assumed as the actual value when the result is below the detection limit. In the case of duplicate sample results, only the primary sample result was used.

The 0.05 confidence limit is used to evaluate trend.

When the number of observations (sample size, "n") is greater than 40, a normal approximation to the Mann-Kendall test is used (Gilbert 1987). This approximation entails calculating the variance of S and using a normal distribution to test for trend.

Table 5
Mann-Kendall Trend Test Evaluation for Arsenic in Groundwater, Post-Remedy Data
April 2012 through October 2014
The Sherwin-Williams Company
Emeryville, California

Location	Number of Samples	Number of Detections	Sum of Trend	Trend	Date Last Sampled

Table 5
Mann-Kendall Trend Test Evaluation for Arsenic in Groundwater, Post-Remedy Data
April 2012 through October 2014
The Sherwin-Williams Company
Emeryville, California

Location	Number of Samples	Number of Detections	Sum of Trend	Trend	Date Last Sampled

Notes:

One-half of the detection limit is assumed as the actual value when the result is below the detection limit. In the case of duplicate sample results, only the primary sample result was used.

The 0.05 confidence limit is used to evaluate trend.

When the number of observations (sample size, "n") is greater than 40, a normal approximation to the Mann-Kendall test is used (Gilbert 1987). This approximation entails calculating the variance of S and using a normal distribution to test for trend.

Mann-Kendall analysis requires a minimum of four results to establish a trend. Trends were not performed for locations with less than four detections; these locations were identified as insufficient detects. All locations with insufficient detects are currently below the cleanup goal for arsenic, or are currently non-detect at a reporting limit below the cleanup goal.

Table 6
Arsenic Mass Flux in Groundwater
The Sherwin-Williams Company
Emeryville, California

Depth-to-Water Measurement Date	Sampling Date	Arsenic in Groundwater at CDM-101 (mg/L)	Arsenic in Groundwater at CDM-102 (mg/L)	C (mg/L)	K (cm/s)	i (cm/cm)	Width of transect (ft)	Saturated Thickness of Transect (ft)	A (ft^2)	CF (ft/cm)/[(sec/day) (L/ft^3)(g/mg)]	w (g/day)

Average arsenic mass through transect (g/day):											**-9.20E-04**
Total annual arsenic mass through transect (based on average g/day, lb/year)											*-7.40E-04*

Notes:

Chemical mass flux through transect is calculated by (CDM Smith 2012): w = (C) (K) (i) (A) (CF)

C = concentration of chemical through transect: as stated in Section C.5.5 of O&M Plan (CDM Smith 2012), if groundwater movement is away from the former Rifkin property, C will be the average concentration of CDM-101 and CDM-102. For non-detect values, half of the reporting limit was used in the calculation

K = hydraulic conductivity: hydraulic conductivity of low permeability backfill; K value from Appendix N of the Remedy Design Implementation Plan (CDM 2011).

i = hydraulic gradient: hydraulic gradient is the average hydraulic gradient between CDM-101 and RP-3, and CDM-102 and RP-3 for each water-level event. Negative hydraulic gradient indicates flow of groundwater is away from former Rifkin property toward Sherwin-Williams property.

A = cross-sectional area associated with the transect: area is calculated using distance of CDM-101 and CDM-102, and the average saturated thickness of the transect; saturated thickness is the average saturated thickness of CDM-101 and CDM-102 during each water-level measurement event.

CF = conversion factor, 80.3 (ft/cm)/(sec/day)(L/ft^3)(g/mg); (CDM Smith 2012)

w = chemical mass through transect mg = milligram cm = centimeter ft = feet lb = pounds

< = non-detect at reporting limit shown L = liter s = second g = grams

Data entered by MG, QC by ENW.

Table 7
Groundwater Quality Remedy Effectiveness Evaluation Summary
through Fourth Quarter 2014
The Sherwin-Williams Company
Emeryville, California

Well[1]	Remedy Effectiveness Evaluation Criteria	Current Effectiveness Status	Arsenic less than CG?	VOCs less than CG?	Historical Arsenic Trend [6]	Post-Remedy Arsenic Trend	Max. Arsenic Conc. Prior to and During Remedy Implementation (mg/L)	Max. Arsenic Conc. Post Remedy Implementation (mg/L)	Most Recent Arsenic Conc. (mg/L)
Former Rifkin Property									
CDM-101	COC concentrations are less than site cleanup goals or their trends are statistically stable to decreasing four years after remedy implementation, and arsenic is less than 5 mg/L four years after remedy implementation	Meets Criteria [5]	No	No[2]	NA	No Trend	NA	0.05	0.049/0.05[DUP]
CDM-102	COC concentrations are less than site cleanup goals or their trends are statistically stable to decreasing four years after remedy implementation, and arsenic is less than 5 mg/L four years after remedy implementation	Meets Criteria [5]	Yes	No[3]	NA	Insufficient Detections	NA	0.0076	0.0076

CDM-112 [7]	COC concentrations are less than site cleanup goals or their trends are statistically stable to decreasing	Meets Criteria	Yes	Yes [7]	NA	Insufficient Data	NA	< 0.005	< 0.005
Union Pacific Property									
LF-24 [7]	COC concentrations are less than site cleanup goals or their trends are statistically stable to decreasing	Meets Criteria	Yes	Yes [7]	Decreasing	Insufficient Data	0.024	< 0.005	< 0.005
LF-25 [7]	COC concentrations are less than site cleanup goals or their trends are statistically stable to decreasing	Meets Criteria	Yes	Yes [7]	Decreasing	Insufficient Data	0.16	0.031	0.021

Notes:
All arsenic concentrations presented in mg/L.
Groundwater quality effectiveness based on criteria established in O&M Plan (CDM Smith 2012).
1 - Table limited to wells with established groundwater quality remedy effectiveness evaluation criteria; see O&M Plan Table C-2.
2 - 1,2-dichloroethane detected at 0.0008 mg/L in October 2014; cleanup goal for 1,2-dichloroethane is 0.0005 mg/L.
3 - 1,2-dichloroethane detected at 0.0011 mg/L in October 2014; cleanup goal for 1,2-dichloroethane is 0.0005 mg/L.
4 - 1,2-dichloroethane detected at 0.0008 mg/L in April 2014; cleanup goal for 1,2-dichloroethane is 0.0005 mg/L.
5 - Meets criteria based on natural attenuation remedy; VOC trends will be evaluated during 5-year review.
6 - Trend includes pre remedy implementation data.
7 - Not monitored during October 2014 event.
a - Designated Rifkin Guard Well.
COC - contaminant of concern
[DUP] - duplicate sample for same event
mg/L - milligram per liter
VOCs - volatile organic compounds
Conc. - concentration
CG - cleanup goal: 0.036 mg/L for arsenic, varies for VOCs

Mann-Kendall analysis requires a minimum of four results to establish a trend. Trends were not performed for locations with less than four detections; these locations were identified as insufficient detects.
All locations with insufficient detects are currently below the cleanup goal for arsenic, or are currently non-detect at a reporting limit below the cleanup goal.
NA - not available. CDM-101 through CDM-114 were installed in 2012 as part of remedy implementation.

- ☐ TPH gasoline by EPA Method 8260
- ☐ TPH diesel by EPA Method 8015 modified
- ☐ TPH motor oil by EPA Method 8015 modified

Is the lab state-certified for the above analytical method(s)?	☑ Yes ☐ No
Were analyses performed according to standard methods?	☑ Yes ☐ No
Were sample holding times met?	☑ Yes ☐ No
Were all reported analytical results values above MDLs?	☑ Yes ☐ No
Were QA/QC samples (i.e., blanks, field replicates, spikes, and surrogates) analyzed in accordance and consistent with the analytical method?	☑ Yes ☐ No
Did QA/QC results meet all acceptance criteria?	☑ Yes ☐ No
Are QA/QC results and acceptance criteria on file?	☑ Yes ☐ No

For any questions above answered with "No", please provide an explanation: *

Table A-2b
Summary of Analytical QA/QC - Fourth Quarter 2014
Groundwater Extraction and Monitoring Wells
The Sherwin-Williams Company, Emeryville, California

Site Name:	**Site Address:**	**Monitoring Period Covered:**
The Sherwin-Williams Facility (EM002616.0014)	1450 Sherwin Avenue Emeryville, California	October 1, 2014 through December 31, 2014

Sampling Performed By: Miljan Draganic and Miguel Gomez
Lab Name: Curtis & Tompkins, Ltd.
Lab Address: 2323 Fifth Street, Berkeley, California 94710
Lab Contact: Tracy Babjar
Lab Telephone Number: (510) 486-0900

Analytical QA/QC Performed By:
Firm Name: ARCADIS U.S., Inc.
Firm Address: 1100 Olive Way, Suite 800, Seattle, WA 98101
Firm Contact: Erica Whiting
Firm Telephone Number: (206) 726-4743

Analytical Method Used: (check applicable methods)

- [x] Arsenic by EPA Method 6010 B
- [ ] Cadmium by EPA Method_____
- [ ] Chromium (total) by EPA Method_____
- [ ] Chromium (hexavalent)
- [ ] Copper by EPA Method_____
- [ ] Lead by EPA Method_____
- [ ] Mercury by EPA Method_____
- [ ] Nickel by EPA Method_____
- [ ] Selenium by EPA Method_____
- [ ] Silver by EPA Method_____
- [ ] Zinc by EPA Method_____
- [ ] Halogenated Volatile Organics by EPA Method 601 or 8010
- [ ] Aromatic and Unsaturated Volatile Organics by EPA 602 or 8020
- [x] Volatile Organics by EPA Method 624 or 8240 or 8260
- [ ] Semivolatile Organics by EPA Method 625 or 8270
- [ ] EDB and DBCP by EPA Method 504
- [ ] TPH gasoline by EPA Method 8260
- [ ] TPH diesel by EPA Method 8015 modified
- [ ] TPH motor oil by EPA Method 8015 modified

Is the lab state-certified for the above analytical method(s)?	[x] Yes [ ] No
Were analyses performed according to standard methods?	[x] Yes [ ] No
Were sample holding times met?	[x] Yes [ ] No
Were all reported analytical results values above MDLs?	[x] Yes [ ] No
Were QA/QC samples (i.e., blanks, field replicates, spikes, and surrogates) analyzed in accordance and consistent with the analytical method?	[x] Yes [ ] No
Did QA/QC results meet all acceptance criteria?	[x] Yes [ ] No
Are QA/QC results and acceptance criteria on file?	[x] Yes [ ] No

Table A-2b
Summary of Analytical QA/QC - Fourth Quarter 2014
Groundwater Extraction and Monitoring Wells
The Sherwin-Williams Company, Emeryville, California

Site Name:	Site Address:	Monitoring Period Covered:
The Sherwin-Williams Facility (EM002616.0014)	1450 Sherwin Avenue Emeryville, California	October 1, 2014 through December 31, 2014

For any questions above answered with "No", please provide an explanation: *

-The analytical laboratory reported that many analytes were detected between the method detection limit and the reporting limit in the method blank for batch 217173; these analytes were not detected in samples at or above the reporting limit; therefore, no corrective actions were necessary.

-Common laboratory contaminant compound acetone, and compounds benzene, toluene, and 2-hexanone were detected in the blank samples listed below. Where compounds were detected in blanks, associated groundwater samples collected may be qualified. In accordance with the Quality Assurance Project Plan (QAPP; LFR 2006), field sample results are considered positive results only if the concentrations in the field sample exceed 10 times the maximum amount detected in their associated blank for common laboratory contaminants, and exceed 5 times the maximum amount detected in their associated blank for other compounds. If the detected concentration in a field sample is less than 5 or 10 times the concentration detected in the blank, then the result was qualified non-detect. Because acetone was detected in the field blank and associated samples in estimated concentrations, groundwater samples associated with the field blanks were qualified as non-detect equal to their respective reporting limits.

-Acetone was detected at a concentration of 0.0011 mg/L in the trip blank sample submitted on October 29, 2014. In accordance with the QAPP, samples collected during the same day may be qualified. Acetone was detected in the primary and duplicate samples from CDM-101, and in the sample from CDM-102. Because the acetone detections in the source and submersible field blank samples were higher than the trip blank sample, these detections of acetone were qualified as described below.

-Acetone, benzene, toluene, and 2-hexanone were detected at a concentration of 0.02 mg/L, an estimated concentration of 0.0001 mg/L, an estimated concentration of 0.0003 mg/L, and an estimated concentration of 0.0006 mg/L, respectively, in the HydraSleeve field blank sample collected from associated monitoring well CDM-102. Acetone, benzene, toluene, and 2-hexanone were also detected at a concentration of 0.021 mg/L, an estimated concentration of 0.0001 mg/L, an estimated concentration of 0.0003 mg/L, and an estimated concentration of 0.0007 mg/L, respectively, in the submersible pump field blank sample. Acetone was detected at estimated concentrations of 0.0006 mg/L and 0.0009 mg/L in the sample collected from CDM-102. Because the acetone result in CDM-102 was less than 10 times the blank concentration, the result was qualified as non-detect with a reporting limit of 0.01 mg/L.

-Acetone, toluene, and 2-hexanone were detected at a concentration of 0.015 mg/L, an estimated concentration of 0.0003 mg/l, and an estimated concentration of 0.0004 mg/L, respectively, in the source blank sample collected on October 29, 2014. In accordance with the QAPP, samples collected within the same batch as the water blank sample may be qualified. Acetone was detected in the primary and duplicate samples from CDM-101 at estimated concentrations of 0.0008 mg/L and 0.0009 mg/L, respectively. Because the acetone results in CDM-101 were less than 10 times the blank concentration, the results were qualified as non-detect with a reporting limit of 0.01 mg/L.

Table C-1
Complete Analytical Results for Groundwater Monitoring Wells, July and October
(Third and Fourth Quarter 2014 Monitoring)
The Sherwin-Williams Company
Emeryville, California

Well Number	Sample Date	Analytical Group (Method)	Analyte	Result	Quals	Detection Limit	Units	Field Sample ID

Notes:

< = Analyte was not detected at or greater than the detection limit reported

ug/L = micrograms per liter

Abbreviations:

DUP = Duplicate sample (field duplicate)

Data Qualifiers:

U = Not detected at or greater than the detection limit reported

J = Concentration is estimated

U5 = Qualified as nondetect (U) based on field blank contamination evaluation.

U12 = Quantified as nondetect (U) based on source water contamination evaluation.

Data updated by MSM. Proofed by EW

Notes:

ft = Feet
NM = Not measured

(a) Measurement taken at higher high tide

(b) Measurement taken at lower low tide

(c) Measurement taken at lower high tide

(d) Suspect that depth to groundwater was measured in LF-B3 instead of LF-21 on August 17, and September 6, 14, 21, and 28, 2007, due to a field oversight

(e) South Bayfront Project Area (SBPA) well monitored by SLR consulting

(f) SBPA well monitored by EKI personnel

(1) Depth to water measurement determined not to be accurate due to damaged well casing.

(2) The depth to water measurement made in LF-B5 on April 9, 2009 was determined to be erroneous: well LF-B5 was remeasured on April 17, 2009.

Table D-2
Summary of Historical Volatile Organic Compounds (EPA Methods 8240 and 8260*) in Groundwater Monitoring Wells
The Sherwin-Williams Company
Emeryville, California

Concentrations reported in milligrams per liter (mg/L)

Well Number	Date Sampled	1,1,1-TCA	1,2-DCA	1,2-DCP	2-Hexa-none	Acetone	Benzene	Chloro-benzene	Chloro-form	cis-1,2-DCE	Ethyl-benzene	Methyl Ethyl Ketone	PCE	Toluene	trans-1,2-DCE	TCE	Vinyl Chloride	Xylenes, Total

Data QA/QC performed by EW.

Notes:

* = Analysis changed from EPA Method 8240 to EPA Method 8260 beginning in February-March 1998 (First Quarter 1998).

< = Analyte was not detected at or greater than the detection limit reported.

ND = Not detected (no associated detection limit was reported)

na = Not analyzed

DUP = Duplicate sample (field duplicate)

(a) Concentrations for LF-B1 may not represent B-zone water quality because LF-B1 is screened in the aquitard between the A- and B-zones.

(b) Concentrations for LF-B5 may not represent B-zone water quality because LF-B5 is screened in the aquitard between the A- and B- zones.

(c) SBPA well monitored by SLR consulting.

(d) SBPA well monitored by EKI personnel.

RPD = Relative percent difference.

Abbreviations for analytes:

1,1,1-TCA = 1,1,1-Trichloroethane
1,1,2-TCA = 1,1,2-Trichloroethane
1,1-DCA = 1,1-Dichloroethane
1,1-DCE = 1,1-Dichloroethene
1,2,4-TMB = 1,2,4-Trimethylbenzene
1,2-DCA = 1,2-Dichloroethane
1,2-DCB = 1,2-Dichlorobenzene
1,2-DCP = 1,2-Dichloropropane
1,3,5-TMB = 1,3,5-Trimethylbenzene
cis-1,2-DCE = cis-1,2-Dichloroethene
PCE = Tetrachloroethene
trans-1,2-DCE = trans-1,2-Dichloroethene
TCE = Trichloroethene
MTBE = Methl teritary-butyl ether

Data qualifiers:

J= Concentration is estimated.

J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated because surrogate recoveries were outside of control limits.

J4 = Concentration is estimated because RPD was outside of control limit for laboratory control sample.

J10 = Concentration is estimated due to field duplicate RPD outside of control limit.

J11 = Concentration is estimated because it was reported at a concentration less than the detection limit.

R = Quantified as rejected.

U = Quantified as nondetect (U).

U5 = Quantified as nondetect (U) based on field blank contamination evaluation.

U6 = Quantified as nondetect (U) based on trip blank contamination evaluation.

U12 = Quantified as nondetect (U) based on source water contamination evaluation.

(1) = High responses were observed for sec-butylbenzene and p-isopropyltoluene in continuing calibration verification.

All notes are listed at the end of this table; see last page.

Table D-3
Summary of Historical Total Petroleum Hydrocarbons as Diesel and Gasoline and Motor Oil in Groundwater Monitoring Wells
The Sherwin-Williams Company, Emeryville, California
Concentrations reported in milligrams per liter (mg/L)

Well Number	Notes	Date Sampled	Total Petroleum Hydrocarbons as Diesel	Total Petroleum Hydrocarbons as Gasoline	Total Petroleum Hydrocarbons as Motor Oil

Data QA/QC performed by EW.

Notes:

< = Analyte was not detected at or greater than the detection limit reported.

DUP = Duplicate sample (field duplicate).
Y = Sample exhibits chromatographic pattern that does not resemble standard.
na/ND = Data from table provided by EKI and/or SES consultants. Volatile Organic Compounds (VOCs) were not detected above reporting limits; however, individual analyte reporting limits were not provided.

a = Concentrations for LF-B1 may not represent B-zone water quality because LF-B1 is screened in the aquitard between the A- and B-zones.

b = Concentrations for LF-B5 may not represent B-zone water quality because LF-B5 is screened in the aquitard between the A- and B-zones.

c = Unknown hydrocarbon mixture with peak patterns atypical of diesel is quantified as diesel for a range of n-C10 to n-C24.

d = Unknown hydrocarbon mixture with peak patterns atypical of gasoline is quantified as gasoline for a range of n-C07 to n-C12.
e = The concentration reported for diesel is due primarily to the presence of a heavier petroleum product, possibly motor oil.
f = The concentration reported for diesel is due primarily to the presence of a lighter petroleum product (range C06-C12), possibly gasoline.
g = The concentration reported for gasoline is due to the presence of a discrete hydrocarbon peak not indicative of gasoline.
h = The concentration reported for gasoline is due primarily to the presence of a heavier hydrocarbon peak not indicative of gasoline.
i = The concentration reported for diesel is due to the presence of a discrete hydrocarbon peak not indicative of diesel.

j = SBPA well monitored by SLR consulting.

k = SBPA well monitored by EKI personnel.

l = Sample exhibits chromatographic pattern that does not resemble standard for diesel.

Data qualifiers and notes for Total Petroleum Hydrocarbon data:

J= Concentration is estimated.
J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.
J2 = Concentration is estimated because the sample was analyzed outside of holding time.
J3 = Concentration is estimated because surrogate recoveries were outside of control limits.
U = Quantified as nondetect.

J11 = Concentration is estimated because it was reported at a concentration less than the detection limit.

Table D-4
Summary of Historical Inorganic Compounds in Groundwater Monitoring Wells
The Sherwin-Williams Company
Emeryville, California
Concentrations reported in milligrams per liter (mg/L)

Well Number	Notes	Date Sampled	Arsenic	Barium	Beryllium	Cadmium	Lead	Total Chromium	Mercury	Selenium	Silver	Vanadium	Zinc

Data QA/QC performed by EW.

Notes:

Samples were analyzed using EPA Method 200/6000/7000 series for selected metals.

< = Analyte was not detected at or greater than the detection limit reported. For some historical samples, detection limit was not available.

na = Not analyzed

DUP = Duplicate sample (field duplicate)

(a) Concentrations for LF-B1 may not represent B-zone water quality because LF-B1 is screened in the aquitard between the A- and B-zones.

(b) Concentrations for LF-B5 may not represent B-zone water quality because LF-B5 is screened in the aquitard between the A- and B-zones.

(c) The samples collected from wells LF-27 and LF-28 may have inadvertently been switched during field or laboratory procedures, as indicated by the concentrations of arsenic in these samples during the first quarter 2004 monitoring event.
(d) Results of split samples taken on behalf of CDM.

* Three groundwater samples were collected from well CDM-1 on 12/8/06 by Camp Dresser McKee, Inc. (CDM). According to CDM, two groundwater samples were collected from approximately 9.8 feet below top of casing (TOC); the samples were analyzed by two different laboratories by different analytical methods; reported dissolved arsenic concentrations were 9.8 and 11.8 mg/l, as analyzed by EPA Methods 6010B and 1637, respectively. The third groundwater sample (*) was collected from approximately 12.2 feet below TOC, was analyzed by EPA Method 1632, and the reported dissolved arsenic concentration was 12.08 mg/l.

MD-1 through MD-4 are wells monitored by SLR consulting, and MD-5 is monitored by EKI personnel.

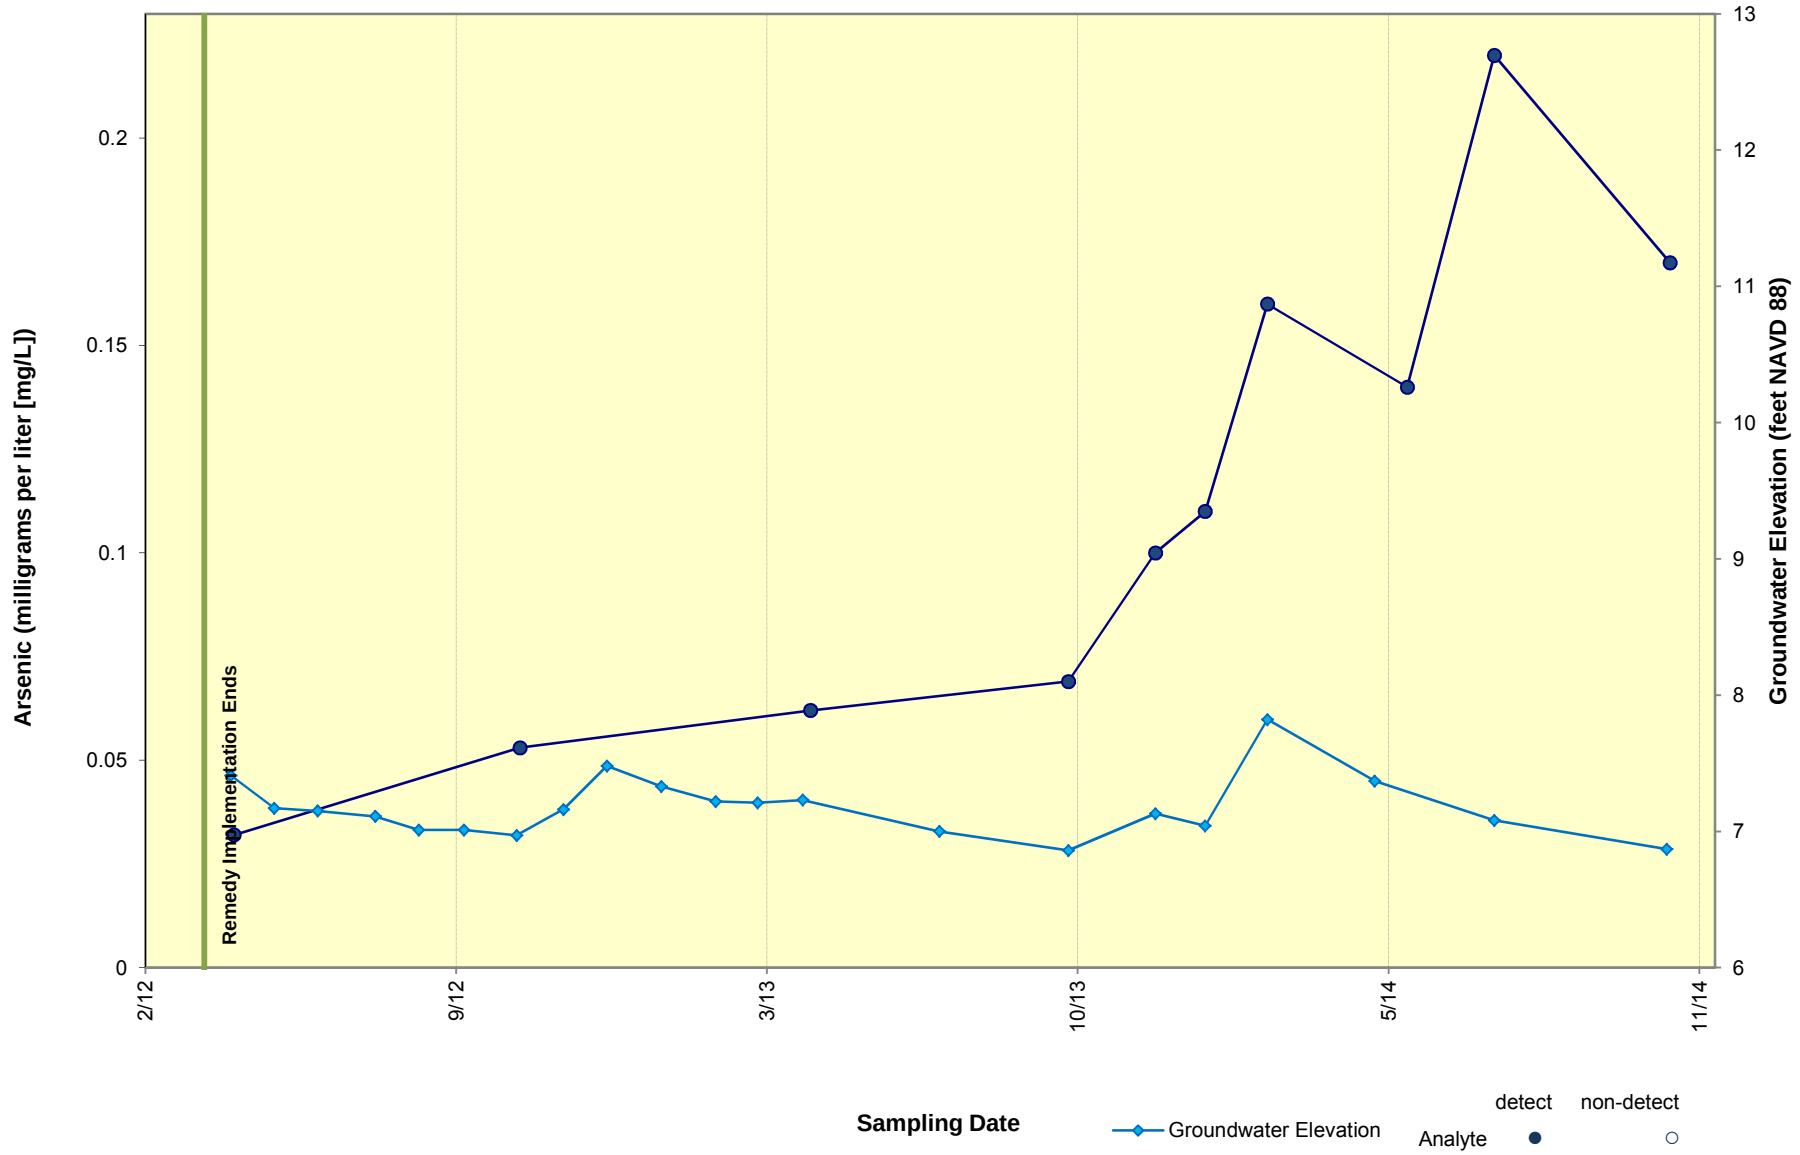
Data Qualifiers:

J = Concentration or detection limit is estimated.

U = Quantified as nondetect.
U5 = Qualified as nondetect (U) based on field blank contamination evaluation.

J8 = Concentration is estimated because laboratory control spike and/or laboratory control duplicate spike percent recoveries were outside of control limits.

UJ8 = Nondetected value is estimated because laboratory control spike and/or laboratory control duplicate spike percent recoveries were outside of control limits.



R = Rejected

F = Field Filtered

CASE NARRATIVE

Laboratory number:	**262086**
Client:	**Arcadis**
Project:	**EM002616.0014.00401**
Location:	**Sherwin Williams-Emeryville**
Request Date:	**10/29/14**
Samples Received:	**10/29/14**

This data package contains sample and QC results for nine water samples, requested for the above referenced project on 10/29/14. The samples were received cold and intact. All data were e-mailed to Erica Whiting on 11/14/14.

Volatile Organics by GC/MS (EPA 8260B):
Many analytes were detected between the MDL and the RL in the method blank for batch 217173; these analytes were not detected in samples at or above the RL. No other analytical problems were encountered.

Metals (EPA 6010B):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**262116**
Client:	**Arcadis**
Project:	**EM002616.0014.00401**
Location:	**Sherwin Williams**
Request Date:	**10/30/14**
Samples Received:	**10/30/14**

This data package contains sample and QC results for ten water samples, requested for the above referenced project on 10/30/14. The samples were received cold and intact. All data were e-mailed to Erica Whiting on 11/06/14.

Metals (EPA 6010B):
No analytical problems were encountered.

Date Opened 10/30 By (print) FJ (sign) FJ
Date Logged in 10/30 By (print) FJ (sign) FJ

1. Did cooler come with a shipping slip (airbill, etc) _____ YES (NO)
Shipping info _____

2A. Were custody seals present? .... ☐ YES (circle) on cooler on samples ☒ NO
How many _____ Name _____ Date _____
2B. Were custody seals intact upon arrival? _____ YES NO (N/A)
3. Were custody papers dry and intact when received? _____ (YES) NO
4. Were custody papers filled out properly (ink, signed, etc)? _____ (YES) NO
5. Is the project identifiable from custody papers? (If so fill out top of form) (YES) NO
6. Indicate the packing in cooler: (if other, describe) _____

☐ Bubble Wrap ☐ Foam blocks ☐ Bags ☒ None
☐ Cloth material ☐ Cardboard ☐ Styrofoam ☐ Paper towels

7. Temperature documentation: * Notify PM if temperature exceeds 6°C

Type of ice used: ☒ Wet ☐ Blue/Gel ☐ None Temp(°C) 1.0°

☐ Samples Received on ice & cold without a temperature blank; temp. taken with IR gun

☒ Samples received on ice directly from the field. Cooling process had begun

8. Were Method 5035 sampling containers present? _____ YES (NO)
If YES, what time were they transferred to freezer? _____
9. Did all bottles arrive unbroken/unopened? _____ (YES) NO
10. Are there any missing / extra samples? _____ YES (NO)
11. Are samples in the appropriate containers for indicated tests? _____ (YES) NO
12. Are sample labels present, in good condition and complete? _____ (YES) NO
13. Do the sample labels agree with custody papers? _____ (YES) NO
14. Was sufficient amount of sample sent for tests requested? _____ (YES) NO
15. Are the samples appropriately preserved? _____ YES NO (N/A)
16. Did you check preservatives for all bottles for each sample? _____ YES NO (N/A)
17. Did you document your preservative check? _____ YES NO (N/A)
18. Did you change the hold time in LIMS for unpreserved VOAs? _____ YES NO (N/A)
19. Did you change the hold time in LIMS for preserved terracores? _____ YES NO (N/A)
20. Are bubbles > 6mm absent in VOA samples? _____ YES NO (N/A)
21. Was the client contacted concerning this sample delivery? _____ YES (NO)
If YES, Who was called? _____ By _____ Date: _____

INTRODUCTION 1

WHAT YOU WILL FIND IN THE BAY-FRIENDLY RATING MANUAL IV

HOW TO USE THIS MANUAL V

A NOTE ON CHANGES VII

DISCLAIMER VII

THE BAY-FRIENDLY LANDCAPING & GARDENING COALITION VII

A. SITE PLANNING 1

1. SELECT AND EVALUATE THE SITE CAREFULLY 1
2. CONSIDER THE POTENTIAL FOR FIRE 4
3. KEEP PLANT DEBRIS ON SITE 6
4. REDUCE AND RECYCLE WASTE 9
5. MINIMIZE SITE DISTURBANCE 10
6. PROVIDE WATER AND/OR SHELTER FOR WILDLIFE 13
7. CONSERVE OR RESTORE NATURAL AREAS & WILDLIFE CORRIDORS 15

B. STORMWATER AND SITE DRAINAGE 19

1. MINIMIZE IMPERVIOUS SURFACES 19
2. DESIGN A SYSTEM TO CAPTURE AND FILTER STORM WATER 23

C. EARTHWORK AND SOIL HEALTH **31**

1. ASSESS THE SOIL AND TEST THE DRAINAGE 31

2. REMOVE AND STORE TOPSOIL BEFORE GRADING 33

3. PROTECT SOIL FROM COMPACTION 35

4. AERATE COMPACTED SOILS 37

5. FEED SOILS NATURALLY & AVOID SYNTHETIC FERTILIZERS 39

6. MULCH 40

7. AMEND THE SOIL WITH COMPOST BEFORE PLANTING 42

8. USE IPM DESIGN AND CONSTRUCTION PRACTICES TO PREVENT PEST PROBLEMS 45

9. KEEP SOIL AND ORGANIC MATTER WHERE IT BELONGS 47

D. MATERIALS **49**

1. USE SALVAGED ITEMS & RECYCLED CONTENT MATERIALS 49

2. REDUCE AND RECYCLE LANDSCAPE CONSTRUCTION WASTE 54

3. REDUCE THE HEAT ISLAND EFFECT WITH COOL SITE TECHNIQUES 59

4. DESIGN LIGHTING CAREFULLY 61

5. CHOOSE AND MAINTAIN EQUIPMENT FOR FUEL CONSERVATION 65

6. SPECIFY LOW EMBODIED ENERGY PRODUCTS. 66

7. USE INTEGRATED PEST MANAGEMENT 67

8. USE ORGANIC PEST MANAGEMENT 68

E. PLANTING **49**

1. SELECT APPROPRIATE PLANTS: CHOOSE & LOCATE PLANTS TO GROW TO NATURAL SIZE AND AVOID SHEARING 69

2. SELECT APPROPRIATE PLANTS: DO NOT PLANT INVASIVE SPECIES 72

3. GROW DROUGHT TOLERANT CA NATIVE, MEDITERRANEAN OR CLIMATE ADAPTED PLANTS 73

4. MINIMIZE THE LAWN 76

5. IMPLEMENT HYDROZONING 79

6. PROVIDE SHADE TO MODERATE BUILDING TEMPERATURES 80

7. PLANT TREES 82

8. DIVERSIFY 85

9. CHOOSE CALIFORNIA NATIVES FIRST 87

F. IRRIGATION **89**

1. DESIGN FOR ON-SITE RAINWATER COLLECTION, RECYCLED WATER AND/OR GRAYWATER USE 89

2. DESIGN AND INSTALL HIGH EFFICIENCY IRRIGATION SYSTEMS 92

3. INSTALL A DEDICATED METER FOR LANDSCAPE WATER USE OR INSTALL A SUBMETER 98

G. MAINTENANCE **89**

1. KEEP PLANT DEBRIS ON SITE 99

2. SEPARATE PLANT DEBRIS FOR CLEAN GREEN DISCOUNTS 102

3. PROTECT SOIL FROM COMPACTION 103

4. FEED SOILS NATURALLY & AVOID SYNTHETIC FERTILIZERS 104

5. MULCH REGULARLY 107

6. MANAGE AND MAINTAIN IRRIGATION SYSTEM SO EVERY DROP COUNTS 108

7. USE IPM AS PART OF MAINTENANCE PRACTICES 111

8. CHOOSE AND MAINTAIN YOUR MATERIALS, EQUIPMENT & VEHICLES CAREFULLY 113

9. USE ORGANIC PEST MANAGEMENT 115

H. INNOVATION **117**

1. BAY-FRIENDLY LANDSCAPE GUIDELINES AND PRINCIPLES ARE DEFINED AND REFERENCED IN THE CONSTRUCTION BID DOCUMENTS 117

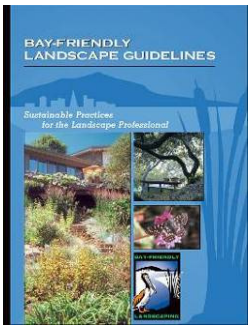
2. DESIGN & INSTALL EDUCATIONAL SIGNAGE 118

3. CREATE A BAY-FRIENDLY MAINTENANCE TASK LIST 119

4. EMPLOY A HOLISTIC APPROACH 120

5. DESIGN YOUR OWN BAY-FRIENDLY INNOVATION. 121

GLOSSARY **11722**



INTRODUCTION

The Bay-Friendly Rating Manual is an essential tool to successfully implement the Bay-Friendly Scorecard for new Civic and Commercial Landscapes. It is written for landscape design and construction professionals and Bay-Friendly Raters, as a guide in describing and verifying the practices in the Scorecard. The manual is geared to assist a Project Team in achieving a Bay-Friendly Rated Landscape.

Bay-Friendly Landscaping & Gardening is a whole systems approach to the design, construction and maintenance of landscapes that contributes to the health of the San Francisco Bay Watershed.

There are 7 Principles of Bay-Friendly Landscaping that provide the environmental lens that built landscapes intersect, these are:

1. Landscape Locally
2. Landscape for Less to the Landfill
3. Nurture the Soil
4. Conserve Water
5. Conserve Energy
6. Protect Water & Air Quality
7. Create Wildlife Habitat

The 7 Principles and practices of Bay-Friendly are fully defined in the companion publication, the Bay-Friendly Landscape Guidelines which can be downloaded at www.BayFriendly.org.

StopWaste.Org in Alameda County developed this manual and the Bay-Friendly Landscape Scorecard, and Guidelines as a method to create a common understanding, a standard for sustainable landscaping among landscape professional, home and property owners and public agencies.

Most cities in Alameda County require that new or renovated public landscapes be built to this standard using the Bay-Friendly Civic and Commercial Landscape Scorecard.

BENEFIT OF A BAY-FRIENDLY RATED LANDSCAPE

What if our built landscapes actually contributed to the health of our watershed and reduced green house gasses? What if they helped recharge the ground water, filter and break down pollutants through the action of healthy soil biota? What if they provided habitat for migrating birds and beneficial insects and reptiles? And what if they do all of this consuming a fraction of the water, energy, fertilizers and materials of a conventional landscape? That is what a Bay-Friendly Landscape sets out to do – to raise the bar, to provide guideposts and green our standard landscape practices.

Environment -- First and foremost, a Bay-Friendly Landscape is a benefit to the environment. Bay-Friendly Rated Landscapes consume significantly less water by creating drought resistant soils, choosing low water using plants and using efficient irrigation systems. They reduce green house gasses by reducing the need for mowing, blowing and shearing and by reducing the amount of plant debris landfilled and the amount of synthetic chemicals consumed and through the used of recycled, local materials. They reduce stormwater runoff and pollution and use materials more efficiently. Most Bay-Friendly practices have multiple environmental benefits.

Supports Compliance – Bay-Friendly Rated landscapes can support compliance with other environmental rating systems or local, state or federal requirements. For example, Bay-Friendly Rated Landscape has been recognized as an innovation credit in LEED (Leadership in Energy and Environmental Design) projects, they have earned additional points for multi-family projects that are Green Point Rated, they have some of the same practices mandated by some water agencies for

new hook-ups or in the State of California's Model Water Efficiency Landscape Ordinance. In addition, other Bay-Friendly practices assist with the federally required stormwater measures and others with local requirement on construction and demolition debris recycling goals. Bay-Friendly's holistic approach means that your Project Team is often one step ahead with complying with a whole spectrum of environmental mandates.

Recognition – A Bay-Friendly Rated Landscape brings recognition to your project and Project Team that this landscape has met an established environmental standard.

Consumer Assurance -- A Bay-Friendly Rated landscape provides the consumer an assurance that a standard has been met because it has be verified by a third party. The Bay-Friendly Rated label is an important method to achieve consumer recognition.

Currently, StopWaste.Org is the certifying body in Alameda County for public projects however the Bay-Friendly Landscaping & Gardening Coalition is seeking funding and support to provide this service regionally.

Competitive Edge – A Bay-Friendly Rated Landscape can provide a competitive edge in the market place because it achieves a higher environmental standard, saving more resources and money over most conventional landscapes. You can market to your clients the benefits of a Bay-Friendly Rated Landscape such as reducing water bills, requiring less labor to mow or shear, and a healthier landscape through the use of less or non-toxic pest control and natural fertilizers.

WHAT IS A BAY-FRIENDLY RATED LANDSCAPE?

A Bay-Friendly Rated Landscape is one where the Project Team, including the developer, landscape design professional, general contractor and landscape contractor are all working together to achieve clearly understood Bay-Friendly goals, that were set early in the design process and that are verified by a third party, a "Bay-Friendly Rater".

The Bay-Friendly Scorecard for Civic and Commercial Landscapes has 9 required practices and has a total of 215 points. The 9 required practices do not contribute to earning points but all 9 must be met in order for the project to be Bay-Friendly. In addition, a minimum of 60 points must be earned to be considered a Bay-Friendly Rated Landscape. It is not possible to earn all 215 points in any given project as some points are conflicting such as points earned for no lawn and points earned for grasscycling.

Low Score	Medium Score	High Score
60-74	**75-89**	**90+**

In general, achieving a low score and all of the 9 required practices is quite readily done, especially if Bay-Friendly goals are set early in the project. It is recommended that if a low score is your goal, then set out to achieve at least 65 or 67 points to insure that even if several points are lost in the process, the landscape still qualifies as Bay-Friendly. Achieving a medium and especially a high score can be increasingly difficult depending upon the site constraints and opportunities, budget constraints, or functions of the landscape and the knowledge/experience of the Project Team in implementing Bay-Friendly practices.

WHEN TO USE THE BAY-FRIENDLY RATING SYSTEM

Bay-Friendly Rated Landscapes have been successfully built in Alameda County on projects such as parks and street medians as well as landscapes around fire stations, senior centers, a college campus, a shopping center, libraries and other civic buildings. The Bay-Friendly Scorecard for Civic and Commercial Landscapes has also been used to rate multifamily projects. For a brief description of some of the landscapes that have been successfully designed and built to Bay-Friendly standards, visit www.BayFriendly.org .

Bay-Friendly practices have been successfully included in smaller projects such as in planters or projects under 2,500 square feet but achieving a Bay-Friendly Rated Landscape is often more difficult as a significant number of Bay-Friendly practices/points would not be applicable or cost-effective. However, for the vast majority of civic, commercial and multifamily residential projects of 2,500 square feet or greater, a Bay-Friendly Rated Landscape makes sense.

The adoption of as many Bay-Friendly practices as practical is encouraged in every new or renovated landscape project.

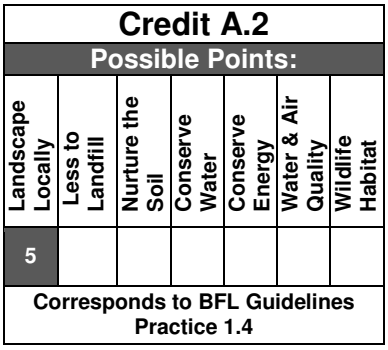
COST OF THE BAY-FRIENDLY RATING SYSTEM

Initially, one of the greatest costs of the Bay-Friendly Rated Landscape can be the learning curve of the Project Team. This Rating Manual is designed to make this process transparent to the entire Project Team and to streamline communication both internally, within the team, and with the Bay-Friendly Rater and reduce the cost of the learning curve. Once landscape professionals have experience and/or training in Bay-Friendly that cost is greatly reduced as Bay-Friendly practices become the new standard for creating a landscape.

There are Bay-Friendly Training and Qualification opportunities for Design, Construction and Maintenance Landscape Professionals. A developer can cut costs by selecting professionals with Bay-Friendly Qualification and experience and by giving a priority for these attributes in a bid document.

As for costs of practices, the scorecard provides flexibility to meet any budget. The minimum requirements can be met with little or no additional costs. Selecting low-water using plants, for example, is no more expensive than water loving plants; compost can be specified at comparable prices of other types of soil amendments, etc. As a project tries to achieve a higher score, costs can go up as more expensive practices are implemented. Pervious concrete is more expensive than impervious but that expense can sometimes be off-set if it replaces other more expensive stormwater drain or filter systems. A Bay-Friendly Rated Landscape is cost competitive –especially when the long term savings of lower resources consumption over the life of the landscape is considered.

WHAT YOU WILL FIND IN THE BFL RATING MANUAL



The Rating Manual follows the same organization and numbering as the Bay-Friendly Scorecard for Civic and Commercial Landscapes with practices grouped to mimic the design and construction process:

Section A: Site Planning
Section B: Stormwater and Site Drainage
Section C: Earthwork and Soil Health
Section D: Materials
Section E: Planting
Section F: Irrigation
Section G Maintenance
Section H: Innovation

Points are awarded according to the 7 Principles of Bay-Friendly Landscaping and are indicated in both the Scorecard and the Rater Verification Manual.

This graphic indicates 3 pieces of information:

- Which credit (practice) on the scorecard is being defined,
- What Bay-Friendly Principle the points are being earned under and the amount of points
- Where this practice can be found in the Bay-Friendly Landscape Guidelines

In addition each practice usually contains the following segments: Practice description, Project Team. Recommendations, Verification, Synergies and Tradeoffs, Resources and Bay-Friendly Tools. Project Team Recommendations are best practices gleaned from implementing this practice in numerous landscape projects in Alameda County. Verification is described thoroughly, later in this section. Synergies and Trade-offs indicates how implementing this practice can contribute towards or compete with earning other Bay-Friendly credits. Resources and Bay-Friendly Tools refer to support information that is not in this manual but is available on our website www.BayFriendly.org or in the website indicated. This information includes:

- A Bay-Friendly plant template to track Bay-Friendly information such as water requirements of each plant, and plant spacing as well as mature size of plant.
- Or sample Bay-Friendly plant list for lawn alternatives, natural hedges or plants for swales.
- Sample specification language for many Bay-Friendly practices as well as a model maintenance specification,
- Case studies and more.

HOW TO USE THIS MANUAL

The manual should be used by both the Project Team and the Bay-Friendly Rater. In the early stages of a landscape project, the Project Team should review the scorecard, select the likely Bay-Friendly practices to be met, insure that all required practices will be met. The team should think holistically, if a practice is not on the scorecard but would make sense to do, then implement it anyway. It could potentially earn credits under the Innovation Section. Conversely, if a practice is on the scorecard but does not make sense to do then, avoid it. For example, if the project does not need outdoor lighting, then don't install some just to earn Bay-Friendly points for efficient lighting.

As you select different practices, use this manual to fully understand the Bay-Friendly practice as the Scorecard does not have the space to fully define each practice. In order to earn the points for any given practice it must match the description and verification requirements that are defined in the Rating Manual. Once the Bay-Friendly practice is understood, evaluate whether or not it makes sense for your project.

PROJECT TEAM –There are notes to the Project Team in each Bay-Friendly credit. The information is focused on best practices on implementation of that measure and what you will need to supply the Bay-Friendly Rater in order to verify that it has been implemented. Be sure to bring your Bay-Friendly Rater on board early in the process and set up clear points in the project timeline when communication is essential.

BAY-FRIENDLY RATER – Both you and the Project Team should rely on the Rating Manual's definitions of each Bay-Friendly practice. Each practice earning points for this project will need to be verified according to this Rating Manual. Your role is to verify Bay-Friendly practice implementation. Depending on the experience of the Project Team you can also be source of support for implementation. Be sure to clear about goals, communication and documentation needs.

VERFICATION BASICS

The Bay-Friendly Rated program is designed to rely on the submittal and review of project plans, planting notes and specifications or worksheets required by the local cities such as those that conform to water efficient landscape ordinances. These documents should all be a part of the standard design process. For many of the credits, an appropriate signature on the "Accountability Form" is required and intended to be an easy to implement approach to ensure the practices have been implemented as per the Practice Description. For some of the credits, verification also requires a site visit and visual verification by the Bay-Friendly Rater. Additional documentation is required only on those measures where project plans or on-site observations are not sufficient to verify compliance with a measure.

The three verification procedures are:

1. Submittal Review
2. Inspection
3. Documentation

Many combinations of inspection, documentation and plan check are required for compliance. Some BFL practices will require physical inspection or on-site observance to verify compliance. Others require documentation in the form of product data sheets, invoices, receipts, calculation worksheets, a signed Accountability Form from a key member of the Project Team, photographs or other paperwork. Some areas of BFL such as site and structural elements can be verified during plan check. Recycled content of materials, requires a product sheet, where achieving water budget will need submittals of a worksheet. Finally, some areas such as application and depth of mulch will be typically verified by a site inspection. Every effort has been made to streamline the process, while at the same time safeguarding the integrity of the Bay-Friendly Rating. Each verification method is described next.

SUBMITTAL REVIEW

Reviewing a set of project plans can sometimes provide proof of compliance for a BFL practice. The term "plans" in this case is taken to represent plans (blueprints) along with other supporting documentation like specifications and planting notes. For measures that call for Plan Review, sets of drawings must be must be the final construction documents or Bid Set construction documents. Earlier sets of plans or specifications, such as Design Documents or 50% CDs are NOT eligible as proof of verifications, since plans in these earlier phases tend to change, unless it is specifically stated in the Verification section for a practice that such plans are acceptable. "Plans" can also include worksheets that must be completed and submitted to the local agency to demonstrate that the project meets the adopted Water Efficient Landscape Ordinance.

However, even though earlier plans won't meet the compliance for verification, it can be prudent to share some of these early plans with the Bay-Friendly Rater. This insures that if changes need to occur in the plans in order to meet compliance, then it can happen before the bid process and can avoid costly "change orders". It is recommended that you designate your Bay-Friendly Rater early in the design process not at the end of CDs, and determine how to streamline this key communication. It is recommended that at least one meeting occurs with the Bay-Friendly Rater and the Project Team during the design phase.

INSPECTION

Usually one site inspection, at post construction, is necessary to prove compliance with numerous practices. However there may be times where an earlier visit during the "rough" phase may be valuable. An example of this was for an innovation credit where forms were being used under sidewalks instead of structural soil to allow for tree root growth. Examples of post-construction verification practices are: confirming that the weather based irrigation controller specified is installed, verifying that recycled content materials such as fencing or site furnishings were used, verifying that turf was installed as planned with no sprinkler heads in sections less than 8 feet wide, etc. For all site visits, take photographs of each practice being verified, they provide backup if the practice is audited.

DOCUMENTATION

In some cases the information needed to verify compliance cannot be found on project plans or through observation in the field. In such instances, documentation is necessary to claim compliance with the measure. Documentation can take numerous forms, from copies of product literature, information sheets, (cut-sheets), to copies of Owners Manuals or other written procedural plans, to a signed "Accountability Form". An Accountability Form is intended to reduce the paperwork burden by allowing some responsible for the particular Bay-Friendly measure to sign-off that the measure has been followed or implemented. The individual signing the Accountability Form must be the person specified for each practice, such as the owner, landscape architect, developer, landscape construction contractor, or other designated professional. While an Accountability Form may streamline the verification process, the person signing the forms must be prepared to show proof of compliance if the measure is audited.

AUDITS

In case of a quality assurance audit, Raters must retain backup documentation or other means adequate to defend a position on any specific measure. In the case of Plan Review measures, this is likely to be selected sheets from a set of 100% CDs (or later) and specifications. For inspection measures (Rough and Final), the Rater must provide photographs of each measure. For Documentation keep a copy of any backup calculations, signed forms or other means of documentation that helps defend a measure.

A NOTE ON CHANGES

Bay-Friendly Landscaping program at StopWaste.Org welcomes feedback and corrections in order to improve future editions of the document. Submit comments to Chavstad@stopwaste.org and or teade@stopwaste.org.

DISCLAIMER

The Bay-Friendly practices and compliance protocols contained in this document are provided for consideration by landscape professionals in the course of designing, constructing and maintaining new civic, commercial and multi-family residential landscapes. The information is presented as a public service by StopWaste.Org, otherwise known as the Alameda County Waste Management Authority and Source Reduction and Recycling Board, to support environmental benefits and reduce costs. The practices and compliance protocols are strictly for use on a voluntary basis. They represent best practices for sustainable landscaping and are not a substitute for sound judgment. StopWaste.Org assumes no legal liability for the effects of proper or improper implementation of these measures.

THE BAY-FRIENDLY LANDCAPING & GARDENING COALITION

The Bay-Friendly Landscaping & Gardening Coalition is an alliance of stakeholders representing public agencies, utilities, non-profits, landscape professionals and associations and businesses from around the San Francisco Bay Area. The Coalition allows for a consistent application of a regional Bay-Friendly standard in sustainable landscaping and gardening and provides a complete package of educational and outreach tools for home gardeners, landscape design and maintenance professionals, as well as local governments. Memberships and sponsorships in the Coalition are encouraged in order to leverage local resources and to receive recognition and discounts to Bay-Friendly trainings and events. Visit www.BayFriendlycoalition.org for more information.

A. SITE PLANNING

1. SELECT AND EVALUATE THE SITE CAREFULLY

Credit A.1						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
11						
Corresponds to BFL Guidelines Practice 1.1						

a. Submit the completed Bay-Friendly Site Analysis Form before completion of 100% design development documents.

POINTS: 5

PRACTICE DESCRIPTION

Complete the Bay-Friendly Landscape Site Analysis to assess climate, vegetation, topography, hydrology and previous use. The site analysis form prompts fifteen key indicators to be included on a site map such as solar exposures, prevailing winds, micro climates, areas of seasonal flooding and how storm water moves across the site and more. Both the form and site map need to be submitted. This measure is meant to insure a thorough analysis is conducted early in the design process to document the natural site features that should inform the project design.

PROJECT TEAM RECOMMENDATIONS

- Maximum benefit to the planning process is gained by completing the site analysis before 100% design documents and using the site analysis to inform the building and landscape design such as building orientation and placement, storm water measures, plant choice, tree and habitat protection, firescaping and more.
- Ideally, the entire project team would have a copy of the site analysis to inform project decisions throughout the development of the project and during the maintenance once constructed. Construction and maintenance costs can be reduced if the site works in harmony with natural features instead of against them.

VERIFICATION

PROJECT TEAM

- Submit written Bay-Friendly site analysis form and site map before 100% design documents are completed.

RATER

- Verify Bay-Friendly site analysis form and site map (that indicates key natural features as indicated on the site analysis form) is completed.

SYNERGIES AND TRADE-OFFS

- Sampling the soil for analysis and testing infiltration as part of

The site *is the area within the legal boundaries of a property and encompasses all areas of the property including constructed areas and non-constructed areas. It is the same as the property area. (*USGBC LEED, *New Construction & Major Renovation v2.2,* September 2006*)*

Urban growth boundar*y is an officially adopted and mapped line dividing land to be developed from land to be protected for natural or rural uses. Urban growth boundaries (also called urban limit lines) are regulatory tools often designated for long periods of time (20 or more years) to provide greater certainty for both development and conservation goals. (*Governor's Office of Planning and Research, *State of California General Plan Guidelines,* 2003)

the site analysis can contribute to earning points for Credit C.1 (Assess the soil and determine infiltration).

RESOURCES AND BAY-FRIENDLY TOOLS

- Bay-Friendly Landscape Guidelines, Practice 1.1
- The Bay-Friendly Site Analysis is available for download from: **http://www.stopwaste.org/home/index.asp?page=777**

b. The site is located within an urban growth boundary and avoids environmentally sensitive sites

POINTS: 3

PRACTICE DESCRIPTION

Project is located within an urban growth boundary defined by a city or county General Plan AND project improvements are not located on wetlands or steep slopes, prime farmland or parkland (as defined by the U.S. Department of Agriculture), or within setback distances from wetlands prescribed in regional or local regulations, or in an area identified as habitat for any species on Federal or State threatened or endangered lists.

VERIFICATION

PROJECT TEAM

- Submit an Accountability Form signed by the Owner, Developer, Landscape Architect or Designer identifying the source of the urban growth boundary and confirming that the site avoids environmentally sensitive sites.

RATER

- Verify the Accountability Form has been signed by the Owner, Developer, Landscape Architect or Designer.

RESOURCES AND BAY-FRIENDLY TOOLS

c. The site development results in the clean up of a contaminated site (i.e. Brownfield) or is in a designated redevelopment area

POINTS: 3

PRACTICE DESCRIPTION

Part or all of the site has been labeled a Brownfield by the California Department of Toxic Substance Control Hazardous Waste and Substances Site List – Site Cleanup (Cortese List) OR is designated a redevelopment area by the local jurisdiction, with the goal of reducing pressure on undeveloped land. The redevelopment of the site does not apply to this credit unless the redevelopment was part of a deliberate city or county redevelopment area plan.

*A **Brownfield site** means real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Partial definition excerpted from Public Law 107-118 (H.R. 2869) - "Small Business Liability Relief and Brownfields Revitalization Act" signed into law January 11, 2002. http://www.epa.gov/brownfields/glossary.htm*

VERIFICATION

PROJECT TEAM

- Submit an Accountability Form signed by the Owner, Developer, Landscape Architect or Designer indicating that the site is located in a designated redevelopment site or on a Brownfield, in which case the report and author of the strategy for clean up is referenced in the design documents

RATER

- Verify the Accountability Form has been signed by the Owner, Developer, Landscape Architect or Designer.

RESOURCES AND BAY-FRIENDLY TOOLS

2. CONSIDER THE POTENTIAL FOR FIRE

Credit A.2						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
5						
Corresponds to BFL Guidelines Practice 1.4						

Open space *is often defined by local zoning requirements. If local zoning requirements do not clearly define open space, open space means land areas that are not build upon or substantially altered from their natural state. They provide important ecological functions, natural resources, or cultural resources that are worthy of conservation and protection. Such areas may contain, but are not limited to, forests, farmland, old fields, floodplains, wetlands, and shore lands. Open Space can also encompass scenic vistas, recreational areas, and historic sites.*

a. For sites adjacent to fire sensitive open space or wildlands only: Submit a Fire Mitigation Plan

POINTS: 5

PRACTICE DESCRIPTION

Determine if the site is in or adjacent to a fire sensitive open space or wildland and prepare a fire mitigation plan.

A typical fire mitigation plan may include: adjacent fire sensitive wildland or open space or developments; exposure to prevailing winds during the dry season; steep slopes, especially south and west facing that can increase wind speed and convey heat; vegetation type, particularly species that burn readily. It may also specify mitigations to the above identified fire vectors including the establishment of a defensible zone immediately surrounding the structure that uses one or more strategies for firescaping, such as:

- Emphasize plants with low fuel volume and/or high moisture content in planting plan. Avoid plants with high oil content or that tend to accumulate excessive dead wood or debris (pyrophites).
- Trees are well spaced and pruned to 6 feet minimum above ground; dense shrub plantings are separate from trees to minimize fuel ladders.
- Trees and tall shrubs planted where limbs and branches will not reach the building or grow under overhangs as they mature.
- Fine shredded bark mulch is avoided. (e.g. gorilla hair or shredded redwood mulch)
- Decks are faced and constructed out of fire resistant materials.

PROJECT TEAM RECOMMENDATIONS

- Identify all local fire safe development requirements

VERIFICATION

PROJECT TEAM

- Submit an Accountability Form signed by the Landscape Architect or Designer indicating that the design features and practices in the fire mitigation plan have been included in the constructed landscape.

RATER

- Verify Accountability Form has been signed by the Landscape Architect or Designer.

SYNERGIES AND TRADE-OFFS

- Specifying recycled content decking materials can contribute to earning points for Credit D.1.a (Non-plant landscape materials are salvaged or made from recycled content materials or FSC certified wood).
- Specifying locally produced green waste mulch instead of shredded bark mulch can contribute to earning points for Credit D.1.d (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste).

BAY-FRIENDLY TOOLS AND RESOURCES

- Bay-Friendly Landscape Guidelines Practice 1.4
- http://frap.cdf.ca.gov/data/frapgisdata/select.asp

3. KEEP PLANT DEBRIS ON SITE:

Credit A.3						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
	5					
Corresponds to BFL Guidelines Practice 2.2						

a. Produce mulch from plants debris

i. Design documents specify areas under tree & shrub canopies and at least 10 feet away from storm drains, to be used as a leaf repository for mulch AND/OR

ii. Construction documents specify that of the trees identified for removal, some are chipped for use as mulch onsite

POINTS: 2

Mulch *is any material spread evenly over the surface of the soil to enhance the growth of plants and the appearance of the landscape. (*StopWaste.Org, *A Bay-Friendly Landscape Guide to Mulch)*

PRACTICE DESCRIPTION

i. To conserve nutrients on-site and protect the soil surface, natural leaf drop shall be retained under one or more trees and/or in one or more shrub beds, except those trees or shrub beds that are within 10 feet of storm drains (in order to keep leaf litter or mulch out of the storm water system).

ii. Construction documents shall specify that of the trees identified for removal, at least 10% are chipped and used as mulch onsite. Trees and logs that are left on site as shelter for wildlife will also be counted.

PROJECT TEAM RECOMMENDATIONS

- Identify sites for leaf repositories in design documents.
- Note on clearing and grading plans and specifications if on-site trees are to be chipped for mulch.

VERIFICATION

PROJECT TEAM

i.

- Submit planting plans with natural leaf repositories clearly identified.

ii.

- Submit total number of trees to be removed and number of trees to be chipped on site for mulch or left as logs on site for wildlife habitat
- Submit specifications in construction documents for chipping removed trees, as well as instructions as to where the chipped material is to be used as mulch OR
- Submit photo documentation (in digital form) of chipping process.

RATER

i.

- Verify that planting plans indicate natural leaf repositories and that they are not within 10 feet of hard surfaces and/or storm drains.

ii.

- Verify that the number of trees to be chipped on site for mulch or left as logs for wildlife habitat is at least 10% of the total number of trees identified for removal.
- Verify that specifications include chipping removed trees, as well as instructions as to where the chipped material is to be used as mulch are submitted OR
- Verify photos have been submitted
- (Optional) Visually verify chipping of removed trees on site.

SYNERGIES AND TRADE-OFFS

- Using mulch made from removed trees can contribute to meeting the requirement of applying 3 inches of mulch for Credit C.6.a (Required planting specifications and plans indicate that after construction, all soil on site is protected with a minimum of 3 inches of mulch)
- If all mulch is supplied by chipping on-site trees identified for removal then points can not also be earned for Credit D.1.d (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste).

RESOURCES AND BAY-FRIENDLY TOOLS

- Bay-Friendly Landscape Guidelines, Practice 2.2
- Bay-Friendly Landscaping Guide to Mulch

b. Produce compost from plant debris

i. A site for composting is included in landscape plans. Systems for composting up to and including 3 cubic yards at one time (1 point) OR

ii. Systems for composting more than 3 and up to 10 yards at one time (total 2 points) OR

iii. Systems 10 cubic yards or larger (total 3 points)

Composting *is the controlled biological decomposition of organic materials*

POINTS: 3

PRACTICE DESCRIPTION

A site for composting plant debris and/or food waste shall be included in landscape plans and it is recommended that compost systems are sized to compost the amount of feedstock that is generated on site, and as per local and state composting regulations.

PROJECT TEAM RECOMMENDATIONS

- Evaluate any CA Integrated Waste Management Board's regulations that may apply to an on-site composting system, depending on the size of the system and the type of feedstock.
- Compost site should be close to level and not exceed a 2% grade. Consideration should be given to providing access to water and allowing enough space not only for compost bins and systems but for easy access. Larger systems could benefit from allowing enough space and site access for a front end loader and providing a push wall and attention should be paid to stormwater flows. See materials listed under Resources for more comprehensive site considerations.

VERIFICATION

PROJECT TEAM

- Submit construction documents showing location, design and capacity of composting system

RATER

- Verify construction documents include composting system
- Visually verify constructed system and confirm size.

RESOURCES AND BAY-FRIENDLY TOOLS

4. REDUCE AND RECYCLE WASTE

Credit A.4						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
	2					
Corresponds to Bay-Friendly Landscape Guidelines Practice 2.7						

a. An easily accessible area(s) is dedicated to the collection and storage of materials for recycling.

POINTS: 2

PRACTICE DESCRIPTION

To reduce waste that is generated both by building occupants and/or landscape/park visitors, receptacles for recycling are co-located with every outdoor trash receptacle. It is recommended that receptacles be made from recycled materials and that they are well marked.

AND, if there is a building on site, a centrally located area(s) that serves the building and site is dedicated to the collection and storage of non-hazardous materials for recycling, including, at a minimum, plant debris, glass, paper, metal, plastic and corrugated cardboard. Plant debris collection may be omitted if all landfill bins are labeled NO GREENWASTE The site should provide easy access to maintenance staff and hauler vehicles.

The number of recycling bins necessary in the storage area will vary based on the waste and recycling haulers in the area. Green waste should be kept separate from all other trash and recyclables. Single-stream recycling vendors allow most other recyclable items to be included in one mixed bin. Other haulers may require separate bins for each type of recyclable material.

PROJECT TEAM RECOMMENDATIONS

- Identify the location of trash/recycling receptacles and central collection/storage area in the design documents.

VERIFICATION

PROJECT TEAM

- Submit construction documents showing size and location of central collection/storage area and specifications for outdoor recycling receptacles.

RATER

- Visually verify central collection/storage area includes plant debris, glass, paper, metal, plastic and corrugated cardboard and outdoor recycling receptacles are collocated with every trash receptacle.

RESOURCES AND BAY-FRIENDLY TOOLS

- Bay-Friendly Landscape Guidelines Practice 2.7,
- Recycled Content Park and Recreation Products in Alameda County Fact Sheet, download from www.StopWaste.Org/buyrecycled.html
- Recycling Guidelines for Multifamily Housing, download from: http://www.stopwaste.org/home/index.asp?page=533

5. MINIMIZE SITE DISTURBANCE

Credit A.5						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
2					2	2

a. On greenfield sites, limit site disturbance to protect topography, vegetation and hydrology.

POINTS: 3

PRACTICE DESCRIPTION

Clearing and grading is limited to the minimum area required for roads, utilities, building pads, other hardscapes and maneuvering equipment or to a maximum of:

- 40 feet beyond the building perimeter;
- 10 feet beyond the surface walkways, patios and parking;
- 10 feet beyond utilities less than 12 inches in diameter;
- 15 feet beyond primary roadway curbs and main utility branch trenches;
- 25 feet beyond constructed areas with permeable paving that require additional staging areas in order to limit compaction in constructed areas AND

The property is walked with equipment operators prior to clearing and grading to clarify these boundaries

Greenfield site: *Sites that are not previously developed or graded and remain in a natural state. (* USGBC, LEED, *New Construction & Major Renovation,v2,2 Reference Guide,* September 2006*)*

Previously developed sites *are those that contained buildings, roadways, parking lots or were graded or altered directly by human activities. (* USGBC, LEED, *New Construction & Major Renovation,v2,2 Reference Guide,* September 2006*)*

PROJECT TEAM RECOMMENDATIONS

- Meet and walk the property with the owner, engineers and others before project design to define goals for limiting clearing and grading.

VERIFICATION

PROJECT TEAM

- Submit grading/construction documents highlighting the disturbance boundaries and access road.
- Accountability Form signed by participants to confirm that the boundaries were walked and identified

RATER

- Verify grading/construction documents have highlighted the disturbance boundaries and access road.
- Verify that Accountability Form has been signed by participants.
- (Optional) Visually verify.

SYNERGIES AND TRADE-OFFS

- Limiting site disturbance to meet above requirements in such a way as to also provide water, and shelter for wildlife, can contribute to earning points for Credit A.6 (Provide water and/or shelter for wildlife).
- Limiting site disturbance to also protect trees can contribute to earning points from Credit A.7.a (The landscape is designed to preserve 80% of existing mature healthy trees and penalties for their destruction are included in the construction contract).
- Limiting site disturbance to meet above requirements in such a way as to also keep the open space on the site connected to open space on adjacent sites, can contribute to earning points for Credit A.7.b (The landscape is designed to increase open space compared to its previous use and/or to connect it to other open space or wildlife corridors).
- Protecting diverse plant buffers by limiting site disturbance to meet above requirements can also contribute to earning points for Credit A.7.c (Create or protect a diverse buffer of low maintenance vegetation along creeks, shorelines or monocultured landscaped areas).

BAY-FRIENDLY TOOLS AND RESOURCES

- USGBC LEED, *New Construction & Major Renovation, v.2.2 Reference Guide,* September 2006, p. 67
- Puget Sound Action Team, Low *Impact Design: Technical Guidance Manual for Puget Sound,* 2005, p 28, 62

b. On previously developed sites, restore vegetation and hydrology.

POINTS: 3

PRACTICE DESCRIPTION

On previously developed or graded sites, a minimum of 20% of the site is restored to its native vegetation and/or hydrology.

Although restoring individual areas on the site is acceptable, designing and constructing the following are highly recommended:

- Large tracts of riparian areas that connect and create contiguous riparian areas or
- Large tracts of critical and wildlife habitat area that connect and create contiguous areas or
- Tracts that create common open space areas among and/or within developed sites or
- Areas on individual lots that connect to areas on adjacent lots or common protection areas.

PROJECT TEAM RECOMMENDATIONS

- Meet and walk the property with the owner, engineers and others before project design to define goals for restoring vegetation and hydrology.

VERIFICATION

PROJECT TEAM

- Submit design documents with restoration sites identified. Include total site square feet and the total square feet of restored areas.
- Accountability Form confirming restoration of vegetation and/or hydrology is signed by the Landscape Architect or Designer.

RATER

- Verify design documents identify restoration sites and that percentage of total site to be restored is equal to or greater than 20%.
- Verify that Accountability Form has been signed by the Landscape Architect or Designer.

SYNERGIES AND TRADE-OFFS

- Restoring vegetation and hydrology in such a way as to also provide water, and shelter for wildlife can contribute to earning points for A.6 (Provide water or shelter for wildlife).
- Restoring vegetation and hydrology in such a way as to also preserve 80% of existing mature, healthy trees can contribute to earning points for Credit A.7.a (The landscape is designed to preserve 80% of existing mature healthy trees and penalties for their destruction are included in the construction contract).
- .Restoring areas that connect to open space on adjacent properties can contribute to earning points for Credit A.7.b (The landscape is designed to increase open space compared to its previous use and/or to connect it to other open space or wildlife corridors).
- Restoring vegetation in riparian areas can also contribute to earning points for Credit A.7.c (Create or protect a diverse buffer of low maintenance vegetation along creeks, shorelines or monocultured landscaped areas).

6. PROVIDE WATER AND/OR SHELTER FOR WILDLIFE

Credit A.6						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
						1
Corresponds to BFL Guidelines Practice 7.3						

POINTS: 1

PRACTICE DESCRIPTION

Water and/or shelter for beneficial and desirable wildlife shall be provided in order to increase the diversity and numbers of natural enemies of landscape pests.

Examples of shelter include birdhouses, bat houses, boulders, logs, wood piles and multi storied plant canopies. Water must also be provided by bird bathes, ponds, creeks, wetlands.

Wildlife *refers to undomesticated birds, mammals, reptiles, and amphibians.*

Natural enemies *are organisms that kill, decrease the reproductive potential or otherwise reduce the numbers of another organism. Natural enemies that limit pests are key components of integrated pest management programs. Important natural enemies of insect and mite pests include predators, parasites, and pathogens.*

PROJECT TEAM RECOMMENDATIONS

- Providing shelter or habitat value can be integrated into a variety of landscapes, Logs and boulders create visual interest in the landscape and habitat for soil organisms and reptiles. Rock walls without mortar provide beauty and habitat for lizards. Even small water features benefit birds and insects -- be sure that water features have shallow ends of 1 to 2 inches preferred by birds, and consider the need for maintenance against mosquitoes by circulating water.
- Providing habitat for wildlife can be done in relatively small landscapes and helps to encourage beneficial birds, insects and reptiles to common landscape pests as well as enliven the landscape for the user. Thought should also be given to avoiding attracting unwanted creatures. Large open expanses of turf for example are preferred by Canadian Geese which in large numbers can be a pest problem in urban areas.

VERIFICATION

PROJECT TEAM

- Submit construction plan(s) showing water source and/or where shelter is provided and including specifications for birdhouse, bird bath, bat house etc. if applicable.
- (Optional) Submit photo documentation (in digital form) of constructed or installed water source and/or shelter.

RATER

- Verify construction plans include water source and/or shelter.
- (Optional) Verify photo documentation has been submitted.
- Visually verify after construction.

SYNERGIES AND TRADE-OFFS

- Leaving logs from trees that are identified for removal as shelter for wildlife can contribute to earning points for Credit A.3.a (Produce mulch from plant debris).
- Providing water and protecting native trees with developed understories as shelter for wildlife can also contribute to earning points for Credit A.7.b (The landscape is designed to preserve 80% of existing mature healthy trees)
- Providing water and selecting sites for wildlife shelter that connect to open space on adjacent areas can contribute to earning points for Credit A.7.b (The landscape is designed to increase open space and/or to connect it to other open space or wildlife corridors)
- Providing wildlife habitat and water by incorporating stormwater measures can contribute to earning points for Credit B.2.b (Incorporate landscape measures that are designed to capture and filter 85% of average annual stormwater runoff).
- A project receiving points for Credit A.7.c can not receive credit for A.6 and vice a versa.
- Creating a water feature can contribute to earning points for Credit D.5.a (Specify solar powered pump(s) for water features) and Credit F.1.a (Irrigation and/or all ornamental use of water are plumbed for recycled water).
- Using boulders on the site can contribute to earning points in D.6.a. 100% of any stone and non-concrete hardscapes materials are produced within 500 miles of the project site.

RESOURCES AND BAY-FRIENDLY TOOLS

7. CONSERVE OR RESTORE NATURAL AREAS & WILDLIFE CORRIDORS

Credit A.7						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
						6
Corresponds to BFL Guidelines Practice 7.5						

Wildlife *refers to undomesticated birds, mammals, reptiles, and amphibians.*

a. The landscape is designed to protect 80% of existing mature healthy trees and penalties for destruction of protected trees are included in construction contract.

POINTS: 2

PRACTICE DESCRIPTION

As per a certified arborist, healthy, non-invasive trees, and their critical root zone, are identified and at least 80% are selected for protection. The trees to be conserved are prepared to withstand the stresses of construction by watering, fertilizing, pruning and mulching well in advance. Fencing is installed at or exceeding the critical root zone and provides a strong physical and visual barrier.

AND Penalties for destruction of protected trees are included in construction contract. The language should include:

Limit to an absolute minimum any excavation within the critical root zone. If excavation in this zone is unavoidable, recommendations from a certified arborist on how to excavate should also be included in the specifications.

Restrict trenching in the critical tree root zone areas, with specifications to bore under or dig a shallow trench through the roots with an air spade if trenching is unavoidable.

Prohibit stockpiling or disposal of excavated or construction materials in the critical root zone.

The following provides a prioritized list of native vegetation protection areas:

- Large tracts of riparian areas that connect and create contiguous riparian protection areas.
- Large tracts of critical and wildlife habitat area that connect and create contiguous protection areas.
- Tracts that create common open space areas among and/or within developed sites
- Protection areas on individual lots that connect to areas on adjacent lots or common protection areas.
- Protection areas on individual lots

PROJECT TEAM RECOMMENDATIONS

Meet and walk the property with owner, engineer, architects and designers to identify priority trees to be protected.

VERIFICATION

PROJECT TEAM

- Submit specifications for preparing trees for construction and delineating their critical root zones.
- Submit contract language with penalties for damage to protected trees
- Submit construction plans with fencing details
- Submit construction plans showing trees to be protected/ total trees= 80% minimum

RATER

- Verify specifications for preparing trees for construction and delineating their critical root zones have been submitted
- Verify construction contract includes penalties for damage to protected trees
- Verify construction plans include fencing details
- Verify construction plans show trees to be protected/ total trees= 80% minimum
- (Optional) Visually verify fencing in installed as per plan details.

SYNERGIES AND TRADE-OFFS

- Selecting and protecting trees in areas that connect to open space on adjacent properties can contribute to earning points for Credit A.7.b (The landscape is designed to increase open space compared to its previous use and/or to connect it to other open space or wildlife corridors).
- Selecting and protecting trees in a buffer along creeks, shorelines or other monocultured landscaped areas can contribute to earning points for Credit A.7.c (Create or protect a diverse plant buffer of low maintenance vegetation along creeks, shorelines, or monocultured landscaped areas).

RESOURCES AND BAY-FRIENDLY TOOLS

- Matheny, Nelda and Jim Clark, *Trees and Development: A Technical Guide to Preservation of Trees During Land Development,* 1998.

REFERENCES

- *Low Impact Design*, Vegetations Protection, Reforestation and Maintenance, p. 55

b. The landscape is designed to increase open space compared to its previous use and/or to connect it to other open space or wildlife corridors.

POINTS: 2

PRACTICE DESCRIPTION

Open space is increased or is connected to open space on other properties because clearing and grading and the building footprint are minimized or located in order to protect and keep open space and wildlife corridors on the project site connected to open space or wildlife corridors on adjacent properties.

OR, on previously developed sites with no open space, native vegetation and streams are brought back to the surface, degraded stream banks or wetlands are restored and the restored open space is connected to open space or wildlife corridors in adjacent properties.

The credit is not applicable to project sites that are not adjacent to sites with open space and/or wildlife corridors.

Open space is often defined by local zoning requirements. If local zoning requirements do not clearly define open space, open space means land areas that are not build upon or substantially altered from their natural state. They provide important ecological functions, natural resources, or cultural resources that are worthy of conservation and protection. Such areas may contain, but are not limited to, forests, farmland, old fields, floodplains, wetlands, and shore lands. Open Space can also encompass scenic vistas, recreational areas, and historic sites.

PROJECT TEAM RECOMMENDATIONS

- Meet and walk the property with the owner, engineers and others before project design to identify large un-fragmented areas of open space that are important as natural, scenic or cultural resources and a priority for protection and to identify linkages between open space areas that are possible for protection or can be restored to maintain an interconnected network of wildlife corridors
- Create a strategy for limiting disturbance, as early in design process as possible, that includes efficient road design and lot layout, and orientation of the long axis of the buildings along contours or staggering floor levels to adjust to gradient changes.
- Map protected areas on all plans

VERIFICATION

PROJECT TEAM

- Submit a parcel map with the following clearly identified: pre and post development open space and/or wildlife corridors on the project site and open space and/or wildlife corridors on adjacent properties AND/OR
- Submit calculations of open space as a percentage of total site area pre and post project development.

RATER

- Verify the parcel map has been submitted with the following clearly identified: pre and post development open space and/or wildlife corridors on the project site and open space and/or wildlife corridors on adjacent properties.
- Verify the calculations of open space as a percentage of total site area pre and post project development are accurate and show an increase in open space AND/OR
- Visually verify that open space on the project site is connected to open space on adjacent properties.

SYNERGIES AND TRADE-OFFS

- Restoring open space along creeks or shorelines (riparian) can contribute to earning points for Credit A.7.c (Create or protect a diverse plant buffer of low maintenance vegetation along creeks, shorelines or monocultured landscaped areas).

RESOURCES AND BAY-FRIENDLY TOOLS

- Washington State University, *Low Impact Technical Guidance Manual for Puget Sound,* January 2005

c. Create or protect a diverse plant buffer of dense vegetation next to monocultures or along creeks, shorelines or monocultured landscaped areas.

POINTS: 2

PRACTICE DESCRIPTION

Create a diverse plant buffer at least 24 inches wide next to monocultured areas

AND/OR along creeks, streams and shorelines to trap and filter sediments, nutrients and chemicals from surface runoff. Diversity is defined as a minimum of 20 distinct plant species, as per Credit E.8.

VERIFICATION

PROJECT TEAM

- Submit construction plans with plant buffers or riparian corridors identified.
- Submit plant palette with buffer plant species identified.
- Submit Accountability Form signed by Landscape Architect, Designer or Contractor confirming the requirements for the credit have been met.

RATER

- Verify that the construction plans identify the plant buffers or riparian corridors and that the minimum width is 24 inches.
- Verify plant palette for buffer meets the diversity requirement (see Credit E.8)
- Submit Accountability Form has been signed by Landscape Architect, Designer or Contractor confirming the requirements for the credit have been met.

SYNERGIES AND TRADE-OFFS

- A project receiving points for Credit A.7.c can not receive credit for A.6 and vice a versa.
- Creating this plant buffer along creeks or shorelines and/or connecting it to open space and wildlife corridors in adjacent properties can contribute to earning credits for Credit A.5.b (On previously developed sites, restore vegetation and hydrology) or Credit A.7.b (The landscape is designed to increase open space compared to its previous use and/or to connect it to other open space or wildlife corridors).
- A diverse plant pallet of 20 or more distinct plant species can contribute to earning points in Credit E.8.a-c (Diversify) providing a minimum of 20 or more distinct plant species.

RESOURCES AND BAY-FRIENDLY TOOLS

- Washington State University, *Low Impact Technical Guidance Manual for Puget Sound*, January 2005

B. STORMWATER AND SITE DRAINAGE

1. MINIMIZE IMPERVIOUS SURFACES

Credit B.1						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
					7	
Corresponds to BFL Guidelines Practice 6.6						

a. Permeable paving, gravel or other porous surfaces are installed for :

- **i. 25% OR**
- **ii. 33% (total 3 points) OR**
- **iii. 50% of the paved area (total 5 points)**

POINTS: 5

PRACTICE DESCRIPTION

Permeable paving such as gravel or other porous surfaces are installed for 25%, 33% or 50% of the paved area. Permeable paving materials shall have a runoff coefficient of .65 or less as calculated for stormwater treatment designs based on small, frequent storms. The following chart provides runoff coefficients for commonly used paving materials.

Estimated Runoff Coefficients for Various Paving Surfaces During Small Storms	
Type of surface	Runoff Coefficients
Concrete	.80
Asphalt	.70
Pervious concrete	.65
Pervious asphalt	.55
Natural stone (without grout)	.25
Turf block	.15
Brick (without grout)	.13
Unit pavers on sand	.10
Crushed aggregate	.10
Adapted from the Alameda Countywide Clean Water Program c.3 Stormwater Technical Guidance	

Paved Area *is the surface that accommodates pedestrian, bicycle or vehicular traffic. It includes sidewalks, patios, walkways, driveways, parking lots and other non-roof hardscapes, regardless of permeability*

Permeable Paving *is hardscape or a paved surface that accommodates pedestrian, bicycle vehicular traffic while also allowing surface runoff to infiltrate into surface soil and/or permeable subbase. Examples include asphalt or concrete rendered porous by the aggregate structure.*

Runoff Coefficient *is the ratio of the runoff rate to rainfall. For example, a runoff coefficient of 0.65 means that sixty five percent of the rainfall that falls on this type of surface will flow off as runoff. (Alameda Countywide Clean Water Program c.3 Stormwater Technical Guidance August 31, 2006 Version 1.0)*

PROJECT TEAM RECOMMENDATIONS

- Utilize LID strategies during the project planning and design phase to identify opportunities to minimize impervious surfaces and reduce stormwater runoff from the site. Specific recommendations include:
  - Consider reducing the size of parking lots, roadways and other impervious surfaces with more effective layout and reduced parking demand ratios
  - Slow runoff and encourage infiltration with bioretention planters and swales along the road and permeable paving with subbase storage capacity
  - Maximize open space connectivity and design roadways and paving areas to minimize disturbing the site and disrupting existing drainage patterns
- Consider permeable paving materials suitable for ADA accessibility including pervious concrete, pervious asphalt and aggregate fines such as decomposed granite that meet compaction test for accessibility.
- For additional stormwater retention consider permeable base material, such as Caltrans class 2 permeable subbase.
- When designing paving for vehicular traffic, work with the project engineer to establish the proper cross-section based upon underlying soil type and expected loading.
- Use deepened curbs to prevent migration of water from underneath the porous paving subbase to adjacent non-porous paving.

Impervious Surface *is the total area of surfaces on a developed site that inhibit infiltration of stormwater. The surfaces include, but are not limited to, conventional asphalt or concrete roads, driveways, parking lots, sidewalks or alleys, and rooftops (Low impact development technical guidance manual for Puget sound January 2005)*

Low impact development (LID) *is a stormwater management strategy that emphasizes conservation and use of existing natural site features integrated with distributed, small-scale stormwater controls to more closely mimic natural hydrologic patterns in residential, commercial and industrial settings. (Low impact development technical guidance manual for Puget Sound January 2005)*

VERIFICATION

PROJECT TEAM

- Submit scaled plan identifying all paved areas and surface materials.
- Submit:
  - Total square feet of impervious paving
  - Total square feet of permeable paving, gravel or other porous paving surfaces
  - Calculations of the percent of permeable paving, gravel or other porous paving surfaces

RATER

- Verify that the scaled plan identifies all paved surface materials and that the surface materials are permeable.
- Verify that square feet and calculations have been submitted and that percentage is correct and meets the criteria for the credit.

SYNERGIES AND TRADE-OFFS

- Preventing runoff from directly entering the storm drain by using permeable paving, gravel or other porous surfaces can contribute to earning points for Credit B.1.b (No impervious surfaces directly connect to the storm drain)
- Capturing and filtering 85% or 100% of average annual runoff by using permeable paving, gravel or other porous surfaces can contribute to earning points for Credit B.2.b.c (Incorporate landscape measures, including vegetated swales, infiltration planters, detention basins and /or stormwater wetlands, that are designed to capture and filter 85% or 100% of average annual runoff)
- Installing recycled aggregate base under permeable paving, gravel or other porous surfaces can contribute to earning points for Credit D.1.b (A minimum 25% of recycled aggregate (crushed concrete) is specified for walkway, driveway, roadway base and other uses)
- Substituting flyash or slag for a percent of the Portland cement in permeable concrete can contribute to earning points for credit D.1.c (Replace Portland cement in concrete with flyash or slag)
- Installing light colored permeable paving, gravel or other porous surfaces can contribute to earning points for Credit D.3.a (at least 50% of the paved site area includes cool site techniques)
- Purchasing permeable materials that are produced within 500 miles of the project site can contribute to earning points for Credit D.6.a.(100% of any stone and non-concrete hardscapes materials are produced within 500 miles of the project site

b. No impervious surfaces directly connect to the storm drain

POINTS: 2

PRACTICE DESCRIPTION

Impervious surfaces shall not directly connect to the storm drain system. All water that falls on the impervious surfaces on the site, including any roof areas, must first be directed into a landscape area or permeable paving or other porous surface before flowing into the storm drain. Driveway flares within the public right of way are excluded from this requirement.

PROJECT TEAM RECOMMENDATIONS

Work with architect/ civil engineer and/or developer of any buildings to ensure all downspouts are directed to landscape areas and not directly connected to the storm drain system.

VERIFICATION

PROJECT TEAM

- Submit Accountability Form signed by the Engineer, Designer or Landscape Architect that as installed the project meets this requirement.

RATER

- Verify that Accountability Form has been signed by Engineer, Designer or Landscape Architect.
- (Optional) Visually verify that as installed the project meets this requirement.

SYNERGIES AND TRADE-OFFS

- Installing permeable paving, gravel or other porous surfaces to prevent runoff from directly running off into the storm drain can contribute to earning points for Credit B.1.a (Permeable paving gravel or other porous surfaces are installed for 25%, 33% or 50% of paved area)
- Directing runoff from parking lots into landscape beds vegetated swales or other landscape stormwater bmps can contribute to earning points for Credit B.2.a (Capture and filter runoff from parking lots into landscape beds, vegetated swales or other landscape stormwater bmps)
- Incorporating landscape measures including vegetated swales, infiltration planters, detention basins and/ or stormwater wetlands, that are designated to capture and filter 85% or 100% of average annual runoff can contribute to earning points for Credit B.2.b,c (Incorporate landscape measures, including vegetated swales, infiltration planters, detention basins and /or stormwater wetlands, that are designed to capture and filter 85% or 100% of average annual runoff)
- Constructing swales or bioswales with flat bottoms can contribute to earning points for Credit B.2.d (Swales or bioswales specify flat bottoms of at least 18 inches across and/or rock cobble at points of concentrated flow.)
- Installing bioswales without turf can contribute to earning points for Credit B.2.e (Turf is not specified in bioswales)
- Using planters or landscape areas to capture rainwater from downspouts can contribute to earning points for Credit B.2.f (Direct rain water from all down spouts to planters, swales or landscaped areas

RESOURCES AND BAY-FRIENDLY TOOLS

- Bay-Friendly Landscape Guidelines Practice 6.6

2. DESIGN A SYSTEM TO CAPTURE AND FILTER STORM WATER

Credit B.2						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
					9	
Corresponds to BFL Guidelines Practice 6.9						

a. Capture and filter runoff from parking lots into landscape beds, vegetated swales or other landscape stormwater BMP's

POINTS: 2

PRACTICE DESCRIPTION

Runoff from a minimum of 95% of all parking lot surfaces shall be captured and directed to landscape based BMP's. Treatments shall meet the post-construction stormwater requirements of the local jurisdiction and all required documents shall be submitted to the local permitting agency. All treatment measures shall be designed to drain completely within 72 hours or per the local Vector Control District's Guidelines.

PROJECT TEAM RECOMMENDATIONS

- Work with civil engineer, architect and/or developer early in the process to coordinate parking lot design and grading to ensure parking lots are designed to drain into planting areas and that planting areas are sufficient size.
- Consider soil type and drainage rate, appropriate plant selection for periods of inundation and required maintenance.
- Review local jurisdictional requirements for post-construction stormwater treatment measures if project exceeds area thresholds. Most jurisdictions will require post-construction stormwater treatment measures if project size adds or replaces 10,000 square feet or more of impervious surfaces, including roofs. In addition, projects adding or replacing more than one acre of impervious surfaces, including roofs, may be required to meet hydromodification management criteria.
- Local permitting agencies may also have specific requirements and possible exemptions. For example, the City of Oakland requires a site plan that incorporates measures to manage stormwater runoff after construction be approved prior to issuance of permits for projects that add or replace less than 10,000 square feet of impervious surface or involve construction of one single family home.
- Refer to Practice B.2.b, below, for additional recommendations regarding capturing and treating stormwater.

Stormwater *is stormwater runoff, snow-melt runoff, surface runoff and drainage excluding infiltration and irrigation tail water. Alameda Countywide Clean Water Program c.3 Stormwater Technical Guidance*

Landscape Based BMPs (Best Management Practices) *refers to any program, technology, process, sitting criteria, operational method or measure, or engineered system, which when implemented prevents, controls, removes, or reduces pollution. Some examples of landscape stormwater BMP's include bioretention areas, extended detention basins, flow through planter boxes, infiltration trenches, tree well filters, vegetated buffer strips and vegetated swales. Alameda Countywide Clean Water Program c.3 Stormwater Technical Guidance August 31, 2006 Version 1.0*

Hydromodification management (HM) *techniques focus on retaining, detaining or infiltrating runoff and matching post-project flows and durations to pre-project patterns for a specified range of smaller, more frequent rain events, to prevent increases in channel erosion downstream. (Hydromodification Management Requirements Information for Developers, Builders and Project Applicants, Alameda Countywide Clean Water Program, November 2007)*

VERIFICATION

PROJECT TEAM

- Submit Accountability Form signed by the Engineer, Designer or Landscape Architect that as installed the project meets this requirement.
- If the project is required to submit specific documents for approval by the permitting agency submit the name and title of the individual approving the plans and the date approved.

RATER

- Verify that Accountability Form has been signed by Engineer, Designer or Landscape Architect
- Verify the name and title of the individual from the permitting agency has been submitted, along with the date of approval.

SYNERGIES AND TRADE-OFFS

- Preventing runoff from directly entering the storm drain by diverting runoff from the storm drain into landscape beds, vegetated swales or other landscape stormwater bmps can contribute to earning points for Credit B.1.b (No impervious surfaces directly connect to the storm drain)
- Capturing and filtering runoff from parking lots into landscape beds, vegetated swales or other landscape stormwater bmps can contribute to earning points for Credit B.2.b,c (Incorporate landscape measures, including vegetated swales, infiltration planters, detention basins and /or stormwater wetlands, that are designed to capture and filter 85% or 100% of average annual runoff)
- Capturing and filtering runoff from parking lots into swales or bioswales with flat bottoms can contribute to earning points for Credit B.2.d (Swales or bioswales specify flat bottoms of at least 18 inches across and/or rock cobble at points of concentrated flow)
- Capturing and filtering runoff from parking lots into bioswales not planted with turf can contribute to earning points for Credit B.2.e (Turf is not specified in bioswales)
- Specifying a diverse palette of California native species for vegetated BMPs can contribute to earning points for Credit E.8 (Diversify) and E.9 (Choose CA natives first).

- Guidelines for the Standard Urban Storm Water Mitigation Plan Storm Water Best Management Practices for New Development and Redevelopment For the Santa Rosa Area and Unincorporated Areas around Petaluma and Sonoma, June 3, 2005 www.sonoma-county.org/prmd/sw/pdf/susmp.pdf

b. Incorporate landscape measures, including vegetated swales, infiltration planters, detention basins and/or stormwater wetlands, that are designed to capture and filter

i. 85% of average annual stormwater runoff (2 points) OR

ii. Incorporate landscape measures, including vegetated swales, infiltration planters, detention basins and/or stormwater wetlands, that are designed to capture and filter 100% of average annual runoff (total 4 points)

POINTS: 4

PRACTICE DESCRIPTION

Incorporate landscape based BMPs that are designed to capture and filter 85% or 100% of the average annual stormwater runoff. Landscape measures include vegetated swales (also referred to as bioswales), infiltration planters, detention basins, stormwater wetlands, dry wells and dry streambeds.

Test infiltration of soils under landscape based BMPs and amend to meet either Alameda County Clean Water Program Soil specifications 9 or other local agency specifications or Low Impact Development requirements (See definition under B.1). The addition of quality compost is highly recommended

PROJECT TEAM RECOMMENDATIONS

- Work with civil engineer, architect and/or developer early in the process to coordinate surface drainage of hardscape and retention and treatment of stormwater.
- Refer to the post-construction (C.3) stormwater handbook from the local jurisdiction for specific requirements and guidance on calculating the runoff and sizing the landscape treatment facilities. Verify submittal requirements by the local permitting agency. San Francisco Bay Area guidebooks are listed under resources.
- Pay particular attention to soil type and percolation rate. Per ACCWP soil specifications for post-construction stormwater treatment measures, sandy loam or loamy sand soils with a percolation rate of 2”-10” or 5” -10”, respectively.
- The addition of quality compost to the existing and/or import soils will help create soil structure, improving the water holding capacity and ability to filter pollutants. A mulch layer of organic material that holds together when inundated will also filter and help with absorption and retention of runoff. Consider additional ways to improve filtering capacity of the soils and plants, such as inoculating the soil with mycorrhizae.

Vegetated swales (bioswales)- *are open shallow channels with thick vegetation covering the side slopes and bottom that collect and slowly convey runoff to downstream discharge points.*

Infiltration planters *or flow through planters Structure designed to treat stormwater by intercepting rainfall and slowly draining it through filter media and out of planter.*

Detention basins *are constructed basins with drainage outlets that are designed to detain runoff from a storm for some minimum time (e.g., 48 hours) to allow settling of sediment and pollutants.*

Stormwater wetlands *are constructed detention basins that have a permanent pool of water throughout the year and capacity for temporary additional storage of runoff that is released via an outlet structure. They differ from wet ponds in that they are typically shallower and have greater vegetation coverage.*

Above definitions are from: Alameda Countywide Clean Water Program c.3 Stormwater Technical Guidance August 31, 2006 Version 1.0

- Refer to additional recommendations under B.2.a, above.

VERIFICATION

PROJECT TEAM

- Submit Accountability Form signed by the Engineer, Designer or Landscape Architect that as installed the project meets this requirement.
- If the project is required to submit specific documents for approval by the permitting agency submit the name and title of the individual approving the plans and the date approved.
- Submit the results of the analysis or estimate of infiltration rate and recommendations for amending the soil, if required to meet Alameda Countywide Clean Water Program or other local or LID specifications.

RATER

- Verify that Accountability Form has been signed by Engineer, Designer or Landscape Architect
- Verify the name and title of the individual from the permitting agency has been submitted, along with the date of approval.
- Verify results of analysis or estimate of infiltration rate has been submitted, if required.

SYNERGIES AND TRADE-OFFS

- Preventing runoff from directly entering the storm drain by capturing 85% or 100% of average annual stormwater runoff can contribute to earning points for Credit B.1.b (No impervious surfaces directly connect to the storm drain)
- Designing landscape areas to capture runoff from parking lots can contribute to earning points for Credit B.2.a (Capture and filter runoff from parking lots into landscape beds, vegetated swales or other landscape stormwater bmps)
- Analyzing the soil and determining infiltration rate can contribute to earning points for Credit C. 1 (Assess the soil and test drainage).
- Incorporating quality compost into the soils under landscape based BMPs can contribute to meeting the requirements and earning points for Credit C.7 (Amend the soil with compost before planting).
- Specifying a diverse palette of California native species for vegetated BMPs can contribute to earning points for Credit E.8 (Diversify) and E.9 (Choose CA natives first).

c. Bioswales specify flat bottoms of at least 18 inches across and/or rock cobble at points of concentrated flow

POINTS: 1

PRACTICE DESCRIPTION

The bottom of any specified **swales or** bioswales shall be flat for a minimum of 18 inches across to slow and increase filtration of the runoff. Rock cobble should be placed anywhere flows may concentrate and cause erosion, such as curb cuts from parking lots and roadways that direct runoff into planters.

PROJECT TEAM RECOMMENDATIONS

If site grading and details are prepared by civil engineer; coordinate swale cross-section and rock cobble placement.

VERIFICATION

PROJECT TEAM

- Submit plans that show where landscape-based stormwater BMP's are located and location of rock cobble AND/OR
- Submit swale or bioswale details that specify flat bottoms for a minimum of 18 inches across

RATER

- Verify that plans show where landscape based stormwater BMP's are located and location of rock cobble AND/OR
- Verify that swale or bioswale details specify flat bottoms for a minimum of 18 inches across.
- Visually verify (by spot check) that as installed the project meets this requirement

SYNERGIES AND TRADE-OFFS

- Specifying landscape based stormwater BMP's without turf can contribute to earning points for Credit B.2.e (Turf is not specified in bioswales)

RESOURCES AND BAY-FRIENDLY TOOLS

- Alameda Countywide Clean Water Program c.3 Stormwater Technical Guidance http://www.cleanwaterprogram.org/uploads/ACCWP_C3_Technical_Guidance_090506-300dpi.pdf

d. Turf is not specified in bioswales

__Turf__ is defined as spreading or stoloniferous grasses that when regularly mowed form a dense growth of leaf blades and roots. Areas planted with lawn alternatives, such as Carex pansa and other tufted grass or sedge species are not considered turf.

POINTS: 1

PRACTICE DESCRIPTION

Mowed turf, which requires ongoing mowing, water and possible chemical inputs, is not planted in landscape based stormwater BMP's.

PROJECT TEAM RECOMMENDATIONS

Select plants that will tolerate periods of inundation and drought, filter sediments and uptake pollutants. Refer to Resources and Bay-Friendly Tools and local jurisdiction's guidelines for landscape based stormwater BMP's planting recommendations.

VERIFICATION

PROJECT TEAM

- Submit planting plans verifying that no turf is specified in landscape based stormwater BMP's.

RATER

- Verify that plans show that turf is not specified in landscape based stormwater BMP's.
- Visually verify (by spot check) that as installed the project meets this requirement.

SYNERGIES AND TRADE-OFFS

- Specifying landscape based stormwater BMP's with flat bottoms can contribute to earning points for Credit B.2.d (Bioswales specify flat bottoms of at least 18 inches across and/or rock cobble at points of concentrated flow)
- Planting landscape based stormwater BMP's with California native, Mediterranean or other climate adapted plants that require occasional, little or no summer water for 75% of all non-turf plants can contribute to earning points for Credit E.3.a.i.
- Planting landscape based stormwater BMP's with native plants can contribute to earning points for Credit E.9.a

RESOURCES AND BAY-FRIENDLY TOOLS

- Alameda Countywide Clean Water Program c.3 Stormwater Technical Guidance http://www.cleanwaterprogram.org/uploads/ACCWP_C3_Technical_Guidance_090506-300dpi.pdf

e. Direct rain water from all down spouts to planters, swales or landscaped areas.

POINTS: 1

PRACTICE DESCRIPTION

Down spouts are placed to empty directly into planters, swales or landscaped areas. Infiltration of soils receiving the water from the downspouts shall be tested and if required, amended to bring the percolation rate to meet Alameda Countywide Clean Water Program or other local agency or LID specifications.

PROJECT TEAM RECOMMENDATIONS

Work with architect/ civil engineer and/or developer of any buildings to ensure all downspouts are directed to landscape areas and not directly connected to the storm drain system.

VERIFICATION

PROJECT TEAM

- Submit Accountability Form signed by the Engineer, Designer or Landscape Architect that as installed the project meets this requirement

RATER

- Verify that Accountability Form has been signed by Engineer, Designer or Landscape Architect
- Visually verify (by spot check) that as installed the project meets this requirement

SYNERGIES AND TRADE-OFFS

- Capturing and filtering water from all impervious roof areas into planters, swales or landscaped areas can contribute to earning points for Credit B.2.b.c (Incorporate landscape measures, including vegetated swales, infiltration planters, detention basins and /or stormwater wetlands, that are designed to capture and filter 85% or 100% of average annual runoff)
- Analyzing the soil and determining infiltration rate can contribute to earning points for Credit C. 1 (Assess the soil and test drainage).
- Incorporating quality compost into the soils under landscape based BMPs can contribute to meeting the requirements and earning points for Credit C.7 (Amend the soil with compost before planting).

RESOURCES AND BAY-FRIENDLY TOOLS

- Alameda Countywide Clean Water Program c.3 Stormwater Technical Guidance http://www.cleanwaterprogram.org/uploads/ACCWP_C3_Technical_Guidance_090506-300dpi.pdf

C. EARTHWORK AND SOIL HEALTH

1. ASSESS THE SOIL AND TEST THE DRAINAGE

Credit C.1						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
2		1				
Corresponds to BFL Guidelines Practice 1.2						

a. Submit laboratory soil analysis results and recommendations for compost and natural fertilizers.

POINTS: 3

PRACTICE DESCRIPTION

An analysis of one or more soil samples that are representative of the site conditions shall be completed by an accredited and approved testing laboratory. Sample collection procedures shall adhere to recommendations of the soil testing laboratory. Contractor shall request that the laboratory make recommendations based on amending with compost and an 'organic' approach to soil and landscape management, Analyses to be performed include:
pH, electrical conductivity, nitrate, ammonium, phosphorus, potassium, calcium, saturation percent, sodium, chloride, sodium adsorption ratio, boron, % sand-silt-clay, lime, % organic

It is also recommended that the infiltration rate and drainage characteristics be determined, particularly for soils in bioswales and other stormwater BMPs.

PROJECT TEAM RECOMMENDATIONS

- Sample problematic areas separately.
- Provide the laboratory with your target soil organic matter content, and the total landscape area to be amended upon which they can then make accurate recommendations for amending the soil.
- Provide soil lab with the types of plantings intended, turf, perennial bed, annual bed, swale, etc. so that they can customize their recommendations accordingly.
- Integrate soil analysis into a soil management plan.
- Consult a geotechnical engineer or soil scientist for initial assessment of infiltration for all beds but particularly for soils under stormwater BMPs such as bioswales.

VERIFICATION

PROJECT TEAM

- Submit soil analysis report and accompanying recommendations from the accredited soil laboratory.

RATER

- Verify soil analysis has been completed and that recommendations from the lab are based on an 'organic' approach.

SYNERGIES AND TRADE-OFFS

- Analyzing the soil and determining infiltration rates can contribute to earning points for Credit B.2 (Design a system to capture and filter storm water).
- Providing the laboratory with a target soil organic matter content of 3.5% or 5% can contribute to meeting the requirement or earning points for Credit C.7 (Amend the soil with compost before planting).
- Requesting recommendations for amending or fertilizing the soil be based on an organic approach can contribute to earning points for Credit C.5 (Feed soils naturally & avoid synthetic fertilizers).

RESOURCES AND BAY-FRIENDLY TOOLS

- *Bay-Friendly Landscape Guidelines lists local soil laboratories, page 66.*
- State of California, Department of Water Resources, Model Water Efficient Landscape Ordinance, Appendix B, Sample Soil Management Plan.

2. Remove and store topsoil before grading

Credit C.2						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
		2				
Corresponds to BFL Guidelines Practice 3.1						

a. The removal, temporary storage, and re-spreading of topsoil is specified in the landscape design documents AND specifications include a maximum topsoil pile height of 6 feet, as well as measures to protect the stored topsoil from erosion.

POINTS: 2

Horticulturally suitable topsoil *has soluble salts less than 0.5mmhos/cm, free of large roots, clots and stones larger than 1 inch, noxious weeds, sticks, lumber, brush, litter and undesirable disease-causing organisms, as evidenced by previous plant growth.*

PRACTICE DESCRIPTION

Specify the removal, during grading, the temporary storage, and the replacement of horticulturally suitable topsoil. If horticulturally suitable topsoil is greater than 6 inches in depth, a minimum of 6 inches shall be removed and stored for re-spreading. If suitable topsoil is less than 6 inches, then entire topsoil depth shall be removed. Specifications shall include a maximum topsoil pile height of 6 feet. Stockpiled soil shall be protected with blankets or socks, or seeded for erosion control if the soil will be stockpiled over the rainy season.

It is highly recommended that the soil below the removed topsoil be scarified or tilled before stored topsoil is re-spread, especially if the stored topsoil will amount to less than 8 inches after replacing.

PROJECT TEAM RECOMMENDATIONS

- Integrate this practice into a soil management plan.
- Review the specifications for removing and storing topsoil with the contractor before grading.

VERIFICATION

PROJECT TEAM

- Submit specifications for removal, storage and replacement of topsoil and details for protecting stored topsoil from erosion.

RATER

- Verify specifications and details have been submitted.
- (Optional) Visually verify stockpiling and protection of soil.

SYNERGIES AND TRADE-OFFS

- Amending stored topsoil with compost can contribute to meeting the requirement and earning points for Credit C.7 (Amend the soil with compost before planting).
- Ripping, scarifying or tilling the remaining soil before the removed topsoil is replaced can contribute to earning points for Credit C.4 (Aerate compacted soils)

RESOURCES AND BAY-FRIENDLY TOOLS

- Guidelines and Resources for Implementing Soil Quality and Depth BMPT5.13
  www.BuildingSoil.org/tools/Soil_BMP_text.pdf
- State of California, Department of Water Resources, Model Water Efficient Landscape Ordinance, Appendix B, Sample Soil Management Plan.

3. Protect soil from compaction

Credit C.3						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
		3				
Corresponds to BFL Guidelines Practice 3.2						

a. Grading specifications or construction plans call for the installation and maintenance of fencing to prohibit parking or materials staging in areas identified for protection.

POINTS: 2

PRACTICE DESCRIPTION

Areas that are to be planted, or areas with native vegetation to be protected are identified as off limits to parking of vehicles, equipment and other materials. This practice is implemented regardless of need for grading. Fencing shall provide a strong physical and visual barrier and be a minimum of 3-4 feet high. The site shall be walked with the contractor and equipment operators prior to beginning construction.

PROJECT TEAM RECOMMENDATIONS

- Integrate the protection of identified areas with the site's stormwater pollution prevention plan and soil management plan.
- Clearly identify limited areas for parking cars and equipment and for staging materials that are outside areas of protection and on the site where roads and utility corridors will be placed.
- Work with the contractor to identify appropriate equipment: axle loads exceeding 10 tons per axle can compact soils as deep as 3 feet and in many cases activities can be completed with mini-track loaders or other smaller scale equipment.

VERIFICATION

PROJECT TEAM

- Submit construction documents with location, type and height of all fencing identified.
- Submit an Accountability Form, signed by the Landscape Architect, Designer or Contractor indicating that the property has been walked with equipment operators prior to clearing and grading to clarify these boundaries

RATER

- Verify construction documents have been submitted with fencing identified.
- Verify Accountability Form has been signed by Landscape Architect, Designer or Contractor.
- (Optional) Visually verify installed fencing before construction.

SYNERGIES AND TRADE-OFFS

- Integrating this practice with a plan to limit grading can contribute to earning points for Credit A. 5.a. (Minimize site disturbance).
- Preserving existing mature healthy trees in areas identified for protection can contribute to earning points from Practice A.7.a (The landscape is designed to preserve 80% of existing mature healthy trees and penalties are included).

RESOURCES AND BAY-FRIENDLY TOOLS

- State of California, Department of Water Resources, Model Water Efficient Landscape Ordinance, Appendix B, Sample Soil Management Plan.
- www.BuildingSoil.org/tools/Soil_BMP_text.pdf

REFERENCES

- *Puget Sound Action Team, Washington State University, Low Impact Development*

b. Design documents specify that soil is not worked when wet

POINTS: 1

PRACTICE DESCRIPTION

Design documents specify that clearing, grading and heavy construction is completed entirely during the dry season, usually April through October.

PROJECT TEAM RECOMMENDATIONS

- Integrate this practice into a soil management plan.

VERIFICATION

PROJECT TEAM

- Submit construction documents with instructions to begin and complete all soil activities during the dry season and to avoid all activities if the soil is wet.

RATER

- Verify construction documents include the appropriate instructions.

RESOURCES AND BAY-FRIENDLY TOOLS

- State of California, Department of Water Resources, Model Water Efficient Landscape Ordinance, Appendix B, Sample Soil Management Plan.

4. Aerate compacted soils

Credit C.4						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
		2				
Corresponds to BFL Guidelines Practice 3.7						

a. Design documents include specification to alleviate compacted soils to a depth of at least 8 inches, before planting, for all landscaped areas that can not be protected during construction. (1 point)

b. Design documents include specification to alleviate compacted soils to a depth of at least 12 inches, before planting, for all landscaped areas that can not be protected during construction. (1 point)

POINTS: 2

PRACTICE DESCRIPTION

The optimal practice is to protect all planting areas from construction equipment and staging materials as equipment can compact soil to a depth of many inches. If the planting areas are not protected, then the soil should be ripped, scarified or tilled during soil preparation to a minimum depth of 8 or 12 inches.

PROJECT TEAM RECOMMENDATIONS

- Integrate the alleviation of compacted soils into a soil management plan.
- Incorporate compost into the soil at the same time it is being aerated for best results.

VERIFICATION

PROJECT TEAM

- Submit design documents and/or construction documents that include instructions for alleviating compaction.
- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor indicating soil has been ripped or tilled to a depth of 8 or 12 inches or more.

RATER

- Verify design or construction documents include instructions for alleviating compaction.
- Verify Accountability Form has been signed by Landscape Architect, Designer or Contractor.
- (Optional) Visually verify by digging at least one 8 or 12 inch test hole per acre of turf and at least one per acre of planting bed. Test holes must be excavated using only a garden spade driven by the inspector's weight.

SYNERGIES AND TRADE-OFFS

- Incorporating compost at the time of tillage can contribute to meeting the requirement or earning points for Credit C.7 (Amend the soil with compost before planting).

RESOURCES AND BAY-FRIENDLY TOOLS

- Bay-Friendly Landscape Guidelines Practice 3.2
- www.BuildingSoil.org/tools/Soil_BMP_text.pdf

5. FEED SOILS NATURALLY & AVOID SYNTHETIC FERTILIZERS

Credit C.5						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
		1				
Corresponds to BFL Guidelines Practice 3.8 & 3.9						

a. Fertilizers or soil amendment materials prohibited by OMRI in its generic materials list are prohibited in construction of the project.

POINTS: 1

PRACTICE DESCRIPTION

Bay-Friendly Landscaping relies on compost and organic fertilizers from natural sources that release elements slowly.

Amendments and fertilizers that are not approved or are restricted for use in crop production by OMRI shall not be specified for use during the construction and establishment phases of the project.

Organic Materials Review Institute (OMRI) *approves amendments and fertilizers for use in crop production. The OMRI Generic Materials List is a catalog of over 900 substances that are allowed, restricted, or prohibited for use in organic agriculture and food processing. Based on the National Organic Program, the list serves as a reference guide for organic farmers, handlers, processors, inspectors, certifiers, agricultural professionals, and all others with an interest in materials for use in organic production. Materials approved for use in organic production are appropriate for use in landscapes.* *http://omri.org/OMRI_generic_list.html*

PROJECT TEAM RECOMMENDATIONS

- Submit a soil sample for analysis and request recommendations for an organic approach to the management of the soil.

VERIFICATION

PROJECT TEAM

- Submit an Accountability Form signed by the Landscape Contractor indicating that no materials prohibited by OMRI have been used in the construction or establishment phases.
- Submit construction document that specify the use of organic amendments and fertilizers.

RATER

- Verify that construction documents require organic fertilizers and amendments.
- Verify Accountability Form has been signed by the Landscape Contractor.

SYNERGIES AND TRADE-OFFS

- Using compost as the soil amendment can contribute to meeting the requirement or earning points for Credit C.7 (Amend the soil with compost before planting).
- Using compost made from plant debris (recycled mulch) can also contribute to earning points for Credit D.1.d. (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste.

RESOURCES AND BAY-FRIENDLY TOOLS

- *Bay-Friendly Landscape Guidelines* Practice

- *Field Guide to Compost Use*, US composting Council www.uscompostingcouncil.org

6. MULCH

a. REQUIRED: Planting plans indicate that after construction, all soil on site is protected with a minimum of 3 inches of mulch.

POINTS: This practice is required for all commercial& civic landscapes that are to be recognized as Bay-Friendly.

PRACTICE DESCRIPTION

A three-inch (3") layer of mulch is spread over the surface of all non-turf planting areas. It is highly recommended that trees identified for removal are chipped and used on-site as mulch or that recycled or green waste mulch be purchased. It is very important that root crowns be kept free of mulch. It is also recommended that landscape fabric not be used under the recycled mulch. All layers of sheet mulch, including cardboard, paper, compost, or other chipped materials if used, will count towards the 3 inches of mulch.

PROJECT TEAM RECOMMENDATIONS

- Specify a three-inch (3") layer of mulch planting notes, specifications, details and in cost estimate.
- If sheet mulching is specified, include a sheet mulching detail in planting plans.
- Include notes on clearing and demolition plans and specifications if on-site trees are to be chipped for mulch.
- Integrate this practice into a soil management plan.
- Be sure that grading instructions include a soil level at least 3 inches lower than the surrounding hardscapes to insure that the finished mulch is at grade or slightly lower to facilitate ease of maintenance and to keep mulch out of storm drains.

VERIFICATION

PROJECT TEAM

- Submit square footage of planting areas as well as cubic yards required to cover planting areas to a minimum three-inch (3") depth.
- Submit a delivery ticket or receipt of purchased mulch and/or
- Submit receipts for sheet mulching materials and/or
- (Optional) Submit photos of trees being chipped for mulch (if applicable).

RATER

- Verify delivery tickets/receipts for purchased materials reflect needed amounts of materials.
- Visually verify the type and depth of the mulch (depth can be spot checked with a ruler).
- If sheet mulch is specified, Rater visually verifies the layer of cardboard has been installed.

SYNERGIES AND TRADE-OFFS

- Using mulch made from plant debris (recycled mulch) can also contribute to earning points for Credit D.1.d. (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste.
- Chipping trees identified for removal, and using on-site as mulch can also contribute to earning points for A.3.a.ii (Construction documents specify that of the trees identified for removal, some are chipped for use as mulch on-site) and D.2 (Reduce and recycle landscape construction waste).
- Sheet mulching can also contribute to earning points for practice C.8.a (Sheet mulch is specified for weed control). See model sheet mulching specifications in Appendix A.

Cubic Yard Calculation

1 Cubic Yard = 3ft x 3ft x 3ft = 27 Cubic Ft

1 Foot = 12 inches

A = Total planting area in square feet to cover

B = Total inches of amendment or mulch required for planting areas

Total Cubic Yards of amendment or mulch required = (A / 27) x (B/12)

Cubic Yards Required to Apply 3 Inches of Mulch	
1000 Square Feet	9.25 cubic yards
One Acre	403 cubic yards

7. AMEND THE SOIL WITH COMPOST BEFORE PLANTING

Credit C.7						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
		R + 3				
Corresponds to BFL Guidelines Practice 4.1						

a. Compost is specified as the soil amendment, at the rates indicated by a soil analysis, to bring the soil organic matter content to a minimum of:

i. Required: 3.5% by dry weight OR 1" of quality compost OR

ii. 5% by dry weight (total 2 points) AND/OR

iii. Specify the use of compost from processors that participate in the US Composting Council's Standard Testing Assurance program.

POINTS: The first part of this practice is required for all commercial & civic landscapes that are to be recognized as Bay-Friendly. Up to 3 additional points may be earned for going above and beyond the requirement.

PRACTICE DESCRIPTION

i. To meet the requirement, the amount of compost recommended by a professional soil laboratory to bring the soil organic matter content to 3.5% is incorporated into the planting area topsoil. Alternatively a minimum one-inch (1") of quality compost shall be incorporated into the planting area topsoil.

If imported or site soil meets the organic matter content of 3.5% or more, or if the plant palette primarily includes California native species that are adapted to soils with little or no organic matter, then the required practice of adding compost is waived.

ii. The amount of compost recommended by a professional soil laboratory to bring the soil organic matter content to 5% is incorporated into the planting area topsoil, with the same allowable waivers.

iii. The compost is purchased from a producer who participates in the U.S. Composting Council's Standard Testing Assurance Program.

Compost *is the product of controlled biological decomposition of organic materials, often including urban plant debris and food waste. It is an organic matter resource that has the unique ability to improve the chemical, physical and biological characteristics of soils or growing media. It contains plant nutrients but is typically not characterized as a fertilizer. Excerpted from US Compost Council , Field Guide to Compost Use*

Quality compost *is a well decomposed, stable, weed free organic matter source, derived from agricultural and/or food waste and/or plant trimmings, contain no substances toxic to plants, possess no objectionable odors. It does not resemble the feedstock (the original materials from which it was derived. It is highly recommended that it be produced in accordance with the U.S. Composting Council's Standard Testing Assurance Program.* www.compostingcouncil.org

PROJECT TEAM RECOMMENDATIONS

- Integrate this practice into a soil management plan.
- Specify a minimum of 1" of quality compost or as recommended in the soils report, as the soil amendment in plans, specifications and details.
- Request a soil analysis and amendment recommendations from a qualified soil laboratory. Ask that the recommendations be based on an organic approach to landscaping, and ask the lab to calculate the amount compost required for the square footage to which it is to be applied.

VERIFICATION

PROJECT TEAM

i. and ii.

If a waiver is requested based on soil organic matter content or the needs of plant palette,

- Submit a completed plant palette with species that need little/no soil organic matter identified, and include the source of information on their soil needs OR
- Submit a soils report that indicates the soil has an organic matter content of 3.5% or greater.

Under all other circumstances:

- Submit the site soil or imported topsoil analysis. No soils analysis is required if 1" of compost is used.
- Submit compost details from construction documents.
- Submit the receipt or delivery ticket for the compost, indicating the amount of the compost delivered/purchased.

iii.

- Submit documentation showing compost is purchased from a processor that participates in the US Composting Council's Standard Testing Assurance Program.

RATER

i. and ii.

- If a waiver is requested based on plant palette, verify plant palette and soil needs (spot check source by looking up soil needs in identified source).
- If a waiver is requested based on adequate soil organic matter content, confirm by reviewing soil analysis.
- Verify compost details have been included in construction documents.
- Verify delivery tickets/ receipts for compost delivered or purchased reflect needed amounts of materials.

iii.

- Verify from receipts that compost is USCC STA program certified.

SYNERGIES AND TRADE-OFFS

- Submitting soil analysis recommendations for quality compost can also contribute to earning points for Credit C.1.a. (Submit laboratory soil analysis results and recommendations for compost and natural fertilizers)
- Tilling quality compost to a depth of 8-12 inches can also contribute to earning points for Credit C.4 (Aerate compacted soils)
- Specifying compost from recycled local organic materials such as plant waste can also contribute to earning points for Credit D.1.d (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste.

Cubic Yard Calculation

1 Cubic Yard = 3ft x 3ft x 3ft = 27 Cubic Ft

1 Foot = 12 inches

A = Total planting area in square feet to cover

B = Total inches of amendment or mulch required for planting areas

Total Cubic Yards of amendment or mulch required = (A / 27) x (B/12)

Cubic Yards Required to Apply 3 Inches of Mulch	
1000 Square Feet	9.25 cubic yards
One Acre	403 cubic yards

8. USE IPM DESIGN AND CONSTRUCTION PRACTICES TO PREVENT PEST PROBLEMS

Credit C.8						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
		1			4	
Corresponds to BFL Guidelines Practice 6.1.a						

Sheet mulching *uses a layer of paper or cardboard underneath the mulch to enhance weed suppression and soil building benefits. This layered mulch system is often used during landscape construction to optimize mulch benefits and encourage plant establishment.* (StopWaste.Org, *A Bay-Friendly Landscaping Guide to Mulch)*

a. Sheet mulch is specified for weed control

POINTS: 3

PRACTICE DESCRIPTION

Sheet mulch shall be specified for weed control

PROJECT TEAM RECOMMENDATIONS

- Use the specifications included in *A Bay-Friendly Landscape Guide to Mulch*
- Cardboard can be bought in large rolls from paper supply companies to reduce labor and materials cost. Wet the cardboard immediately to prevent it from blowing away and to facilitate manipulating the material.
- If using drip irrigation, place irrigation on top of cardboard and below compost and mulch.
- Be sure that the finish grade of the sheet mulch is at the same height or slightly lower than the surrounding hardscape in order to keep mulch in place.

VERIFICATION

PROJECT TEAM

- Submit sheet mulching details included in construction documents.
- Submit tags or receipts for all layers, and/or photo documentation of weed barrier layer.

RATER

- Verify sheet mulching detail has been included in construction documents.
- Verify tags or receipts or photos for all layers.
- Visually verify weed barrier layer while verifying mulch layer.

SYNERGIES AND TRADE-OFFS

- Sheet mulch can contribute to meeting the requirements for Credit C6 (Mulch)
- Using compost and/or mulch made from plant debris (recycled mulch) can also contribute to earning points for Credit D.1.d. (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste.
- Chipping trees identified for removal, and using on-site as mulch can also contribute to earning points for A.3.a.ii (Construction documents specify that of the trees identified for removal, some are chipped for use as mulch on-site) and D.2 (Reduce and recycle landscape construction waste).

b. Synthetic chemical pre-emergents are avoided

POINTS: 2

PRACTICE DESCRIPTION

Synthetic pre-emergent herbicides that are listed as prohibited by OMRI shall be avoided. Alternative weed control measures shall be specified, such as sheet mulching, watering sites and tilling over a few cycles to exhaust weed seed banks or spot spraying.

VERIFICATION

PROJECT TEAM

- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor that the criteria for this credit have been met.

RATER

- Verify Accountability Form has been signed by the Landscape Architect, Designer or Contractor.

9. KEEP SOIL AND ORGANIC MATTER WHERE IT BELONGS

Credit C.9						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
		1			1	
Corresponds to BFL Guidelines Practice 3.3						

a. Compost berms or blankets or socks are specified for controlling erosion

POINTS: 2

PRACTICE DESCRIPTION

Compost blankets shall be specified for temporary erosion and sediment control during the construction of the project, and shall be a depth that is appropriate to the slope, as per the California Department of Transportation (Caldrons) Specifications. Compost blankets shall be stabilized with netting or other confinement systems and the compost particle size and compost depth shall be specially designed if applying to steeper slopes AND/OR Compost berms or socks shall be specified for all perimeter sediment controls. No silt fences or straw bales will be used.

Compost for any erosion control BMPs is specified as per the California Department of Transportation or the US EPA, and is produced by a participant in the US Composting Council's Standard Testing Assurance (STA) program.

PROJECT TEAM RECOMMENDATIONS

- Specify the compost used for compost blankets be tilled into the soil before planting.

VERIFICATION

PROJECT TEAM

- Submit calculations of area to be blanketed, and amount of compost required for targeted depth.
- Submit specifications for compost products and source of specifications (Caldrons or US EPA).
- Submit a delivery ticket or receipt of purchased compost, and/or socks indicating amounts and that the compost is supplied from a participant in the US Composting Council's STA program.

Compost blankets *1-3 inch layers of compost that are blown onto slopes up to 2:1 or up to 1:1 with additional stabilization. The compost can also be spread on shallower slopes. The use of compost blankets is a USEPA approved BMP for construction sites. They make excellent surface contact, preventing rilling underneath and thereby controlling erosion. Compost blankets can be less expensive than other erosion BMPs because they do not need to be removed, hauled and landfilled.* www.BuildingSoil.org

Compost berms and socks *are also US EPA approved for perimeter sediment and pollutant control, and are increasingly used instead of silt fences and straw bales. Berms can be blown in place or placed with a front end loader. Socks can be filled in place by compost suppliers or filled and delivered on pallets. They do not need to be trenched in and are highly effective at filtering out sediments, oil, grease and metals.* www.BuildingSoil.org

RATER

- Verify calculations are accurate.
- Verify receipts for compost and that the amount of compost purchased for use as a blanket will cover the area as calculated.
- (Optional) Visually verify the depth of the compost blanket and/or installation of compost berms or socks.

SYNERGIES AND TRADE-OFFS

- Turning a compost blanket used for erosion control into the soil before planting can contribute to meeting the requirement or earning points for Credit C.7 (Amend the soil with compost)
- Using compost made from plant debris (recycled mulch) can also contribute to earning points for Credit D.1.d. (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste.

RESOURCES AND BAY-FRIENDLY TOOLS

D. MATERIALS

1. USE SALVAGED ITEMS & RECYCLED CONTENT MATERIALS

Credit D.1						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
	16					
Corresponds to BFL Guidelines Practice 2.6						

Recycling *is the collection, reprocessing, marketing and use of materials that were diverted or recovered from the solid waste stream (LEED New Construction & Major Renovation Version 2.2 reference Guide)*

Salvaged materials *are items that are put to a new use after their initial use, without being remanufactured between uses.*

Recycled content products *are those made from materials derived from discarded goods. They are remanufactured between uses.*

FSC certified wood *is certified in accordance with the Forest Stewardship Council's criteria*

a. Non-plant landscape materials are salvaged or made from recycled content materials or FSC certified wood

- **i. Decking (100% of non structural materials) (1 point)**
- **ii. Fencing (100% of non structural materials) (2 points)**
- **iii. Outdoor furniture such as bike racks, benches, tables and chairs (50% minimum) (2 points)**
- **iv. Planters or retaining walls (100% of either or both) (1 point)**
- **v. Parking stops or lighting/sign posts (100% of either or both) (1 point)**
- **vi. Play structures or surfaces (100% of either or both) (2 points)**
- **vii. Edging or decorative glass mulch (100% of either or both) (1 point)**

POINTS: 10

PRACTICE DESCRIPTION

Non-plant landscape materials are salvaged or made from recycled content materials or FSC certified wood. The percentages are calculated per each category of item that qualifies. For example, all of the non structural decking on the entire project must be salvaged and/or recycled content and/or FSC certified. In addition, the recycled content must be:

- Plastic: 100% recycled content with 90-100% postconsumer content
- Plastic/Rubber: 90-100% total with 90-100% postconsumer content
- Plastic composites: 95-100% recycled content with 50-100% postconsumer content
- Aluminum: 25% recycled content with 25% postconsumer
- Steel from the Basic Oxygen Furnace (BOF) process: 25-30% recycled content with 16% postconsumer content
- Steel from the Electric Arc Furnace (EAF) process 100% total with 67% postconsumer content

.

PROJECT TEAM RECOMMENDATIONS

Assess which items can be salvaged from the site and reused early in the design process and include salvage of these items in the demolition plan.

VERIFICATION

PROJECT TEAM

- Submit plans showing the quantity of each product meeting requirements above
- Submit tags and receipts for FSC wood and/or product literature indicating correct recycled content of plastic, rubber surfaces and/or composite lumber, or that furnishings have reclaimed lumber and/or metal components OR
- Submit specifications and an Accountability Form signed by the Landscape Architect, Designer or Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify quantity of each product meets requirements above
- Verify tags, receipts and manufacturer literature indicates correct recycled content OR
- Verify that specifications have been submitted and an Accountability Form has been signed by Landscape Architect, Designer or Contractor.
- Visually verify compliance on site (spot check).

SYNERGIES AND TRADE-OFFS

- Salvaging materials onsite can contribute to meet the requirements for Credit D.2. (Reduce and recycle landscape construction waste)
- Specifying recycled lighting posts that also have low energy light fixtures can contribute to earning points for Credit D.4.a. (Low energy light fixtures are specified for all site lighting)
- Specifying recycled light posts that are also photovoltaic can contribute to earning points for Credit D.4.b. (Photovoltaic is specified for site lighting).

b. A minimum 25% of recycled aggregate (crushed concrete) is specified for walkway, driveway, roadway base and other uses

Recycled aggregate *is clean crushed concrete and crushed asphalt pavement.*

POINTS: 2

PRACTICE DESCRIPTION

A minimum 25% of recycled aggregate shall be specified for all areas where Caldrons Class II materials are specified. Purchased crushed concrete or asphalt as well as materials salvaged from the jobsite such as crushed concrete, crushed asphalt or existing aggregate will qualify as recycled aggregate to meet the criteria for this credit.

PROJECT TEAM RECOMMENDATIONS

Assess whether existing concrete or asphalt on site could be crushed for reuse early in the design process or if existing aggregate can be reused. Note salvaging this material on the demolition plan. Recycled aggregate can also be purchased and should be specified on the plans, details, and specifications and in the cost estimate.

VERIFICATION

PROJECT TEAM

- Submit tags or vendor receipts showing recycled aggregate percentage OR
- Submit specifications and an Accountability Form signed by the Owner, Developer, Landscape Architect, Designer or Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify tags or receipts have been submitted and that percentage meets the standard OR
- Verify that specifications have been submitted and an Accountability Form has been signed by Owner, Developer, Landscape Architect, Designer or Contractor.
- Optional: field verification

SYNERGIES AND TRADE-OFFS

- Salvaging recycled aggregate from onsite could contribute to meeting the requirement for Credit D.2. (Reduce and recycle landscape construction waste)

RESOURCES AND BAY-FRIENDLY TOOLS

- Bay-Friendly Landscape Guidelines Practice 2.6 http://www.stopwaste.org/home/index.asp?page=431

c. Replace Portland cement in concrete with flyash or slag.
i. 20% (1 point) OR
ii. 25% (2 points total)

POINTS: 2

Fly Ash *is a by product from coal combustion. It can be used as a substitute for Portland cement in concrete.*

Slag *is a by product of metal smelting and can be used as a substitute for Portland cement in concrete.*

PRACTICE DESCRIPTION

Flyash AND/OR slag replaces Portland cement in concrete to the specified percentage on a per weight basis for all flatwork and poured in place concrete.

VERIFICATION

PROJECT TEAM

- Submit tags or receipts showing flyash or slag percentage in the concrete mix OR
- Submit specifications and an Accountability Form signed by the Engineer, Designer or Contractor stating percentage for compliance.

RATER

- Verify tags or receipts have been submitted and that percentage is meets the standard OR
- Verify that specifications have been submitted an Accountability Form has been signed by the Engineer, Landscape Architect, Designer or Contractor

SYNERGIES AND TRADE-OFFS

- Specifying permeable concrete paving could contribute to earning points for Credit B1 (Minimize impervious surfaces)

RESOURCES AND BAY-FRIENDLY TOOLS

- Bay-Friendly Landscape Guidelines Practice 2.6 https://www.stopwaste.org/docs/bay-friendly_landscape_guidelines_-_all_chapters.pdf

d. Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste

i. 100% of compost OR 100% of mulch (1 point)

ii. 100% of both (2 points total)

POINTS: 1

Compost *is the product of controlled biological decomposition of organic materials, often including green waste and food waste*

Mulch *is any material spread evenly over the surface of the soil to enhance the growth of plants and the appearance of the landscape.* (StopWaste.Org, *A Bay-Friendly Landscaping Guide to Mulch)*

Recycled mulch *is chipped or shredded wood and green waste from used pallets or untreated lumber scraps, branches, leaves and tree trunks. Its use provides the benefits of mulch and keeps wood and green waste out of landfills.* (StopWaste.Org, *A Bay-Friendly Landscaping Guide to Mulch)*

PRACTICE DESCRIPTION

All purchased compost and/or mulch shall be produced from local, organic materials such as plant, food or wood waste.

VERIFICATION

PROJECT TEAM

- Submit tags or receipts showing quantity, supplier and feedstock of compost and/or mulch

RATER

- Verify that tags or receipts show quantity, supplier and feedstock of compost and/or mulch qualify

SYNERGIES AND TRADE-OFFS

- If mulch is supplied by chipping on-site trees identified for removal for Credit A.3.a.ii (Construction documents specify that of the trees identified for removal, some are chipped for use as mulch onsite), then points can not also be earned for this credit.
- Submitting soil analysis recommendations for quality compost can contribute to earning points for Credit C.1.a. (Assess the soil and test drainage)
- Specifying 3" of mulch will contribute to meeting the requirements for Credit C.6.a (Required planting specifications and plans indicate that after construction, all soil on site is protected with a minimum of 3 inches of mulch)
- Specifying Quality compost as the soil amendment could contribute to earning points for Credit D7 (Amend the soil with compost before planting)

RESOURCES AND BAY-FRIENDLY TOOLS

- The *Bay-Friendly Landscape Guidelines* and other printed materials can be downloaded from: http://www.stopwaste.org/home/index.asp?page=777, including

2. REDUCE AND RECYCLE LANDSCAPE CONSTRUCTION WASTE

Credit D.2						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
	R + 5					
Corresponds to BFL Guidelines Practice 2.7						

a. REQUIRED: Required: Divert 50% of landscape construction and demolition waste.

POINTS: This practice is required for all commercial& civic landscapes that are to be recognized as Bay-Friendly.

PRACTICE DESCRIPTION

Identify the types and quantities of materials generated at the job site and reuse or recycle an average of at least fifty (50) percent, by weight, of all C&D debris from construction, demolition, and renovation projects.

Create and follow pre and post construction debris recovery plans that include

- allocating space for recycling bins and containers on the job site
- securing recycling bins against illegal dumping
- training workers before demolition or construction begins
- separating green waste from other materials
- If applicable, establishing and using a cut-pile to reduce waste from scrap pieces of wood.
- Documenting the results of the waste management efforts

Put waste recycling and reuse specifications into contract language and require contractors to review the waste management plan with subcontractors.

Construction and Demolition Debris *means used or discarded materials removed from premises during construction or renovation of a structure resulting from construction, remodeling, repair, or demolition operations on any pavement, house, commercial building, or other structure. It generally consists of wood, drywall, metals, concrete, dirt, cardboard, plastic pots and more. StopWaste.Org Model C&D Policy*

Green waste *consists of the plant debris from trees, shrubs, groundcover and turf that is generated during demolition, installation or maintenance phases of the project.*

PROJECT TEAM RECOMMENDATIONS

- Verify the local jurisdiction's minimum requirement and reporting procedures for C&D recycling.
- State the percent diversion goal in the design documents.
- List specific goals and recycling and reuse requirements in plans and specifications
- Require contractors to review the waste management plan with subcontractors and to include contract language requiring subcontractors comply with the plan.
- To facilitate this process occurring smoothly, plans should be submitted with the Build It Green Sample Debris Recovery Statement or equivalent form required by local jurisdictions or regularly used by the Builder.
- Hauler and gate tags may show that all materials were sent to a C&D Recycling facility. However, that does not mean that 100% of all of the materials were recycled, as not all C&D materials can be recycled. Most large C&D facilities have a calculated diversion rate and can provide you with documentation stating the percentage of materials recycled at that facility. (The diversion rates range from 50% to 90%).

VERIFICATION

PROJECT TEAM

- Submit the Pre Construction Debris Recovery Plan in the planning stages of construction,
- Submit Post Construction Debris Recovery Plan, and documentation of results (i.e. hauler or facility gate tags, builder's waste tabulation supplied by local waste authority).
- Submit the diversion rate from the C&D facility.

RATER

- Verify that Pre Construction Debris Recovery Plan and Post Construction Debris Recovery Plan were submitted and documentation confirms this has been accomplished by comparing hauler and gate tags to facility diversion rates.
- Conduct field observations to get a sense of waste diversion practices (optional). However, field observation can not be used as a judgment or verification method of the documented results as some builders have waste separated and recycled off site and it is not evident on site.

SYNERGIES AND TRADE-OFFS

- Chipping trees identified for removal, and using mulch on-site is highly recommended and can also contribute to earning points for Credit A.3.a.ii (Construction documents specify that of the trees identified for removal, some are chipped for use as mulch onsite), C.6.a (Required: Planting specifications and plans indicate that after construction, all soil on site is protected with a minimum of 3 inches of mulch) and Credit D.1.d. (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste)
- Reusing site materials can also contribute to earning points for Credit D.1. (use salvaged items and recycled content materials)
- Donating unused materials can also contribute to earning points for Credit D.2.d. (Donate unused materials)

RESOURCES AND BAY-FRIENDLY TOOLS

- Find out where to recycle C&D debris, including wood, drywall, metals, concrete, soil and cardboard from StopWaste.Org, *Builders' Guide to Reuse & Recycling: A Directory for Construction and Demolition Materials*, *www*.BuildGreenNow.Org
- StopWaste.Org also provides extensive information about C&D waste management, including a sample Waste Management Plan for recycling C&D materials. Visit www.BuildGreenNow.Org to download these documents electronically.

b. Divert 100% of asphalt concrete and Portland cement concrete and 65% of remaining materials (2 points) OR

c. Divert 100% of asphalt concrete and Portland cement concrete and 80% or more of remaining materials (Total 4 points)

POINTS: 4 points

PRACTICE DESCRIPTION

Identify the types and quantities of heavy and inert materials generated at the job site and where local facilities are available for heavy and inert materials, divert at 100% (by weight) of the asphalt concrete and Portland cement concrete construction debris, AND 65% or 80% or more of all other waste, including green waste. If local facilities are not available for heavy and inert materials, the diversion of asphalt concrete and Portland cement concrete are exempt.

Create and follow pre and post construction debris recovery plans that include

- allocating space for recycling bins and containers on the job site
- securing recycling bins against illegal dumping
- training workers before demolition or construction begins
- separating green waste from other materials
- If applicable, establishing and using a cut-pile to reduce waste from scrap pieces of wood.
- Documenting the results of the waste management efforts

PROJECT TEAM RECOMMENDATIONS

- Determine that local facilities are available for diverting heavy and inert materials.
- Verify the local jurisdiction's minimum requirement and reporting procedures for C&D recycling.
- State the percent diversion goal in the design documents.
- List specific goals and recycling and reuse requirements in plans and specifications
- Require contractors to review the waste management plan with subcontractors and to include contract language requiring subcontractors comply with the plan.
- To facilitate this process occurring smoothly, plans should be submitted with the Build It Green Sample Debris Recovery Statement or equivalent form required by local jurisdictions or regularly used by the Builder.
- Hauler and gate tags may show that all materials were sent to a C&D Recycling facility. However, that does not mean that 100% of all of the materials were recycled, as not all C&D materials can be recycled. Most large C&D facilities have a calculated diversion rate and can provide you with documentation stating the percentage of materials recycled at that facility. (The diversion rates range from 50% to 90%).

VERIFICATION

PROJECT TEAM

- Submit the Pre Construction Debris Recovery Plan in the planning stages of construction,
- Submit Post Construction Debris Recovery Plan, and documentation of results (i.e. hauler or gate tags, builder's waste tabulation supplied by local waste authority).
- Submit the diversion rate from the C&D facility.

RATER

- Verify that Pre Construction Debris Recovery Plan and Post Construction Debris Recovery Plan were submitted and documentation confirms this has been accomplished.
- Conduct field observations to get a sense of waste diversion practices (optional). However, field observation can not be used as a judgment or verification method of the documented results as some builders have waste separated and recycled off site and it is not evident on site.

SYNERGIES AND TRADE-OFFS

- Chipping trees identified for removal, and using mulch on-site is highly recommended and can also contribute to earning points for Credit A.3.a.ii (Construction documents specify that of the trees identified for removal, some are chipped for use as mulch onsite), C.6.a (Required: Planting specifications and plans indicate that after construction, all soil on site is protected with a minimum of 3 inches of mulch) and Credit D.1.d. (Purchased compost and/or mulch is recycled from local, organic materials such as plant or wood waste)
- Reusing site materials can also contribute to earning points for Credit D.1. (use salvaged items and recycled content materials)
- Donating unused materials can also contribute to earning points for Credit D.2.d. (Donate unused materials)

RESOURCES AND BAY-FRIENDLY TOOLS

- Find out where to recycle C&D debris, including wood, drywall, metals, concrete, soil and cardboard from StopWaste.Org, *Builders' Guide to Reuse & Recycling: A Directory for Construction and Demolition Materials*, *www*.BuildGreenNow.Org
- StopWaste.Org also provides extensive information about C&D waste management, including a sample Waste Management Plan for recycling C&D materials. Visit www.BuildGreenNow.Org to download these documents electronically.

d. Donate unused materials

PRACTICE DESCRIPTION

Unused materials, such as benches, wood scraps, plants, planting pots, etc. is donated to a local school or community garden, or other entity(s), in order to minimize material sent to the landfill.

PROJECT TEAM RECOMMENDATIONS

- State the percent diversion goal in the design documents, including the intent to donate unused materials.
- Identify materials to be donated and method of delivery in plans and specifications.

VERIFICATION

PROJECT TEAM

- Submit letter or receipt from receiving organization for donated materials OR
- Submit an Accountability Form signed by the Designer or Contractor.

RATER

- Verify receipt or letter from receiving organization has been submitted indicating that unused materials have been donated OR
- Verify an Accountability Form signed by the Designer or Contractor has been submitted.

SYNERGIES AND TRADE-OFFS

- Donating unused materials can also contribute to meeting the requirement for Credit D.2.a (Divert 50% of landscape construction waste)

3. REDUCE THE HEAT ISLAND EFFECT WITH COOL SITE TECHNIQUES

Credit D.3						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
				2		
Corresponds to BFL Guidelines Practice 5.2						

a. At least 50% of the paved site area includes cool site techniques

POINTS: 2

PRACTICE DESCRIPTION

Reduce heat islands by applying any combination of the following cool site techniques to a minimum of 50% of the paved site area.

Covered parking (underground parking garage or under overhangs/awnings/roof), roof or exposed podium patio must meet the criteria of solar reflectance greater than or equal to 0.3 or a reflectance index greater than or equal to 29%

White concrete, gray concrete or other light colored paving materials or pavers with an albedo of greater than or equal to .30 or a solar reflective index (SRI) of 29% or greater

Open grid paving system

Specifying trees, large stature shrubs and/or vegetated structures (such as trellises)

Locating paving to take advantage of shade from trees, and/or large stature shrubs on adjacent properties.

PROJECT TEAM RECOMMENDATIONS

Site plan identifies the goal for implementing cool site techniques.

- Identify all paved site areas (PA).
- Identify all paved site areas that have covered parking. (CP)
- Identify all paved site areas that will have an open grid paving system (OGP).
- Identify all paved site areas with light colored paving (LCP).
- Conduct a shade study to calculate the shaded area provided at noon on summer solstice (June 21) by trees, large stature shrubs and/or vegetated structures, assuming a mature height and width. Do not double count canopies that overlap. (VS).
- % cool site = (CP+ OCP + LCP +VS)/ (PA).

*The **Heat island effect** is the experience of warmer temperatures in urban landscapes compared to adjacent rural areas, resulting from the retention of solar energy on constructed surfaces. Principal surfaces that contribute to the heat island effect include streets, sidewalks, parking lots and buildings.* (USGBC, LEED New Home Construction & Major Renovation, v2.2 Reference Guide, September 2006.)

***Albedo** or **solar reflectance** is a measure of ability of a surface material to reflect sunlight- including the visible, infrared and ultraviolet wavelengths on a scale of 0 to 1. Solar reflectance is also called "albedo" Solar Reflectance is measured according to ASTM E 903, ASTM E 1918 or ASTM C 1549*

***Paved site area** includes sidewalks, patios, walkways, driveways, parking lots and other non-roof hardscapes, regardless of permeability.*

***Open-grid paving** is defined as having less than 50% imperviousness and containing vegetation in the open cells. (GreenPoint Rated MultiFamily Rating Manual, v1.2, July 2007)*

VERIFICATION

PROJECT TEAM

- Submit relevant site plan and calculations as defined in project recommendations.
- Submit an Accountability Form signed by the Landscape Architect or Designer that as installed the project meets the criteria for this credit.

RATER

- Verify that site plan has been submitted, calculations are complete
- Verify that an Accountability Form has been signed by the Landscape Architect or Designer.

***Large stature shrubs** are those that, under normal conditions, can reach a mature height of 12 feet or more. Examples include Arbutus 'Marina', some Arctostaphylus spp., some Ceanothus spp., Sambucus mexicana, Nerium oleander trained as a single or multistemmed tree*

SYNERGIES AND TRADE-OFFS

- Preserving mature healthy, large stature trees can also earn points for Credit A.7. (Conserve or restore natural areas and wildlife corridors).
- Using an open-grid system can contribute to earning points for Credit B.1 (Minimize impervious surfaces).
- Specifying that all stone and other non-concrete hardscape materials are produced within 500 miles of the project site can contribute to earning points for Credit D.6 (Specify low embodied energy products).
- Providing trees and vegetation with the space that each plant will require to reach its mature shape and size will contribute to earning points for credit E.1 (Select appropriate plants: choose & locate plans to grow to natural size and avoid shearing).
- Specifying drought tolerant large stature species can also earn points for Credit E.3 (Grow drought tolerant CA native, Mediterranean or climate adapted plants).
- Shading hardscapes with trees and other vegetation can contribute to earning points for Credit E.7 (Plant trees)
- Specifying a diversity of trees can contribute to earning points for Credit E.8 (Diversity)
- Specifying California native species can contribute to earning points for Credit E.9 (Choose California natives first)

4. DESIGN LIGHTING CAREFULLY

Credit D.4						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
				9		
Corresponds to BFL Guidelines Practice 5.4						

a. Low energy fixtures are specified for all site lighting.

POINTS: 2

PRACTICE DESCRIPTION

High efficiency, low energy consuming fixtures shall be specified for all site lighting.

Low energy fixtures *are light fixtures that are Energy Star Qualified or LED.*

VERIFICATION

PROJECT TEAM

- Submit lighting plan and documentation indicating light fixtures are Energy Star Qualified or LED fixtures.
- Submit an Accountability Form signed by the Lighting Designer and/or Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify that lighting plan and documentation have been submitted and that fixtures are Energy Star Qualified or LED.
- Verify that Accountability Form has been signed by Lighting Designer and/or Contractor.

SYNERGIES AND TRADE-OFFS

- Specifying recycled lighting posts can contribute to earning points for Credit D.1. (Non-plant landscape materials are salvaged or made from recycled content materials or FSC certified wood)
- Installing photovoltaic panels to general a percentage of building/site energy needs can contribute to earning points for Credit D.4.b. (Photovoltaic is specified for site lighting)
- Specifying fixtures that are Dark Sky certified can contribute to earning points for credit D.4.c (Reduce light pollution and trespass)
- Specifying fixtures that do not cast direct beam illumination onto adjacent properties or right of ways can contribute to earning points for Credit D.4.d

RESOURCES AND BAY-FRIENDLY TOOLS

- Illuminating Engineering Society of No. America Lighting for Exterior Environments
- IDA the light pollution authority www.darksky.org
- The California Energy Commission http://www.energy.ca.gov/efficiency/lighting/outdoor_reduction.html
- California's Energy Efficiency Standards for Residential and Nonresidential buildings http://www.energy.ca.gov/title24/
- Energy Star http://www.energystar.gov/

b. Photovoltaic is specified for site lighting.

i. All path lighting is solar powered (1 point))

ii. 50% of all other site lighting (2 points) OR

iii. 100% of all other site lighting (4 points total)

POINTS: 5

PRACTICE DESCRIPTION

All path lighting is powered by solar cells within the light fixtures and/or, a percentage of all other site lighting is powered by onsite solar photovoltaics. It is to be assumed that if a PV system is installed to provide a percentage of the estimated annual electric energy demand for the site and/or building, that same percentage of the site lighting demand will also be met.

VERIFICATION

PROJECT TEAM

- Submit lighting plan and cut sheets showing that all path lighting is solar powered AND/OR
- Submit a copy of the CF-1R-PV or C-46 solar report (or other appropriate forms) based on what was actually built (system size, output and percentage of load served by PV system).

RATER

- Verify that lighting plan and cut sheets have been submitted and path lighting is solar powered OR
- Visually verify that photovoltaics have been installed and verify percentage of load served by the PV system.

SYNERGIES AND TRADE-OFFS

- Specifying recycled lighting posts could contribute to earning points for Credit D.1. (Non-plant landscape materials are salvaged or made from recycled content materials or FSC certified wood
- Specifying low energy fixtures may contribute to earning points for Credit D.4.a. (Low energy fixtures are specified for all site lighting)
- Specifying fixtures that are Dark Sky certified could contribute to earning points for credit D.4.c (Reduce light pollution and trespass)
- Specifying fixtures that do not cast direct beam illumination onto adjacent properties or rights of way could contribute to earning points for Credit D.4.d

RESOURCES AND BAY-FRIENDLY TOOLS

- *Bay-Friendly Landscape Guidelines* Practice 5.4 https://www.stopwaste.org/docs/bay-friendly_landscape_guidelines_-_all_chapters.pdf
- Illuminating Engineering Society of No. America Lighting for Exterior Environments
- IDA the light pollution authority www.darksky.org
- The California Energy Commission http://www.energy.ca.gov/efficiency/lighting/outdoor_reduction.html

c. Reduce light pollution and trespass: exterior luminaries emit no light above horizontal or are Dark Sky certified.

Light pollution *occurs when outdoor fixtures let excess light escape into the night sky.*

Light trespass *occurs when outdoor light fixtures spill light onto neighboring properties.*

Full cut off luminaries *emit no light above horizontal.*

Dark Sky Certified *means that a light is certified by the International Dark-Sky Association, a third party certification for luminaries that minimize glare, reduce light trespass, and don't pollute the night sky. http://www.darksky.org*

POINTS: 1

PRACTICE DESCRIPTION

Full cut-off luminaries or Dark Sky certified fixtures are used for all exterior lighting that is installed by the builder. Landscape lighting that points upward shall not be allowed. Exceptions to this include lighting placed in areas where shielding is unnecessary to control light pollution (such as fixtures placed under overhangs) or where the builder does not install the lighting.

VERIFICATION

PROJECT TEAM

- Submit lighting plan showing lighting fixtures or schedules and/or cut sheets showing Dark Sky qualified luminaries OR
- Submit an Accountability Form signed by the Lighting Designer and/or Lighting Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify that lighting plan and/or cut sheets are submitted showing qualified luminaries OR
- Verify that Accountability form is signed by the Lighting Designer and/or Lighting Contractor
- Visually verify compliance.

SYNERGIES AND TRADE-OFFS

- Specifying recycled lighting posts could contribute to earning points for Credit D.1 (Non-plant landscape materials are salvaged or made from recycled content materials or FSC certified wood)
- Specifying low energy fixtures may contribute to earning points for Credit D.4.a. (Low energy fixtures are specified for all site lighting)
- Specifying photovoltaic fixtures may contribute to earning points for Credit D.4.b. (Photovoltaic is specified for site lighting)
- Specifying fixtures that do not cast direct beam illumination onto adjacent properties or right of ways could contribute to earning points for Credit D.4.d

RESOURCES AND BAY-FRIENDLY TOOLS

- The California Energy Commission http://www.energy.ca.gov/efficiency/lighting/outdoor_reduction.html

REFERENCES

- Build it Green, GreenPoint Rated Multifamily Rating Manual, V. 1.5, June 2008, Credit D.8.A (Exterior luminaries Emit No Light Above Horizontal OR Are Dark Sky certified)

d. The site and exterior building lighting does not cast direct beam illumination onto adjacent properties or right of ways

POINTS: 1

PRACTICE DESCRIPTION

For areas more than 15 feet away from the property line, the following values are not exceeded:

• For residential-only areas: 0.2 average foot-candles (FC).

• For mixed use areas: 0.6 average FC.

Alternatively, lamp must not be visible at the property line when viewed at a maximum elevation of 5 feet; OR more than fourteen feet (14') into adjacent property when viewed at ground level.

VERIFICATION

PROJECT TEAM

- Submit photometric site plan with analysis showing average foot-candles have not been exceeded OR
- Submit an Accountability Form signed by the Lighting Designer and/or Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify that photometric site plan OR
- Verify that Accountability Form signed by the Lighting Designer and/or Contractor.
- (Optional) Visually verify compliance.

SYNERGIES AND TRADE-OFFS

- Specifying recycled lighting posts can contribute to earning points for Credit D.1. (Non-plant landscape materials are salvaged or made from recycled content materials or FSC certified wood)
- Specifying low energy fixtures may contribute to earning points for Credit D.4.a. (Low energy fixtures are specified for all site lighting)
- Specifying photovoltaic fixtures may contribute to earning points for Credit D.4.b. (Photovoltaic is specified for site lighting)
- Specifying fixtures that are Dark Sky certified could contribute to earning points for credit D.4.c (Reduce light pollution and trespass)

5. CHOOSE AND MAINTAIN EQUIPMENT FOR FUEL CONSERVATION

Credit D.5						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
				1		
Corresponds to BFL Guidelines Practice 5.5						

a. Specify solar powered pump(s) for water features

POINTS: 1

PRACTICE DESCRIPTION

Solar powered pump(s) shall be specified for water features

PROJECT TEAM RECOMMENDATIONS

Identify the solar powered pump on plans, specifications and in cost estimate. If designed as a custom system, verify the power generated is sufficient to operate the pump, especially if it is multi-phased.

VERIFICATION

PROJECT TEAM

- Submit the make and model of the solar powered pump that was installed
- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify that the Accountability Form has been signed by the Landscape Architect, Designer or Contractor.

6. SPECIFY LOW EMBODIED ENERGY PRODUCTS.

Credit D.6						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
				2		
Corresponds to BFL Guidelines Practice 5.6						

Embodied energy *is energy that is used during the entire life cycle of the commodity for manufacturing, transporting and disposing of the commodity as well as the inherent energy captured within the product itself. (LEED New Construction & Major Renovation Version 2.2 reference Guide)*

a. 100% of any stone and non-concrete hardscape materials are produced within 500 miles of the project site

POINTS: 2

PRACTICE DESCRIPTION

Stone must be mined and manufactured within the 500 mile radius. All other non-concrete hardscape materials must be produced within 500 miles of the project site. The origin of the source materials for all hardscape materials (except stone) is not considered.

PROJECT TEAM RECOMMENDATIONS

Identify potential products to be included during the design process and note on plans and in specifications.
Consult with local suppliers and manufacturers to locate products that meet the criteria for this credit. and support local industry.

VERIFICATION

PROJECT TEAM

- Submit cut sheets for all stone indicating sources and submit cut sheets for non hardscape materials indicating where they are produced.
- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify that cut sheets were submitted and materials qualify.
- Verify that the Accountability Form has been signed by the Landscape Architect, Designer or Contractor.

SYNERGIES AND TRADE-OFFS

- Specifying stone and non concrete hardscape materials that are salvaged from the site is encouraged and can contribute to earning points for Credit D.2. (Reduce and recycle landscape construction waste)

7. USE INTEGRATED PEST MANAGEMENT

Credit D.7						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
					2	
Corresponds to BFL Guidelines Practice 6.1a						

Integrated Pest Management *is a holistic approach to mitigating insects, plant diseases, weeds, and other pests. It involves the use of many strategies for managing, but not eliminating pests. Integrated Pest Management (IPM) uses cultural, mechanical, physical, and biological control methods before using pesticides to control pests and diseases in the landscape.. Chemical controls are applied only when monitoring indicates that preventative and non-chemical methods are not keeping pests below acceptable levels. When pesticides are required, the least toxic and the least persistent pesticide that will provide adequate pest control is applied.*

a. Design documents include construction specifications that require integrated pest management

POINTS: 2

PRACTICE DESCRIPTION

Construction specifications call for integrated pest management. Pre-emergent herbicides are not used as a first and only weed control method.

VERIFICATION

PROJECT TEAM

- Submit final specifications that include integrated pest management
- Submit an Accountability Form signed by the Landscape Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify that specifications include integrated pest management
- Verify an Accountability Form has been signed by the Landscape Contractor.

SYNERGIES AND TRADE-OFFS

- Specifying Organic pest management can contribute to earning points for Credit C8.a (Use organic pest management)

8. USE ORGANIC PEST MANAGEMENT

Credit D.8						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
						2
Corresponds to BFL Guidelines Practice 7.4						

a. Design documents include construction specifications that prohibit the use of pesticides that are not allowed by OMRI in its generic materials list for the maintenance of the landscape.

POINTS: 2

PRACTICE DESCRIPTION

Design documents shall include construction specifications that prohibit the use of pesticides that are not allowed by OMRI in its generic materials list for the maintenance establishment period of the landscape.

.

VERIFICATION

PROJECT TEAM

- Submit specifications that prohibit the use of pesticides that are not allowed by ORMI in its generic materials list for the maintenance establishment period of the landscape.
- Submit an Accountability Form signed by the Landscape Contractor that as installed the project meets the criteria for this credit.

RATER

- Verify that specifications prohibit the use of pesticides that are not allowed by ORMI in its generic materials list for the maintenance establishment period of the landscape.
- Verify an Accountability Form has been signed by the Landscape Contractor.

*The **Organic Materials Review Institute (OMRI)** is a national nonprofit organization founded in 1997 to support the organic community. OMRI reviews products to determine their suitability for producing, processing and handling organic food and fiber under the USDA National Organic Program Rule (OMRI General Materials List)*

SYNERGIES AND TRADE-OFFS

- Specifying Organic pest management will contribute to earning points for Credit C7.a (Use integrated pest management)

RESOURCES AND BAY-FRIENDLY TOOLS

- OMRI Generic Materials List a directory of substances allowed and prohibited in organic production and handling http://omri.org/
- Model Bay-Friendly Maintenance Specifications http://www.stopwaste.org/home/index.asp?page=782

E. PLANTING

1. SELECT APPROPRIATE PLANTS: CHOOSE & LOCATE PLANTS TO GROW TO NATURAL SIZE AND AVOID SHEARING

Credit E.1						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
	R + 1					
Corresponds to BFL Guidelines Practice 2.1 a-c						

Shearing *is a method of pruning, used for forming and maintaining plants or hedges of uniform shape, by routinely cutting them back with hedge shears and resulting in a geometric growth habit.*

a. REQUIRED: No species will require shearing

POINTS: This practice is required for all commercial& civic landscapes that are to be recognized as Bay-Friendly.

PRACTICE DESCRIPTION

Species will be selected and plants spaced to allow them to grow to their mature size and natural shape without shearing at any point in the lifespan of the plant. (Pruning for structural integrity and plant health is permitted.) Shrubs and groundcover plants located in a row or adjacent to buildings, sidewalks, or roads will be spaced between their minimum and maximum mature plant spread, according to a published reference, to fit into their planting area without overhang. Trees must meet the spacing requirements only when adjacent to buildings or other vertical obstructions. Vines are not subject to spacing requirements. Projects including existing sheared hedges or plants to remain that do not meet the requirements above will not meet this required credit. References can include:

- Bornstein, Carol, David Fross and Bart O'Brien, *California Native Plants for the Garden*
- East Bay Municipal Utility District's publication *Water Conserving Plants for the Bay Area*
- *Sunset Western Garden Book*

PROJECT TEAM RECOMMENDATIONS

- Use of the Bay-Friendly Plant Legend template facilitates verification of the plant palette.
- Prepare plans to scale showing all species and spacing.

VERIFICATION

PROJECT TEAM

- Submit plant legend indicating plant species, spacing and mature spread of plant. Indicate the source of information on spacing and spread.
- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor verifying that installed plants meet this requirement.

RATER

- Verify mature size of all plants in the plant legend and compare to spacing.
- Verify Accountability Form has been signed by the Landscape Architect, Designer or Contractor.

SYNERGIES AND TRADE-OFFS

- Selecting appropriate plants that will not require shearing can also contribute to earning points for credit E.1.b (Plants specified can grow to mature size within space allotted them)

BAY-FRIENDLY TOOLS & RESOURCES

- The following can be downloaded from: **http://www.stopwaste.org/home/index.asp?page=777**
  - *Bay-Friendly Landscape Guidelines* Practice 2.1
  - Bay-Friendly Plant Palette template,
  - Bay-Friendly Natural Hedges to Avoid Shearing plant list

b. Plants specified can grow to mature size within space allotted them

POINTS: 1

PRACTICE DESCRIPTION

Trees, shrubs and groundcovers are selected and spaced to allow them to grow to mature size within the landscape area in which they are to be planted.

Even when formal hedging or shapes are not planned as elements of the landscape, species can be selected and specified for a space that is too small for them to reach their mature size and shape, or too many of the plants are specified for the space to allow all of them to reach their mature size and shape. Spacing of all plants must be within the minimum and maximum plant spread according to third party source, such as the following:

- Bornstein, Carol, David Fross and Bart O'Brien, *California Native Plants for the Garden*
- East Bay Municipal Utility District's publication *Plants and Landscapes for Summer Dry Climates*
- *Sunset Western Garden Book,*

PROJECT TEAM RECOMMENDATIONS

- Use of the Bay-Friendly Plant Legend template facilities the verification of the plant palette.
- Prepare plans to scale showing all species and spacing to avoid overcrowding.

VERIFICATION

PROJECT TEAM

- Submit plant legend indicating plant species, spacing, and mature spread of the plants. Indicate source of information on spacing & mature spread.
- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor verifying that installed plants meet this requirement.

RATER

- Verify mature size and compare to spacing of all plants in the plant legend.
- Verify Accountability Form has been signed by the Landscape Architect, Designer or Contractor.

SYNERGIES AND TRADE-OFFS

- Plants specified can grow to mature size within space allotted them can also contribute to earning points for Credit E.1.a (Required: No species will require shearing)

BAY-FRIENDLY TOOLS & RESOURCES

- The following can be downloaded from: **http://www.stopwaste.org/home/index.asp?page=777**
  - *Bay-Friendly Landscape Guidelines* Practice 2.1
  - Bay-Friendly Plant Palette template,
  - Bay-Friendly Natural Hedges to Avoid Shearing plant list

2. SELECT APPROPRIATE PLANTS: DO NOT PLANT INVASIVE SPECIES

Credit E.2						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
	R					
Corresponds to BFL Guidelines Practice 2.1 d						

An invasive species *is defined as a species that is non-native (or alien) to the ecosystem under consideration and whose introduction causes or is likely to cause economic or environmental harm or harm to human health. Federal Executive Order 13112*

a. REQUIRED: None of the species listed by Cal-IPC as invasive in the San Francisco Bay Area are included in the planting plan

POINTS: This practice is required for all commercial& civic landscapes that are to be recognized as Bay-Friendly.

PRACTICE DESCRIPTION

None of the species listed by Cal-IPC *Don't Plant a Pest* as invasive in the San Francisco Bay Area shall be included in the planting plan

VERIFICATION

PROJECT TEAM

- Compare the complete list of plants in the plant palette to the Cal-IPC list of plants that are invasive to the San Francisco Bay-Area
- Submit the complete plant palette
- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor confirming that no invasive species were substituted for specified species

RATER

- Compare the Cal-IPC list of invasive species with the plant palette to confirm no invasive species have been specified.
- Verify Accountability Form has been signed by the Landscape Architect, Designer or Contractor.

BAY-FRIENDLY TOOLS & RESOURCES

- *Bay-Friendly Landscape Guidelines Practice 2.1d*

3. GROW DROUGHT TOLERANT CA NATIVE, MEDITERRANEAN OR CLIMATE ADAPTED PLANTS

Credit E.3						
Possible Points:						
Landscape Locally	Less to Landfill	Nurture the Soil	Conserve Water	Conserve Energy	Water & Air Quality	Wildlife Habitat
			R + 5			
Corresponds to BFL Guidelines Practice 4.2						

a. Specify drought tolerant California native, Mediterranean or other climate adapted plants that require occasional, little or no summer water for

i. REQUIRED: 75% of all non-turf plants

ii. 100% of all non-turf plants (2 points)

POINTS: The first part of this practice is required for all commercial, multifamily & civic landscapes that are to be recognized as Bay-Friendly. Up to 2 additional points may be earned for going above and beyond the requirement.

PRACTICE DESCRIPTION

A minimum of 75% of the total number of plants in non-turf areas must be species that require no or little summer watering. California native or Mediterranean species are strongly recommended.

All species should be adapted to the climate in which they will be planted, as indicated by a plant reference book. If plants are given a range of water needs from "occasional to moderate" for example, the landscape designer must determine if the plant will require either occasional or moderate watering based on site, soil, and climate conditions and categorize the plant appropriately. Sources used to determine climate adaptation and watering requirements include:

- Bornstein, Carol, David Fross and Bart O'Brien, *California Native Plants for the Garden*
  - Qualifying irrigation designation: "occasional", "infrequent", or "drought tolerant"
- East Bay Municipal Utility District's publication *Plants and Landscapes for Summer Dry Climates*
  - Qualifying irrigation designation: "occasional", "infrequent" or "no summer water".
- *Sunset Western Garden Book,*
  - Qualifying irrigation designation: "little or no water"
- University of California Cooperative Extension's *Guide to Estimating Irrigation Water Needs of Landscape Plantings in CA,* www.owue.water.ca.gov/docs/wucols00.pdf
  - Qualifying irrigation designation: "Low" or "Very Low"

PROJECT TEAM RECOMMENDATIONS

- Use of the Bay-Friendly Plant Legend template facilities the calculation of percent plants that meet this criteria and the verification of the plant palette.
- If hydroseeding or specifying plugs, include one plant per 2.25 square feet in the calculation of percent plants that meet these criteria, assuming the species in the hydroseed mix and plugs are drought tolerant.

VERIFICATION

PROJECT TEAM

- Submit a plant legend that identifies species, number of plants, irrigation requirements (and source of that requirement), total number of drought tolerant plants and total number of non-turf plants.
- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor verifying that installed plants meet this requirement.

RATER

- Verify that a plant legend was submitted with 75% or more plants meeting the drought tolerant requirement and that the calculations are correct.
- Spot check the irrigation requirement identified in the Bay-Friendly Plant legend by comparing it to its source.
- Verify that an Accountability Form has been signed by the Landscape Architect, Designer or Contractor.

SYNERGIES AND TRADE-OFFS

- Grouping plants by water needs and exposure can also contribute to earning points for Credit E.5 (Implement hydrozoning).
- Specifying a diversity of plant species can also contribute to earning points from Practice E.8. (Diversify)
- Specifying 50% California native plant species to meet the requirements of this practice can also contribute to earning points from Practice E.9 (Choose CA natives first)

BAY-FRIENDLY TOOLS & RESOURCES

- The following can be downloaded from: **http://www.stopwaste.org/home/index.asp?page=777**
  - *Bay-Friendly Landscape Guidelines* Practice 2.1
  - Bay-Friendly Plant Palette template,
  - Bay-Friendly Natural Hedges to Avoid Shearing plant list

b. 100% of the non-turf plant palette needs no irrigation once established.

POINTS: 3

PRACTICE DESCRIPTION

100% of the non-turf plant palette needs no summer irrigation once established.

California native or Mediterranean species are strongly recommended. All species should be adapted to the climate in which they will be planted. Sources used to determine climate adaptation and watering requirements include:

- Bornstein, Carol, David Fross and Bart O'Brien, *California Native Plants for the Garden*
  - Qualifying irrigation designation: "drought tolerant"
- East Bay Municipal Utility District's publication *Plants and Landscapes for Summer Dry Climates,* www.ebmud.com.
  - Qualifying irrigation designation: "no summer water".
- *Sunset Western Garden Book*
  - Qualifying irrigation designation: "no irrigation needed"
- University of California Cooperative Extension's *Guide to Estimating Irrigation Water Needs of Landscape Plantings in CA,* www.owue.water.ca.gov/docs/wucols00.pdf
  - Qualifying Irrigation Designation: "Very Low"

PROJECT TEAM RECOMMENDATIONS

- Use of the Bay-Friendly Plant Legend template facilities the calculation of percent plants that meet this criteria and the verification of the plant palette.

VERIFICATION

PROJECT TEAM

- Submit a plant legend that identifies species, number of plants, irrigation requirements (and source of that requirement), total number of drought tolerant plants and total number of non-turf plants.
- Submit an Accountability Form signed by the Landscape Architect, Designer or Contractor verifying that installed plants meet this requirement.

RATER

- Verify that a plant legend was submitted with 100% of the plants qualifying.
- Spot check the irrigation requirement identified in the Bay-Friendly Plant legend by comparing it to its source.
- Verify that an Accountability Form has been signed by the Landscape Architect, Designer or Contractor.

SYNERGIES AND TRADE-OFFS

- Grouping plants by water needs and exposure can also contribute to earning points for Credit E.5 (Implement hydrozoning).
- Specifying a diversity of plant species can also contribute to earning points from Practice E.8. (Diversify)
- Specifying 50% California native plant species to meet the requirements of this practice can also contribute to earning points from Practice E.9 (Choose CA natives first)
